Foligno, or **Fuligno** (anct Fulginia), It. tn, in Umbria (q.v.), 20 m. S.E. of Perugia (q.v.). It has a 12th-13th-cent. cathedral (now restored, after war damage), and other medieval churches. In the 15th-cent. Palazzo Trinci is a museum and art gallery. The tn was very severely damaged during the Second World War by bombing and mining; among the art treasures lost was Perugino's 'Baptism of Christ.' F. is a railway centre, and has textile, leather, soap, paper, and brick industries. Pop. (tn) 19,600; (com.) 44,000.

Folio (ablative of *folium*, leaf, or often an adaptation of It. *folio*), with reference to pagination, a leaf of paper or parchment of a MS. or book, numbered only on the front, measuring about 17 by 22 in. Modern printing paper F. sizes are: foolscap 8½ by 13½, crown 10 by 15, large post 10½ by 16½, demy 11½ by 17½, medium 11½ by 18, royal 12½ by 20, imperial 15 by 22 in. In bibliography and printing the phrase 'in folio' is used of a sheet folded once to make 2 leaves, and hence of a book formed of such sheets, a book of a large size. In book-keeping a F. is the page or 2 pages (numbered alike) in a ledger on which the creditor and debtor account is entered.

Folk Dancing, the simple, spontaneous, and uninstructed dances of people in small tns and country places. The word F. means the common people, and such phrases as F.-lands, F.-lore, and F. D. are related to the rights, the customs, the habits and life of the ordinary pop. In every country of the world dancing has played its part, and practically everywhere is susceptible of a rough div. into 2 main parts: formal and spontaneous. In its more stately and intentional manner dancing has been surrounded with rigid rules, precise etiquette, or social custom from antc times when it was part of religious ritual to the later day of pomp in court balls. In its simpler aspect it has been part of the play of the children in the street and a natural outlet of the spirits of adult merry-makers on the vil. green. Dancing is now influenced by professionalism, and the habit of the professional mind is to adopt the convenient plan of limiting its definition to a specific style. In the strict language of the dancing instructor, F. D. is not quite the same as country dancing, but in a looser and more general use of words the 2 phrases are interchangeable. In England the Eng. Folk Dance and Song

Society leads a vigorous movement to keep alive and revive popular interest in F. D., which except in the N. had virtually *d.* out late in the 19th cent. Cecil Sharp, a devoted pioneer, worked hard to preserve F. music and F. D. before it became extinct. The Brit. Gov. gives a grant to assist the organisation of the pastime on the ground that F. D. is a traditional and inexpensive means of keeping the people cheerful and healthy. See J. Diack, *Folk Dances of Europe*, 1910; and D. Kennedy, *England's Dances: Folk Dancing To-day and Yesterday*, 1948.

Folk High Schools, Dan. residential, non-vocational S. or colleges for adults. Winter courses last, as a rule, for 5 or 6 months; the summer courses are shorter. Three main influences led to the foundation of the now world-famous F. H. S., the first of which was estab. in 1844. The leaders of the movement wished to fortify the Dan. people in S. Jutland against Germanisation. Thus through the 'living word' Bishop Grundtvig, the father of the movement, hoped to arouse in the ordinary people a consciousness of their national culture. This nationalistic element was much stronger after the disasters of 1864 when Schleswig-Holstein was lost to Germany. The second strong influence was the view that in their movement towards independence the peasants should be equipped to take their place in the rising political democracy by knowing their rights and their obligations as citizens. Finally, Grundtvig's ideas on Christianity lent the movement a strongly religious bias, still existent in the F. H. S. to-day. Throughout the country there are some 60 S. Their general aims are similar and the typical syllabus is centred round Dan. language and literature, Scandinavian hist., gymnastics, and arithmetic. But Dan. social conditions, war affairs, and scientific-economic subjects find their place. There are no examinations, and although the S. are now heavily subsidised from state funds, any interference by the authorities has been strongly resisted. Great freedom is allowed both to teachers and students to pursue their cultural interests. Independent work is important and centres on well-stocked libraries.

Inevitably ideological and operational differences exist. Some F. H. S. emphasise one activity, others another. The Inner Mission H. S., for example, and those of other religious sects, have a greater sectarian bias than the Grundtvigian ones. Some specialise in gymnastics, others emphasise agric., artisan, or craft studies. Another group of S. is interested in international co-operation. There are also F. H. S. for industrial workers. These, contrary to the general tendency, draw their students from the towns and factories rather than from rural areas and agriculture. There is little doubt that the movement has been very influential in developing attitudes and outlooks that have made the world-famous Dan. co-operatives work so well.

Perhaps, of them all, Askov is the most famous. Opened in 1865, it has become the High School 'univ.' and has trained over the years many teachers who subsequently set their mark on the movement. To-day Askov, with over 300 students, is the largest F. H. S. and provides advanced education for people from all parts of the country, most of whom have already attended other H. S. In this 'extended' school opportunities are provided for courses continuing through 2 or 3 winters. The F. H. S. movement spread to other Scandinavian countries and later to many nations in Europe and elsewhere.

Folk-Lore Society, estab. in 1878 for the purpose of collecting, recording, and studying the traditions and culture of the people. The S. publishes a quarterly jour., *Folk-lore*, containing, besides minutes of the S.'s meetings, papers on aspects of folk-lore, records of the folk-lore of given areas or dists., notes, communications, and reviews of Eng. and foreign books on folk-lore and kindred subjects. It has an extensive library.

Folk Music, traditional melodies, the spontaneous expression of national temperament in songs, and in dance tunes played by a great variety of frequently rustic instruments. The div. between F. M. and 'art' music in Europe and the Americas is not, as is often said, that the former is a kind of natural growth, whereas the latter is attributable to a composer, since all organised music—and F. M. is often highly organised in its own way—must have been originally invented by one single person, who is a composer whether he writes down a tune or merely improvises it. But 'art' M. is fixed by notation and remains essentially unchanged, except by interpretation and possibly ornamentation, whereas F. M. is transmitted orally from generation to generation, suffering a continual process of small changes as memory fades or new fancy dictates; changes affecting words, rhythm, melodic intervals, and to a much smaller extent the formal construction of a tune, which can be quite elaborate. The style of a tune, however, remains practically unchanged, so that its age cannot be determined on stylistic grounds or by the manner of a period, as in the case of European 'art' M. even where its date of composition is unknown. Much less do dates of original pub. help, as in the latter case, another characteristic of F. M. being that it was never pub. at the time of its origin. The tunes are therefore ageless and can neither be assigned to any particular century nor imagined ever to 'grow out of fashion.' If the essentials that make F. M. are borne in mind, it is impossible to agree with the view until recently held, especially in Ger.-speaking countries, that a composer's song, if it is only simple and popular enough, can become a folksong. The *Lorelay*, for instance, although regarded as such, is decidedly not a folksong, for both its poet (Heine) and its composer (Silcher) are known, it is of no particular antiquity

and it was pub. at the time of its composition. Many of the popular songs ed. by Brahms are not genuine folksongs either, nor are his *Hungarian Dances* or Liszt's *Hungarian Rhapsodies* (the latter based on Gypsy M., not on true Magyar tunes) to be regarded as F. M. Many composers, however, have used F. material in their work or, more often and more successfully, written M. of their own that is closely modelled on or deeply influenced by such material without actually using existing tunes. A few of those who might be named are Tchaikovsky as well as the more determined nationalists in Russia, Chopin in Poland, Smetana and Dvořák in Bohemia, Grieg in Norway, d'Indy in France, Albéniz and Falla in Spain, Vaughan Williams in England, Janáček in Slovakia, and so on. The systematic collecting of folk tunes is a recent movement, apart from a few early pioneers, and in some countries, where the cultivation of F. M. has almost d. out, it was undertaken only just in time to yield a representative crop. Cecil Sharp in England, Stanford and Herbert Hughes in Ireland, Bourgaunt-Ducoudray in France, Bartók and Kodály in Hungary, and others elsewhere, have both collected and edited tunes rescued from threatened oblivion.

Folkestone, municipal bor. and seaport in Kent, England, about 6 m. WSW. of Dover and 72 m. from London. It has a deep-sea harbour, begun in 1881, admitting vessels of from 10 to 12 ft draught at high water, and the shipping entering and leaving the harbour is about 1,000,000 tons per annum. The tn lies in a hollow between 2 high cliffs on the Eng. Channel. F. is opposite Boulogne, and forms a gateway to the Continent. The Leas, on the top of cliffs 130-180 ft high, form a tableland of lawns, 2 m. in length; the Leas Cliff Hall is built into the face of the cliff and is used for concerts and for conferences. At the foot of the cliffs are wooded walks. To the E. of the tn is the E. Cliff, and beyond lies the Warren, an area of undisturbed natural beauty. Other parks and open spaces are Radnor Park; the sports ground on the Cheriton Road, with a co. cricket ground; and the Westernhanger race course (about 5 m. from the tn), where 6 meetings are held yearly. Kingsnorth Gardens, near the Central Station, are laid out in the It. style. Among places of entertainment are the Pleasure Gardens Theatre, the Leas Pavilion, and the Marine Gardens Pavilion. F.'s anct par. church, dedicated to Sts Mary and Eanswythe, stands on a site that was previously occupied by a priory. This has disappeared, as has also the first nunnery in England, which stood near it, founded by St Eanswythe, granddaughter of St Ethelbert, king of Kent, to whom sev. miracles are ascribed. The church dates back to the 12th cent. and is of great historical interest. It possesses a fine stained-glass window given by members of the Brit. medical profession to commemorate Wm Harvey (b. in F. on 1 April 1578), discoverer of the

circulation of the blood. The free grammar school was founded in 1874. There is a fine central library on Grace Hill, and a branch was opened at Cheriton in 1938. The art gallery and museum occupy the upper floors of the central library. The tn was frequently raided by enemy aircraft in the Second World War, but a progressive policy of rehabilitation has restored the tn's many amenities. Pop. 43,560 (1953).

Folklore, science of the elucidation of the peasant and local elements in modern culture. These elements in contemporary primitive cultures are the domain of anthropology (q.v.). In all customs and traditions of the peasant class in all countries are embedded the knowledge of past events which hist. ignores, and religious and legal observances, the significance of which has long been forgotten. Those fragmentary survivals of a savage past are to be found in such apparently meaningless entities as game rhymes, nursery rhymes and tales, ballads and mären, vil. ann. observances, and old saws. These survivals of an older culture remain among the non-progressive portion of the pop., and their analysis and elucidation constitute the science of F., in which there are 2 main fields of study: that of superstitions, including proverbs, songs, and popular sayings; and that of folk-tales.

The logical and inductive treatment of traditions respecting persons and places often results in the elucidation of facts which throw considerable light upon the dark places of hist. Thus the children's rhyme 'London Bridge is broken down,' when taken in conjunction with sundry Eng., Breton, and Norse folk-tales, reveals first the intense interest and wonder of the Britons of the Rom. period in the architectural work of an alien and superior culture, and secondly illustrates the fact that London Bridge was captured by King Olaf the Dane in the 10th cent.

The little that can be gleaned concerning some characters known to be historical may be supplemented by F., as in the case of Hereward the Wake, Rob Roy, and Wm Tell, tales regarding whom are prevalent in the dists. where they dwelt. But in such cases the wonder element is mingled with fact, and discrimination is necessary to arrive at sound conclusions.

The testimony of F. as regards anct religious practice is chiefly afforded by old vil. or civic observances, customs in connection with calendric or seasonal changes or 'sacred' wells. For example, the tn of Hawick, in the Scottish border country, possesses an anct civic rhyme sung annually at the riding of the tn marches, which commences 'Teribus and Teri Odin.' This in A.-S. is 'Tyr habbe us, ye Tyr, ye Odin.' or 'Uphold us, Tyr: uphold us, Odin,' so that the lay is undoubtedly a fragment of an invocation to the N. war-god Tyr and the All-Father Odin.

Again in many parts of Great Britain and Ireland 'sacred' wells are found, the bushes surrounding which are covered

with rags. In pagan times these springs were regarded as the haunt of a minor deity or spirit to whom sacrifice was periodically rendered. The rags surrounding these shrines are still offered up by the country folk, and the practice is strikingly illustrative of the substitution of the part for the whole, which follows the breakdown of the practice of human sacrifice, the rag representing a part of the person who makes the sacrifice. Fragments of worship of the rain-god are often retained in connection with well worship, as in the Isle of Gigha, off the coast of Scotland, where the water of a sacred well is blown to the 4 quarters of the heavens when rain is desired.

The legal aspect of F. is important. Many rhymes employed by the peasant class are fragments of ancient law. Thus the Scottish children's rhyme, 'Tappie, tappie touse, will ye be my man?' probably typifies the surrender of a freeman to an overlord. The rhyme gathers greater significance when we learn that the speaker seizes by the forehead the child to whom he addresses the words. Countless gifts of land are still commemorated in doggerel, and it is significant that until a late date in Eng. law it was admitted as a principle that if oral declarations conflicted with written instruments the former had the more binding authority.

Many folk-tales describe a constitution of society which is plainly barbarous. Implicit in them are vestiges of marriage by capture, totemism, fetishism, witchcraft or shamanism. In elucidating these—as indeed all F. problems—the anthropological method, or argument by analogy from the habits and customs of existing savage races, is insisted upon by folklorists in contradistinction to the mythological method, or elucidation by reference to natural phenomena. Where the folklorist sees only the record of some prehistoric custom or event, and the mythologist spies the hist. of a sun-god, the impartial observer may discover traces of both, or neither. But there are many cases in which both methods may be singly employed. Thus by the anthropological we find in old tales the savage elements which prove their vast antiquity, to which has been super-added during the centuries a certain amount of the matter of modern culture. A considerable amount of work has also been done on such tales and myths by psycho-analytically minded researchers. But, like many mythologists, these symbolists have failed to realise that mere conjecture and possibility are almost worthless without some firmer demonstration of hypotheses.

Turning from folk-tale to folk custom pure and simple, the exact description of which is dubious, and which may or may not refer to religion, law, or hist., we have such phenomena as 'sin-eating' (q.v.), the Irish customs of placing a dead person's hand in the milk-pail in order that the milk may increase in richness, and taking mould from graveyards for medicinal purposes, and so forth. Lastly, differ-

ences in race may be traced in many folk customs; thus the daubing of the bridegroom's feet with soot in NE. Scotland, the painting of the Southam 'Godiva,' the slaughter of the ram lamb at Holne, are all possibly remnants of non-Aryan culture. The race has become absorbed, but its customs remain in a more or less fragmentary condition.

See A. Banier, *The Mythology and Fables of the Ancients*, 4 vols., 1739-40; H. Ellis and W. C. Hazlitt, *Brand's Popular Antiquities of Great Britain*; *Faiths and Folklore*, 2 vols., 1905; N. W. Thomas, *Bibliography of Anthropology and Folklore*, 2 vols., 1907-8; J. G. Frazer, *The Golden Bough*, 12 vols., 1911-15; E. B. Tylor, *Primitive Culture*, 2 vols., 1924; B. Malinowski, *Myth in Primitive Psychology*, 1926; R. S. Loomis, *Celtic Myth and Arthurian Romance*, 1927.

Folkmoot, or **Folcgemot** (folk-meeting, O.E. *folc*, people, *gemot*, assembly). Limited evidence exists that there were local popular courts of some kind among the early A.-S. settlers in England, possibly modelled on the Germanic assemblies described by Tacitus. But the early references are few. Not until Alfred's reign does the actual word *folcgemot* appear in the laws, and then in a context which implies something more like the later shire court than like the primitive Germanic popular gathering. However, it is known that in London before the Conquest there existed a F. which met in the open on a hill in the NE. of the city and which had the fundamental characteristics of a popular assembly. An extensive and controversial literature exists on the subject of F.s, but see W. Stubbs, *Constitutional History of England*, 1874-8; F. Pollock and F. W. Maitland, *The History of English Law*, 1898; and F. M. Stenton, *Anglo-Saxon England*, 1943.

Folkgright, see **FOLC-RIGHT**.

Follicle, in anatomy, a small tubular gland. A dental F. is a sac enveloping the developing tooth; a Graafian F., one of the small vesicles in the ovary (q.v.), each containing an ovum; sebaceous F.s, the glands of the skin which secrete sebum; hair F.s, the sacs enclosing the roots of the hair.

Folquet de Marseille (c. 1150-1231), Provençal troubadour of lt. race. He wrote many love songs and a moving lament on the death of his patron Barral de Baux. In 1198, being weary of love and having taken holy orders, he became abbot of Le Toronet in Provence. See S. Stronski, *Le troubadour Folquet de Marseille*, 1910.

Folliceni, see **FALTICENI**.

Fomentation (from Lat. *foveo*, I warm), method of applying warmth to some part of the body, but very often the term is used to signify the substances used. F.s are used to remove pain and relieve inflammation, and a simple one is made by dipping flannel into very hot water, boiling if possible, and wringing it out in a towel. This should be applied immediately and covered with wool and

waterproof sheeting to prevent the escape of the heat. As soon as this becomes cool it should be replaced by another flannel. Very often boracic powder is dissolved in the hot water.

Femorians, anct race of gods in Irish Gaelic tradition, related to the pre-Celtic race known in Irish story as Fir-boigs. Though the Celts regarded them as baneful, they were generally regarded as peaceful agric. deities. The most prominent was Balor of the Evil Eye.

Fonblanque, Albany William (1793-1872), Brit. journalist of Huguenot descent. He studied law, but turned to journalism, in which he took a high place. From 1828 to 1847 he was editor and then also proprietor of the *Examiner*, enhancing the reputation it had already won under Leigh Hunt. His best articles were pub. as *England under Seven Administrations*, 1837, and he also wrote *How We are Governed*, 1858. See life by E. B. Fonblanque, 1874.

Fond du Lac, city, cap. of F. du L. co., Wisconsin, U.S.A., at the S. of Lake Winnebago, 55 m. NW. of Milwaukee, in a dairying and resort area with railway shops and limestone quarries. It manufs. precision tools, machinery, refrigerators, textiles, and clothing. Pop. 29,900.

Fondi (anct Fundi), lt. tn, in Lazio (q.v.), on the Appian Way (q.v.), 28 m. SE. of Latina. Close by is a salt lagoon, *Lago di F.* (anct *Lacus Fundanus*). It has anct walls, a ruined Colonna (q.v.) castle, a Gothic church which was formerly a cathedral, other fine churches, and a Dominican convent where St Thomas Aquinas (q.v.) taught. Very severe damage was done to the tn by bombing during the Second World War. Pop. (com.) 16,000.

Fons Sanus, see FOSSANO.

Fonsagrada, Sp. tn in the prov. of Lugo. It has an agric. trade and flour mills. Pop. 19,000.

Fonseca, Manoel Deodoro da (1827-92), first president of the United States of Brazil, b. Alagoas (q.v.), now named *Marechal Deodoro* in his honour. He entered the army, and took part in the wars against Montevideo (1864) and Paraguay. On 14 May 1887 he issued a manifesto defending the political rights of military officers, and won over the entire army. When Corrêa de Oliveira became *Conservative Prime Minister* he gave F. a command. Six months later the ministry was overthrown; soon afterwards F. returned and was persuaded to head an insurrection. The result was a bloodless victory and the proclaiming of a rep., of which he became president (Feb. 1891). In the following Nov. he retired from public life.

Fonseca, Marchesa de (née Eleonora Timental) (c. 1768-99), Neapolitan patriot, married (1784) to the marquis of F. Introduced to the court of Ferdinand I, she became for a short time maid of honour to his queen, Marie Caroline. In 1789 she espoused the cause of the Fr. Revolution. Her salon at Naples was the H.Q. of opposition to the court, and she

founded and ed. the *Montore Napolitano* during the brief rule of the popular party in Naples (1798-9). On the restoration of Ferdinand she was executed.

Fonseca, Gulf of (Amapala Gulf or Bay of Conchagua), large gulf (700 sq. m.) of the Pacific, bordered by Salvador, Honduras, and Nicaragua, in W. Central America, discovered 1522-3, and named after the bishop of Burgos. The volcanoes Conchagua and Colegrina are on either side of the entrance (about 21 m. apart).

Font (Lat. *fons*, a fount), vessel or basin for the water used for the rite of baptism. Primitive Baptistries (e.g. in the Duomo at Naples) contain a basin in the floor large enough for the immersion of adult converts. When infant baptism became the general rule this was much diminished in size, and was placed higher. When baptism was generally by affusion the size decreased still more until, as now, the F. was a basin about 2½ ft in diameter or less. The material is generally stone and is often lined with lead. In the Middle Ages examples of F.s composed entirely of lead also occur. The exterior is generally octagonal, sometimes circular, square, or hexagonal, and is frequently decorated in a rich manner. The F. almost always stands at the W. end of the church. It is sometimes enshrined in a special chapel, or Baptistry, dedicated to St John the Baptist. Elaborate covers often hang over the F. In the Rom. Catholic Church these are locked to protect the water (blessed and mingled with Chrism) which is used for baptisms throughout the year. The covers also serve to give a proper dignity to the F., as representing a prin. sacrament of the Church.

Fontaine, Jean de la, see LA FONTAINE.

Fontaine-l'Évêque, tn in the prov. of Hainaut, Belgium, 6 m. W. of Charleroi. It has coal-mines and freestone quarries, and manufs. of iron, nails, knives, bolts, chains, boilers, etc. Pop. 8,600.

Fontainebleau (Fontaine Belle Eau, Lat. Fons Bellaguerus or Bleaudi), Fr. tn in the dept of Seine-et-Marne, near the Seine, 37 m. SSE. of Paris. It is situated in a magnificent forest of 42,500 ac., one of the loveliest wooded tracts in France, greatly esteemed by landscape painters (see, e.g. under BARBIZON). The celebrated royal palace was traditionally founded by Philip the Good (q.v.), but, as it exists to-day, was begun by Francis I (q.v.). Here Napoleon signed his abdication in 1814. The tn manufs. porcelain, glass, and gloves, and there are sand and stone quarries. Grapes (called 'F. grapes') are cultivated. Philip IV, Francis II, Henry III, and Louis XIII (qq.v.) were b. here. Pop. 15,000. Consult E. Bourges, *Recherches sur Fontainebleau*, 1896; L. Tarsot and M. Charlot, *Palace of Fontainebleau*, 1902; Marie Louise Gothein, *A History of Garden Art* (trans. by Laura Archer-Hind), 1928; and E. Pilon, *Fontainebleau* (trans. 1933).

Fontana, Domenico (1543-1607), It. architect, b. Mili, near Como. In 1563 he went to Rome and Cardinal Montalto

became his patron; under his auspices he built a chapel in the church of Santa Maria Maggiore and the Villa Negroni. When his patron became Pope Sixtus V he carried out alterations to the Lateran Palace, the Quirinal, and the Vatican library. His most remarkable achievement, however, was the removal of the Egyptian obelisk (brought to Rome in the time of Caligula) from Nero's circus (now Piazza Pia) to the Piazza of St Peter's (1586), of which he leaves a written account. When Clement VIII became pope, F. was dismissed and went to Naples, where he became architect to the viceroy, the count of Miranda, and built the Royal Palace (1600 onwards). His son, Giulio Cesare, succeeded to his post and built the Naples Univ.

über Fontane, 1933; R. R. Knudsen, *Der Theaterkritiker Fontane*, 1942.

Fontanes, Louis Marquis de (1757-1821), Fr. poet and politician. In 1783 he pub. a trans. from Pope, *L'Essai sur l'homme*, *La Chartreuse*, and *Le Jour de mort*, and in 1788 *Le Verger* and *Épître sur l'édit en faveur des non-catholiques*. Under Napoleon he became president of the legislative chamber from 1804 to 1810. His *dégo* on Washington was written at Napoleon's request. He was a brilliant speaker, one of his best speeches being made in 1814 as *Grand Maître* of the Univ. His verse was technically skilful, but is now forgotten. His works were collected in 1839 and ed. by Sainte-Beuve with a life of the author. See A. Wilson, *Fontanes*, 1928.

D. McLeish

THE PALACE, FONTAINEBLEAU

Fontana, Prospero (1512-97), It. painter, b. Bologna. He belongs to that period of the Bolognese school that was influenced chiefly by imitators of Raphael. At Bologna he started a school of art, and among his pupils were Lodovico and Agostino Carracci. His masterpiece is the 'Adoration of the Magi,' in the church of Santa Maria delle Grazie at Bologna.

Fontane, Theodor (1819-98), Ger. poet and novelist, b. Neuruppin, Brandenburg. His literary method changed with the years, and gradually moved from historical romance (*Vor dem Sturm*) to realism. His best novels, all written when he was over 60, describe every-day life in modern Berlin: *Irrungen Wirrungen*, 1888, *Effi Briest*, 1895, *Der Stechlin*, 1898. He toured England and interested himself in O.E. ballads; his *Gedichte* and ballads (*Männer und Helden*) tell of the glories of old-time England. He was also a free-lance journalist, and one of the first to defend Ibsen and Hauptmann as dramatic critic in the *Vossische Zeitung*. See K. Hayens, *Theodor Fontane, a critical study*, 1922; F. Behrend, *Aufsätze*

Fontarabiz, see FUENTERRABIA.

Fontenay-le-Comte, or Fontenay-Vendée, Fr. tn. cap. of an arron., in the dept of Vendée. It has numerous fine anc. buildings, including the 16th-cent. church of Notre-Dame, with its 261 ft high tower. Leather goods, hats, and coarse linen are manuf. Pop. 9800.

Fontenay-sous-Bois, Fr. tn in the dept of Seine, an E. suburb of Paris. There is much trade in wood, and market-garden produce. Pop. 30,200.

Fontenelle, Bernard le Bovier de (1657-1757), Fr. philosopher and poet, nephew of Cornelle, b. Rouen. He has been called 'one of the last of the Précieux, or inventor of a new combination of literature and gallantry,' and was in Voltaire's eyes the most universal genius of his age. He wrote tragedies (*Aspar*, 1681), operas (*Psyché*, 1678, *Bellerophon*, 1679), pastorals like those of Segrais, 1624-1701, and *Lettres galantes du chevalier d'Her*, 1685, in the style of Voiture (1598-1648). In 1688 he sided with the moderns in the 'Quarrel of Ancients and Moderns.' In La Bruyère's *Caractères* he is satirised as Cydias. He had a brilliant reputation in

the salons of the time, and was at the height of his fame under Fleury's ministry (1726-43). His works include: *Poésies pastorales*, 1688; *Dialogue des morts*, 1683; *Entretiens sur la pluralité des mondes*, 1686, maintaining the fascinating paradox that planets and fixed stars are populous worlds, *Histoire des oracles* (suggested by van Dale's work), 1700; *Éloges des Académiciens*, 1699-1740. Admitted to the Fr. Academy (1691), in spite of Racine's and Boileau's opposition, he was also admitted to the Academy of Sciences (1697), and was secretary from 1699 to 1741. His *Éléments de la géométrie de l'infini* appeared 1727; *Théorie des Tourbillons cartésiens* in 1752. F. is one of the first successful popularisers, who by his elegant and lively style introduced science and philosophy into the salons. See collected works, 1790 and 1825; É. Faguet, *Études littéraires sur le XVIII^e siècle*, 1890; A. Laborde-Mila, *Fontenelle*, 1905; J. R. Carré, *La philosophie de Fontenelle*, 1932; F. Grégoire, *Fontenelle*, 1947.

Fontenoy, vill. in the prov. of Hainaut, Belgium, 5 m. SE of Tournai. It was the scene of the battle of 1745 when, during the War of the Austrian Succession, the Fr. under Marshal Saxe defeated the duke of Cumberland and his allies, the onslaught of the Irish Brigade, which was fighting for the Fr., being irresistible. Pop. 700.

Fontevault-l'Abbaye, in the dept of Maine-et-Loire, 9 m. SE. of Saumur. Here, in 1099, a great abbey was founded, which became the mother-house of the Order of F. In later times the abbess of F. generally belonged to the Fr. royal family. The abbey was converted into a prison in 1804. Pop. 2500.

Fonteyn, Dame Margot (1919-), ballerina. She studied with Goncharov and Astafieva. After entering the Sadler's Wells school in 1934, she made her début with the Vic-Wells Ballet that same year. Following the departure from the company of Markova (q.v.) in 1935, F. made rapid progress, gaining in authority and reputation until by the outbreak of war her supremacy was fully estab. She has created many roles, particularly in ballets by Ashton (q.v.), and excels in the great classical ballets such as *Le Lac des cygnes* and *The Sleeping Beauty*. She has also danced with the Ballets de Paris as guest artist, creating the leading role in *Les Dames de la nuit*, has appeared at the Granada Festival in Spain, and has gained many triumphs abroad with the Sadler's Wells Ballet. She succeeded Dame Adeline Genée as president of the Royal Academy of Dancing in 1954, was awarded the C.B.E. in 1951, and created a D.B.E. in 1956.

Foochow, Fuchow, or Minhou, cap. of the prov. of Fukien, China. It is on the R. Min, 34 m. from its mouth, and has been open to foreign merchants since the first Chinese war in 1842. Suburbs sprawl in every direction, but the city itself is girded by upwards of 5 m. of wall, 30 ft high, topped at intervals by curious watch towers and pierced by 7 gates.

The riv. is spanned by the 'Bridge of Ten Thousand Ages,' which is supported by 40 granite piers, and which was probably built in the 11th cent. The chief export is tea. The staple imports are woven and metal goods. The prov. of Fukien is its outlet for tinned food, bamboo-pulp paper, and soap. The great arsenal on Pagoda Is. was instituted by Fr. engineers in 1867. F. has one of the few dockyards in China. Since 1921 it has been the seat of the Christian Univ. The Japanese occupied F. for some years following their invasion of China, but in May 1945 Chinese troops retook the port. After the liberation of F. by the Chinese People's Army in 1949, the Nationalist régime in Formosa seized Matsu Is. off the coast of F. Pop. 400,000.

Food, Adulteration of, see ADULTERATION.

Food and Agriculture Organisation (F.A.O.) was first proposed by the U.N. conference on F. and A. held at Hot Springs, Virginia, May 1943. An interim commission formulated a constitution for the O., which was adopted by a later conference held at Quebec, Nov. 1945. This later conference estab. the F.A.O., the constitutional purposes of which are to raise the levels of nutrition and standards of living of the peoples under the respective jurisdictions of the U.N.; secure improvements in the efficiency of the production and distribution of all F. and agric. products; better the condition of rural pops.; and thus contribute towards an expanding world economy. The functions of the F.A.O. are to collect, interpret, and disseminate information on nutrition, F., and A., and to promote national and international action with respect to scientific and economic research relative to these topics; the conservation of natural resources; the improvement of processing and marketing; the adoption of policies for the provision of adequate agric. credit; and other matters. Provision is made for an ann. conference of F.A.O. to determine the policy and approve the budget of the O. and make recommendations for submission to member nations with a view to national action. The F.A.O. is run by a director-general and his staff, a council, and a conference (of 1 representative from each member-state: this conference elects the council of 24). It is financed by contributions from its members. Its H.Q. are in Rome.

Food and Diet. F. (from a Teutonic root, whence O.E. *foda*—cf. 'fodder') is anything taken into the body which is capable of supplying physical energy, promoting growth, repairing tissue, furnishing energy for bodily heat and work, and aid in protection from disease. Man is the only animal who does not know instinctively how to select his F., and so the science of dietetics has evolved. He is also the only animal who cooks his F., which may render it more appetising to some people, but certain F.s become less digestible and not so nutritious as in their natural raw state. On the other hand, heat destroys harmful bacteria, particu-

arly in meat and milk (see C. E. Duks, *Bacteria in relation to Domestic Science*, 1947).

The solid or 'nutritious' components of F. fall into the following classifications:

NITROGENOUS

Proteins:

Cascin: precipitated from milk, especially by rennet: important in cheese.

Myosin: present in the muscle or fibres of meat.

Gluten: present in the viscid matter (dough) of wheat.

Legumen: found in pulses, i.e. peas, beans, lentils, etc.

Albumen: found in egg white, milk, muscle, vegetables, etc.

NON-NITROGENOUS

Carbohydrates: starches and sugars.

Fats: olive oil, butter, etc.

The 2 groups, organic in origin are derived from living organisms. The first, or nitrogenous, group is essentially composed of nitrogen, carbon, hydrogen, and oxygen; is mainly flesh forming, building up and repairing nitrogenous tissues of the body; and, in the process, supplying a limited amount of heat. The second, non-nitrogenous, group (sometimes called carbonaceous compounds) is composed of carbon, hydrogen, and oxygen, and is the main source of energy and heat. The *inorganic* or *mineral matters* in F. include sodium, potassium, iron, sulphur, calcium, phosphorus, iodine, etc. They are necessary for the normal building and functioning of the body, the greatest proportion being found in the bones. Most of these inorganic matters are contained in organic F.s, e.g. iron in meat and egg yolk; calcium and phosphorus in milk; iodine in fish, etc. Vegetables, grown in fertile soil, are also an important source of mineral salts, some of which salts can only be absorbed by the body in their natural combinations in F. Certain mineral matters cannot be utilised by the body unless particular *vitamins* are present. Vitamins are minute substances in natural F., and are essential to health (see VITAMINS). There are also certain complex organic substances (enzymes) which by their presence alone set up catalytic action in the digestive organs; and it is probable that these substances are present in natural F.s but, by refinement or concentration such F.s become relatively 'indigestible.' *Roughage* in F., i.e. the unabsorbed cellulose from vegetables, fruit, whole wheat, flour, bran, etc., is necessary to supply bulk for the elimination of waste matters; and, in the refinement of F.s, valuable material which aids digestion and nutrition is discarded.

The amount of F. required in health is determined generally by the size and muscular output of the individual; but the growing child needs relatively more than his parents; and the adult muscular worker requires more energy-producing F. than the sedentary worker. The

energy value of F. is measured in 'calories,' i.e. the amount of heat (great calories) required to raise a kilogram of water 1° C. The calorie value of F. varies, e.g. carbohydrate giving only half as many calories as its equivalent weight of fat.

The following table (pub. in 1933, and printed by permission of the Brit. Medical Association) shows the approximate number of calories required for the average child and adult:

MAN-VALUES AT AGES (CATHCART AND MURRAY)

Age	Man-value	Calories
Adult male	1.00	3400
female	0.83	2840
Child 1 and under 2 years	0.30	1020
" 2 " " 3 "	0.40	1360
" 3 " " 6 "	0.50	1700
" 6 " " 8 "	0.60	2040
" 8 " " 10 "	0.70	2380
" 10 " " 12 "	0.80	2720
" 12 " " 14 "	0.90	3060
Old person (65+)	0.75	2550

A definite proportion of calories should be derived from first-class protein, second-class protein, fat, and carbohydrate, in order to fully supply the needs of the body. The recommended proportion is 6 per cent first-class protein and 6 per cent second-class protein; 27 per cent fat, and 61 per cent carbohydrate. The following table shows the total calorific value of certain F.s, together with their protein, fat, and carbohydrate content:

TABLE OF FOOD VALUES. ANALYSIS AND ENERGY VALUE OF EDIBLE PORTION TAKEN FROM TABLES. (R. H. A. PLIMMER, D.S.C.)

Per lb. (or 453.5 gm.)	Protein (gm.)	Fat (gm.)	Carbo- hydrate (gm.)	Cal- ories
Beef, fore- quarter	85.3	83.5	—	1126

Oranges	2.7	0.4	29.9	137

Most F.s contain, in varying proportions, the essential elements to life, proteins, carbohydrates, fats, mineral salts, water, and vitamins. Certain F.s have a much larger proportion of one constituent than another, e.g. meat supplying mostly protein and potato mostly starch. Milk, however, is a scientifically complete F., containing all the nutritive constituents to maintain life and promote growth, though the addition of some iron and vitamin C is recommended. Raw cow's milk is generally considered unsafe for human consumption owing to the possible presence of harmful bacteria. It should therefore be 'heat treated,' and this is usually done by pasteurisation. This destroys harmful organisms and some of the vitamin value. The latter may be supplemented by fresh orange juice, rose-hip syrup, etc. Milk is a F. for children and invalids; but, to provide sufficient calories for his needs, the average man would need to take about 8 pints a day and this would contain more protein and fat than is necessary, and insufficient bulk of unabsorbed matter to act as intestinal ballast.

Protein is the main constituent of protoplasm, and is essential to the body structure. It does, however, supply a limited amount of heat and so may take the place of carbohydrates; but starches, sugars, and fats can never take the place of nitrogenous F.s in building and repairing the tissues of the body. Meat, fish, cheese, milk, and eggs provide good proteins. Lean meat and milk are readily assimilated, but cheese is difficult to digest owing to its insoluble fatty matters, but grating or thoroughly chewing renders it more easily digested. Eggs are an ideal F. comparing favourably with meat and milk. They contain protein, fat, and mineral matters (particularly iron, phosphoric acid, calcium, etc.). The protein contained in egg white, however, is more easily digested when the myriad cells enclosing it are broken down by whisking or beating. Shell fish, particularly lobster and crab, are indigestible and sometimes contain certain irritant poisons. They should be eaten with caution. Oysters are easily digested but they are not very nutritious.

Carbohydrates (starches and sugars) are obtained mainly from vegetables, the most important source coming from the cereals wheat, rye, oats, maize, and rice. Green vegetables, fruits, and nuts are also a source of starch and sugar. Wheat, rye, and maize are all used in bread-making, but wheat has the highest F. value. Rice contains mostly starch, the whole grains being of better F. value than the huskless polished grains. None of these cereals is a complete F. as they are somewhat poor in fat and protein, hence the addition of milk, eggs, and butter. Sugar is of great importance as a F., and is derived from various sources, the chief being from the sugar-cane, sugar-beet, and sugar-maple; treacle, molasses, and syrup being by-products. Honey is an invert sugar (see DIET). Boiling for some time (as in home-made jam) converts white (refined) sugar into fruit sugar and renders it a more nutritious and desirable F.

Pulses (peas, beans, lentils, etc.) are a rich and economical source of protein, and are a fairly good source of carbohydrate. The soya-bean is rich in protein and fat, but contains little carbohydrate, and for this reason is used in the making of diabetic bread. It is also eaten with rice to supplement its protein deficiency; and a 'synthetic' milk can be made from the powdered bean, which is comparable to cow's milk.

Green vegetables, salads, and root vegetables are a valuable source of mineral salts and vitamins, and many (like the potato and carrot) are rich in carbohydrate. The soil in which vegetables are grown influences their nutritive value. It should be healthy and fertile, as inferior vegetables grown on poor soil are responsible for ill-health. Green vegetables particularly should be eaten only when they are quite fresh. The potato is one of the most important root vegetables, and when properly cooked (see DIET) is

a valuable source of F. Many vegetables may be grated and eaten raw with advantage, especially cabbage, sprouts, spinach, and also some root vegetables such as carrots, beetroot, etc. Young dandelion leaves are 10 times as rich in iron as other vegetables. Tomatoes are a valuable source of vitamins. Edible fungi, such as mushrooms, are not very nutritious, and when cooked are indigestible. Vegetables as a source of protein must be considered bulky and indigestible. They contain much water and cellulose and the protein is not as easily assimilated as that from animal sources. Vegetarians supplement this protein deficiency by the addition of milk, cheese, eggs, and nuts.

Fats are an important F., especially to people living in cold climates. They include all the animal fats, vegetable fats, and fish fats (see DIET).

Fruit is principally of value on account of its refreshing qualities, sugar, vegetable acids, salts, and vitamins. Much of value lies in the skin of some fruits, but it should always be washed before being eaten. Bananas, figs, dates, and raisins are the fruits which contain a high caloric value, and therefore supply the most energy. Nuts are rich in nitrogenous matter, but indigestible unless ground. They also contain more fat than any other vegetable.

The main constituent of every beverage is water. The chief restorative beverages are tea, coffee, and cocoa; they have a stimulative effect, but are of little nutritive value, except from any milk which is added. Alcohol taken in moderation with F. acts mainly as a digestive stimulant; it has very little actual food value. In excess it is a protoplasmic poison and anaesthetic.

Diet is the F. of an individual considered as a whole, particularly with regard to its efficiency in maintaining the nutrition of the body. *Dietetics* is the art of using the F.s required to make suitable and appetising meals. A *dietary* is an organised system of taking F., the various constituents, their amounts, and time of eating being estab. beforehand. A dietary may be estab. as part of the treatment of disease. This is particularly important in such conditions as diabetes where some constituents of ordinary F. may have a harmful effect. In obesity satisfactory weight reduction may be achieved by a knowledge of F. composition and body requirements. In institutions such as prisons and in public services such as the army and navy, dietaries are necessary if only to regulate the actions of the officials immediately concerned in the distribution of F. In prisons and other institutions the D. is dependent upon considerations of economy, efficiency, and discipline. The F. must be sufficient in quantity and nature to satisfy the physical needs of the inmates while at the same time having a degree of austerity sufficient to minimise the attraction which might be felt by individuals disinclined to work for F.

The average man requires daily 2700-2800 grms. of water, 30 grms. of salts,

70-100 grms. of protein, 30-90 grms. of fat, and 340-750 grms. of carbohydrates. Man needs about 3000 net calories a day, but feeding by the theoretic caloric value of F. presupposes perfect metabolism, whereas some F.s are incompatible with others and should not be eaten together.

Metabolism (q.v.) is the sum of all the physical and chemical processes by which living organised substance is produced and maintained, as well as the transformation of F., etc., by which energy is made available for the uses of the organism. A D. can be calculated on the basis of the amount of work a man is to perform, but normally the organism regulates automatically (by means of appetite) the quantity of F. The amount of energy obtainable from a D. will depend not only on its quantity, but also on its make-up. The heat obtainable from a given F. is called its caloric value. In 1933 a committee appointed by the Brit. Medical Association to determine the minimum D. for the maintenance of health and working capacity agreed that, as about 10 per cent of F. is undigested and passed out of the body as waste matter, the caloric value of F. as purchased should be 3300-3400 calories for a daily requirement of 3000 calories for the average man.

Vegetarianism, which has a certain number of adherents, is the practice of living upon F.s obtained exclusively from the vegetable world, and abstaining entirely from flesh F. and all F. obtained by the killing of animals. Vegetarians are usually also total abstainers from all alcoholic liquors. The average vegetarian admits into his D. such articles of F. as eggs, milk, butter, cheese, cereals, and some moderate vegetarians even eat fish. The movement took its rise about the middle of the 19th cent., and the idea was best received in England, where there are numerous vegetarian societies and restaurants. There are sev. varieties of vegetarian D., but they all have one point in common, viz., abstention from flesh F.s. In all ages there have been idealists who have advocated a vegetable D., chiefly on ethical grounds, as exemplified by Plato, Plutarch, Shelley, Rousseau, etc., but they never had any very extensive following. The arguments for and against are many. Vegetarians maintain that flesh-eating is responsible for the propagation of some of the most serious diseases, especially cancer and tuberculosis. They also contend that nature provides the means of supporting life in the best and most nutritive form by such products as nuts, seeds, roots, eggs, etc., and not in the comparatively degenerate form of flesh. Anti-vegetarians object that with a purely vegetable D., in order to obtain sufficient nourishment, an enormous amount must be consumed and that the waste products are excessive in quantity. Scientific opinion too is unfavourable to vegetarianism, it being held that the structure of man's stomach and intestines proves that nature intended him for an omnivorous animal, his digestive organs being fitted to derive nourishment from every

kind of F. The advances in the knowledge of the construction of vegetarian dietaries in recent years have been considerable, one of the greatest developments in extending the bill of fare being the manu. of nut meats. There are also many vegetable extracts useful for making soups and gravies especially prepared from grains by malting processes. Various combinations of cooked grains exist, such as shredded wheat, biscuits, and others—all satisfactory F.s. Generally speaking, however, vegetable foodstuffs are less appetising than others, and the vegetarian feeder, in consequence, is less likely to indulge in excess.

Diabetic diet. devised for patients suffering from diabetes, consists in removing from the F., as far as possible, everything which easily turns to the formation of sugar in the system, especially all excess of farinaceous F. Gluten bread, that is bread composed of wheat without starch, skim milk, cheese, eggs, meats, fresh fish, and green vegetables are prescribed, and sugars, starches, and all F.s. of an indigestible nature should be avoided. Saccharin is of great service in this D., as it supplies the flavour of sugar without its objectionable properties. As regards beverages, sweet wines, liqueurs, ale, stout, cider, and cocoa should be avoided, but brandy, whisky, burgundy, claret, aerated waters, coffee, and tea may be taken with impunity. Milk too is as a rule allowable. Generally speaking a diabetic D. involves the use of F.s. rich in proteins and fat, and the abstention from those containing sugar and starch.

Banting system, for reducing obesity by means of a strict D. The effect of this particular system of D. in his own case forms the subject of an interesting 'Letter on Corpulence,' pub. in 1863 by Wm Banting (q.v.). He was 66 years of age, 5 ft 5 in. in stature, and weighed 202 lb., and by strict attention to D. managed to reduce the total amount of fat and in little more than a year lost 46 lb. of bodily weight. For breakfast he took from 4 to 5 oz. of any meat except pork; tea; and dry toast or biscuits. For dinner he took from 5 to 6 oz. of any fish except salmon; any meat except pork; any vegetable except potato; any kind of poultry or game; 2 or 3 glasses of unsweetened wine; and a small quantity of dry toast. His tea he always took without milk or sugar, and his supper was similar to dinner. He made his own case widely known by the circulation of his pamphlet, and his system was tried by numerous people and proved to be a great success. The large amount of meat, however, in this D. would be unsuitable in many cases, and such a radical change should not be adopted without medical advice, as a prolonged course might have the effect of setting up dyspepsia. Weight can now be scientifically reduced by a definite D. which satisfies the requirements of the body but contains F.s. with a low calorie value.

Artificial feeding.—This occasionally

has to be resorted to in the case of disease and grave illness, when F. cannot be taken through the mouth, and when it is essential to try the artificial method, subcutaneous or intravenous.

Preparation and cooking of Food.—This has much to do with its nutritive value, and many articles which, when raw, are unfit for nourishment, become nutritious when cooked. Well-cooked F. is wholesome and appetising, while the same material badly cooked is unpalatable. Cooking serves 3 distinct purposes. It alters the physical condition and structure of the F., renders it appetising by improving the appearance and flavour, and kills by means of heat any disease germs, parasites, or such-like organisms the F. may contain. This last is a very important matter and applies to both animal and vegetable F.s. Scrupulous cleanliness should also always be observed in serving and keeping F. Every care should be taken to ensure this for the sake of health. If kept or handled under unhealthy conditions, food, and drink too, become very dangerous purveyors of disease. See COOKERY.

Food and National Health.—The continued austerity of the Brit. D. after the Second World War prompted sev. medical bodies, such as the Brit. Medical Association and the Central Council for Health Education, to review the prospects with some care. The maintenance of health since 1939, together with improvement in many mortality rates, and in height and weight records of children, suggests that the D. had been on the whole a well-balanced one. Medical opinion favours the retention of such features of the D. as have plainly helped to secure the health and stamina of the public. It seems agreed that sev. elements have acted in combination to produce the good effect. Among these are the provision of milk to special groups, the availability of fruit juices for these groups, the higher, but as yet by no means adequate, consumption of vegetables (including potatoes), and the lower consumption of sugar. It is considered further that the average D. would be improved by a somewhat higher consumption of cheese than was the pre-war habit, a higher consumption of fat fish, and a more general provision of milk and eggs. Implicit in the medical view is the realisation that a thorough educational campaign is needed to persuade the public to maintain the beneficial features of the war-time dietary.

Food Control, British, in Wartime.—*The First World War* (1914–18).—During the first 2 years of the war gov. interest in F. was concentrated on the rations of troops rather than on the F. supply of the nation. But matters became acute in Britain about the middle of 1916, and in Oct. of that year a royal commission on wheat was set up, which soon expanded into an organisation for controlling the wheat supply of Great Britain, France, and Italy. In the same year a F. controller was appointed (Lord Devonport), and later a Ministry of Food was created. In the spring of 1917 the gov. took over the supervision of all flour mills, and the people were exhorted to ration themselves according to a certain scale. The Ger. submarine campaign was now making itself felt in connection with the supply of F., and there were signs of growing unrest among the people. At this time sugar was rationed, but the system was extended to other commodities, and brought into being numerous F. C. commissioners to administer the system. The following were some specimen rationed articles per head per week: sugar 8 oz., butter and margarine 5 or 6 oz., lard 2 oz., meat 1½ lb., bacon and ham and other meats varied amounts, jam 4 oz., cheese 2 oz., and tea 2 oz. This scheme of rationing ended the queues which had previously gathered at shops and solved the problem of F. distribution in a manner that caused little hardship. Towards the middle of the year the submarine peril was practically overcome (see VINDICTIVE; ZEHRUGGE).

The Second World War (1939–45).—As in the First World War the gov. had to regard national feeding as of overriding importance, and again the problem arose as to the means of operating national C. of F.s through a centralised organisation. The circumstances in Sept. 1939 were, however, very different from those in 1914; for the gov. now had the documented experience of 1914–18 and of the application of public rationing, besides the experience of various marketing schemes under which elaborate national organisations were formed. In anticipation of war a special F. (defence plans) dept had been set up in the Board of Trade in 1936. Towards the end of 1939 the real F. problem became evident; it was not that of feeding the nation so much as that of fixing prices at levels to suit everyone, including the consumer. Meanwhile the F. (defence plans) dept had prepared commodity plans and in a report of 1937 issued a statement of general policy, including the following principles: The experience of the war (viz. 1914–18) showed that if control were to be effective in maintaining supplies and holding prices, it had to be introduced before a shortage had arisen and prices began to get out of hand: all F. should be controlled by a single authority; the F. controller should ensure that everyone

would be able to obtain a fair share of the national F. supply at a reasonable price; whenever C. had to be imposed the transition from normal trading to wartime C. should begin to take effect within a few hrs; and experience showed that if prices were to be controlled demand as well as supply must be regulated.

The Essential Commodities (Reserves) Act of 29 July 1938 estab. a fund and empowered the Board of Trade to proceed with storage of essential F. Trading interests influenced the plans to the extent of centralising C. in the first instance through the large importing and wholesale houses with subsequent application through retailers to the public. Nearly a score of F. divs. for regional application of plans were set up in Britain. F. committees estab. under the local authorities were responsible for registration of retailers, ration C. of the consumer, and licensing of local manufacturers. This was the first deviation from the principle of control through one central authority and in consequence there was some overlapping of functions. The gov. then provided for committees at all stages of handling F. on the general foundation of an independent chairman, civil servants, and trading interests. Ration books were printed to ensure the retail control of such commodities as sugar, meat, bacon and ham, butter, margarine, and cooking fats, indicating that demand control in these specified F.s was held to be essential. On 31 Aug. 1939, before the declaration of war, the gov. issued the Acquisition of Food (Excessive Quantities) Order, making it an offence for the public to buy more than one normal week's supply of F. F. C. committees appointed by local authorities were estab. under constitution orders. Requisition and control orders authorised the acquisition and C. of stocks of imported F.s and feeding stuffs and of home-produced F.s in quantities exceeding stated amounts in any stores exceeding a given capacity. Thus the first application of C. operated from the importing or large-scale wholesale end without effective check on consumer demand.

The next step was the fixing of maximum prices of most commodities under provisional orders limiting prices to the highest figures secured in ordinary market conditions before the war. A series of maximum prices orders controlled all stages from production to consumer. These allowed increases to satisfy reasonable demands of home producers and the chief trading interests, covering higher costs due to war risk insurance, freight charges, etc. The gov. held imported stocks and *pro tanto* became an early war profiteer. But on the other hand the gov. subsidised producers on condition that retail prices remained low to the consuming public.

It is fair to state that government food plans were originally intended to maintain low food prices to the public, to take powers to fix maximum prices at all stages, to rationalise transport, and to

pool supplies, and so were theoretically means towards complete nationalisation of food supplies. Price levels were to be advanced only in response to proved increases of cost. In spite of all previous experience, however, the gov., generally too late to anticipate price advances, tried to legalise higher price levels, whilst warning interested parties of the dangers of exceeding maximum C. prices. For a well-reasoned statement of the problems involved in feeding the nation in peacetime and wartime see G. Walworth, *Feeding the Nation in Peace and War*, 1940.

The war brought about a considerable tightening in the supply situation: in the case of the U.K. this was caused chiefly by the necessity of husbanding shipping space required for imports; while in the case of Sweden and Switzerland the continental blockade reduced imports to a fraction of peacetime requirements. Nevertheless in spite of these difficulties the overall situation was less strained than on the Ger.-dominated Continent, and left room for more flexible systems of rationing than in Germany. The good supply of bread and potatoes meant that each individual had the opportunity—as distinct from the totally rationed pops. on the Continent—to consume as many calories as his individual requirements indicated. While the purpose was to maintain a diet adequate in all essential nutritive elements, this end could only be achieved with the greatest economy of means, and F.s requiring more shipping space, land, and labour were reduced in favour of those requiring less. Rationing was concerned mainly with protein F.s, milk and fats. The need for these F.s varies less between different groups than does the need for other nutritive elements, and it was found possible to adopt a system of relatively undifferentiated individual rations. Nevertheless it was recognised that an overall *per capita* rationing was not capable of taking into account all special nutritional needs, which were then met by various schemes superimposed, as it were, on the basic system. The most important of these schemes were communal feeding and schemes for the distribution of protective F.s, namely milk, eggs, and certain fruit and fruit juices, for which special ration cards were given. The best known and most important of these schemes related to milk. In addition children received through welfare and maternity clinics quantities of fish liver oil and fruit juices. A third scheme was the use of 'points rationing.' Each consumer received a card containing a certain number of points, and the commodities were 'priced' not only in ordinary currency but also in points. For sev. years after the war tinned meat, tinned fish and beans, for instance, were under point rationing. The system rendered it possible to include or exclude F.s as the situation demanded, and through the double mechanism of price and point changes demand could be steered in the direction desired. At the time the system left a considerable

degree of choice to the consumer. (Consult *Food Rationing and Supply, 1943-44*, issued by the Economic, Financial and Transit Dept. of the League of Nations, Geneva, 1944.)

In contrast with the First World War, when profiteering in produce was found to be a constant evil, the gov., by combining excess profits tax with price control, largely prevented profit from war. See R. J. Hammond, *Food* (H.M.S.O.), vol. 1, 1951, vol. II, 1956.

Food Council. The prices of F. remained at a high level for some years after the First World War had ended, and there were frequent complaints that traders were demanding unjust prices. The result was that a royal commission was appointed to investigate these complaints, and after its report in April 1925 a F. C. was set up in July of that year which consisted of 12 members, under the presidency of Lord Bradbury. The C. from the first was a somewhat impotent body. However, the Weights and Measures Act, 1926, resulted from its activities.

Food-poisoning. The term generally refers to outbreaks of acute illness—pain, vomiting, and diarrhoea—which occur shortly after a meal. F. is caused principally by the contamination of food by bacteria which multiply rapidly under suitable conditions. Fifty per cent of cases are caused by bacteria of the *Salmonella* group, which get into the food from animal or human excreta. *Salmonella* F. is characterised by sickness, diarrhoea, and fever, developing within 24 hrs; attacks may last for from 1 to 3 days.

Certain strains of the *Staphylococcus* produce a toxin within the intestine which causes a violent attack from 2 to 6 hrs after eating infected food and lasting from 12 to 24 hrs. The majority of cases are caused by nasal carriers.

Miscellaneous bacteria that are resistant to cooking temps. may grow in stored cooked food and cause mild attacks of abdominal pain with diarrhoea but no vomiting.

Botulism is due to the growth of an anaerobic organism, *Clostridium botulinum*, the spores of which are very heat-resistant. The toxin attacks the central nervous system. In Europe, where cases are caused mainly by eating contaminated meat or fish, the mortality rate is about 25 per cent; in the U.S.A. cases most frequently follow the ingestion of home-canned vegetables or fruit; here the death rate is about 70 per cent.

Some poisoning may be caused by chemicals such as arsenic, used as weed-killers or insecticide sprays on fruit and vegetables.

The extension of communal feeding in recent years has led to a marked increase in the incidence of F. Another cause is the increased sale of ready-prepared foods. Foods liable to carry infection include cooked meats, sausages, soups and stews, trifles, cream buns, meat pies, fish-cakes, duck eggs, and shellfish. Lack of personal hygiene among those who handle and prepare food is the major cause of

infection. Bacteria from the intestines, nose and throat, or from septic cuts, may be conveyed via the hands. Animals such as mice, rats, cats, dogs, flies, cockroaches, etc., may also be a source of infection. Once food has been infected, keeping it at a heat near body temp. will cause a rapid increase in the growth of the bacteria.

Prevention. necessitates (1) strict control of foods for sale, to avoid infected food being made available on the market; (2) cleanliness in the distribution of food; (3) high standards of hygiene among those handling food and in places where cooked food is prepared and served. High temps. destroy bacteria; clean storage and refrigeration prevent their growth. See G. M. Diack, *Food-poisoning*, 1950; Betty Hobbs, *Food-poisoning and Hygiene*, 1953.

Fool, see JESTER.

Fools, Feast of (Lat. *festum fatuorum*, *stultorum*, or sometimes *astrorum*), grotesque masquerade or medieval merry-making, taking place more particularly on Holy Innocents' Day (28 Dec.), but extending more or less over the whole period between Christmas and Epiphany. Probably a survival of the old Rom. Saturnalia, it crept into the ceremonial of the Christian Church in spite of the fierce anathemas of fathers and councils, and even after the Protestant Reformation an observance of it was kept at Antibes as late as 1644. The festival apparently originated in France, and was first mentioned by J. Belet (12th cent.). The aim professed was to interest people in the story of Christmas, but the boisterous drollery soon degenerated into profanity. Usually the donkey played a leading part in the pageant. Mock popes, cardinals, and bishops were elected with ridiculous titles, and the most sacred Christian rites were travestied. See Du Tillot, *Mémoires pour servir à l'histoire de la fête des Fous*, 1741; Schneegans in Müller's *Zeitschrift für deutsche Kulturgeschichte*, 1858.

Fools' Day, April (or All), 1 April, observed (up to 12 noon in Britain) as a day of practical joking. It is of almost universal origin, and connected probably with the spring equinox. India observes 31 Mar. in this way. The custom of sending people on fools' errands, thus making April fools of them, may have reached England from the Continent in the 18th cent. An A. fool is called *Aprilennarr* in Germany, *Poisson d'Avril* in France, and *April Gouk* (cuckoo) in Scotland. The custom has been given a Christian derivation from the sending to and fro of Christ from Annas, to Calaphas, to Pilate, and to Herod, which was made a feature of some medieval passion plays, but its pagan origin seems certain.

Foolscap, see PAPER.

Foot (length), see METROLOGY.

Foot. In the human F. the bones are 26 in number, arranged in 3 groups, viz. the tarsal, or hindmost bones, the metatarsal, and the phalanges of the toes. The weight of the F. is borne on 3 distinct

points; the heel, the point where the big toe joins the first metatarsal bone, and a similar point at the base of the little toe. The elasticity of the F. is greatest in the longitudinal arch. The F. is also arched transversely so that normally the heads of the 1st and 5th metatarsal bones only bear weight. The bones of the F. are all held together by short ligamentous bands of great strength. In the condition known as flat F. (q.v.), or pesplanus, these ligaments become lax and stretched.

LONGITUDINAL SECTION THROUGH THE FOOT IN THE LINE OF THE BIG TOE

A, tibia; B, bone of the heel; C, tarsal; D, metatarsal; E, phalanges; F, sesamoid bones; G, ankle joint

Foot and Mouth Disease, eruptive-febrile D. of cloven footed animals and swine. Hedgehogs may also be affected, and, more rarely, human beings. It is caused by a virus, so small that it will pass through a fine bacterial filter. The disease is characterised by 'blisters' which form in the mouth and on the feet and udder. Symptoms may vary with outbreaks, the type of virus responsible, and the species of animal affected. In sheep and pigs, mouth lesions may not be obvious. The virus is present in liquid from 'blisters' and may live in the bone marrow of infected animal carcasses for long periods—especially in frozen meat. Not infrequently outbreaks in Britain are due to infection from imported meat. Contaminated packing straw and similar materials may carry the infection. It is a notifiable D. under the Diseases of Animals Act, and all infected and contact animals are slaughtered and the owners compensated in order to stamp out the infection. The slaughter policy, although often criticised, is economically sound and all progressive countries adopt it when conditions allow. Contrary to popular notions, treatment is relatively easy and recovery rates fairly high in those countries where the disease is endemic, but the overall losses are substantial and considerably in excess of the cost incurred by those countries where the radical stamping-out policy is practicable. Britain leads the world in research and in the typing of the virus involved. Vaccination against the D. is practised abroad, but is only of limited use owing to the

variations in type of the causal virus and the fact that it is not possible to prepare a single vaccine which will give universal immunity. Moreover, vaccination may, by masking the infection, favour the undetected spread of the D.

Foot Guards, select regiments, the 'flower of the Brit. infantry,' including Grenadier (2 battalions), Coldstream (2 battalions), and Scots G. (2 battalions), the Irish G. (1 battalion), and the Welsh G. (1 battalion). See **HOUSEHOLD TROOPS** and under the names of the sev. regiments. See Sir H. L. Aubrey Fletcher, *A History of the Foot Guards*, 1927.

Foot-pound, see **MECHANICS**; **METROLOGY**.

Football, game in which 2 teams of players play with a ball. There are 2 main codes of F. in this country, Rugby and Association; the former allows the ball to be carried as well as kicked, whilst in the latter game handling is prohibited, except by the goalkeeper. The affairs of the Association game are in the hands of the F. Association (F.A.), whilst the Rugby Union controls those of the handling code. Sev. public schools, such as Eton, Harrow, and Winchester, play varieties of F. peculiar to themselves. The game as played in the U.S.A. is now very different from the Rugby Union game on which it was modelled. From the earliest times games with a ball were probably in vogue, and we have record of some amongst both the Greeks and Romans. The Greeks had a game which consisted simply in throwing the ball from one person to another, another game (*aporrhais*) in which the ball was struck with the palm of the hand on to the ground as often as possible, and one called *thaeninda*, in which the players threw from one to another, with tricks and feints. None of these games had so much in common with F. proper as the Gk *episkuros* and the Lat. *harpastum*, the latter of which was in all probability the precursor of Eng. F. Pollux describes the latter as a game in which the players, divided into 2 bands, strove to carry the ball over 2 lines. There is no historical evidence to show that the Romans actually introduced *harpastum* into Great Britain, but the probability is that they did so. There is no doubt, whatever the precise origin of the game, that it was known at a very early time in England. Its name occurs before that of any other athletic sport which is popular at the present day. W. Fitzstephen, in his *History of London*, c. 1175, speaks of the young men of the city annually going into the fields after dinner to play at the well-known game of ball on the day *quae dicitur Carnilevaria*, and as far as is known this is the earliest definite mention of F. in England. It is notable that Shrove Tuesday seems to have been the day on which more than all others F. was played, and the custom of a rough and tumble game on that day survives in some parts of the country. At Derby, for instance, all the able-bodied men in the par. of St Peter's and All Saints took part in the contest. The game began in the

market-place, a large ball being tossed up in the middle of the bands. The goals in such games were at opposite ends of the tn, and nothing stopped the players, who took the ball through water if necessary, and reeked nothing of broken heads, torn clothing, and such details. This is also an ann. event at Atherstone (Warwickshire). Such ball-play was popular also among the anct Scots, for we find the Shrovetide game at Scoone, in the co. of Perth, described by Sir F. M. Eden, in his *Statistical Account of Scotland*. A feature of these games was their length, as they lasted in most cases for the major portion of a day. Fitzstephen, writing in the 12th cent., says that 'the boys annually on Shrove Tuesday play at the well-known game of ball.' Many further proofs of the popularity of F. among the anct residents of the country are forthcoming. In many of the games every able-bodied man was compelled to take part in the contest; the day was made a general holiday, and any player who was fortunate enough to ground the ball in goal was a popular hero. In all these early contests the element of danger both to life, limb, and property was considerable, and sev. proclamations were issued at various times forbidding it. Edward II, as a result of a petition of the citizens of London, issued a proclamation on 13 April 1314 commanding and forbidding the game to be played in the city in future, 'as many evils may arise, which God forbid.' In 1349 Edward III pub. a proclamation against F. and in favour of archery; similar writs to that then issued at London were sent to the sheriffs throughout England. In the time of Henry IV, AD 1410, we find F. prohibited in Normandy, described among the *jeux importunes*, and again in the statute 12 Richard II c. 6. James III of Scotland ordered in 1447 that 'football, and golfe, be utterly cryed down and not to be used,' and a royal proclamation was made in England in 1491 against the same 2 sports. F. was by no means stopped by these prohibitions, being played to a very great extent in the reign of Elizabeth. There were still no set rules for the conduct of the game, and no referees or umpires; consequently the number of accidents was large, and some of them were fatal. Proclamations continued to be issued against the sport, as in 1572 and 1581. In the 17th cent. various names appear to have been given to it; in Cornwall it was called hurling, and in the E. cos. camping or camp ball. An exception to the rule of hostility to F. among kings was furnished by Charles II, who made a match at F. between his own servants and those of the duke of Albemarle in 1681. During these times there was practically no opportunity for the working classes to indulge their liking for F. save on Sundays, as there was no Saturday half-holiday then. This desecration of the sabbath naturally provoked the wrath of the religious people of the time, as is forcibly expressed by P. Stubbes in *The Anatomy of Abuses in the Realm of England*, 1583. Towards the end of the 18th cent. F. waned in

popularity, and between 1820 and 1840 it was hardly ever played. But it survived. The reason for its survival must be looked for in the public schools, which each had a game peculiar to itself in many respects. The prin. features of these games will be dealt with later, but the natural wish of the old boys of public schools to continue playing was primarily responsible for the revival of the game and the development of Association F.

The first attempts to originate a code of rules to enable old boys to play together was made at Cambridge Univ. in 1846.

relegation, fixtures, transfer of players, and other domestic matters. In co-operation with the F. Association and the Players' Union, constant watch is kept on all affairs concerning the welfare of players—registration, transfers, wages, benefits, etc.

Similar associations govern the game in Scotland, Ireland, and Wales. The Scottish League is organised on similar lines to the F. League in England.

All 4 home associations are affiliated to the Fédération Internationale de Football Association, whose H.Q. are in

Sport and General

ASSOCIATION FOOTBALL

Arsenal v. Wolverhampton Wanderers at Highbury

Between that date and 1863, the date of the formation of the F. Association, sundry unsuccessful attempts were made to reduce the numerous school rules to one satisfactory code. In 1855 the Sheffield club was formed, in 1857 the Hallam club, and in 1859 the Forest F. club, afterwards the famous 'Wanderers.' In 1863 the F. Association was started, and has gradually assumed control of the Association game or 'soccer,' over which it is now the supreme authority in this country and the Brit. Commonwealth.

The F. League, consisting of 92 clubs, controls the prin. professional matches in the country. The clubs are divided into 4 divs., First, Second, Third North, and Third South. The F. League send 8 representatives to the F. Association Council. Its Management Committee deals with all questions of promotion and

Switzerland. Over 80 national associations are affiliated to this organisation, which frames statutes and regulations for the control of the game's affairs throughout its member associations. The Laws of the Game, however, are the concern of the International Board, consisting of 2 members of each of the F.A., the Scottish F.A., the F.A. of Wales, and the Irish F.A., together with 2 representatives from F.I.F.A., to speak for the remainder of the associations. It requires a 4 to 1 majority of the members of the International Board before any alteration in the Laws of the Game come into force. It is, therefore, almost entirely in the hands of the U.K. associations as to whether or not any alterations are made.

There are many smaller professional leagues operating in England; perhaps the best known are the Southern League, the

F. Combination, the Central League, the Midland League, the Western League, the Lancs Combination, the North-Eastern League, the Birmingham Combination, the Eastern Counties League, and the Kent League.

Amateur F. flourishes more particularly in the S. There are hundreds of amateur leagues throughout the country occupying the attention of some 25,000 amateur clubs. Well-known amateur leagues include the Isthmian, Athenian, Corinthian, and the Spartan Leagues. Possibly the best known of all amateur clubs in England was the Corinthians, who amalgamated with the Casuals in 1938; but in recent years Bishop Auckland and Pegasus have taken over this rôle. In 1895 the England team that met Wales was composed entirely of Corinthians. Their first tour was in South Africa in 1897, and few clubs have done more to popularise the amateur game. Their name used to attract players from all over the country, although it has been said that the 1938 fusion was not a success. Another famous amateur club is Queen's Park, who compete in the Scottish League.

In the early years of the game there were naturally many changes in the laws. Until 1869 handling the ball was permitted under certain conditions, but in that year the practice was abolished. The game is played with 11 men on each side, the formation being 5 forwards, 3 half-backs, 2 full-backs, and a goal-keeper. The field of play is 120 yds by 80 yds (full-size). The goal posts are 8 yds apart; the goal area is a space 20 yds by 6 yds in front of the goal, and the penalty area is a space 44 yds by 18 yds in front of the goal. When a player handles the ball or commits a foul inside the penalty area, the opposing team is awarded a penalty kick. The ball is placed on a spot 12 yds from the goal, no player being allowed to stand between the ball and the goal-keeper. The penalty kicker endeavours to place the ball between the posts, only the goal-keeper being allowed to intercept the ball. The ball is kicked off at the beginning of each half period and after each goal, by the centre-forward in the centre of the field within the kick-off circle, 20 yds in diameter. The ball is round, leather-covered, weighing 14-16 oz and 27-28 in. in circumference. A goal is scored when the ball is kicked or headed between the goal-posts and under the horizontal bar. A goal may be scored from a free kick. The referee is assisted by 2 linesmen, who watch particularly when the ball goes into touch, and advise the referee when so asked. The referee has power to send off any player guilty of violent and gentlemanly conduct, and his decision in all matters is final.

The F. Association organises the F.A. Challenge Cup Competition, the greatest F. competition in the world; the Amateur Cup Competition, the F.A. County Youth Challenge Cup Competition, and the F.A. Youth Challenge Cup Competition. The F.A. Challenge Cup Competition was instituted in 1871, and in the

first years only very few teams competed for it, but their number has gradually grown, until now the first qualifying round for the trophy is played off in the first month of the season. The Scottish Cup was started 2 years later, and Ireland and Wales now have similar cups. Owing to the greater skill of professional footballers, the F.A. Cup is practically a competition for such teams, as no amateur club of recent years has survived longer than the first round of the competition proper. The present F.A. Cup is a modern vase; the original was stolen from a shop window in Birmingham in 1895 while Aston Villa were the holders.

The cup is open to all clubs in the country. By a series of preliminary rounds, however, the vast number of entries are whittled down to the first round proper, when the F. League clubs join in. The same principle applies to the Scottish, Irish, and Welsh Cups, entries being confined to the applicable countries.

Fourteen Welsh clubs participate in the F.A. Cup.

The popularity of the game is now universal and the standard of play in many European and South Amer. countries is equal to, and in some instances better than, that of Brit. teams. In 1953 England lost an unbeaten home record in international matches when Hungary won at Wembley by 6 goals to 3. During the following year further severe set-backs in Budapest and Belgrade against Hungary and Yugoslavia, and in the World Cup (when Germany were the ultimate winners) demonstrated the great progress made on the Continent and the apparent elimination of Brit. dominance. However, there has been a steady improvement in the years 1955 and 1956 and England is once again reckoned to be one of the world's leading F. countries.

The World Cup Competition is staged every 4 years, when 16 countries take part in the final. Eliminating matches are played beforehand. The next final series will be held in Sweden in 1958.

Rugby Union Football, or Rugger as it is generally termed, in contradistinction to 'soccer,' is governed by the Rugby Union which was founded in 1871 by a group of clubs in the London area. Its origin is attributed to Wm Webb Ellis of Rugby School who 'with a fine disregard for the rules of football as played in his time, first took the ball in his arms and ran with it, A.D. 1823' (commemorative tablet in Rugby School Close). Many members of the Union are clubs associated with schools, univs., and the armed services. The laws of Rugby Union F. have been recodified and altered from time to time by the International Board, founded 1890. The ball used is oval in shape and composed of the same materials as an Association ball; its length is from 11 to 11½ in.; its circumference, measured lengthwise, 30 to 31 in.; and measured over the width, 25½ to 26 in.; and its weight at the beginning of a game is between 13 and 14½ oz. The score is made by means of tries and goals. A try is scored when the

ball is touched down by one of the attacking side behind the opponents' goal-line. A goal is scored when the ball is kicked over the crossbar and between the uprights of the opponents' goal. The width of the goal is 18 ft 6 in., and the height of the crossbar is 10 ft; the uprights extend for over a foot above the crossbar, and the ball may pass between them at any height. The field of play is not more than 75 yds by 110 yds; lines are drawn parallel with the goal-lines at a distance of 25 yds out, these being known as the 'twenty-fives.' A goal may be scored in 4 different ways: (1) When a try is scored the ball is brought out any

kick-off or goal is decided by tossing, and the kick-off is made from the centre of the half-way line. Any player who is onside may run or kick directly after the kick-off. A player is offside if he gets in front of the ball during a scrimmage (this applies especially to the halves), or if the ball has been kicked or is being run with by one of his own side who is behind him; when an opponent has kicked or touched the ball, or when one of his own side, with the ball, or the kicker of the ball has run in front of him, the player is onside again. The ball must not be passed forward, or 'knocked on.' When a player is fairly tackled by an opponent he must at once

Sport and General

RUGBY UNION FOOTBALL

The Hospitals Cup, Semi-final. St. Mary's Hospital v. London Hospital at the Richmond Athletic ground

distance desired from the place where it was 'touched down' at right angles to the goal line, and a place kick is taken. If this results in a goal, 2 points are added to the 3 already gained for a try. (2) A dropped goal is a goal from a drop-kick, which is a kick where the player drops the ball on the ground and kicks it immediately on the half volley. It counts 3 points. (3) When a player catches the ball from a kick by the opposing side he may, instead of running with it, strike his heel into the ground and claim a mark. A free kick may then be taken, and if a goal results it counts 3 points. (4) A penalty goal is a goal scored from a place kick which has been given as a penalty against the opposing team for some breach of the rules, and counts 3 points. A team consists of 1 full-back, 4 three-quarter backs, 2 half-backs, and 8 forwards. Eighty mins., 40 in each half, is the usual time played, but 35 mins. each way can be arranged by the captains. The choice of

drop the ball, which is then played with the foot (it must not be at once picked up). A 'scrum' consists of the opposing forwards packing in 2 phalanxes, generally 3, in the first row, then 2, then 3 again, and shoving. The ball is put into the scrum by the 'scrum half' of the side which did not commit the breach of the rules causing the scrum, and must be 'heeled out' as quickly as possible by the forwards to the rear, where the half is waiting for it. Offences which are punished by free kicks are handling the ball in the scrum, 'feet up' in the scrum; tripping, and impeding, and tackling an opponent who has not got the ball. The most common offences are passing forward, knocking on, and offside. If the ball is kicked into touch it is thrown in by the side which did not kick it in; if carried into touch, by the side carrying it. A 'line out' is formed when the ball has gone into touch; the player who throws the ball in must throw it so that it alights

on a line at right angles to the touch line, or a scrum is held where it deviated from the straight line. When a player has crossed the touch in goal-line, after a player has touched the ball down behind his own goal, and after an ineffectual attempt to place a goal from a try has been made, the ball is dead. If, however, a player carries the ball over his own goal-line and then touches down, a scrum is held 5 yds out from the goal-line, opposite where he touched down. In the cases where the ball is dead a drop-kick or punt is taken by the defending side from their '25'; all the men of the side must be behind the man who takes the kick, or they are offside. A referee is in charge of the game, assisted by 2 touch judges with flags, which they hold up where the ball goes into touch; they also assist the referee in judging goals. No professionalism is allowed in Rugby Union F., a rule that led in 1893 to the formation of the Northern Union, renamed the Rugby League (see below) in 1922. The game has grown considerably in the last few years, Rugby Union F. being played all over the world. Many schools have changed to Rugby Union F. Competitive interests centre in the International Championship (England, Ireland, Scotland, Wales, France); the Co. Championship; the Service matches, the big club matches, and the fixtures with famous touring sides such as the All Blacks (New Zealand), the Springboks (South Africa), and the Wallabies (Australia). The H.Q. of the Rugby F. Union is at Twickenham, Middx.

Rugby League.—This 13-a-side game is played by both professionals and amateurs and has much in common with Rugby Union F., from which the League 'broke away' in 1895. The changes which have been made in the laws of the game since then have produced a more open, spectacular type of play. Rugby League is popular in Lancs, Yorks, and Cumberland, where it is organised on a competitive basis. Only occasional matches, e.g. the cup final which is played each year at Wembley, are played outside these areas in this country. Rugby League is widely played in Australia, New Zealand, and France.

Gaelic Football.—F. of one form or another was popular in Ireland for 300 years from 1600, when it was first mentioned in records of the pastime of the period. The old game was called 'caid' in Kerry and was a communal game in which the ball was carried as in Rugby. It was an Irishman, Ellis, who first 'carried' the ball when at school in England, and his style of play was adopted. Cross-country, inter-par. games were common before the Gaelic Athletic Association estab. the game in its present form in 1884. It is now popular in every one of the 32 Irish cos.; all enter for the prin. competitions—championship of co., prov., and All-Ireland National Leagues, the railway cups, etc. The pitch is 140 to 160 yds in length, and 84 to 100 yds in breadth. The spherical ball is 27 to 29 in. in circumference and must weigh between

13 to 15 oz. In the scoring area goal-posts are 7 yds apart and 16 ft high with a crossbar 8 ft from the ground; a goal counts 3 points if under the bar and 1 point if over the bar. Teams are 15 a side. Duration of play is 30 mins. in each half. The ball can be caught in the air but must not be carried more than 4 yds before being kicked or punched, but not thrown or hit with the open palm. All tripping, holding, jumping, butting, and charging from behind are prohibited. The ball on the ground must not be touched with the hand but may be lifted by the foot into the hand. Accurate catching at all heights or angles is essential; accurate lengthy kicking, punch or drop-kicking, and accurate passing with hard straight shots at goal are features of the game. Gaelic F. is unlike any other form of F. though Australian F. is very similar. Between first-class sides, the game is fast, attractive, and continuous—interest is constant for the game continues unbroken from score to score.

Australian Football.—Devised in Victoria in the 1860's and embodying features of Gaelic F., this is the most popular code in the 5 S. Australian states, a grand final in Melbourne attracting up to 90,000 spectators. In New South Wales and Queensland rugby F. is more popular. The ground is oval, areas being 150-200 yds between goals and 120-170 yds across the centre; the ball is ovoid, like a rugby ball, and weighs 16-17 oz. At either end of the field are 4 posts, each 7 yds apart; the 2 central posts are the goal-posts and the 2 outer posts are 'behind' posts. There are no crossbars. When the ball passes between the goal-posts, 6 points are scored for a goal; when it passes between a goal-post and a behind post, 1 point is scored for a 'behind.' Teams are 18 a side plus 2 reserves, 15 players being in fixed positions in lines of 3 (backs, half-backs, centres, half-forwards, and forwards) and the remaining 3 being followers; duration of play is 4 quarters of 25 mins. There is no 'off-side,' and long kicking, accurate passing, shepherding, and high-marking duels are features. The ball may be kicked or punched but not thrown nor carried more than 10 yds without bouncing. Bumping and tackling around the waist are allowed, and the ball must be passed on if the possessor is held, hence the game is kept fast and open. Excessive man-handling, tripping, charging, and pushing from behind are barred. Free kicks are awarded for marks and against infringements.

The Eton games.—There are 2 separate varieties of F. played at Eton, the wall game and the field game. The former game is played by only a small proportion of the boys, but is interesting for its peculiarities. The ground is bounded on one side by a wall about 9 ft high and 120 yds long; on the other side by a line drawn parallel to the wall at a distance of 6 yds from it. Another wall containing a door runs at right angles to the wall, and at the other end of the ground is a large

elm; the door and a chalked space on the trunk of the tree form the 2 goals. Scoring is by shies and goals, one of which outweighs any number of shies.

The field game is more generally played at Eton. The ground is 150 yds by 100 yds, and goals 12 ft in width and 6 ft high. Eleven players form a side, divided up into 8 forwards and 3 behinds. The game is begun by a 'bully' in the centre of the field. Four players form the bully; just outside the bully on each side is a corner, and an 'extra corner' on one side, whilst just behind is the 'flying man'; then comes the 'short behind,' the 'long behind,' and the 'goals.'

The *Harrow game* is played with a ball which resembles a church hassock in shape, flattened at the sides and irregularly circular elsewhere. The ground is about 150 yds by 100 yds. Two upright poles without any crossbar, 18 ft apart, mark the goals. A goal is scored by kicking the ball between them at any height. Any number of players may form a team; in matches the number is 11.

The *Winchester game* is played with a ball slightly smaller and lighter than an Association ball. The ground is 80 yds by 25 yds. A net runs along each of the long sides to a height of 10 ft, and a line of stakes and ropes 1 yd inside the net. This enclosed space is called under ropes. A furrow, called 'worms,' is marked on each short side. A goal is scored by kicking across worms, but the ball must not touch ropes, stakes, or nets, or an opponent.

American football.—From colonial times until 1871 a kind of Association F. was played by the colleges in the U.S.A. The first formal F. game was the Rutgers-Princeton game in 1869, but Amer. F. as played to-day really dates back to 1873, when Columbia, Princeton, Yale, and Rutgers adopted a set of rules, and in 1880 the uniform adoption of 11 men to each side was secured. An ann. convention was appointed to modify the rules as required, but the game became so rough that at one time the authorities forbade the matches between Harvard and Yale. The National Collegiate Athletic Association now is responsible for the laws of the game, which is now less rough and more scientific. The teams are composed of 11 men, and substitutes are allowed. The ground is 360 ft long by 160 ft wide. At each end of the ground, extending 30 ft behind the goal line to end line, is the end zone, where the scoring takes place. The area between the 2 goal lines (300 ft) is the field of play, and is divided with lines parallel to the goals every 5 yds. The goal-posts, consisting of 2 uprights more than 20 ft high, 18 ft 6 in. apart, and joined by a crossbar at a height of 10 ft are in the middle of each end line. The ball has the general appearance of an Eng. rugby ball, but is thinner and more pointed. There are 7 forwards or 'line-men' (2 guards, 2 tackles, 2 ends, and a centre) and 4 backs (a quarter-back, 2 half-backs, and a full-back). A touch-down (an Eng. rugby try) is 6 points

with 1 point scored for the conversion after the touch-down, a goal kick from the field 3 points, and 'safety' (a rugby touch-down) 2 points. The side with most points at the end of the 4 15-min. periods of play is the winner. At the half-way mark there is a 15-min. rest. The ball is kicked off from the kicking team's 40-yd line, and the teams then try to get it across the opposing goal line by carrying or passing. A man is offside as in Eng. rugby, but is put onside when the ball strikes the ground. In order to prevent blocks it was enacted that 10 yds must be made by one side in 4 successive plays or 'downs,' i.e. the man with the ball being stopped by a member of the opposing team. A great feature of Amer. F. is the 'interference' which is allowed; the games resolves itself into a series of 'scrimmages' interspersed with kicks and runs. Each man faces his opponent in the scrimmage, and thus a kind of man to man contest is continually going on. A ball going out of play along the sidelines is put in play again by a scrimmage. Another feature is the 'shift,' a tactical manoeuvre entailing a sudden change of formation; various shifts have been developed but were regulated by rules after 1922. There was little professionalism in Amer. F. until after the First World War; in 1957 there were 2 major professional leagues, the rules in these differing slightly from those used in college F.

See M. Shearman and J. E. Vincent, *Football, its History for Five Centuries*, 1885; A. M. Weyand, *American Football*, 1926; H. B. T. Wakelam, *Rugby Football*, 1935; F. N. S. Creek, *Association Football*, 1937; W. G. Killinger, *Football (Amer.)*, 1938; and E. H. Sewell, *Rugger, the Man's Game*, 1947; O. L. Owen, *The History of the Rugby Football Union*, 1955.

Foots, Samuel (1720-77), actor and dramatist. After squandering his patrimony, he went on the stage, making his first appearance in a small part in *Othello* at the Haymarket in 1744. He at once achieved some success, and later became a fashionable actor, and was highly regarded by the public of his day. Occasionally he gave entertainments, in which he was able to exhibit his powers of mimicry, which were very considerable. He wrote many plays, some of which were once highly regarded. More than once the censor interfered with his productions, and he was forbidden to play his *Trip to Calais*, in which he lampooned the bigamous duchess of Kingston. A clever man and a brilliant conversationalist, he was much sought, but his selfishness and unscrupulousness left him almost friendless. He lost a leg as a result of a practical joke played on him, and as compensation was given a royal charter for the Haymarket Theatre. He continued to act with only one leg. There is a biography by Wm Cooke, 1805. See also Boswell's *Life of Johnson*.

Footpaths, and Preservation of. F. are for the use of pedestrians (foot-passengers) only, as opposed to highways for vehicles

or horses. The Commons, Open Spaces, and Footpaths Preservation Society (formed 1899 by amalgamation of the National Footpath Preservation Society with the Commons Preservation Society) aims at preserving F., bridle-paths, and other rights of way. It serves to guard public rights to common land, roadside waste, vil. greens, and all open spaces of the kind. London offices are at 71 Eccleston Square, Westminster. Scotland has a similar Scottish Rights of Way and Recreation Society Ltd.

Plans for giving to the public new rights of access to mts, moors, and other uncultivated land, and for creating new rights of way and defining and maintaining old ones, are outlined in the report of the Special Committee on Footpaths and Access to the Countryside (under the chairmanship of Sir Arthur Hobbhouse), which was appointed by the National Parks Committee in July 1946 at the request of the minister of tn and country planning. The report (pub. as Cmd. 7207 in 1947) strongly recommends (*inter alia*) such schemes as the proposed Pennine Way, along which, according to a preliminary survey, 180 m. of F. already exist, and the reopening of the old coast-guards' path as a right of way for walkers round the whole coastline of England and Wales, except where building makes this impossible, and in such cases as the latter detours should be provided. Other long-distance F. recommended are Chilterns to the Devon coast (about 200 m., requiring about 60 m. of new F. from the Gog Magog Hills, near Cambridge, to Seaton Bay); the Pilgrims' Way (Canterbury to Winchester, about 120 m., requiring about 50 m. of new F.); the S. Downs to Salisbury Plain (from Beachy Head to Winchester, about 70 m., requiring about 25 m. of new F.); Offa's Dyke (Prestatyn to the Wye near Chepstow, roughly 150 m., requiring perhaps 50 m. of new F.); the Thames (Teddington to Cricklade via the towpaths, about 136 m.). The report recognised a national element in the demand for long-distance routes, and recommended that the National Parks Commission (see NATIONAL PARKS) should be empowered to make grants to local planning authorities for the creation or improvement of long-distance and coastal F. The recommendations of the report were largely implemented by the National Parks and Access to the Countryside Act, 1949. This act also requires local authorities to prepare maps delineating F., bridleways, and certain other highways. Interested parties (e.g. landowners or the Ramblers' Association) may lodge objections to the inclusion of new F. on the maps or the closing of existing ones. Local authorities have powers to create new public rights of way. The minister of housing and local gov. may, in certain circumstances, make orders for the diversion or closure of public F. See Sir L. Chubb and R. Glen, *Maintenance of Public Footpaths*, 1932; Hutchins, *The National Parks and Access to the Countryside Act, 1949*, 1950.

Footpaths and Rights of Way. Public rights of passage exist in many country places for walkers across fields and moors and through woodlands, etc., and some ('bridle-paths') may also be used by horse-riders. Such ways may fall into disuse or be wrongfully obstructed or closed, to the public loss; the Commons, Open Spaces and Footpaths Preservation Society (11 King's Bench Walk, London, E.C.1) is watchful to maintain them. There is a similar society for Scotland. New rights of way were recommended in the *Report of the Special Committee on Footpaths and Access to the Countryside*, 1947, and may be created under the National Parks and Access to the Countryside Act, 1949 (see NATIONAL PARKS). By proper legal procedure public rights of way may be diverted, but never without public notice. See L. Chubb and R. Glen, *Maintenance of Public Footpaths*, 1932; and pubs. of the Society named.

Footscray, busy manufacturing suburb of Melbourne (4 m. E. of F.), in Victoria, Australia, on the Saltwater R. It is noted for its bluestone quarries. Pop. 20,000.

Footwear, see BOOTS AND SHOES.

F.O.R. Abbreviation for 'free on rail,' denoting in contracts for the sale of goods that the cost of carriage and handling the goods and putting them on the railway, but not the cost of the railway freight, must be paid by the seller.

Forage Crops, see FATTENING FOODS.

Foraminifera, marine protozoans with calcareous, siliceous, or agglutinated skeletons. They are adapted to all aquatic habitats, and include bottom-dwelling and planktonic forms. F. are widely distributed in modern seas, and their skeletons may form ooze on the ocean floor, e.g. *Globigerina* ooze. They are very common as fossils in certain geological formations, and are of great economic importance as index fossils in correlating oil-bearing and associated strata. They are the most important group of fossils in micro-palaeontology (q.v.). See J. A. Cushman, *Foraminifera, Their Classification and Economic Use*, 1948.

Forbach, Fr. tn, cap. of an arron., in the dept of Moselle. It was the scene of a Fr. defeat during the Franco-Prussian War (q.v.), and was damaged in the Second World War. There are coal mines, and iron works, and glass and pottery are manufactured. Pop. 9600.

Forbes, Archibald (1838-1900), journalist, b. Keith, Morayshire. He served in the Royal Dragoons, but soon abandoned the army for journalism, and joined the staff of the *Daily News* as war correspondent, accompanying the Ger. Army through the war of 1870-1. During the Afghanistan campaign of 1878-9 F. was under fire, and after that he visited Mandalay and Zululand, and his famous ride of 120 m. in 15 hrs to convey the news of the victory of Ulundi to England ranks as one of the finest achievements in journalistic enterprise. His pubs. include

Souvenirs of Some Continents, 1885, and *Memories and Studies of War and Peace*, 1895.

Forbes, David (1828-76), geologist and brother of Edward F., b. Douglas, Isle of Man. In England he was a pioneer in microscopic petrology, and was elected F.R.S. in 1858. Among his scientific papers are *The Relations of the Silurian and Metamorphic Rocks of the South of Norway*, 1855, *Researches in British Mineralogy*, 1867-8, and *The Causes producing Foliation in Rocks*, 1855, etc.

Forbes, Duncan (1685-1747), statesman and jurist, b. near Inverness. In 1709 he was admitted advocate at the Scottish Bar. He took an active part in putting down the rebellion of 1715. In 1725 he became lord advocate, and in 1737 he was made lord president of the court of session. By his exertions in the Hanoverian interest the rebellion of 1745 was prevented from spreading more widely among the clans. See his autobiography, 1748.

Forbes, Edward (1815-54), naturalist, b. Isle of Man. In 1843 he became prof. of botany at King's College, London, and curator of the Geological Society; and 10 years later he was elected to the chair of natural hist. in the univ. of Edinburgh. A new era in that branch of zoology was begun by his classification of the Brit. star-fishes. Upwards of 200 of his works and papers were pub., notably *Star-fishes*, 1842, *Naked-eyed Medusae*, 1843, *British Mollusca*, 1848, etc.; and, with T. Spratt, *Travels in Lycia*, 1847. See G. Wilson and A. Geikie, *Memoir of Edward Forbes*, 1861.

Forbes, James David (1809-68), scientist, b. Edinburgh, grandson of Sir W. F. (1739-1806). Elected F.R.S. in 1832. He was prof. of natural philosophy at Edinburgh Univ., 1833-60, and then became principal of St Andrews United College. With Brewster he helped to found the Brit. Association, 1831. His discoveries relative to the movement of glaciers and the polarisation of heat and light are famous. The latter subject is described in 'Researches on Heat' (*Transactions of the Royal Society of Edinburgh*) in which he explains the polarisation of heat by different methods. Among his pub. are *Travels through the Alps of Savoy* . . ., 1843, *Norway and its Glaciers*, 1853, *Tour of Mont Blanc and Monte Rosa*, 1855, *Dissertation on the Progress of Mathematical and Physical Science*, 1858, *Occasional Papers on the Theory of Glaciers*, 1859, contributions to the *Edinburgh Philosophical Journal*, signed '4'. See J. Tyndall, *Professor Forbes and his Biographers*, 1873.

Forbes, Joan Rosita (1893-), travel writer, b. Swinderley, Lincs, daughter of Herbert J. Torr. She married, first, Col. R. F., whom she divorced, and later Col. A. T. McGrath of the War Office. Frail-looking, beautiful, and very feminine, she was nevertheless a great traveller, visiting such out-of-the-way parts as Libya, Ethiopia, Syria, the Balkans, Central Asia, and South America. During the First World War she drove an

ambulance for the Fr. Red Cross. Her books include *From Red Sea to Blue Nile*, 1925, *Angora to Afghanistan*, 1931, *The Secret of the Sahara*, 1931, *Eight Republics in Search of a Future*, 1933, *Kabul to Samarkand*, 1937, *A Unicorn in the Bahamas*, 1939, *The Prodigious Caribbean*, 1940, and *Islands in the Sun*, 1949. *Appointment in the Sun*, 1946, is an autobiography.

Forbes, Stanhope Alexander (1857-1947), painter, b. Dublin; educ. at Dulwich College, the Lambeth School of Art, and the Royal Academy schools. He also studied in Paris, and became a pupil of Léon Bonnat, by whom and by Jules Bastien-Lepage his subsequent work was strongly influenced. Scenes of everyday life, realistic in atmosphere, were his subjects, and he became a leader of the Newlyn school of painters in Cornwall. He exhibited in the Royal Academy from 1882, when he was elected A.R.A., becoming R.A. in 1910. His first wife, Elizabeth, was also an artist of distinction, whose influence, like that of her husband, was exerted on the Cornish school of painters. Elizabeth F. d. in 1912. The fresco of the 'Fire of London,' which F. painted for the Royal Exchange, was completed in 1899. Among his best pictures are 'The Fish Sale on the Cornish Beach,' 'By Order of the Court,' 'Forging the Anchor,' 'The Smithy,' and 'The New Calf.' In later life he turned his attention away from genre painting, and more to landscape.

Forbes, in Ashburnham co., New South Wales, Australia, on the r. b. of the Lachlan R., 90 m. W. of Bathurst. It serves the surrounding agric. and pastoral dists. Pop. 6620.

Forbes-Robertson, Lady, see ELLIOTT, MAY GERTRUDE.

Forbes-Robertson, Sir Johnston (1853-1937), actor, b. London; son of the art critic (d. 1903); educ. at Charterhouse, Rouen, and Royal Academy schools. He early won reputation as a painter, exhibiting at the Royal Academy about 1870. He studied elocution under S. Phelps, making his first stage appearance in 1874, and soon became one of the foremost actors of his time, noted for his beautiful voice. He toured with Ellen Terry, and acted also with her sister Marion, making a hit in *Dr and Mrs Neill*, and as Geoffrey Wynniard in *Dan'l Druce*, 1876. He acted with the Bancrofts, Hare, and Henry Irving, and under his own management with Mrs Patrick Campbell won success in *The Notorious Mrs Ebbelworth*, 1895, *Romeo and Juliet*, and other plays. He played with Mary Anderson in *The Winter's Tale*, 1887, designing the dresses for this production. Among his noted Shakespearian rôles were Hamlet (he was probably the finest Hamlet the stage has ever seen), Othello, Shylock, Leontes, and Macbeth. As a romantic actor he triumphed in *For the Crown*, 1896, *Mice and Men*, 1902, *The Light that Failed*, 1903, and *The Passing of the Third Floor Back*, 1908. He married Gertrude Elliott in 1900, and appeared with her as his

leading lady—frequently touring in America, where *Caesar and Cleopatra* was first produced, 1906. His farewell London season was held at Drury Lane, 1913, with selections from his repertoire. He was knighted in 1913, and retired from the stage in 1915. He wrote *A Player under Three Reigns*, 1925.

Forbidden Fruit, or **Adam's Apple**, so called from the fruit forbidden to Adam (Gen. ii. 17), is the name often applied to sev. species of *Citrus*, especially on the Continent to *C. decumana*, a Malayan or Chinese tree much cultivated in India and Florida. *C. medica* (variety *paradisi*) is also so called. In Great Britain pomeloes, a variety of shaddock, are known by this name. The fruit of *Tabernemontana diehotoma* (Apocynaceae) in Ceylon also bears the name, and is fabled to be poisonous since Eve ate of it.

Forbin, Claude, Comte de (1656-1733), one of the greatest Fr. naval commanders. He showed reckless courage at Messina (1675), the Antilles (1680), Algeria (1682-1683). He accompanied Chaumont to Siam, 1685, becoming admiral to the king of Siam, 1686-9. As *chef d'escadre* in the Sp. Succession war, he fought often against the Eng. and Dutch, 1702-10. His *Mémoires* were ed. by Reboulet, 1730. See life by A. Richer, 1784.

Force, in mechanics, that which changes or tends to change a body's state of rest, or of uniform motion in a straight line. This definition is derived from Newton's first law of motion, which states that every body continues in its state of rest, or of uniform motion in a straight line, except in so far as it may be compelled by impressed F. to change that state. We can only get an idea of F. by observing its effects, that is, F. can only be measured by measuring the change of motion produced by it. Thus Newton's second law states that change of motion is proportional to the impressed F., and takes place in the direction in which the F. acts. By motion Newton meant momentum, which is a function of the mass of a body as well as of its velocity. This agrees with our experience, because the idea of force is derived from muscular effort, and we know that we have to exert more strength to stop the motion of a heavy body than of a light one, just as we have to exert more strength to stop the motion of a rapidly moving body than of a slowly moving one. F., then, is measured by change of momentum, momentum being equal to mass \times velocity. But it is obvious that the longer the F. acts the greater is its effect in changing the momentum. Therefore, we have F. proportional to change of momentum and inversely proportional to the time. The unit of F. may now be expressed as that F. which produces on a unit of mass a unit change of velocity in a unit of time, or, more concisely, $F. = \text{mass} \times \text{acceleration}$. Given the foot as unit of length, pound as unit of mass, and second as unit of time, we have as the derived unit of F. that F. which, acting on a mass of 1 lb. for 1 sec., produces an additional velocity of 1 ft per sec., or,

assuming that the body is originally at rest, that F. which acting on a mass of 1 lb. for a sec., produces in it a velocity of 1 ft per sec.; this unit is called the *poundal*. In the C.G.S. system of units, the unit of F. is the *dyne* (q.v.), which is that F. which produces in a mass of 1 gramme an acceleration of 1 centimetre per sec. per sec. See F. Barracough and E. J. Holmyard, *Mechanics for Beginners*, 1931, 1947. See also METROLOGY.

Forced Vibrations, see RESONANCE.

Forcellini, Egidio (1688-1768), It. savant, pupil of Jacopo Facciolati (q.v.). It was F. who assisted the latter in his great work, and F. in his turn, on Facciolati's suggestion, compiled the great *Lexicon infans latinatis* (pub. posthumously in 1771), which had many eds.; the last one (ed. by Francesco Corradini and Giuseppe Perin), in 4 vols., was pub. in Padua in 1864-98; it is still useful for the study of Lat. lexicography.

Forceps, 2-bladed metal instrument of the nature of pliers or pincers, used for seizing and holding objects firmly, especially in surgical and obstetric operations, and by dentists and watchmakers. There are many varieties, such as the dissecting F. with rounded points, the lithotomy F., the artery F., Liston's cutting F., and the fenestrated F. with apertures in the blade. The midwifery F., invented by P. Chamberlen in the 17th cent., came into general use in the 18th cent. Chemists and mineralogists use small F. for adjusting weights and working with the blowpipe. In entomology, the word is applied to an organ or part of the body resembling a F., or to one of its 2 branches. Examples are the horny appendages at the extremity of the abdomen, found in many male insects, such as the earwig's caudal appendage.

Forces, Parallelogram of, see PARALLELOGRAM OF VECTORS.

Forchheim, Ger. tn in the *Land* of Bavaria (q.v.), on the Ludwigskanal (see REGNITZ), 104 m. N. by W. of Munich. In the early Middle Ages it was an important city of the empire, and was the scene of the coronations of Arnulf of Carinthia and Louis IV 'l'Enfant' (q.v.). Later it belonged to the bishops of Bamberg (q.v.). It has a palace, a fortress, and many other old buildings. Textiles and dyes are manufactured. Pop. 19,000.

Forcible Entry, see ENTRY.

Forcing, acceleration of maturity in flower, vegetable, or fruit, according to whether blooms, fruit, or foliage are desired. Warmth is essential for F., and while in some cases a hotbed provides sufficient temp., in other cases elaborately equipped F. houses are needed. Among flowering plants, hardy shrubs are most easily forced into early bloom, but they must be thoroughly matured and well provided with flower buds, or foliage instead of blooms will be produced. A large variety of bulbs and bulbous-rooted plants are well suited for F., and lilies of the valley are brought into bloom throughout the whole year. Most kinds of fruit

can be produced by F. Strawberries are grown in pots standing on ash beds, and in a temp of 75° fruit can be ripened by Christmas. Forced tomatoes need a similar temp., but they meet with a very severe competition from importations from warmer countries and scarcely pay to grow. Grapes can be ripened at almost any time from the early spring by starting the shoot in a temp. of about 40° and gradually increasing it until after the flowering period, when from 60° to 70° is needed. Peaches, nectarines, and figs are forced in pots, starting with a temp. of 45° and increasing to 60°. Hardier fruits are forced in cold or orchard houses. Asparagus, potatoes, lettuce, endive, and other salad plants, scakale, chicory, and rhubarb are all easily forced on hotbeds; the 3 last need to be kept in the dark, but the others need abundance of light. Remarkable experiments have recently shown that the natural resting period of plants can be intensified by exposing them with their roots in an air-tight box to chloroform or ether. This is followed by much increased activity, and lilac and azalea blooms have been produced in about a fortnight: lilacs of the valley were forced into flower in only 10 days. F. some of the harder flowering plants is simplified by retarding the growth for a time in a refrigerating chamber. Following such treatment, lilacs, lilacs, spruces, and *Azalea mollis* will come quickly into flower in an ordinary cool greenhouse.

Ford, Edward Onslow (1852-1901), sculptor, studied painting in Antwerp and Munich, 1870-2, and then took up sculpture; he was elected R.A., 1895. His most famous works are statues of Sir Rowland Hill, 1882 (Royal Exchange); W. E. Gladstone, 1883, Irving as 'Hamlet,' 1883; Gen. Gordon, 1890 (Chatham); Shelley memorial at Univ. College, Oxford; Marlowe memorial at Canterbury; Huxley, 1900 (Brit. Museum of Natural Hist.); busts of Millais, Briton, Rivière, and others, statuettes of 'Folly,' 'Music,' 'Dancing' (Tate Gallery); a relief, 'In Memoriam,' 1885. See M. H. Spielmann, *British Sculpture and Sculptors of To-day*, 1901.

Ford, Ford Madox, formerly **Ford Hermann Hueffer** (1873-1939), novelist and poet, b. Merton, Surrey. His grandfather was Ford Madox Brown, the artist whose life he wrote in 1896. After publishing *Poems for Pictures*, 1897, he collaborated with Joseph Conrad (q.v.) in 2 novels, *The Inheritors*, 1901, and *Romance*, 1903, and wrote independently *The Fifth Queen*, 1906, and *The Half Moon*, 1909. In 1908 he founded the *English Review*. During the First World War he served in a Welsh regiment, and wrote *The Good Soldier*, 1915. After the war, having changed his name to Ford, he pub. a series of war novels, *Some Do Not*, 1924, *No More Parades*, 1925, *A Man Could Stand Up*, 1926, and *The Last Post*, 1928. His *Collected Poems* appeared in 1913 and *New Poems* in 1927. Among his critical works are books on Henry James, 1913, Conrad, 1924, and the Eng.

novel, 1922. In 1924 he ed. the *Transatlantic review* in Paris. Thus to *Revisit*, 1921, *It Was the Nightingale*, 1933, and *Memories and Criticisms*, 1938, are vols. of reminiscences. See D. Goldring, *The Last Pre-Raphaelite*, 1948.

Ford, Henry (1863-1947), Amer. industrialist and one of the greatest manufacturers of motor-cars in the world, b. Greenfield, near Dearborn, Michigan, U.S.A.; son of Wm Ford, farmer of Irish stock. His mother was of mixed Dutch and Scandinavian origin. He was educ. at the dist. school, where he seemed good, but not brilliant, at his studies. In 1880

Topical Press

HENRY FORD

he obtained a situation at \$2.50 a week in a machine-shop in Detroit, and night-work at mending watches—a thing he had taught himself at home. On his father's farm he experimented in the manuf. of a steam tractor. In 1884 his father presented him with 40 ac. of timbered land, on which he erected and worked a saw-mill to dispose of the wood. In 1887 he became machinist in the employ of the Edison company in Detroit, which thereafter was the centre of his activities. In 1896 he produced his first motor-car—a 2-cylinder 4 h.p. In 1899 he left the Edison company and went into the motor-car business—founding the Detroit Automobile Company. He disagreed with his fellow-directors, who wished to restrict output to orders; and he resigned directorship in 1902. By himself he built some 4-cylindred cars; and one, called 999, won all the races for which it was entered. Then he formed the Ford Motor Company with a nominal cap. of \$100,000: by 1926

its assets were valued at \$1,000,000,000. The stock was entirely held by F. and his son, who bought out the other stockholders. He introduced vanadium-steel into motor construction; and in 1909 the company standardised the 'T' model, which was the F. car known all over the world, and was superseded only in 1927 by the 'A' model.

In 1916 he turned his attention to his early preference, the farm tractor, and his Fordson tractor proved of notable use in Britain when there was a food shortage through the Ger. submarine campaign in the First World War. Within 28 years of his start F. had put 20,000,000 cars on the road. His factories employed 200,000 persons, and comprised some 50 complete businesses. In 1914 he made known that throughout his plants there was to be a standard wage of \$5 a day, which at the time was nearly double the average figure of Detroit. Subsequently, when he realised that the old car had had its day, he shut down all his plants, did not reopen until the new models were ready, and then started afresh in full power. In 1940 he built the vast bomber plant of Willow Run. Through 1941-2 Willow Run had the appearance of mass-production's most spectacular failure; but afterwards it functioned to scale when F. had surmounted the difficulties imposed by labour, transport, and the conditions of gov. contracts. He is said to have been a scornful opponent of unionism, and he always argued that no trade union could get for its members any benefit to compare with the F. standard wage. But in some things he moved with the times, and the H. F. hospital in Detroit is a free institution of unrivalled excellence, with the highest standard of comfort and equipment. A few m. out of Detroit, adjoining Greenfield, is the F. Museum of Amer. Hist., the main building of which reproduces, in Georgian brick, the noble Independence Hall of Philadelphia. That F. was a visionary, ignorant of much that quite ordinary people knew, but with goodwill for all, is illustrated by the fact that in 1915-16 he visited Europe as leader of a peace party, whose members went to various neutral caps. in an endeavour to end the war. Yet, in spite of his character as an emotional visionary, he had a power of handling the practical things of life which has seldom been surpassed. In 1918 he ran unsuccessfully for the Senate, and in 1923 there was some talk that he would run for the presidency, but later he announced his refusal to stand against Mr Coolidge. In the following year his acquisition of the Dagenham sites in addition to his Trafford Park and Cork works was announced. This was part of a post-war policy of expansion, and between 1931 and 1946 over 1,000,000 vehicles were manufactured at the Dagenham factory alone. He founded factories in many European countries, but his plant at Dagenham is the largest outside the U.S.A. He then went into the civil aviation business, and soon afterwards his all-metal monoplanes were on sale. The

industrial empire which F.'s imagination and energy estab. was in due course to yield him an immense fortune; but wealth was never his goal. F. wrote 4 books concerning his own life's work and ideals: *My Life and Work*, 1922, and *To-day and To-morrow*, 1926, both in collaboration with Samuel Crowther, *Philosophy of Labour*, 1929, and *Moving Forward*, 1930. See K. C. Thalheim, *Sozialkritik und Sozialreform bei Abbe, Rathenau und Ford*, 1929.

Ford, John (c. 1586-c. 1640), dramatist, b. Islington, Devonshire. His mother was a sister of Lord Chief Justice Popham. F. matriculated at Exeter College, Oxford, 1601, and in 1602 became a member of the Middle Temple. In 1606 he pub. his first work, *Fame's Memorial*, an elegy on the death of the earl of Devonshire, with a dedicatory sonnet to Penelope, the earl's widow. In the same year he issued *Honor Triumphant, or the Peeres Challenge*, a prose pamphlet, and also, appended to the latter, *The Monarches Meeting*, a poem. In 1613 his first comedy, *An Ill Beginning has a Good End*, was produced at the Cockpit, but is not extant. In 1621 he collaborated with Dekker and Rowley in *The Witch of Edmonton*. Other plays and masques produced in collaboration are *The Sun's Darling*, 1623, *The Fairy Knight* (masque), and *The Bristol Merchant*, 1624, with Dekker; and *A late Murder of the Son upon the Mother*, 1624, with Webster. In 1629 a comedy, *The Lover's Melancholy* (psychological, and indebted as to sev. passages to Burton's *Anatomy*), produced 1628, was the first of his plays to be printed. In 1633 his 2 best tragedies, *'Tis Pity She's a Whore* and *The Broken Heart*, appeared. These are little inferior in impressiveness to the best works of Webster. His other plays are *Love's Sacrifice*, 1633, in which Bianca is one of the best drawn of all F.'s characters; *The Chronicle History of Perkin Warbeck*, 1634, one of the best historical dramas since Shakespeare; *The Fancies Chaste and Noble*, 1638, well constructed but marred by a ridiculous story; *The Lady's Trial*, 1638 or 1639; and sev. lost dramas. F. is one of the most modern of the Elizabethans: he studied the sources of action and, as a psychologist, subtly analysed the human soul. See A. C. Swinburne, *Essays and Studies*, 1875; and M. J. Sargeant, *John Ford*, 1935.

Ford, John (Sean O'Feeney) (1895-), Amer. film director, b. Portland, Maine. He won the Academy Award for the best direction in 1935, 1940, 1941, and 1952 (*The Quiet Man*). His films include *The Informer*, *The Plough and the Stars*, *Stage Coach*, *The Grapes of Wrath*, *The Long Voyage Home*, *Tobacco Road*, *How Green Was My Valley*, *My Darling Clementine*, *The Fugitive*, and *Mister Roberts*.

Ford, Richard (1796-1858), Brit. writer on art and travel. Educ. at Winchester and at Trinity College, Oxford, he was called to the Bar at Lincoln's Inn but never practised. From 1830 to 1833 he travelled in Spain, becoming intimately

acquainted with the country and people. The work by which he is remembered is his *Handbook for Travellers in Spain*, 1845. This is much more than a mere guide-book, and remains one of the earliest and best of travellers' handbooks, notable for its literary quality. He also wrote *Gatherings from Spain*, 1846. An accomplished artist and art critic, F. was the first to make Velasquez (q.v.) generally known in England.

Ford, Thomas (c. 1580-1648), lutenist and composer. It is not known where he was b., nor what he did before 1607, when he pub. *Musicke of Sundrie Kindes*, containing airs performable by voice and lute or by 4 voices, and dances for various instruments. In 1611 he was musician to Prince Henry, in 1626 to Charles I., and in 1614 he contributed to Leighton's *Tears and Lamentations*. He also wrote rounds and catches, and was a great melodist, as is shown by the still familiar air 'Since first I saw your face.'

Ford Foundation, founded by Henry F. and his family in 1936. Its policy is to support 5 areas of public welfare: public affairs, education, economic development and administration, behavioural science, and international peace and understanding. It does not provide funds for medicine or natural science. Its assets in 1964 were \$493,213,842.

Forde, Francis Michael (1890-), Australian statesman, b. Mitchell, Queensland, member of the legislative assembly, Queensland, since 1955. He first entered Queensland Parliament in 1917, was the member for Capricornia in the house of representatives, 1922-46, Australian high commissioner in Canada, 1946-53. F. was minister for trade and customs, 1930-1, and acting minister for markets and transport, 1930-1, in the Scullin gov. He was minister for the army, 1941-6, minister for defence, 1946, and deputy prime minister, 1941-5 and 1945-6. On sev. occasions, 1941-6, he was acting prime minister, and in July 1946 was prime minister for a short period. In 1945 he was a member of the Australian delegation to the U.N. Conference, San Francisco.

Fordingbridge, tn of Hants, England, on R. Avon, here crossed by a stone bridge, 10 m. S. of Salisbury. Pop. 4500.

Fordun, John of (d. c. 1384), Scottish chronicler. Little is known of his life. He is supposed to have been b. at F. in Kincardineshire, and to have been a secular priest and a chantry priest in the cathedral of Aberdeen. Between 1363 and 1384 he is said to have travelled on foot through Britain and Ireland in search of materials for his chronicle of Scotland. Of his *Scotichronicon*, or *Chronica Gentis Scotorum*, only 5 books are completed, and the work was continued in 1441 by Walter Bower (q.v.), who finally brought the hist. down to 1437. The work is the chief authority for Scottish hist. before the 15th cent.

Foreign Debts, see PUBLIC DEBT.

Foreign Enlistment Act was an A. passed in 1870, which forbade the E. of any Brit. subject in the army or navy of any F. state at war with any friendly state. The A. states definitely that no Brit. subject shall under any conditions enter into the service of any state at war with a state which is friendly to Britain, save with the consent of the queen, or by an Order in Council. The officers of the customs or of any port have full power to detain any vessel concerning which they hold information that she is proceeding to the aid of some F. state which is at war with a friendly state. This legislation was an outcome of the celebrated *Alabama* case. Any ship so taken, together with all stores, arms, and equipment, is confiscated. It was under the provisions of this A. that the leaders of the 1895-6 Jameson Raid were punished.

Foreign Exchange, see EXCHANGES; METROLOGY.

Foreign Jurisdiction. The administration of Brit. law in countries outside the dominion of the Crown is regulated by the F. J. Act of 1890, extended by a further act in 1913. The power of exercising J. in F. countries may be acquired by the Crown as a result of treaty or capitulation, and is usually vested in the consular officers. The J. is generally limited to Brit. subjects or persons under Brit. protection, and covers civil and criminal cases. The F. J. Act may also apply in a Brit. protectorate, where the ter., not having been annexed, remains outside the normal colonial administration. See also CAPITULATIONS.

Foreign Law. The Eng. courts do not take judicial notice of F. L., and the party who relies on a F. L. must prove it like any other fact. Strictly, all F. L. has, as such, no extra-territorial force; such effect as it has is by virtue of comity (q.v.), and unless specially proved in any particular case, the L. of another state will be presumed to be similar to Eng. L. *Written* F. L.s must be proved by the text or some authoritative collection or duly certified copy of the same, expert evidence in such cases being merely by way of secondary evidence. F. unwritten L. is generally proved by oral evidence.

Foreign Legion, military unit formed of men who are foreigners to the country in whose service they are engaged. The best-known F. L. is the Fr. *régiment étranger*, organised in 1831, and later forming a permanent regiment of sev. battalions based on Algiers. Recruits were accepted for service of varying periods without proof of identity. A F. L. of Swiss and Germans volunteered for Brit. service in the Crimean war. F. L.s served in Spain in the First Carlist war, and in the Civil war, 1936-9.

Foreign Marriages, see MARRIAGE.

Foreign Moneys, see METROLOGY.

Foreign Office (U.K.), that dept of the executive through which negotiations with foreign powers are conducted. At the head is the Prin. Secretary of State for Foreign Affairs, appointed from the

dominant party in Parliament. The Foreign Secretary (who has a Parl. Private Secretary) is assisted by 2 Ministers of State (each with a Parl. Private Secretary), 2 Parl. Under Secretaries, a Permanent Under Secretary, 4 Deputy Under Secretaries, and 7 Assistant Under Secretaries. It is needless to say that the post of Foreign Secretary is of such vital and commanding importance that it is essential to appoint to it a minister who, by reputation and attainments, is as far as possible above the rancour of merely party politics. In the discharge of his prin. function, which is nothing less than the formulation of Brit. foreign policy, the Foreign Secretary is responsible both to the Cabinet (q.v.) and to Parliament; and for the fulfilment of this function he is necessarily in constant touch with the ambas., envoys, plenipotentiaries, or other foreign representatives in England, and with Brit. diplomatic agents abroad, the latter of whom it is his duty to instruct (taking into consideration any advice that they may offer). Through Brit. ambas., etc., abroad and foreign representatives in England he should endeavour, so far as is consistent with Brit. state interests, to promote cordial relations with foreign powers. Among the purely formal duties of a Foreign Secretary are the reception of new ambas. and their presentation to the sovereign; among his other duties are the granting of passports, and the protection of all Brit. subjects abroad. In conjunction with the rest of the Cabinet the Foreign Secretary carries into execution the treaty-making prerogative of the Crown (q.v.). It should, however, be realised that the function of the F. O. is executive, i.e. it is not responsible for the actual formation of foreign policy but is responsible, under the direction of the Foreign Secretary, for carrying out the policy laid down by the Foreign Secretary and the Cabinet.

The creation of the combined Foreign Service was effected by the merger of the F. O. and Diplomatic Service, the Commercial Diplomatic Service, and the Consular Service. It was foreshadowed in 1941, and the proposal was carried into effect in 1943 by the passage of the Foreign Service Order in Council of that year. The system of recruiting for the service was also reformed. These reforms were the outcome of the report of Sir Malcolm Robertson to the Foreign Secretary on the reform of the Foreign Service, a report which, in part, recommended the acceptance of proposals urged upon the Brit. Gov. by the MacDonnell Commission in 1914. The abolition of the means test for the diplomatic service was one of the major reforms of 1919, and a number of far-reaching reforms both as to organisation and recruitment were made between the wars. The account of the reforms in the Foreign Service (explained in the House of Commons, 18 Mar. 1943) emphasised that diplomacy must now be based on the representation of the whole nation, and must comprehend the whole life of the nations to which it is accredited.

There is a growing fusion of politics and economics in foreign affairs which represents a great change from the old-established conception of diplomacy.

Foreign Relations Committee. The U.S.A. has a secretary of state in the president's cabinet who deals with F. affairs. The president is responsible for dealing with international subjects, but his decisions need the endorsement of two-thirds of the Senate. This arrangement, as laid down in the Constitution, was designed to maintain a democratic hold upon the F. policy of the gov. The difficulty of such a large body being required to deal with issues, many too delicate and intricate to permit open discussion, and the fact that the president has no absolute guarantee that his actions will be endorsed, have led to the establishment in the Senate, of a F. R. C., the restricted and qualified powers of which are fully realised by other nations. This C. works in close touch with the Senate and the president. Even when the F. R. C. approves an action by the president, it is not always certain that the Senate will approve.

Foreigner, see ALIEN.

Foreland, North and South, 2 capes of England, projecting from the E. coast of Kent. They are composed of chalk cliffs. N. F. is situated in lat. $51^{\circ} 22' 28''$ N., and long. $1^{\circ} 26' 48''$ E., and is 66 m. E. of London. A lighthouse is placed with a fixed light, 183 ft high, visible 20 m. off. S. F. is 16 m. S. of N. F., situated in lat. $51^{\circ} 8' 23''$ N., and long. $1^{\circ} 22' 22''$ E. It juts out into the Dover Strait, 4 m. NE. from Dover. There are here 2 fixed lights which are visible at distances of 22 m. and 25 m. Near here was fought a naval battle in 1666, between the English under Albemarle and the Dutch under De Ruyter.

Forensic Ballistics, the art or science of bullet and firearms identification. Makers vary in the number, width, and direction of twist of the grooves they give their particular make of weapon, and in 1911 Robert Churchill was able in a famous murder trial to determine the make of weapon used. In 1924 Goddard and Waite in America discovered the comparison microscope which allows 2 objects to be microscopically compared through 1 single eyepiece. First used by Churchill in England in 1927, it allows comparison of the finer lines or striations within each bullet groove, and as each groove differs even from its next door neighbour a wealth of evidence allows the gun expert to relate a bullet definitely to the weapon which fired it. Further advances include identification of the striker indentation and breech markings on a fired cartridge case, all or any of which allow the gun expert to show that the fired bullet or fired cartridge case was fired from a particular weapon and could not have been fired from any other.

Forensic Medicine, see MEDICAL JURISPRUDENCE.

Foreshore, see SEASHORE and COAST PROTECTION.

Forest, Lee de, see DE FOREST.

Forest (Flem. *Vorst*), suburb of Brussels, Belgium, 3 m. to the SW. of the city. Pop. (1955) 49,000, engaged in agriculture and manufs. of stoves, footwear, carpets, chemicals, and soap. It has breweries and malt-houses.

Forest and Forest Laws. F. is defined by Manwood, the old authority on the F. L., as being 'a circuit of woodes, grounds, and pastures, known in its bounds, and privileged for the abiding of wild beasts and fowls of forest, chase, and warren, to be under the king's protection for his princely delight.' According to Coke, the royal F.s in his time appear to have been 69 in number, while the origin of by far the greater part was lost in remote antiquity. The 4 prin. F.s in England were the New F., Sherwood, Dean, and Windsor. Among the others were Epping (Essex), Dartmoor (Devon), Wichwood (Oxon), Salcey, Witlebury, and Rockingham (Northants), Waltham (Linces), and Richmond (Yorks). Prof. Freeman has pointed out that afforestation in its older connotation had nothing to do with trees, and simply meant putting a tract of land outside the common law in order to secure for the king, by special laws, the freer enjoyment of the pleasure of hunting. The F.s were the private property of the king, and trespassers were so barbarously punished that one of the chief things insisted upon in the early national demand for the reform of the F. L. was the mitigation of the severe code of punishments. The policy of afforestation of William I was continued by his immediate successors to the throne, but although the F.s were strictly guarded by the Conqueror, no F. L. are attributed to him. Subsequently, in the reign of Henry I, a system of F. L., with special courts for their administration, was estab., and developed by Henry II. These courts were (1) the Court of Attachments, or Woodmote, held every 40 days to punish offences against vice and venison (trees and covert and game); (2) the Court of Sweinmote, held 3 times a year, originally for business relating to agistment, but later to punish general offences under the F. L.; (3) the Court of Regard, held triennially for the expeditation of dogs, i.e. the cutting of the claws in such a way as to prevent their use in hunting; and (4) the Court of Justice Seat, held before the itinerant justices of the F.s for the trial of all causes connected with F.s. Besides the justices, the officers were the wardens, verderers, foresters, agisters, regarders, keepers, bailiffs, and beadles. The assize of Woodstock of 1184 made attendance at the F. courts compulsory, and heavy fines were extorted for every breach of the F. L. The first substantial concessions were those granted by Magna Carta, under which all F.s made by John were to be disafforested, and all bad customs connected with F.s abolished. Then came the Carta de Foresta of Henry III, the first separate charter of F.s, which disafforested private lands improperly afforested, and abolished the

punishments of death and mutilation for offences against the F. L. This charter was confirmed by Henry III in 1225, but so often infringed by him and Edward I that the latter monarch had to promise and carry out reforms under the Articuli super Cartas of 1300. From the time of the Confirmatio Cartarum of 1327 the F. L. began to fall into disuse, and the oppressive powers vested in the Crown had almost ceased to be exercised at the time of the Stuart dynasty, when Charles I revived them with the object of replenishing his empty exchequer by fines for trespass. This was one of the grievances to which the Long Parliament directed its attention, and from the passing of the 16 Car. I. c. 16 the whole F. organisation fell into a state of decay. In 1817 the offices of warden, chief justice, and justice in eyre of the F.s were abolished, and the powers attached to these offices, relating mainly to the revenues of such royal F.s as remained, were vested in 1829 in the Commissioner of Woods, Forests, and Land Revenues. In 1832 the powers of the commissioner passed to the predecessors of the Commissioners of Woods and Forests, an emanation of the Commissioners of Works and Public Buildings. *See FORESTRY.*

Forest-fly, *Hippobosca equina*, a dipterous insect of the family Hippoboscidae which is found clinging to horses and cattle. After attachment to the host the wings of these blood-sucking insects are lost.

Forest Gate, populous suburb of E. London in the co. bor. of West Ham, 5 m. from the city of London. Pop. 33,000.

Forest of Dean, see DEAN, FOREST OF.

Forester, Cecil Scott (1899-), Brit. novelist, b. Cairo. Educ. at Dulwich College, he studied medicine at Guy's. His first book, a crime novel entitled *Payment Deferred*, 1926, was very successful and was dramatised. Later novels are *The Gun*, 1933, and *The Ship*, 1943, but he is best known by his 'Hornblower' series of naval stories, which include *The Happy Return*, 1937, *Flying Colours*, 1938, *A Ship of the Line*, 1939, which was awarded the Tait Black Memorial Prize, *The Commodore*, 1944, *Lord Hornblower*, 1946, *Mr Midshipman Hornblower*, 1950, and *Hornblower and the Atropos*, 1953.

Foresters, Ancient Order of, estab. 1834, having earlier formed part of the Royal Order of Foresters. It is one of the largest affiliated orders of friendly societies, that is a society having a central body to the funds of which branch bodies or 'Courts' contribute. The objects of the society are to secure to members, their wives, husbands, and other relatives or dependants weekly allowances during sickness or other infirmity, or in old age or widowhood, also to provide sums at death, during unemployment or other distress, and by way of endowment assurances. The branch courts are semi-autonomous bodies managed by the members, who are also engaged in social activities.

Forestry: Historical.—Forest may be described as an area set apart for the production of timber and other forest produce, or which is expected to exercise certain climatic effects or to protect a locality against injurious influences. Probably the greater part of the dry land was formerly covered with forests which consisted of a variety of trees, and which were grouped according to climate, soil, and configuration of the sev. localities. When old trees reached the limit of existence they disappeared and younger trees took their place, and conditions for uninterrupted continuation of the forest were thus rendered favourable. The result of this was a healthy and vigorous production by the creative powers of soil and climate. The interference of man broke this continuous chain and gradually the area under forest has been greatly reduced. Then the estab. of domestic animals showed the first decisive interference in the life of the forests. Forests were burnt down in order to obtain pasture and later for agric. purposes. In modern times the ruthless cutting down of trees for timber is a menace to the already decaying supply of wood and other forest products.

Character and Distribution of Forests

There are 5 prin. types of forest which can be distinguished, and their total area covers about one-fifth of the earth's land surface, or some 11,700,000 sq. m. *Firstly*, at the top of the map, there is the evergreen coniferous forest, which stretches round the world in a belt, 'the Conifer Belt,' across N. Russia and Siberia, Scandinavia, the Baltic countries, and Scotland, and then, on the other side of the Atlantic, from E. Canada to the Rockies and down the Pacific coast from Alaska to California. The upper edge of this belt marks the N. limit of tree growth, 'the timber line,' where, in the extreme N., trees become no more than prostrate shrubs and give way to mosses and lichens and finally to the eternal snows. It is from this conifer belt that the great bulk of the world's softwood timber is obtained. *Secondly*, the S. edge of the coniferous forest merges gradually and over a wide area into the mixed hardwood and softwood, but predominantly deciduous hardwood, forests of the N. Temperate Zone. This is a type of forest of which the woodlands of Britain, France, Germany, and Central Europe are typical, as are those of the NE. U.S.A. and the N. is. of Japan. *Thirdly*, in the sub-tropical or 'Mediterranean' climatic zone, a predominantly evergreen vegetation is found, the box and the olive for instance, the lt. cypress, certain species of pine and fir, and the evergreen oaks, the cork oak among them. The deciduous sweet chestnut forests of Sardinia and Corsica, the walnut and the plane are also of importance, while across the Atlantic are found persimmon, dogwood, and the S. yellow or pitch pines of Florida. In the tropics are found the *fourth* and *fifth* types of forest. In areas

of high rainfall such as Central America, N. Brazil, W. Africa, and SE. Asia, the forests are dense and composed of many thousand different species of trees, the timbers of only comparatively few of which are of major commercial importance. In areas of low rainfall such as parts of India and E. Africa, a type of forest is found known as 'Savannah' forest, in which the trees are sparsely scattered in open rolling country usually covered in coarse grasses and low shrubs. The 5 prin. types of forest can, therefore, be listed, from N. to S., as (i) evergreen coniferous forest; (ii) temperate hardwood forest; (iii) sub-tropical evergreen forest; (iv) tropical rain forest; and (v) tropical Savannah forest.

The Conifer Belt

In the E. hemisphere 2 species predominate, the Scots pine and the European or Norway spruce. They constitute between them the greater part of the forest area and are of first-rate economic importance for their timber. The imported wood of the Scots pine is known commercially in Great Britain as European redwood, redwood, red or yellow deal, Archangel, Baltic, Memel, Swedish, Finnish fir, etc. It is the most important structural wood in Europe, and huge quantities are imported from Finland, Russia, Sweden, and the Baltic States for all kinds of building work, flooring, joinery, railway sleepers, telegraph poles, boxes, pitwood, and many other purposes. The tree is native in Scotland. The European spruce is familiar as the Christmas tree and its timber is marketed as European whitewood, whitewood, white deal, white fir, etc. It is used for much the same purposes as European redwood and is important in addition as the prin. raw material in Europe for the manuf. of paper pulp. The tree is thought to have been introduced into Britain about 300 years ago. Found in company with these 2 trees are the European and Siberian larches, aspen, the timber of which is largely used for making matches, and the European birch. The latter, one of the few hardwood trees in addition to aspen which can thrive in the austere conditions natural to the conifers, is of considerable importance for the manuf. of plywood and has greatly increased in value in recent years.

Extensive coniferous forests are also found in Yugoslavia and the mountainous regions of SE. Europe. Across the Atlantic in E. Canada, the forests are very similar in appearance. Pine and spruce and birch again predominate, though of different species from those in the E. hemisphere. In the Rockies and on the Pacific coast, from Alaska to California, are found some of the finest forests in the world. The trees are longer-lived and attain much greater dimensions than those in any other part of the conifer belt. Douglas firs and Western red cedar trees of virgin growth are many of them centuries old and from 200 to 300 ft tall. Other important species are sitka.

aeroplane or silver spruce, Western hemlock, the true fir, Port Orford cedar, Nootka cypress from Alaska, and from the Rocky Mts ponderosa pine, Western white pine and Engelmann spruce.

The Temperate Hardwood Forests

The woodlands of Great Britain are typical of the temperate hardwood forests, the appearance of which will, therefore, be familiar. There is a much greater variety of species in the woods than there is in coniferous forests; though trees such as beech do sometimes form more or less pure woods in areas such as the Chilterns, for instance, where the soil is particularly suitable to beech. The prin. Brit. forest trees and those of Europe and NE. U.S.A. are well known. Oak, ash, elm, beech, sweet chestnut, and sycamore are among the most important on this side of the Atlantic, but numerous others such as alder, willow, lime, wild cherry, and poplar are of use for particular purposes. In the E. U.S.A. and S. Ontario other species of these trees are found, with, in addition, maples, hickories, red gum, and the tulip tree which produces the timber known in this country as canary whitewood and in the U.S.A. as yellow poplar.

The Sub-Tropical Evergreen Forests

The sub-tropical zone in the N. hemisphere is not a zone of primary importance for the production of anything more than local supplies of timber. An exception is provided by those parts of the Southern yellow or pitch pine forests which extend into Florida and the is. of the Caribbean from the temperate climate of Virginia and the Carolinas. These forests are now much depleted as a result of over-cutting in the last 160 years, but they are still important as the source of supply of a very fine softwood timber. The cork oak forests of Portugal are also of interest in that they supply a large percentage of the world's cork, which is simply the outer bark of the trees and is peeled off from time to time on a regular rotation.

The Tropical Forest

The most extensive and most varied forests of all are those of the tropics. Large areas of forest have never been explored and doubtless contain many species of trees of which we have no knowledge. Broadly speaking, the timber of tropical trees is of 3 main types: (i) soft and light in weight, e.g. obeche from W. Africa, about 24 lb. per cub. ft; (ii) medium hard and heavy, e.g. teak from Burma and Siam, about 43 lb. per cub. ft; and (iii) very hard and heavy, e.g. greenheart from Brit. Guiana, about 65 lb. per cub. ft. There are enormous numbers of timbers of each type, many of them in common use in Great Britain. Some are 'specialist' timbers, that is timbers required for special purposes and which have special qualities that fit them for a particular use, examples being *lignum vitae*, the ebonyes, balsa, rose-

wood, and rare cabinet woods such as satinwood. There are also what may be called 'general utility' timbers such as gurun and the red and white lauans from Malaya and the Philippines, iroko and opepe from W. Africa, and peroba from Brazil.

The Southern Hemisphere

In comparison with the N. hemisphere, the conifers are poorly represented S. of the Equator, and, with the exception of insignis pine, an introduction from California, only 3 softwood genera produce timber in appreciable quantities. These are *Agathis*, *Araucaria*, and *Podocarpus*. The genus *Agathis* is represented by the kauri pine of New Zealand, a magnificent tree now rare, while the more important arancarias are Parana pine, of which there are extensive forests in the highlands of S. Brazil and N. Argentina, and the timber of which is well known in Great Britain; Chilo pine, which is the familiar monkey puzzle tree, often grown for ornament; the bunya pine of Queensland; and the hoop pine, which extends from E. Australia to New Guinea. *Podocarpus* is a large genus, containing over 60 species, and is found in Australia and New Zealand, tropical and South Africa, Central and South America, and in India and SE. Asia as far N. as Japan.

As far as the hardwoods are concerned, one genus is of particular interest and importance, namely *Eucalyptus*. This is the 'type' genus of Australian forests and comprises about 500 species, which range in size from the giant 'gum trees,' the tallest hardwood trees in the world, to the scrub of the Australian Bush. The species best known in Britain are jarrah and karri from Western Australia, tallow-wood, Sydney blue gum, and Tasmanian and Victorian 'oak.'

Use of Forests

Forests are absolutely indispensable to mankind for both their direct and indirect value. They are indirectly valuable through their influence on climate, stability of soil, on moisture, and on the healthiness and beauty of the country. Their direct value is through the produce they yield. Bare land is exposed to the full effects of the sun and air-currents, and the climatic conditions produced by these agencies. Land which is covered with a growth of plants, and especially with dense forest, enjoys the benefits of certain agencies which modify the effect of sun and wind upon soil. The chief of these modifying agencies are (1) crowns of trees which intercept the rays of sun and falling rain and reduce radiation at night; (2) leaves, flowers, and fruits, together with certain plants which grow in shade of trees, form a layer of mould: this protects the soil against rapid change of temp. and greatly influences the movement of water in it; (3) roots of trees bind the soil together. By careful experiment the following results, proving the utility of forests, have been obtained:

(1) Forests reduce the temp. of air and soil to a moderate extent and render climate more equable; (2) they increase the humidity of the air and reduce evaporation; (3) they tend to increase the precipitation of moisture; (4) they help to regulate the water supply, tend to reduce violent floods, and produce a more sustained feeding of springs; (5) they assist in preventing denudation, erosion, landslips, and avalanches; (6) under certain conditions they improve the healthiness of a country and help its defence; (7) they increase the beauty of a country and tend

were transplanted from England by Philip II, husband of Queen Mary of England, the elm not being a native of Spain. In addition to the above-mentioned trees, the ash, the maple, the sycamore, and small-leaved limes may be enumerated as growing wild in Great Britain. The chief forests of England are the New Forest, the Forest of Dean, and Epping Forest.

The New Forest was originally a royal forest. The origin of royal forests is lost in antiquity. There are said at one time, in England alone, to have been 68 forests

OLD FOREST OAKS IN ENGLAND

to produce a healthy aesthetic influence upon people.

British Forests

The oak and the beech are natives of Great Britain. The elm was introduced at an early date. Each of these trees has its appropriate soil. In the W. part of the co. of Sussex we have 2 distinct belts of country, each strongly marked by the character of its vegetation. To the N. there is a strong and deep clay, admirably adapted to the growth of oak. Then come the chalk hills where the luxuriant growth of the beech attests that this tree has found its congenial soil. The elm is not met with N. of Stamford in Lincs. The elm seen in Scotland and the N. of England is the wych elm, a different species, growing in a more straggling form, with pendent branches and a larger leaf. Its wood is very unlike that of the Eng. elm, and more resembles that of the ash. In the approaches to some of the royal palaces in Spain are some rows of elms which, we are assured by Evelyn,

in the possession of the Crown. All the 68 forests have long ago been disafforested, in the sense that the sovereign has no longer the privilege of maintaining deer and other game in them for sport, protected by special laws and tribunals. A few forests only exist in the popular sense of the term, that the land is uncultivated and covered wholly or partially by woods, such as the New Forest, the Forest of Dean, Epping Forest, Windsor Forest, and the Forest of Dartmoor. The New Forest (Hants) was created by William the Conqueror, who in doing so is popularly believed to have devastated a wide dist. of cultivated land, demolished churches, and converted the land to the use of wild animals. The forest now consists of about 65,000 ac., of which a little over 2000 ac. are the demesne lands of the Crown, inclosed and cultivated, and the residue belongs to the Crown, but subject to the rights of common of a large body of owners and occupiers of cultivated lands in the neighbourhood of the forest. *The Forest of Dean*, about 19,000 ac. in

extent, is another of the few remaining royal forests, which has come under the consideration of Parliament in recent years, and where the policy of maintenance has prevailed over that of inclosure. The forest lies in the hundred of St Briavel, between the estuary of the Severn and the R. Wye, about 12 m. from Gloucester. The Crown is the owner of the soil and of all the timber growing on it. Of the forest, about 4000 ac. consist of heath and open land; the residue is planted with oak trees. *Epping Forest*

of state for Scotland being responsible for forest policy. The F. Act, 1951, placed responsibility on the commissioners for maintaining a reserve of growing trees and gave them powers to regulate felling through a system of licensing.

In their White Paper of 1943 (Command 6447) the commissioners proposed the formation of 5 million ac. of productive woodland, to be achieved in the main by the afforestation by the F. C. of 3 million ac. of low or no agric. value, and the restocking by private woodland owners

MATURE SCOTS PINE

consists of a little over 6900 ac. of woodland, open to the public at all points, extending for a distance of nearly 13 m. from Wanstead, on the confines of London, to beyond the vil. of Epping, with an irregular breadth at its widest part of about 1 m., and in its narrower parts of about half a m. It is densely covered with timber consisting of hornbeam, beech, and oak trees. See AFFORESTATION; DARTMOOR; DEAN, FOREST OF; EPPING; FOREST AND FOREST LAWS; FORESTRY COMMISSION; NEW FOREST; TIMBER; TREE; and articles under names of individual trees.

Forestry Commission, estab. by the F. Act of 1919, consists of a chairman and not more than 9 commissioners, appointed by the Crown. It has a general duty of promoting the interests of F., the development of afforestation, and the production and supply of timber in Britain. The F. Act, 1945, made provision for the reconstitution of the C., the minister of agriculture, fisheries and food and the secretary

and the C. of 2 million ac. of existing woodland considered suitable for economic management. Although the actual programme for the first decade has not been achieved, substantial progress has been made by both the F. C. and private woodland owners. In 1956, at Eggesford Forest, Devon, H.M. the Queen planted a tree and unveiled a commemorative stone to mark the planting by the F. C. of a million ac. of woodland. See also AFFORESTATION; FORESTRY; TIMBER.

Forez, anct Fr. co. in Lyonnais (q.v.), united to the crown in 1532. Its cap. was Montbrison (q.v.).

Forez, *Monts du*, mts in France, part of the Auvergnais, lying between the rvs. Allier and Loire. The highest peak is *Pierre sur Haute* (5380 ft.).

Forfar, royal burgh and co. tn of Angus, Scotland, in the fertile valley of Strathmore, 14 m. NE. of Dundee. F. was a royal residence of Malcolm Canmore and his Queen Margaret; its castle was destroyed by King Robert Bruce during

the Balle Bruce dispute for the Scottish crown; later the town was captured by Cromwell and its ancient charter destroyed. Charles II granted a new charter in 1665 to reward F.'s loyalty. Its chief industry is jute manuf., but other fibres such as linen, wool, cotton, and modern synthetics are also woven. It has 2 large auction marts, and manufacturing and maintenance depots for farm implements and machinery. F. is in the S. Angus parl. constituency. Pop. 16,000.

Forfarshire, see ANGUS.

Forfeiture: (1) denotes the divesting of property or the loss of rights entailed by law as a consequence of some crime or breach of condition. Formerly any conviction and attainder (q.v.) for treason or felony was followed by the transfer to the Crown or the feudal superior of the person convicted of all his lands and goods. Since the passing of the Forfeiture Act, 1870, F., in this sense of the word, may be said to be practically obsolete. By that Act it is provided that no conviction for any treason, felony, or *felo de se* shall cause any attainder, F., or escheat. But the Act does not affect the consequences of outlawry or the putting of a person outside the protection of the law for refusing to make himself amenable to legal process. Apparently F. may still follow on conviction for misprision of treason (q.v.). But the Forfeiture Act further provides that the property of a convicted felon may be committed to the custody and management of an administrator appointed by the court, or in default of such administrator to the management of an interim curator appointed by magistrates on an application made on behalf of the convict or his family. The management of the convict's estate, whether by an administrator or curator, is, of course, entirely in the interests of his family; but the Act allows the court to order a convicted felon to pay a sum not exceeding £100 as compensation for loss sustained by any person in consequence of the felony. But a conviction for treason or felony, where the sentence is at least imprisonment for more than 12 months, or, if less, with hard labour superadded, entails the loss of any military, naval, or civil office, or any other public employment or eccles. benefice or pension or superannuation allowance, unless a pardon is received within 2 months after conviction, or before the filling up of the office if the pardon comes at a later period. Furthermore, sentence completed, the felon until pardoned is debarred for the future from the above offices, and from sitting in Parliament or exercising the parl. or municipal franchise. (2) F. also denotes the loss of land or hereditaments consequent on a breach of covenant between landlord and tenant. But the right to take advantage of a F. may be waived by any act of the landlord which recognises the continuance of the title of the tenant, as, for example, the acceptance of rent by him in respect of a time subsequent to the act by which the F. was incurred. Equity, however, has for long

given a tenant a right to apply for relief upon certain terms, such as payment of compensation to the landlord. (3) F. in the language of statutes is used to denote 'penalty.' (4) The term is now used to denote the seizure by revenue officers, the police, or other authorised persons of goods in regard to which some breach of the law has been committed. (5) Failure to perform the condition of a bond on the part of the obligor (see BOND) formerly entailed a penalty. Equity, however, has long relieved the obligor from F. of anything more than the other party was in conscience entitled to be paid. The like observations apply to the case of foreclosure as between mortgagor and mortgagee. (6) As to F. of contraband of war see DECLARATION OF LONDON. Other uses of the term, such as F. of marriage—the penalty imposed on a ward who married contrary to the wishes of a guardian—and F. for waste of a freehold inheritance, are obsolete. See also CONFISCATION.

Forged Transfer Acts, 1891 and 1892. The F. T. A. empower a company to make cash compensation out of its funds for any loss occasioned by a F. T. of its shares or stock, or by a transfer under power of attorney. It is always desirable to set aside a fund exclusively for such compensation, because the title of the true owner of shares can never be affected by a F. T., and he can always compel the company to recognise him as the holder of the shares so transferred, and to cancel the F. T. The F. T. A. enable a company to form a compensation fund by insurance or out of reserve cap., or in any other way it may resolve upon; and it may also borrow on mortgage to effect the same object. If the company elects to create the fund by insurance it may do so by charging fees not exceeding 1s. per £100, and not less than 3d. The F. T. A. also empower a company to guard itself against loss from F. T.s by imposing reasonable restrictions on the right to transfer shares, as, for example, by giving the directors the right of veto. See Buckley on Companies and Limited Partnerships Acts; and Palmer's Company Law.

Forgery, falsification or alteration of any document or writing with intent to defraud. The crime is only a misdemeanour at common law; but as commerce developed and paper credit became proportionately extended, many acts were passed making F.s of the more important types of official and commercial documents felonies, punishable in most cases by terms of imprisonment ranging from 7 years to life. A F. which is a misdemeanour is punishable by 2 years' imprisonment, fine, or binding over. It is also an offence to alter or 'put off' a document knowing it to be forged. There can be no conviction for statutory F. unless the instrument purports on the face of it to be valid for the purposes for which it was created; hence a forged cheque with no signature to it will sustain at most only a charge of F. at common law. F. only applies to documents in

off a counterfeit picture for that of a particular artist by painting his name in the corner is not F., though it may constitute obtaining by false pretences. F. implies a general intent to defraud and not necessarily an intent to defraud any particular person. It may be noted that an instrument may be a F. even though the forger has put his own name to it, e.g. if A transfers shares to B, and subsequently with a fraudulent intent purports to assign the same shares to C by a signed transfer, the latter instrument is a F. See also COINING.

Forgery in Art, or Faking, is the executing of a new or altering of an existing work of art with the intention of passing it off as the work of a particular famous artist or of a well-known 'school' or period—usually that of the old masters. The art of faking—a source of considerable amusement and excitement to the world at large—is a serious matter for dealers, collectors, etc., and the ever-increasing resources of science are needed and used to the full in this battle of wits in which the unravelling of a good piece of faking is rather like the unfolding of a first-class detective story.

Faking can take many forms—complete copies, touching up and additions, imitations, transpositions, etc., 'variations in the style of.' Methods of detection include examination of technique and materials and details of costume, inscriptions, furnishings, etc. The general run of faking is crude enough and usually designed to be accepted as the work of a minor artist of the period currently most popular with collectors: real artistic talent is more likely to interfere with slavish imitation and strike a discordant note. There are, however, fakes which have genuine merit, e.g. the Renaissance sculptures of Giovanni Bastiani, which have a place of their own in the Victoria and Albert Museum, and Rouchomovsky's famous gold bottle. The Van Meegeren (q.v.) case in 1948 concerning forged Vermeers and de Hoochs was typical of the interest aroused in art F.: here the forger seemed to have a genuine talent perverted by admiration of his own cleverness. There are at present only 2 collections of avowed fakes—Dr Ruhemann's and that of the scientific dept of the Courtauld Institute of Art—and these are invaluable for teaching purposes. See O. Kurz, *Fakes: a Handbook for Collectors and Students*, 1948; and H. Tietze, *Genuine and False*, 1948.

Forget-me-not, popular name of herbs of the genus *Myosotis*, family Boraginaceae, sometimes called scorpion grass. Common F. is *M. arvensis*; early F., *M. hispidula*; yellow and blue F., *M. discolor*; all anns.: while the water F.s, *M. palustris*, *M. secunda*, are perennial, and the wood F., *M. sylvatica*, is also perennial. All the foregoing are found in Britain and Europe. *M. alpestris* is alpine, native to mts of N. Britain. Mostly blue-flowering though colour changes with ageing.

'Forget Me Not' (anthology), see ANNUALS.

Forging, see ANNEALING; DROP-FORGING; METALLURGY; WELDING.

Fortio, It. tn, on the W. coast of the is. of Ischia (q.v.). It has hot springs. Pop. 6400.

Fork (Lat. *furca*), implement used for different purposes, and having 2 or more points or prongs. The various kinds of F. include F.s for the table, pitch-F.s, hay-F.s, and tuning-F.s (q.v.). The table-F. does not seem to have been used in England before the reign of Charles I. The oldest Eng. F. known is at present in the Victoria and Albert Museum, London. It was made for John, earl of Rutland, in 1632, and has 2 prongs. F.s are made of various materials, such as silver, silver plate, white metal, and steel. The making of F.s consists first in forging the tang,

FORGET-ME-NOT

shoulder, and shank, and the piece from which the prongs are made. The other processes are the grinding, polishing, and basting or fitting into the handle. The hay-F., used for turning and tossing hay, and the pitch-F. have long wooden handles—occasionally short ones—and usually 2 prongs called tines. There is also a 3-pronged F. used for some purposes in agriculture and the 4-pronged garden fork. See also TUNING-FORK.

Forlì: 1. Prov. of Italy, in SE. Emilia-Romagna (q.v.). It is mainly in the Apennines (q.v.), but has a broad plain in the E. and NE., and a coastline in the E. on the Adriatic. There are numerous riv. valleys, running generally NE.-SW.; the chief rivs. are the Montone, Ronco, Savio, and Marecchia. The prin. tns include F., Rimini, and Cesena (qq.v.). Area 1145 sq. m.; pop. 495,000.

2. (anc. Forum Livii) It. city, cap. of the prov. of F., on the Montone, 38 m. SE. of Bologna (q.v.). It stands on the Aemilian Way (q.v.), against a background of low hills. There is a cathedral (17th cent.), and a fine Romanesque abbey church (begun 1179) with a noteworthy campanile. The 14th-cent. castle was taken by Cesare Borgia (q.v.) from

Catherina Sforza in 1499. F. is an important agric. centre, and has rayon, woollen, and silk industries. Pop. 81,000.

Form: 1. In philosophy, F. means that which makes matter a determinate species (see **FORMALISM**).

2. In music, the F. of a composition is the course it is planned to take from beginning to end in such a way as to unfold itself logically, as for example by means of an exposition, working-out section, recapitulation and (optional) coda in first-movement sonata F., or the periodical statement of a subject intersected by episodes in a rondo. Fugues, minuets, or scherzi with their trios, various old dances, etc., also have their recognised F.s, while fantasias, rhapsodies, etc., may be treated quite freely from the formal point of view, though they must not be allowed to fall into mere shapelessness. See **FUGUE**; **RONDO**; **SCHERZO**; **SONATA**; **SUITE**; **SYMPHONY**; **VARIATIONS**.

Forma Pauperis, see **IN FORMA**.

Formaldehyde ($H \cdot CHO$), one of the organic substances called aldehydes which are formed when the primary alcohols lose 2 atoms of hydrogen, hence alcohol *dehydrogenatum*. F. is prepared by oxidising methyl alcohol by passing air saturated with the alcohol vapour over red-hot platinised asbestos. It is a gas at ordinary temps., condensing at $-21^{\circ}C$. It rapidly decomposes to form metaformaldehyde, a crystalline compound. When the metaformaldehyde is heated F. is again formed, which decomposes once more on cooling. When the aqueous solution of F. is evaporated, the F. is converted into paraformaldehyde, an amorphous substance. All 3 substances have the same percentage composition, so that they form an example of polymerisation. F. occurs in the chlorophyll cells of plants, and is an effective germicide. **Formalin** is a trade product, consisting of an aqueous solution containing about 40 per cent of F.: it is much used as an antiseptic. F. reacts with ammonia to form a white solid, hexamine, which, when treated with concentrated nitric acid, yields cyclonite ($CH_3 \cdot N \cdot NO_2$). Cyclonite (R.D.X.) was a prin. ingredient in the under-water explosive used against U-boats in the Second World War. With phenol (q.v.) F. reacts to form the well-known and extensively used plastic bakelite. F. is used in tanning leather, in the dye industry, and in the synthesis of many drugs.

Formalin, solution obtained from formaldehyde (q.v.) which has great powers of deodorising and preserving various substances. The former fact makes it a particularly unsuitable medium for preserving foodstuffs, where the odour is often the chief check the consumer has upon the good or bad quality of an article; none the less it is largely used on the Continent for this purpose. F. is used in many industries because of its chemical effect upon soft substances, and is also a powerful antiseptic and disinfectant.

Formalism (in philosophy), according to

Kant (q.v.) those qualities and determinants which fix the arrangement of matter, and thus invest a thing with identity. F. becomes a kind of enhanced idealism. Aristotle says that an individual organism has two aspects: matter, out of which he is emerging, and form, into which he is passing. Thus everything is matter, and the potentialities of the individual thing which impel it to its reality are its form. The form is therefore immanent. In reason, matter corresponds to the passive reason, while form is the active reason. In art, form is the 3rd of the 4 causes, material, efficient, formal, and final. Advanced F. actually denies the existence of matter and recognises form only.

In religion F. stands for excessive devotion to formal precedence and observance, as distinct from the spirit.

Formentera, 4th largest of the Balearic Isles (q.v.), lying S. of Ibiza (q.v.). It is hilly in the E., and produces wheat, wine, and salt. The cap. is San Francisco Javier, which has a fortified 18th-cent. church. Pop. 5500.

Formia (formerly **Mola di Gaeta**; anct **Formiae**), lt. port and tourist resort, in Lazio (q.v.), on the Gulf of Gaeta (q.v.), 40 m. SE. of Latina. It stands on the Appian Way (q.v.), and has the remains of Rom. villas, including that of Cicero (q.v.), who was murdered nearby. The tn has sev. fine churches, of which 2 were badly damaged during the Second World War. In Rom. times F. was known for its wines. Pop. 17,700.

Formic Acid, fatty acid, being a derivative of methyl alcohol or formaldehyde. It is a colourless liquid of sp. gr. 1.24; it solidifies at low temps., melting at $8^{\circ}C$. and boiling at $101^{\circ}C$. It has a powerful irritating odour, and blisters the skin on contact. It occurs in nature in nettles, ants, and other stinging creatures, and owes its name to the ant (*formica*), whose irritating sting is due to the secretion of F.A. The molecular formula of F.A. is CH_2O_2 , and the substance may be prepared by heating oxalic acid with glycerin. The salts of F.A. are termed formates and may be prepared by neutralising the A. with the appropriate alkalis.

Formic Ether, or **Ethyl Formate**, ester of F. acid. It may be prepared by treating F. acid with alcohol. Its formula is $H \cdot CO_2C_2H_5$; it is a colourless liquid with a pleasant peach-like odour, boiling at $55^{\circ}C$. Like many of the esters of organic acids, it is used as a perfuming and flavouring agent in the preparation of sweets, etc. It is also used as an ingredient of a kind of rum.

'Formidable', name of a Brit. battleship. It was torpedoed and sunk by the Germans on 1 Jan. 1915. The present **Formidable** is an aircraft carrier of 23,000 tons displacement, completed in 1940.

Formosa: 1. See **TAIWAN**.

2. Ter. in the extreme N. of the Argentine Rep., South America, lying between the R.s Pilcomayo and Bermejo. The estimated area is c. 23,780 sq. m.; pop. 113,800. F. ter. forms part of the

great Chaco plain. The region is hot and humid; it is covered with forests and large sections are liable to inundations; the summer rains last from Oct. to May. Some cattle are reared, and agriculture is carried on. F. is the chief tn.

3. Cap. of the above, a riv. port and agric. and processing centre, situated on the Paraguay R. It was founded after the defeat of the natives of Chaco by Gen. Victoria in 1884-5. Pop. 17,300.

Formula, in chem., a collection of symbols (q.v.) and numbers which together denote *one molecule* (q.v.) of an element or compound. A molecule of an element is denoted by writing the symbol of the element, and below it to the right a number which expresses the number of atoms in the molecule.

For example, H_2 denotes 1 molecule of hydrogen containing 2 atoms;

S, denotes 1 molecule of sulphur containing 8 atoms.

In representing the molecule of a compound the same device is used, but at least 2 symbols must appear since at least 2 elements must be present, e.g. H_2O denotes 1 molecule of water containing 2 atoms of hydrogen and 1 atom of oxygen. The close proximity of these symbols denotes chemical combination between the elements. When a group of symbols is common to a certain class of compounds, it is written as a bracketed group in their formulae with a number to show the number of groups present, e.g. $Cu(NO_3)_2$ for copper nitrate could be written as CuN_2O_6 , but the former indicates the relation of copper nitrate to nitric acid. A number of molecules of a compound is indicated by writing the appropriate number before the compound, and this figure multiplies the whole of it, e.g. $2HNO_3$ denotes 2 molecules of nitric acid containing 2 atoms of hydrogen, 2 atoms of nitrogen, and 6 atoms of oxygen in all. A F. not only stands for 1 molecule of a compound but also represents a definite relative weight (molecular weight) which can be found from the atomic weights (q.v.) of the elements concerned, e.g. H_2SO_4 represents $2 \times 1 + 32 + 4 \times 16$, i.e. 98 parts by weight of sulphuric acid.

A F. which indicates the respective proportions of the elements is an *empirical F.*, e.g. H_2O and H_2O_2 are both empirical formulae for water as the ratio of the weights of hydrogen and oxygen is constant. When the F. of a substance represents the actual numbers of the atoms of each element in the molecule, it is a *molecular F.* Thus H_2O and not H_2O_2 is the molecular F. for water, since 1 molecule of water actually has 2 (and not 4) hydrogen atoms and 1 (and not 2) oxygen atoms. Some compounds have the same molecular F. but different chemical and physical properties. The latter is because the arrangement of the atoms in each molecule is different; e.g. ethyl alcohol and diethyl ether both have the same molecular F., $C_4H_{10}O$, and the disposition of the atoms can be indicated by a *graphic F.*

The graphic F. of ethyl alcohol is

whereas that of diethyl ether is

The same information is conveyed by a *structural* or *constitutional F.* Thus ethyl alcohol is $CH_3 \cdot CH_2 \cdot OH$ whereas diethyl ether is $C_2H_5 \cdot O \cdot C_2H_5$ or $(C_2H_5)_2O$. In *electronic* formulae, crosses and dots are often used to indicate the types of electrical bonds between the atoms. Thus the F. $H \times \cdot Cl$ indicates that the bond between H and Cl consists of 1 electron (\times) from the hydrogen and 1 (\cdot) from the chlorine. See also DIPOLES; ISOMERISM; ISOTOPES.

Foro Appio, see FORUM APPII.

Forres, royal burgh of Morayshire, Scotland, 12 m. WSW. of Elgin, on the R. Findhorn. On Cluny Hill is built a tower in honour of Nelson (1807); the 11th-cent. carved stone monument (Sweno's Stone) is the largest single stone monument in the kingdom. Pop. 4700.

Forrest, Edwin (1806-72), Amer. tragedian, b. Philadelphia, of Scottish and Ger. descent. He made his first public appearance in 1820 in Philadelphia in the part of Douglas in Home's tragedy of that name. He crossed to England in 1836 and entered on a season at Drury Lane Theatre, London, where he achieved distinction in the Shakespearian rôles of Macbeth, Lear, Othello, and Richard III. He finally returned to the New York stage, and his last appearance was in 1871. See J. Rees, *Life of Edwin Forrest*, 1838; and L. Barrett, *Edwin Forrest*, 1881.

Forrest, John, 1st Baron Forrest of Bunbury (1847-1918), Australian explorer and statesman, son of Wm F. Educ. at Perth, Western Australia. At the age of 22, after 4 years' service in the State survey dept, he was sent in charge of an expedition to seek for traces of the lost explorer Leichhardt. Five years later he explored the colony of Western Australia from Champion Bay to Port Darwin, being awarded for this and his other journeys the gold medal of the Royal Geographical Society and other honours, together with a large grant of colonial land. On the attainment by Western Australia of responsible gov. for which the colony was largely indebted to his exertions, he became its first premier and held office for over ten years. In his term as premier important gold discoveries were made in Western Australia, and it was to his vision and determination that the colony owed the Fremantle harbour works, the projection of railroads to the mining dists., the gold-fields water scheme, and its excellent land laws. He held many ministerial posts in

the Federal parliament, including those of treasurer and acting prime minister. He pub. *Explorations in Australia*, 1876. See H. G. Turner, *First Decade of the Australian Commonwealth*, 1911.

Forrest, Nathan Bedford (1821-77), soldier, b. near Chapel Hill, Tennessee. On joining the Confederate Army after the beginning of civil war in America, he became a commander of cavalry and did some distinguished service for his country. Military men rank him as one of the greatest of natural cavalry leaders. In the campaign of 1862 he made a dash across the state of Tennessee and for 2 weeks cut Gen. Grant off from communication with the world and seriously delayed the advance on Vicksburg. See lives by J. A. Wyeth, 1904; E. W. Sheppard, 1930; A. N. Lytle, 1939.

Forrestal, James Vincent (1892-1949), Amer. statesman, b. Beacon, Dutchess co., New York. F. went to local schools, and then worked as a newspaper reporter; but later went to Dartmouth College and Princeton Univ. He sold bonds for the banking house of Dillon, Read and Company. In 1918 he served in the office of naval operations, in the Navy Dept., Washington, and subsequently as a naval aviator. After the war he returned to his banking house, becoming its president in 1937. F. was nominated by Roosevelt to be under-secretary of the navy—a newly created post, entailing responsibility for all material provided for the navy. Acting-secretary of the navy 1944; secretary a month later. F. was the driving force behind an immense production of ships, planes, guns, and other munitions of war, besides establishing close relations with Britain in solving problems connected with the Lend-Lease Act. In 1947 he was appointed first U.S. secretary of defence, resigning for health reasons in 1949.

Forrester, Alfred Henry (1804-72), writer and illustrator, b. London. He worked under the pseudonym of 'Alfred Crowquill,' contributed drawings to *Punch*, and wrote and illustrated more than 20 humorous books, verse, burlesques, and fairy tales. Among his illustrations are those to the 'Bon Gaultier Ballads,' 1849; 'The Travels of Baron Münchhausen,' 1859; and the works of his brother, Charles Robert F.

Forskål, Peter (1732-63), Swedish botanist. In 1761 he was chosen by the king of Denmark to join the scientific expedition to Arabia, and here he collected sev. hundred plants, previously unknown, and pub. a 'Flora' at Malta. He d. of the plague on his return journey. His papers, etc., were pub. by Niebuhr.

Forst, Ger. tn in the dist. of Kottbus, 14 m. E. of Kottbus (q.v.). It stands on the l. b. of the Lusatian Neisse (q.v.); its former suburb, Zasieki, on the r. b. of the riv., has been Pollitz since 1945. It has chemical and textile industries and an electricity generating station. Pop. 30,000.

Forster, Edward Morgan (1879-), novelist and essayist, b. London. He was

educ. at Tonbridge School and at King's College, Cambridge, of which he became a Fellow in 1927. At Cambridge he made a lifelong friendship with Lowes Dickinson, who with F., Nathaniel Wedd, his classics tutor, G. M. Trevelyan, and others founded the *Independent Review*. F.'s first novel, *Where Angels Fear to Tread*, 1905, was written while he was living in Italy. It was followed by *The Longest Journey*, 1907, *A Room with a View*, 1908, and *Howards End*, 1910. These 'project an exquisite and animated crowd *of beings—delicious elderly ladies, priggish or tormented or cheerfully barbarian young men, perceptive or conventional young women, beautifully of their period and class; and all set in the silver-point world of their creator's civilised irony' (Rose Macaulay). *The Celestial Omnibus*, a collection of short stories, appeared in 1911. The last of his novels, and the best known, *A Passage to India*, was begun shortly afterwards, but not completed and pub. until the year 1924. It gained him a wide reputation for the insight and wisdom with which he depicted the relations between the Indians and the Eng. in India. There are many striking passages in his books, while, as a satirist dealing with conventions, he is both penetrating and mordant. The integrity with which F. approached life in his novels has also enhanced the value of his miscellaneous and critical writings. *Aspects of the Novel* was delivered first as the Clark lectures at Cambridge in 1927 and pub. in the same year. A vol. of short stories, *The Eternal Moment*, appeared the following year and included stories such as *The Story of the Siren* which were written much earlier. Other books are *What I Believe*, 1939, *Nordic Twilight*, 1940, and the Rede lecture on Virginia Woolf, pub. in 1942. Contributions to Eng. periodicals in the twenties were collected and pub. under the title *Abinger Harvest*, 1926. In 1937 he was awarded the Benson Medal of the Royal Society of Literature, and in 1953 was made a Companion of Honour. See Rose Macaulay, *The Writings of E. M. Forster*, 1938; L. Trilling, *E. M. Forster*, 1944. Studies of F. also appear in Virginia Woolf's *The Death of a Moth*, 1929; Katherine Mansfield's *Novels and Novelists*, 1930; and Lord D. Cecil's *Poets and Story-Tellers*, 1949.

Förster, Friedrich Christoph (1791-1868), Ger. historian and poet, and brother of the painter Ernst Joachim F., b. Münchengosserstadt. On the outbreak of the War of Liberation, in 1813, he joined the army. On his return to Berlin, he taught in the school of artillery and engineering for a short time, and in 1820 became custodian of the Royal Art Museum with the title of court councillor. F. was connected with various Jours. and was the founder and secretary of the *Wissenschaftlicher Kunstverein* in Berlin. His prin. works are *Der Feldmarschall Blücher*, 1821, *Albrecht von Wallenstein*, 1834, and *Wallensteins Prozess*, 1844. He also wrote poems and a drama, *Gustav Adolf*, 1833.

Forster, Hugh Oakeley, see **ARNOLD-FORSTER, H. O.**

Forster, Johann Georg Adam (1754-94), eldest son of Johann Reinhold F., b. Nassenhuben, near Danzig. At the early age of 17 he accompanied his father on Cook's second voyage, and pub. an account of the expedition. He was for sev. years prof. of natural hist. at Cassel and Vilna (Vilna) respectively, and then became librarian to the elector of Mainz in 1788. His writings, of which the most important are *Ansichten vom Niederrhein*, 1791-4, and *Beschreibung einer Reise um die Welt*, 1784, rank high amongst Ger. works descriptive of nature. His *Letters* were pub. by his widow in 1829 (2 vols.). See P. Zincke, *Georg Forsters Bildnis im Wandel der Zeiten*, 1925.

Forster, John (1812-76), biographer, b. Newcastle. Educ. at the grammar school there, and at Univ. College, London, he became a barrister of the Inner Temple, but soon gave up law for literature. At the age of 20 he was appointed dramatic critic to the *True Sun*, and 2 years later ed. the short-lived *Reflector*, to which his friends Lamb and Leigh Hunt contributed. During this period he did much journalistic work, but his ambition was to write books, and between 1836 and 1839 he wrote the *Lives of the Statesmen of the Commonwealth*. In 1846 he was for a few months editor of the *Daily News* in succession to Dickens, and in the next year he became editor of the *Examiner*. His admirable *Life and Adventures of Oliver Goldsmith* appeared in 1848. Being appointed in 1855 secretary to the Commissioners of Lunacy, he at once gave up journalism, and devoted himself to more serious labours. Among his close friends were Carlyle, Dickens, and Landor. His best-known work is his biography of Dickens, 1872-4, which, in spite of many defects, still ranks as a standard authority. He also wrote lives of Landor, 1868, Sir John Eliot, and the first vol. of a life of Swift. See P. H. Fitzgerald, *John Forster, by one of his Friends*, 1903; and R. Renton, *John Forster and his Friendships*, 1912.

Forster, William Edward (1818-86), politician, b. Bradpole, Dorset, of Quaker ancestry. He became a successful woollen manufacturer in Bradford. He became Liberal member for Bradford in 1861, and held the seat until his death, in 1865 being appointed under-secretary for the colonies. He became vice-president of the Council 3 years later, and was given charge of various Bills, which he piloted successfully through the House. Upon Gladstone's return to power in 1880 he became chief secretary for Ireland, but resigned in 1882, later declaring his opposition to Home Rule. See life by T. Wemyss Reid, 1888.

Forsyth, Alexander John (1768-1843), inventor, b. Aberdeenshire. After the death of his father he became the minister of Belhelvie, Aberdeenshire, and about the year 1806 invented the percussion lock, which secret Napoleon offered to buy for £20,000, but was refused. See

Sir A. J. Forsyth Reid, *The Rev. Alexander J. Forsyth and his invention of the Percussion Lock*, 1909. See also **FIRE-ARMS**.

Forsyth, Andrew Russell (1858-1942), mathematician, b. Glasgow, educ. at Liverpool College and Trinity College, Cambridge. He became prof. of mathematics at Univ. College, Liverpool, 1882-3, and Sadlerian prof. of pure mathematics at Cambridge, 1895-1910. Chief prof. of mathematics, Imperial College of Science and Technology, South Kensington, 1913-23. F.'s chief work was *Theory of Differential Equations*, 1890-1906.

Forsythia, or **Golden Bell**. Deciduous shrub, genus, family Oleaceae, blooming early in advance of the leaves, and with yellow flowers. *F. ovata*, *F. suspensa*, *F. viridissima*, and *F. x intermedia* and its variety *spectabilis*, are popular species of these E. Asian shrubs.

Fort, see **FORTIFICATION**.

Fort Augustus, vil. on the Caledonian canal at the head of Loch Ness, 33 m. SW. of Inverness. It was built in 1716, under the name of Kilohurmin, and captured by the Jacobites in 1745. After the battle of Culloden it was reoccupied and received its present name in honour of Wm Augustus, duke of Cumberland, the victorious general. Here is a Benedictine abbey and school of the Eng. Congregation. Pop. 1130.

Fort Beaufort, dist. in the SE. of the prov. of the Cape of Good Hope. Its cap. is F. B., which lies 45 m. W. by N. of King William's Tn. Pop. of dist., 20,000.

Fort Collins, city, cap. of Larimer co., Colorado, U.S.A., c. 55 m. N. of Denver. Altitude 5100 ft. It is the shipping and trade centre for a livestock and irrigated sugar-beet region; it has flour, dairy, and meat products, and manufs. bricks, tiles, woollen goods, and machinery. The city is the site of the Colorado Agric. and Mechanical College. Pop. 14,937.

Fort Dodge, city, cap. of Webster co., Iowa, U.S.A., on the Des Moines R., 70 m. NNW. of Des Moines, in an agric. area with valuable deposits of gypsum, coal, and clay. Industries include meat packing, creameries, gypsum mills, bricks and tiles, and soy-bean processing. The Blanden Memorial (art gallery) is here. Pop. 25,100.

Fort Garry, see **WINNIPEG**.

Fort George, fortress (depot of the Seaforth Highlanders) in Inverness-shire, Scotland, at the mouth of the Moray Firth.

Fort Hamilton, residential section of Brooklyn bor. of New York. Here is the U.S. fort (1831), on the Narrows opposite F. Wadsworth, Staten Is.

Fort Johnston, Nyasaland, at the spot where the R. Shire flows from Lake Nyasa. Owing to the rise of the lake level it is possible that the Shire R. may become navigable as far as Mpimbe, which would increase the importance of F. J.

Fort Lee, bor. of New Jersey, U.S.A., lies on the W. bank of the R. Hudson,

opposite the N. part of New York, of which city it is a residential suburb (George Washington Bridge connection). It received its name in honour of Gen. Charles Lee, being originally a fortification erected by the Americans early in the War of Independence. Held in 1776 by Gen. Greene, it was abandoned by him on the advance of Lord Cornwallis, and an attempt to recover it in 1780 failed. F. L. manufs. metal products, furniture, and baby carriages, and was an early centre of the motion-picture industry. Pop. 11,648.

Fort Madison, city in Iowa, U.S.A., on the Mississippi R. (bridged) 17 m. SW. of Burlington. It manufs. fountain pens, ink, mechanical pencils, farm tools, signal flares and lamps, food products, and paper. Pop. 15,000.

Fort Panmure, or **Rosalie**, see **NATCHEZ**.

Fort St George, see **MADRAS**.

Fort Smith, city of Arkansas, U.S.A., cap. of Sebastian co.; it is situated on the Arkansas R., 140 m. NW. by W. of Little Rock. It is the chief manufacturing centre of the state. Its products include furniture, glass, textiles, bricks, tin cans, wood and paper products, vehicle bodies, stoves, and buckets; zinc smelting and petroleum and natural-gas processing are also carried on. Coal mines and hardwood are in the region. Pop. 47,942.

Fort Sumter, fort in Charleston harbour, South Carolina, about 4 m. from Charleston. Here the first Civil War engagement took place in 1861, when the Federals under Maj. Anderson surrendered to the Confederates. In 1865, at the fall of Charleston, F. S. was captured by the Federal fleet. It became a national monument in 1948.

Fort Victoria, oldest settlement in Southern Rhodesia, on main N. to S. road, 180 m. from Beit Bridge; centre of an important ranching area and near the famous Zimbabwe Ruins (q.v.). Pop.: Europeans 1200; Africans 5000.

Fort Wayne, city, cap. of Allen co., Indiana, U.S.A., an important railway centre, 148 m. from Chicago. It manufs. electrical appliances, farm and mining equipment, radio and electronic equipment, etc. It has a Catholic cathedral and is the seat of F. W. Art School and Museum and Indiana Technical College. Pop. 133,600.

Fort William: 1. Tn of the co. of Inverness, Scotland, near the head of Loch Linnhe, at the S. end of the Caledonian Canal. The fort was built in 1665 by Gen. Monk; rebuilt in 1690; besieged by the Jacobites in 1746, and demolished in 1890 to make room for a railway station. For many years F. W. was the key of the Highlands, and is now a well-known centre for tourists and mt climbers. Ben Nevis, 4406 ft, the highest mt in Great Britain, is 3 m. SE. of the tn. Pop. 3 00.

2. City of Ontario on the delta of the Kaministiquia R., on the shores of Lake Superior, Canada, 600 m. NW. of Toronto; has one of the finest land-locked harbours in the world. The city has 10 parks, the largest, Chippewa Park, having 3 m. of shore line on the lake. F. W. has a fine

library, collegiate school, and vocational school; all public utilities are municipally owned. It is on the Canadian National and Canadian Pacific railways, and there is a good airport 4 m. distant. Its chief business activities are railways, shipping, grain elevators and allied waterfront undertakings, paper and pulp mills, general timber operations, water power, steel products. It is the greatest coal-handling centre in Canada, having handled 2,500,000 tons in 1948. Originally settled by Fr. fur traders in 1678 as F. Kaministiquia, it was renamed F. W. in 1806. Notable as ann. meeting-place of old 'fur brigades' from far W. and N. with Hudson's Bay Company's dealers from Montreal. Incorporated as a city in 1907. Pop. 37,630.

3. Calcutta (q.v.), name given to 3 vils. conferred upon the East India Company in 1700 by the Emperor Aurungzebe. They were immediately fortified, and received their name in honour of William III.

Fort Worth, city of Texas, U.S.A., cap. of Tarrant co., on Trinity R., 30 m. from Dallas. It is on the Missouri, Kansas and Texas, Texas and Pacific and other railways. There are flour and grist mills, machine shops, foundries, and tanneries. Manufs. include flour, woollen and cotton goods, cotton-seed oil, agric. implements. F. W. is the seat of a polytechnic college, a univ. (Texas Christian Univ., founded in 1873), and a medical college. It has also a court-house, a city hall, and 2 theatres. Pop. 279,000.

Fortaleza, the cap. of the state of Ceará (q.v.), NE. Brazil. It is a seaport, being situated on a protected roadstead, though vessels cannot anchor very far into the harbour. The tn itself is well laid out, and is connected by rail and air with the interior regions of the country, which are much more fertile than its environs. F. trades principally in coffee, cotton, hides, sugar, rubber, oilseed, and drugs. Pop. 270,150.

Fortescue, Adrian (1874-1923), Eng. Catholic priest, scholar, orator, and artist; son of former provost of St Ninian's, Perth, who was received into the Catholic Church. Educ. at Jesuit preparatory school, Boulogne; St Charles College, Bayswater; Scots College, Rome; Innsbruck Univ. An exceptional linguist, he studied Hungarian, Arabic, Syriac, Russian, as well as the more regular Hebrew, Greek, Italian, German, and French. At Innsbruck he prescribed for himself in due course Sanskrit, Icelandic, and O.E.—'If God spares me.' Learnt Flem., 1915, and preached fluently in that tongue to Belgian war-time refugees. A vivid and powerful personality, as interested in action as in literature, he wrote and drew standing at his desk. Fought at least twice for his life, with fanatics or brigands in E. Europe. Held pastoral posts at Ger. Church, Whitechapel, 1899; Chipping Ongar, Colchester, Enfield, Witham, and Maldon. In 1907 F. was appointed to the charge of the Catholic community at the new garden city, Letchworth, which he

held for his last 16 years. He lectured, talked, and debated with startling ease, force, and charm on a wide variety of linguistic and scholarly subjects. Among his many pub. works are books on the Gk Fathers and the Orthodox Eastern Church; *Liturgy of St John Chrysostom*, 1908; preface to Thomas à Kempis's *De Imitatione Christi*, 1919, and *Roman Missal*, 1920, *The Mass*, 1920; *The Ceremonies of the Roman Rite*, with designs by the author, 1920; *Histoire des Patriarches d'Alexandrie* (par Jean Maspero), revu par A. Fortescue and G. Wiet,

him. At the accession of Edward IV, F. was charged with high treason, and accompanied Queen Margaret and her court in exile to Holland. He afterwards returned to England and received a pardon from Edward IV on the defeat of the Lancastrian party. F.'s fame rests on his works, *De laudibus legum Angliæ*, written c. 1470 (printed 1537) for the instruction of the young Prince Edward, and *On the Governance of the Kingdom of England* (printed 1714). See Lord Clermont, *History of the Family of Fortescue* 1869.

Valentine & Sons Ltd., Dundee

THE FORTH BRIDGE FROM SOUTH QUEENSFERRY

1923. Pamphlets: *How to Pronounce Latin*, 1908, *Pope Gregory VII*, 1909, *The Branch Theory*, 1910, *The Vestments of the Roman Rite*, 1912, *Formal of Hormidas*, 1914, *Russia and the Catholic Church*, 1915, *Pacifism*, 1916, *Date of Anglican Schism*, 1917, *Catholic because Roman Catholic*, 1917. See Adrian Fortescue, memoir by J. G. Vance and J. W. Fortescue, illustrated with his illuminated penwork, 1924, and R. L. Hine, *Confessions of an Un-common Attorney*, 1946.

Fortescue, Sir John (c. 1394–c. 1476), b. Somerset and educ. at Oxford. He was 3 times appointed governor of Lincoln's Inn during Henry VI's reign, and in 1442 was chief justice of the king's bench, being highly recommended for his wisdom, gravity, and uprightness. He was a great favourite with Henry VI and held office during the remainder of his reign, faithfully serving and steadily adhering to

Fortescue, Sir John William (1859–1933), military historian, a son of the 3rd Earl F. Librarian at Windsor Castle, 1905–26. Author of *History of the British Army*, 1890–1930, a monumental work in many vols. Other pubs.: *History of the 17th Lancers*, 1895, *Wellington*, 1925, *The Empire and the Army*, 1928, *Six British Soldiers*, 1928, *The Royal Army Service Corps*, 1930.

Forteventure, see FUERTE VENTURA.

Forteviot, vil. of Perthshire, Scotland, on the R. Earn to the SW. of Perth. The old tn of that name, which was close by, was the cap. of the Picts and Scots. Pop. 450.

Forth, see CARNWATH.

Forth, Scottish riv., formed by the union of 2 headstreams, the Duchray Water and the Avonduh, which drains Lochs Chon and Ard. Rising on the NE. side of Ben Lomond, the F. flows E.

joining the Laggan or Avondhu (Perthshire) just above Aberfoyle. The 12½ m. between Stirling and Alloa are known as the 'Links of Forth,' from the many picturesque windings. The riv. then expands into the arm of the North Sea called the Firth of F. (Bodotria, Boderia, Aestuarium, Scots Water). The riv. is about 107 m. long, reaching Stirling after a picturesque course of 39 m., instead of a direct one of 18 m. Its chief tribs. are the Teith, draining Lochs Katrine, Achray, Vennachar, and Lubnaig (by means of the Leny), the Allan Water, and the Devon. The riv. and, lower, the firth divide the shires of Perth, Clackmannan, and Fife on the N. from Stirling, West Lothian, Midlothian, and East Lothian on the S. The riv. is navigable for vessels of 100 tons up to Stirling, and for vessels of 300 tons to Alloa. Grangemouth on the F. is connected with Bowling on the Clyde by the F. and Clyde Canal, about 38 m. long, on which Symington tried his first steamer in 1801-2. The firth is a bay-like extension of the riv., about 50 m. long, with an average breadth of 2½ m. (as much as 17 m. wide at Prestonpans). At Queensferry it is only 1 m. across, and is spanned by a cantilever railway bridge. 8295 ft long, with 2 main spans of 1710 ft each, built between 1882 and 1890. The firth is from 3 to 37 fathoms deep, and has good harbours, St Margaret's Hope being one of the safest Scottish roadsteads. Rosyth, near by, became a naval base in 1903. The Bass Rock and the Isle of May are at the entrance to the firth, which encloses the is. of Inchcolm (with a ruined monastery), Cramond, and Inchkeith (with a lighthouse, as has also the Isle of May). The chief rivs. flowing into the firth are the Carron, Avon, Almond, Water of Leith, Esk, and Leven. Its chief port is Leith, the port of Edinburgh. Others are Granton, Bo'ness, Grangemouth, and Kirkcaldy. Salmon and herring fisheries are carried on in the F.'s basin, and white fish abound. There are vast deposits of coal beneath the bed of the firth, already worked by the Fife collieries. There are various places of historical interest on the riv.'s banks, amongst them Stirling (once a royal residence), Cambuskenneth, Alloa, Kincardine, and Aberfoyle. Falkirk, near by, has the remains of the wall of Antoninus, and Carberry Hill and Loch Leven, noted in the hist. of Mary Queen of Scots, are not far distant. Bede (d. 735) called the firth *Sinus orientalis*; to Nennius (fl. 796) it was the *Mare Frisicum*. *Consult* Dick, *The Pageant of the Forth*, 1910.

Forth and Clyde Canal, canal 38 m. in length by means of which the R. Forth communicates with the Clyde. It extends from Grangemouth on the E. to Bowling, Dumbartonshire, on the W., and divides the country at its narrowest part. It was completed in 1791.

Fortification, 'the art or science of fortifying places in order to defend them against an enemy.' F. may definitely be divided into 3 parts: first, permanent F.s which have been continually built in

time of peace to defend some vulnerable point in the defences of a country. Much time and labour have been given to this, as, especially on the Continent, the permanent F.s formed a most essential part of a country's defences. Mobility in war, as in the Second World War, and the coming of nuclear weapons have largely made permanent F.s obsolete. Secondly, semi-permanent F.s, such, for example, as are erected when war seems to be imminent and care is being taken to see that all points of the defence are made secure. Thirdly, field F.s, e.g. such military works as are constructed by military engineers during a campaign which have no real permanence and which are only of value during the campaign itself. Such works are built to strengthen the position taken up by an army and to provide as many obstacles as possible to the attacks of the enemy. Field F.s reached an extraordinary pitch of development in the First World War (see e.g. HINDENBURG LINE; HOHENZOLLERN REDOUBT).

During the early stages of military hist. defence was stronger than attack. The main weapons of attack were the battering-ram and the catapult. This latter weapon hurled a variety of missiles at the walls of the place attacked. Obviously, then, the best means of defence against attacks of this kind was the building of huge walls. These, which often attained a thickness of 30 to 40 ft, were practically impregnable, and to this fact the medieval baron owed a great deal of his power. It was obviously impossible for the king to take the castle save by a long siege, and the time expended on such a proceeding was not sufficiently compensated for by the result. The great curtain wall of the castle was commanded by huge towers at each corner, which prevented the enemy from easily attacking the walls, since they could be met by a front and flank defence. Up to the time of the Renaissance the castle may be regarded as the chief method of F. The invention of gunpowder did not immediately bring with it the abolition of the castle. At first the difficulties of firing and the poor ammunition used (usually stone balls) caused little or no damage to the fortified places, but with the invention and customary use of cast-iron cannon balls, the superiority of the fortified places over the army of attack came to an end. The classic example is the rapid success of Charles VIII of France during his attack upon the fortified places of Italy. Before his artillery these places fell rapidly, and new means had to be adopted to prevent the enormous damage done by the artillery fire. Mounds of earth began to replace the towering walls of the forts, and these mounds were protected by means of wide, deep ditches. The depth was usually 20 to 30 ft, and the ditches were strengthened with masonry (revetments). The face of the castle also began to alter, and the 16th cent. saw the erection of great bastioned fortresses. The enemy naturally massed

their artillery together when besieging a fortress in order to breach the curtain wall the more easily.

The bastion (q.v.) consisted of 2 faces and 2 flanks, and a cross fire was able to be poured on to the massed artillery of the enemy from the face of the bastion, whilst at the same time from the flank of the bastion the curtain wall could be easily defended. The enemy could also be attacked by a direct fire from the curtain wall. The attacking army gradually altered its tactics. Instead of attempting to breach the curtain wall, it began to attack the bastion itself. The usual point of attack was the salient angle of the bastion—that is, the angle formed by the meeting of the 2 faces of the bastion itself. Ravelins or outworks which commanded the position of the attacking artillery were consequently added in order to counter this form of attack, and under the great engineers of the 16th and 17th cents. the outworks of the bastions were extended until they became what can best be described as a step-by-step defence, i.e. the garrison resisted to the best of their ability until forced to retire from the outer line, when they fell back on the next line, resisting all the time. The names of famous engineers during this period are legion, but probably the greatest of all names is that of the Fr. engineer, Sébastien le Prestre de Vauban. The art of war underwent some considerable modification during the 17th and 18th cents., but in no essential feature did it actually change. The sieges of the Napoleonic wars were conducted on very similar lines to those of Marlborough's campaigns, but with the end of these wars a change was brought about. The range of the artillery was rapidly increasing; the distance from which it was effective had increased to half a m. It became obvious, therefore, after the Napoleonic wars that the guns of the besiegers must be kept at a greater distance. The enceinte, i.e. the line of F.s forming the chief works of a fortified place, must be more amply defended. To do this fortresses were built some distance from the enceinte and yet sufficiently close to one another to be able to give support when attacked. Each of these smaller fortresses was self-sufficient, i.e. it was adequately garrisoned and adequately provisioned so that if necessary it could stand a siege by itself. These fortresses were built on much the same plan as was used for the larger fortresses themselves. The introduction of rifled artillery fire caused stonework F.s which were exposed to artillery to be condemned. The Franco-Prussian war and the siege of Paris proved the uselessness of the fortress defended by bastions. Fortresses were thrown out to greater and greater distances to prevent the direct attack of the enemy on the enceinte. This in itself made it necessary that the besieging army should increase in proportion to the distance to which the protecting fortresses were thrown out, since the zone to be invested by the besieging army had become

much greater. The main lines which modern F.s followed up to the Second World War, however, were: that in the first place the girdle of fortresses should be thrown out to such a distance that direct bombardment of the place could not occur. Secondly, that the guns in the fortresses should be protected by armour, but that the bulk of the defending artillery should be outside the defended fortress. Thirdly, that the defence should depend to a very large extent upon the infantry, and that for this purpose the forts should be connected one to another by means of infantry entrenchments. Fourthly, that the lines of communication should be kept open and well guarded between the main fortress and the girdle of defensive fortresses. The guns outside the fortresses were either to be concealed or protected by means of cupolas, and the entrenchments of the infantry should be bomb-proof. The strength of a fortified position depends upon its communications, the rapidity with which the defending infantry can co-operate, and the concealment of its guns. The famous Maginot line, extending from the Swiss frontier to Verdun, was pre-eminently a combination of passive obstacle and active defence. Its construction marked the abandonment of the 1914 conception of the *offensive à outrance*, which led to such tragic results in the First World War. Galleries were hollowed out which, in a straight line, would cover the distance from Paris to Liège, and the whole work cost 7,000,000,000 francs. The towers of the subterranean workings, which weighed 120 tons, were monolithic, and no shell could penetrate their concrete walls. Defence against gas was assured by a special process. In order to do away with loop-holes, the guns in the turrets pivoted on a ball mounted in the armour plate. Artillery officers saw the outside world through panoramic telescopes built into the armour plate. Telephone lines were buried 5 metres deep in concrete slabs. The 'zone of fire' was protected by look-out posts, alarm signals, sound-locating posts, and barrages of infra-red rays. The big forts were nothing less than buried barracks with kilometres of passages lit by electricity and provided with metal tracks. They were habitable for months on end. The Maginot line conformed to the formula of Marshal Pétain (q.v.): 'The minimum of danger, the maximum of comfort.' Behind their cusped embasures the men of the Maginot line could literally have covered the frontier zone with a sheet of fire through which no infantry could possibly have advanced. That, at all events, was what was claimed for these F.s. Their cardinal defect was that the line was not prolonged to the coast. Its strength for defence was never tested in the operations of 1940, for the Germans broke through the allied lines at Meas-tricht, and outflanked the line. In the operations of 1944, when the Anglo-Amer. armies advanced on Germany, the enemy was favoured by the advantages accruing from his strong defensive lines, first the

Siegfried F.s (q.v.), and behind them the great barrier of the Rhine. The Maginot line, as such, was no integral part of his defence. *See also* WESTERN FRONT IN SECOND WORLD WAR.

Field Fortification.—The differences between permanent, semi-permanent, and field F.s were a century ago very much more strongly marked than they are at the present time. Nowadays no masonry defences are necessary to make a place defensible, and in a short time, with surprisingly little material, very strong F.s

ate bomb-proof shelters and parapets has been made practically useless, since no military work can be thrown up in a short time which is able to resist the highly explosive shell which is fired nowadays. Thirdly, the most important point of all is to obtain a concealed position. This is an additional reason why parapets are made nowadays comparatively low, seldom, if ever, exceeding 18 in. in height. Fourthly, although obstacles are still used and created, i.e. wire entanglements, pits, and abatis, these are gradually falling

K. L. M.

THE FORTIFIED TOWN OF NAARDEN, NETHERLANDS

Beyond the town, on the right, is the shore of the IJssel Meer (Zuyder Zee).

can be made. The elementary field F.s, such as the use of obstacles for defence, have been known practically since the dawn of hist. Trenches, abatis, and stakes have always formed a part of the protective measures of even savage tribes. But the art of field F. has undergone tremendous changes during the last century. Practically up to the present time the great object aimed at by field engineers was to obtain command and to defend by obstacle; nowadays military engineers aim at obtaining concealment and protection. The main points to be noticed in modern field F.s are that the works erected are adapted to the ground which is being defended. The line of the trenches usually follows the natural line of the hill and valley on which they are erected. Secondly, the erection of elabor-

more and more out of use, but they are still of considerable value when stopping the rush of the enemy, and give the defender an opportunity of attacking the enemy while he is labouring under difficulties. Another object of field F. is to give the enemy as little shelter as possible. With this object the ground in front of the position to be defended is cleared as far as possible to the limits of the range of fire. The outstanding military lesson from the 2 world wars is that it is practically useless to depend on permanent works of defence constructed some years before a campaign, because the continual progress of scientific and industrial development in relation to offensive weapons more than counter-balances the military value of such works. Liège, with its 12 forts in a perimeter of over

30 m., fell within 9 days. As the ground between the forts had not been provided with field defences or obstacles, the Ger. infantry were in the city before the forts had fallen. Namur fell in a similar manner, the forts being literally blown to pieces. The Ger. bombardment opened 20 Aug. 1914, and all forts were destroyed by the 25th. The defence of Antwerp was carried out on different lines from that of Liège and Namur. Although the Germans soon demolished the forts they had also to contend with a defensive trench line held jointly by some Belgian forces and a Brit. naval div. along the R.s. Nethe and Rupel. Sev. attacks were made on the Nethe line, but were all repulsed, until the Germans secured a crossing on 6 Oct. Although the steel and concrete forts and works fell in 4 days, the trench line held out for 6. Maubeuge was similar to Antwerp. Here the commander constructed field works well in advance of the permanent works, and although the forts were swiftly destroyed, the field works held the Germans in check for over a week, a delay which had an important bearing on succeeding events, because it held up 60,000 Ger. troops and deprived von Kluck of facilities for supplying his command in its advance to the Marne. Verdun was mainly a repetition of Maubeuge as regards methods of defence. Confidence was not placed in the great forts, but during the winter of 1914-15 a new defence line was constructed some m. beyond the outer line. This line was eventually forced back to within 4 m. of Verdun, but it covered the most important points. *See also* VERDUN.

Some of the new features that have affected F.s are *Aircraft*, which can locate works hidden by rising ground and can bomb at practically any distance in the theatre of operations; *Artillery*—long-range heavy guns can be made mobile by mounting on tracked armoured vehicles and railways; *Camouflage* (q.v.) can be used by both sides, i.e. to hide works and also to screen guns.

Concrete 'pill-boxes' were an undoubted success in the First World War. They could resist a direct hit by a 6-in. shell and were usually too small and well concealed to be hit by large shells. The use of gas by an attacker can render areas in F.s virtually ineffective for sev. days, according to the type and quantity of gas used.

Field Fortifications and Tactics in the Second World War.—With the development of tanks and aircraft after 1918 and of deep infiltration as a basic tactical principle, attack, which had been much more costly than defence, became cheaper than defence in lives and material, and, in consequence, fortified posts held by machine-gun fire were overrun by *blitzkrieg* methods. Protection in the Second World War was no longer mainly given by earthworks; it was mainly given by armour and invisibility. In 1918 tanks won a great war; by 1938, with their increased speed and offensive power, they revolutionised warfare and outmoded

many former conceptions of F.s. The development of planes was no less decisive. As a flying artillery, planes could do what guns used to do in Napoleon's day—open a breach in the enemy's field F.s for decisive manoeuvre. The modern tank, combined with swiftly-moved lorry-borne infantry, produced a new type of force, capable of a strategic infiltration that was the essence of the war by the end of 1941. Mechanisation gives the blitz attack the power to penetrate almost any linear defences, because it gives the power to concentrate spearhead forces of half a dozen divs. on a m. or two of front. But another form of defence, a non-linear form, was also demonstrated in the Second World War, especially on the Russian front. This is the form known as 'web defence,' of which the basis was the holding, not of consecutive lines, but of is. or strong points of resistance, or 'hedgehogs,' capable of all-round defence, and also of continued fighting for long periods after they have been surrounded. This form of defence was learned in the Russian Civil war, in which the rapidly-moving fronts and partisan or guerrilla fighting crystallised around positions defended in isolation, and particularly around tns, vils., and other road centres. Those defensive tactics were borrowed from the Ger. methods in the First World War, the system of defence by strong point; but in the Ger. invasion of 1941 the Russians developed the system to a much greater depth of defence with much more reliance on the fortified strong point, with the result that each blitz offensive by the Germans was less of an actual victory and more of a stalemate. One of the essential features in any modern system of defence, especially in web defence, is the use in F.s of an immense number of land-mines. In the Russian and Libyan campaigns both sides used land mines in quantities never before employed. Indeed the Brit. defences in Libya, like those of Rommel earlier in the campaign, consisted largely of vast mine-fields, and Ger. offensive tactics consisted in opening breaches through the mine-fields and forming, with armoured forces, a *kessel* or cauldron to attack the defending troops in the rear and so widen the gap. The tactics of the phalanx or spearhead of tanks in the blitz attack were shock tactics, since the tanks tried to get to close quarters with the enemy as quickly as possible, using projectile weapons at short ranges; and this was effective against troops deployed in linear positions. But when troops were deployed defensively in fortified tns and vils., into which the tanks could only penetrate at great risk, and in is. of resistance or 'hedgehogs' bristling with weapons in all directions and either naturally tank-proof or made proof against direct tank assault by the use of deep mine-fields, tanks could no longer employ shock tactics in the same way and the pendulum began to swing back from shock towards fire, the tank being armed with an artillery piece equivalent in size

to a field gun. During 1942 the *blitzkrieg* won full successes only against obsolete field F.s; against the modern methods of defence shown in Russia it could only prevail at greatly increased cost. Another method of nullifying F.s is by the use of airborne troops dropped behind the enemy's defences, the logistic problem being solved in the same way, namely by airborne supplies. In a period dominated by armour and mobility it is impossible for infantry to protect themselves on the battlefield mainly by entrenchment. Their chief protection becomes invisibility, and this is the first reason why the methods and tactics of modern infantry in the Second World War were largely approximated to those of guerrillas; for a guerrilla force is essentially invisible, strikes from the void, and retires or scatters to disappear after it has struck its blow. See also ENTRENCHMENT. See Sir G. Clarke, *Fortification*, 1907; H. Plessis and E. Legrand, *Manuel complet de fortification*, 1900; O. Micksche, *Blitzkrieg* (trans.), 1941; T. Winttingham, *Weapons and Tactics*, 1943; and S. Toy, *A History of Fortification*, 1955.

Fortiguerra, Niccolò (pseudonym Carteromaco) (1674-1735), It. poet and bishop, b. Pistoia. His best remembered work is *Il Ricciardetto* (first pub. in Paris in 1738), a comic epic, parodying Pulci, Bolardo, and Ariosto. See F. Canici, *Notizie della vita et delle opere di Niccolò Fortiguerra*, 1895.

Fortitude Valley, site of the first settlement in Brisbane, Queensland, Australia, and now a busy commercial and shopping centre of that city.

'Fortnightly', periodical, estab. in 1865 by Anthony Trollope, under the title *Fortnightly Review*, for expression of the political and social views of the philosophical Radicals. It became a monthly very early in its career, and in 1934 its title was changed to *Fortnightly*. It was incorporated with the *Contemporary Review* in Jan. 1955.

Fortnightly Nutation, see NUTATION.

Fortrose, burgh of Ross and Cromarty, Scotland, on the Moray Firth, 10 m. N.E. of Inverness, consisting of 2 tns, Rosemarkie and the anct tn of Chanonry. There is a harbour, and the ruins of a red sandstone cathedral (13th and 14th cents.) are near by. F. is a summer resort for golf and bathing. Pop. 900.

Fortuna, or **Fortune**, It. goddess, originally of fertility, but later identified with the Gk Tyche (Chance). With no reference to law, entirely at her pleasure, she dispensed joy or sorrow indifferently, unlike Fate, the goddess of destiny. F. had temples at Smyrna, Corinth, Ellis, Antium, and Praeneste, and in the last, 2 statues of her were oracular. She is represented with a rudder, cornucopia, ball, wheel, or wings.

Fortunate Isles: 1. Another name for Canary Is. (q.v.).

2. See ISLES OF THE BLEST.

Fortunatus, hero of a popular collection of tales, centring on the adventures of F. and his son, with their inexhaustible

purse and wishing-cap, the moral being that worldly prosperity alone is insufficient to produce lasting happiness. The book originated about the end of the 15th cent., though some of the legends included are of older date still. The oldest printed ed. now extant bears the date 1509. Versions of the story have appeared in German, Fr., Italian, Dutch, Eng., Dan., Swedish, and Icelandic. The story was dramatised by Hans Sachs in 1553, and by Thomas Dekker with the title *Old Fortunatus* in 1600. An unfinished narrative poem of the tale, entitled *Fortunatus and his Sons*, was left by Ludwig Uhland. See W. V. Schmidt, *Fortunatus und seine Söhne*, 1819; and H. Günther, *Fortunatus*, 1914.

'Fortune', an elaborate, illustrated monthly magazine primarily for business owners and executives, founded at New York in 1930 by Henry R. Luce. Its articles, on business and economic subjects, are based on thorough and extensive research and are written by members of the staff.

Fortune-telling. Under the Vagrancy Act of 1824 in England anyone pretending to tell fortunes is liable to imprisonment as a disorderly person, but prior to this date the telling of fortunes by palmistry, astrology, or other forms of divination was not an offence against the law. The arts of divination are of great antiquity. See DIVINATION and PALMISTRY.

Fortuny y Carbó, Mariano José Bernardo (1839-74), Sp. painter and etcher, b. Reus, Catalonia. He studied at the academy of Barcelona, and at Rome. During the Sp. war against Morocco, F. followed the army to Africa and filled his portfolios with studies of local life. F.'s work is distinguished by a superlative facility of execution. He specialised in a minutely treated *genre*, as in his 'The Trial of a Model,' of a kind nowadays dismissed as trivial. A large number of his works are in America, both in public and private possession. See C. Davillier, *Fortuny, sa vie, son oeuvre, sa correspondance*, 1876; and lives by C. Yriarte, 1886; E. Calvi, 1911; and J. Clervo, 1920.

Forty, cardinal number equivalent to 4 tens, denoted by the symbols 40 or XL. From time immemorial this number has apparently been regarded with superstitious veneration by both Jews and Muslims, and figures largely in the Bible and in Mohammedan writings. See notes to W. A. Clouston's *Group of Eastern Romances and Stories* (privately printed, 1889) for Biblical references. Muslims mourn F. days for their dead, and consider women ceremonially unclean until F. days after childbirth. Similarly the number F. appears repeatedly in Muslim fiction, as in the Arabian *Tale of the Third Calender*, or *Aladdin and his Wonderful Lamp*, or the Persian romance of *Ndsir*. Gangs of robbers in E. tales usually number F. (cf. *Ali Baba and the Forty Thieves*). In Wales F. loaves of bread and F. dishes of butter commonly occur in records of rent paid to the bishop of Llandaff. A bard's fee for his song

was 40d. if a disciple, twice 40d. if a master. Ships suspected of being infected with cholera or any infectious disease are placed under quarantine, forbidden to land passengers or cargo, for F. days. The privileges of sanctuary lasted F. days. There is a popular superstition that St Swithin's Day is followed by F. days of either rain or sunshine.

'Forty-five' ('45), The, term employed by modern writers for the year 1745 and the Jacobite rising under Prince Charles Edward, 'the Young Pretender,' or 'Bonnie Prince Charlie,' which was crushed at Culloden Moor, 1746. See

Appian Way among the Pontine marshes, 43 m. SE. of Rome. A canal started from here, running S. nearly to Terracina. See Horace, *Satires*, I. v. 3; Acts xxviii. 15.

Forum Cornelia, see IMOLA.

Forum Julii, see PRÆJUS; FRIULI.

Forum Livii, see FORLÌ.

Forum Neronis, see LODÈVE.

Forum Sempronii, see FOSSOMBRONE.

Foscoli, Francesco (b. c. 1372), doge of Venice (1423-57). In early life he was guardian of the young marquis of Mantua, and won fame as one of the procurators of San Marco. As doge he waged numerous wars against Filippo Maria Visconti, duke of Milan, and other It. princes, securing

Forty-shilling Freeholder, see ELECTORATE.

Forum, in Rom. times the central public space of a city, especially the market-place of Rome itself, the *F. magnum*, extending from the foot of the Capitoline to NE. of the Palatine. It was used as a place of assembly for political, judicial, and other public business. Near by was the *F. Julium*, built by Julius Caesar as an annexe to the *F. magnum*; behind it lay the *F. Augusti*. Between these last two and the Temple of Peace was the small *F. Nervæ*. The *F. Trajani* stood between the *F. Augusti* and the Campus Martius. See T. Ashley and S. Platner, *Topographical Dictionary of Ancient Rome*, 1929.

Forum Appii (modern Foro Appio), small tn of anct Latium, Italy, on the

Carmagnola as general of his allied forces. After the first war (1426-7) Venice won the provs. of Cremona, Bergamo, and Brescia. The second war (1431-3), after a hard struggle, fixed the Adda as the Venetian boundary. A third war, against Bologna, Milan, and Mantua, broke out about 1435. Supported by Cosimo de' Medici and Francesco Sforza, Venice finally conquered Bellagio, Peschiera, and Lonato. The peace of Lodi (1454) put an end to hostilities. F.'s later life was clouded by the misconduct of his son, which resulted in F.'s deposition in 1457. He d. a week later. Byron's tragedy, *The Two Foscari*, is based on the story of F. and his son.

Foscolo, (Niccolò) Ugo (1778-1827), It. poet and patriot, b. Zante, son of a Gk mother and It. father. From 1796 onward he was an officer in the armies of various attempted It. reps., and served in France (1804-6). In 1808 he was

appointed to the chair of eloquence at Pavia Univ. His tragedies *Tieste*, *Ilicia*, and *Ajace* are essentially political plays; the last-named (performed 1811) was thought to contain hits at Napoleon, and caused him to leave Milan till the decline of Napoleon's power in 1813. When the Austrians regained control of the tn, F.'s patriotic sentiments forced upon him a voluntary exile, first to Switzerland, then to England (c. 1816). His remains were removed from Chiswick cemetery to Florence in 1871. His works include *Le ultime lettere di Jacopo Ortis*, 1797, a novel partly founded on Goethe's *Werther*; *Luigia Pallavicini caduta da cavallo* and *All'amica risanata*, 2 odes, 1799-1803; *Orazione a Bonaparte*, 1802; and *I Sepolcri*, 1806, his best-known poem, written in blank verse, where he considers tombs in their political and philosophical significance. He also trans. Homer, and Sterne's *Sentimental Journey*. See L. Le Monnier, *Collected Works*, 1850-62, and ed. by Tobler, 1871; C. Gemelli, *Della Vita e dell'opere di U. Foscolo*, 1839; G. Chiarini, *La Vita di U. Foscolo*, 1927; E. Donadoni, *Ugo Foscolo pensatore, critico, poeta*, 1929; G. Citanna, *Le Poesie di U. Foscolo*, 1932; M. Fabrin, *Foscolo Minore*, 1949; E. R. Vincent, *U. Foscolo: an Italian in Regency England*, 1953.

Foss, or **Fosse** (Lat. *fossa*, a ditch, from *fodere*, to dig), in fortification, a long narrow excavation, such as a moat or ditch, dug outside the walls or rampart of a fort to serve as barrier against the advancing foe and prevent an escalade. It is often filled with water or with abatis and palisades.

Foss, **Foss-way**, or **Fosseway**, one of the great military roads constructed by the Romans in England and other parts of Europe, so called from the foss on either side to keep it well drained and dry. This road or series of roads ran from Lincoln via Leicester (Ratae) and Bath to Exeter. It went past Newark and High Cross (Venonae), intersecting Watling Street at a point called the 'centre of England,' then on past Cirencester, Bath, the hills near Chard, Axminster, and Honiton to Exeter. It is mentioned by 11th-cent. writers as one of 4 'royal roads' in Britain.

Fossa (**Fossan**), or **Foussa**, largest carnivorous mammal of Madagascar. A link between cats and civets, it is about twice the size of a house-cat (about 5 ft long), with a long tapering tail and sharp, curved, retractile claws. The naked soles of the hind feet rest entirely upon the ground in walking. The colour is usually a uniform, unspotted, pale brown, and the hair short and close. These animals are of a very savage disposition, and of nocturnal habits. They feed on small animals and birds, sometimes invading poultry yards. They are usually regarded as representing a group within the mongoose family (Herpestidae), under the name *Cryptoprocta ferax*.

Fossa Clodia, see CHIOGGIA.

Fossa et Fures, see PIT AND GALLOWES. **Fossano** (ancient **Fons Sanus**, or **Fossanum**), It tn, in Piedmont (q.v.), 14 m. NW. of Cuneo (q.v.). It has ancient walls, a cathedral, and a 14th-cent. castle. There are mineral baths, and paper and silk manufs., and the tn is an important railway junction. Pop. 21,900.

Fossil. The term (Lat. *fossus*, dug up) was formerly applied to any object taken out of the earth's crust, whether mineral or organic, but it is now applied only to the remains or traces of animals and plants which have been buried in the earth by natural causes. Objects which prove the previous existence of organisms, such as the footprints of animals and the burrows and trails of worms in shales and sandstone are as much F.s as are the remains of the organisms themselves. The majority of F.s are the hard parts of animal or plant organisms, such as the shells of molluscs, the calcareous skeletons of corals, the teeth and bones of vertebrate animals, and the trunks, branches, and leaves of plants, the state of preservation being dependent on the amount of change undergone subsequent to their burial.

For preservation in the F. state the organism must be covered by sediment, or it will disappear by the processes of decay. The remains of terrestrial animals and plants are therefore less likely to become preserved than marine organisms, and the conditions must necessarily be local. Thus, land plants and animals may be found in lakes, peat bogs, marshes, deltas, mineral springs, and 'bone caves.'

It is in the sea that the most favourable conditions for the preservation of organic remains prevail. Sheets of mud and sand are laid down, particularly in shallow water on the continental shelf, and cover the remains of the faunas which flourish there. Elsewhere, organic limestones may be formed containing abundant calcareous F.s. In the deepest parts of the ocean only the remains of planktonic organisms and hard parts such as teeth and ear bones are found in abyssal sediments.

The condition of the preserved remains depends upon the structure and composition of the organisms and also on the manner of fossilisation. The skeletons of most vertebrates consist of calcium phosphate. In the invertebrates the durable parts may be calcium carbonate (calcite or aragonite) as in the molluscs, or may be composed of silica as in the diatoms. Organisms with skeletons of chitin (a complex organic compound) are often preserved intact, while plants and the soft parts of some other organisms are frequently preserved as carbonised films. Sev. methods of preservation may be distinguished: (1) *The original substance is preserved unaltered*. Whole carcasses of Siberian mammoths have been preserved in frozen soil, while entire insects have been preserved in amber. The stony skeletons of shells and corals, and, in a lesser degree, trees and their fructifications, are sometimes wholly preserved.

Naturally, F.s are least changed from their original condition in the newest rock formations and most changed in the oldest. (2) *The original substance is replaced by mineral matter with partial or entire preservation of the structure or the organism.* This is also known as petrification, the organic matter being replaced, molecule for molecule, by mineral matter such as calcite or silica. Minute structures may be preserved in silicified wood, where the cellular details may be seen under the microscope as distinctly as in the section of a modern tree. The aragonite shells of invertebrates such as gastropods and lamellibranchs are dissolved away, and entirely replaced by more durable calcite, forming 'pseudomorphs after aragonite.' (3) *The original substance is wholly removed, the external form being retained.* After the organisms have been buried by sediment, they decay, and merely leave hollow moulds retaining their external form. These moulds may later be filled by mineral matter, which may have been mechanically deposited or chemically precipitated from infiltrating waters, forming casts of the original F. These casts show none of the internal structure of the organism but only the external form.

F.s, as well as being of interest as records of the progress of life on the earth, and lending strong support to the theory of evolution, are of use to the geologist in revealing former geographical conditions. The distribution of land and sea, changes in climate, and the distribution of plants and animals in past times can be elucidated. F.s are also of great importance in geological chronology. It has been possible by the use of the contained F.s to correlate the sequences of stratified formations in different parts of the world and to subdivide geological formations into a series of life zones characterised by 'index fossils.' This has been of great economic value, e.g. in developing coalfields, and in finding and exploiting new oilfields. The F. hist. of many animals and plants is now known in great detail and the evolution of man has also been traced by his fossilised remains. See also PALAEOLOGY; PALAEOBOTANY; PALAEO-ECOLOGY; MICRO-PALAEOLOGY; ANTHROPOLOGY; GEOLOGY.

Fossil Copal, see COPAL.

Fossombrone (anc. *Forum Sempronii*), It. tn, in the Marches (q.v.), on the Metauro, 12 m. SSW. of Pesaro (q.v.). It was severely damaged during the Second World War. There is a cathedral, and there are numerous Rom. remains. Silk is manufactured, and there are mineral springs. Pop. (tn) 4100; (com.) 11,200.

Fossombroni, Vittorio, Count (1754-1844), It. statesman and scientific writer, studied at Pisa Univ., distinguishing himself in mathematics and philosophy. He became minister of foreign affairs to the grand duke of Tuscany (1796), and held offices under the new gov. of Bonaparte (1799). On the restoration of the grand duchy (1814) F. became prime

minister, under Ferdinand III and Leopold II. He put Tuscan finances on a sound footing. He also wrote treatises on hydraulics, mathematics, etc.

Foster, Sir Michael (1836-1907), physiologist, b. Huntingdon and graduated in medicine at London Univ., 1859. He practised for a time in Huntingdon, then returned to London to teach physiology at Univ. College, 1869, and at Trinity College, Cambridge, 1870-83. He became prof. of physiology at Cambridge in 1883 and held that chair until 1903, during which time he became renowned as a teacher; many of his pupils became distinguished scientists. He was the virtual founder of the Cambridge school of physiology. His own work was principally on the physiology of the heart and circulation. F. was biological secretary of the Royal Society, 1881-1903, and president of the Brit. Association, 1899. In 1900 he was Liberal M.P. for London Univ. but was defeated in the election of 1906. He was chairman of the royal commission on tuberculosis and member of that on sewage disposal. His works include *Textbook of Physiology*, 1877, *Elements of Embryology* (with F. M. Balfour), 1874, *Lectures on the History of Physiology*, 1901, a work of permanent value. F. was knighted in 1899. See memoir in the *Journal of Physiology*, vol. 35, 1907.

Foster, (Miles) Birket (1825-99), painter and engraver, b. North Shields, early apprenticed to the wood-engraver Landells. He engraved plates for Gray's *Elegy*, Coleridge's *Ancient Mariner*, Longfellow's *Evangeline*, 1850, *Old English Ballads*, etc. From 1859 F. began painting in water-colours. His landscapes, mainly of Surrey and scenes of rural and child-life, have retained great popularity. Some of the best known are 'Nutting,' 'The Bird's Nest,' 'Sailing the Boat,' 'Cows in the Pool,' 'Feeding the Ducks,' 'Arundel Mill,' 'Castle of Rheinfels.' His illustrated *Christmas with the Poets* appeared in 1850, *Cowper's Task*, 1855, *Britany*, 1878, and *Some Places of Note in England*. See Scherer, *The Birket Foster Album*, 1880; and H. M. Cundall, *B. Foster*, 1906.

Foster, Stephen (1826-64), Amer. song composer, b. near Pittsburgh, Pennsylvania. He is especially noted for his Negro melodies, which have become very popular in all Eng.-speaking countries, e.g. *The Old Folks at Home*; *Massa's in the Cold*, *Cold Ground*; *Louisiana Belle*; *Come where my Love lies Dreaming*; *Nellie Bly*, etc.

Fothergill, John (1712-80), physician, b. Carr End, Yorks. Educ. at Edinburgh, where he qualified in 1768. He then went to London where he built up a very lucrative practice. F. was a Quaker, noted for philanthropy and professional skill. He helped to found a school for Quaker children at Ackworth and assisted Howard in his efforts at prison reform. His *Account of the Sore Throat Attended with Ulcers*, 1748, was the first authoritative account of diphtheria. He

also pub. important early descriptions of migraine and facial neuralgia, besides many other works. His botanical garden was famous. See *Works* (Lettsom's ed.), 1784; *memoirs* by J. C. Lettsom, 1783; J. H. Tuke, 1879; R. H. Fox, 1919.

Fotheringhay, par. and vil. of Northants, England, on the R. Nene, 9 m. SW. of Peterborough. A castle was built here in the time of William the Conqueror, but was later enlarged. Here Richard III was b., and Mary Queen of Scots was imprisoned and executed, 1586. The mound and moats still remain. The magnificent 15th-cent. collegiate church is but the nave, aisles, and W. tower of a far larger structure, the choir and aisles of which were destroyed at the Reformation. The tower, surmounted by an octagonal lantern, is remarkable. Pop. 200.

Fotmal, see METROLOGY.

Foucauld, Vicomte Charles de (1853-1916), Fr. explorer and hermit, b. Strasbourg, famous in the annals of Fr. exploration in the Sahara. At one time a soldier, he later became a monk. In 1883-4 he travelled through the first and middle ranges of the desert and, disguised as a Jew, made 3 routes over the Great Atlas Mts. Lived as a hermit at Tamanrasset, and was assassinated on the doorstep of his hermitage in 1916. He enjoyed the greatest prestige with the Hoggar Tuaregs, who to-day consider him a saint and martyr. He compiled, amongst other works, a Tamashek dictionary, and made a collection of Tuareg poems and proverbs. His name is spoken, and his life and work are immortalized, in every corner of Algeria. See E. F. Gautier, *Le Sahara, Conquête du Sahara*, 1881-1909, and *Oasis Sahara*, 1905; P. Turnbull, *Sahara Unveiled*, 1940; and P. de Boissieu, *Le Père de Foucauld*, 1945.

Foucault, Jean Bernard Léon (1819-68), Fr. natural philosopher and mechanician, b. Paris, noted for his investigations in optics and mechanics. He perfected the process of Daguerro and Niépce known as the daguerreotype process, and worked with Mizeau and Arago. In 1844 he invented an apparatus for using electric light in optical experiments and microscopic researches. From 1845 he conducted the scientific section of the *Journal des Débats*. F. demonstrated the earth's rotary motion by means of the pendulum, and invented the gyroscope (1851-2). After that his fame was firmly estab. He became physicist to the imperial observatory. 1855, and won the Copley medal of the Royal Society for his researches concerning the velocity of light, showing it to be greater in a vacuum than in air. His scientific treatises form part of the *Bibliothèque d'instruction populaire*. F. became a member of the Academy of Sciences, 1865. See J. Lissajous, *Notice historique sur la vie et les travaux de Léon Foucault*, 1875; C. M. Gariel and J. Bertrand, *Recueil des travaux scientifiques de Léon Foucault*, 1878.

Fouché, Joseph, Duke of Otranto (1759-1820), Fr. politician. b. Le Pellerin,

Nantes, and educ. in Paris by the Oratorians. He took holy orders, and when the Fr. Revolution broke out he was principal of the college of Nantes. F. soon became a prominent revolutionary. In 1792 he represented Loire-Inférieure in the national convention, and sided with the Mountain (q.v.). He helped to crush the risings in La Vendée, and was one of the leaders of the worship of Reason, and an antagonist of Christianity. In 1794 he helped to overthrow Robespierre. F. became minister of police in Paris, 1799, retaining this office under Bonaparte till 1802. He was recalled in 1804, and granted various titles. After 1810 F.'s influence declined, as he was suspected, not without reason, of intriguing with the Bourbons. For a short time F. held office under Louis XVIII, but was forced to resign (1816) and d. in exile. See lives by L. Madelin, 1901, and S. Zweig (Eng. trans.), 1930.

Fouquet, Jean, see FOUQUET.

Fougères, tn in the dept of Ille-et-Vilaine, France, 30 m. N.E. of Rennes. Footwear, cloth, and glass are manufactured. There is a 12th-cent. castle with 13 towers, and the 15th-cent. walls still stand. Pop. 19,300.

Fouillée, Alfred Jules Émile (1838-1912), Fr. philosopher, a member of the academy of moral and political sciences. He greatly influenced modern philosophic thought. His *Mémoires sur la philosophie de Platon*, 1869, and *Mémoires sur la philosophie de Socrate*, 1874, were crowned by the Academy. Other works are *Histoire de la philosophie*, 1875, *La Science sociale contemporaine*, 1880, *Critique des systèmes de morale contemporains*, 1883, *L'Évolutionnisme des idées-forces*, 1890, *Tempérament et caractère*, 1895, *Le Moralisme de Kant et l'amoralisme contemporain*, 1905, *La Morale des idées-forces*, 1907. His wife wrote under the pseudonym 'G. Bruno.' See A. Guyau, *La Philosophie et la sociologie d'A. Fouillée*, 1913.

Fould, Achille (1800-67), Fr. financier and politician, of Jewish parentage. After the revolution of 1848 he was minister of finance, and as such introduced many innovations and improvements. He became senator and minister of state, 1852-60. F. gave the first impulse to the foundation of the Crédit Mobilier. He was reappointed minister of finance by Napoleon III (1861-7), having resigned (1852) on the confiscation of the property of the Orleans family.

Foulis, Andrew (1712-75) and **Robert** (1707-76), 2 noted Glasgow printers who set up their business in 1741. Robert became printer to the univ. in 1743. They followed their profession for over 30 years, issuing eds. of Gk and Lat. classics, poetry, plays, trans., etc. Their 'immaculate' *Horace*, 1744, is famous, but has 6 misprints. Another famous work is the fine folio *Homer*, 1756-8. Their books are distinguished by an absence of ornament and a plainness which often comes near to elegance. In 1753 they founded an academy at Glasgow

for engraving and modelling. The expenses incurred unfortunately proved their ruin. See W. J. Duncan, *Literary History of Glasgow* (Maitland Club), 1831; J. Ferguson, *The Brothers Foulis*, 1889; and D. Murray, *Robert and Andrew Foulis*, 1913.

Foulness, is. at the mouth of the R. Crouch, in Essex, England, connected with the mainland by road. Pop. 371.

Foundations, in building, the base upon which the structure is built up generally below the level of the ground and whose purpose is to distribute the weight of the building over the soil beneath. In all buildings the weight is concentrated in certain small areas, the bases of walls, columns, etc. The aim of foundation courses is to distribute that weight over as large an area of soil as necessary to avoid subsidence. The possibilities of well-devised F. are illustrated by the construction of the Eiffel Tower, where a weight of 7500 tons is so distributed that each sq. ft sustains only 2½ cwt. The design of F. depends upon the weight of the building in comparison with the area of the base, the manner in which the weight is distributed, and the strength and stability of the underlying soil. Land used for building varies from hard, stable rock to loose sand or marshy soil. Between these extremes are gradations of soft rock, firm earth, hard compact clay, dry gravel, and dry close-packed sand. The presence or absence of water, the slope of the strata and the possibility of sliding effects are also important. Before designing F., it may be necessary to make borings in the ground so that the succession and depth of strata may be determined. When the ground consists of hard rock little needs to be done except procuring a level surface upon which to build the walls. On looser soils, load-bearing walls may be carried on concrete strip F.: framed buildings may be carried on separate pad F., one under each column. On very soft or unstable ground, it may be necessary to found the whole building on a continuous reinforced concrete raft. Alternatively, piles (see **PILING**) may be driven vertically into the soil, to carry the load down to firmer strata.

Recently a type of short pile foundation has been developed for small buildings on clay soil. Such a soil shrinks or expands as it dries out or absorbs water at the surface, and this movement may crack walls on shallow footings. To avoid this, holes about 8-10 ft deep are bored with an earth auger and filled with concrete, the piles so formed being joined at the surface by reinforced concrete beams cast in trenches to form F. for the walls. Shrinkage and expansion of the clay, which is usually confined to the top 5 ft, will then have no effect on the building.

Bridges, dams and other special structures raise their own special foundation problems. The basic principles, however, are always the same: either the load has to be transferred to points at or below the surface where no movement will occur.

or the construction has to be such as to accommodate any movement that cannot be avoided. The pontoon bridge provides a striking example of the latter alternative.

See Civil Engineering Code of Practice No. 4 (1954), *Foundations*; British Standard Code of Practice CP101: 1948, *Foundations and substructures of houses, flats and schools of not more than two storeys*; Building Research Station Digest No. 42, *The short-bored pile foundation*.

Foundations, American, non-governmental, non-profit organisations with funds of their own, estab. to conduct or aid activities which serve the welfare of mankind. George Peabody, who set up a fund in 1867 for the advancement of education in the S. states of the U.S.A., was the first to define A. F. in this way. It was not until this century that their numbers began to multiply rapidly, Andrew Carnegie (q.v.) setting the pace. To-day (1957) there are some 5000 F. in the U.S.A. Of the 7 very large ones, Carnegie, Ford, and Rockefeller are best known. The activities and organisations supported by A. F. funds vary. Money is often granted to univ. and similar institutions, and travel grants and scholarships to individuals. Altogether the resources of the A. F. total \$4.5 billion. They provide a good deal of 'risk' capital for educational and public welfare experiments. See W. S. Rich, *The American Foundations*, 7th ed. 1955. See also CARNEGIE TRUST; FORD FOUNDATION; ROCKEFELLER FOUNDATION.

Founder, see HORSE (DISEASES).

Founders' Shares. When a limited liability company is formed, provision is usually made that, after outside shareholders have received a reasonable profit upon their investments, the original owners of the business or founders of the company shall receive the larger share of benefit from any excess profit. In the early days of limited companies this was often contrived by the issue of F. S. to these privileged persons. The plan worked fairly well in many cases, as the special benefits they carried did not become operative until the public subscribers had obtained a satisfactory profit. It was discovered, however, by some rather unscrupulous promoters that, by the insertion of apparently innocent conditions and advantages for these special S. in the articles of association, it would be possible to saddle the outside investor with all the loss, and give him little of the profit. In consequence F. S. fell into disrepute, and the more satisfactory method of issuing preference S. was generally adopted where it was thought desirable to have 2 classes of shareholder. The newer method gives the outside investor the first claim upon profit up to a certain percentage, but when he has received that share, he only benefits in any further profits that may be made in such a way as his arrangement or the prospectus has defined. Preference S. are of so many kinds, and can be issued upon so many conditions, that there is no

object now in issuing S. of which the popular record is unsavoury.

Founding, or Metal Casting, see CASTING; IRON AND STEEL; STEREOTYPING; TYPE AND TYPEFOUNDING; TYPE-CASTING AND TYPE-SETTING MACHINES.

Founding Hospitals, or Asylums. Originally these were institutions for the rearing and care of children who were deserted by their parents, by means of private charity or at public expense. They were intended mainly to prevent infanticide or wilful procurement of abortion, and the exposure and abandonment of children.

The more enlightened Rom. emperors, Constantine, Valentinian, and Justinian, took measures to abolish such offences. In the 6th cent. the bishop of Trèves ordained that the Church should support all children abandoned and placed in a marble basin by the cathedral porch. The capitularies of the Frankish kings mention similar arrangements. The Council of Nicaea in AD 787 decreed that every city should have an institution for the care of neglected children, resulting in the first true F. hospital (as now understood) at Milan (787), estab. by Dutheus. Between the 11th and 14th cents. many similar institutions followed this in France, Italy, and Germany. In France, especially, the subject received much study and attention. Children were first received in the porch of Notre-Dame at Paris. Marguerite de Valois opened a special home in 1536; but no sum was set aside by the state for the maintenance of the F.s till 1552 when the bishop of Paris founded the Couche, but owing to limited accommodation children could only be taken in by drawing lots.

St Vincent de Paul and Colbert, in the 17th cent., tried to remedy the evils that had become prevalent, and the former estab. a home in 1638. Out of it grew the famous Paris F. hospital, incorporated in 1670 under Louis XIV. The Couche was united with it in 1688, and Marguerite de Valois's orphanage in 1772. This hospital takes in all *enfants assistés*, including illegitimate children and *enfants moralement abandonnés* (incorrigibles), as well as real F.s (*enfants trouvés*), almost indiscriminately. The children are generally boarded out in the country after a few days, a sum being paid for their keep, but decreasing yearly and ceasing when the child is 12 years old. The child then usually becomes the apprentice or servant of its foster-parents, but is more or less under gov. supervision till the age of 21. This institution also aims at helping poor parents, and allows the reclaiming of children at any time. Capt. Coram's F. hospital in London was estab. in 1739, but reserved for illegitimate children. Real F.s and waifs and strays are admitted to Dr Barnardo's Homes, Wantage Infant Orphan Asylum, or similar institutions. In the early 19th cent. an arrangement called the 'cradle-tour' (revolving basket or box) was in use for admitting children secretly. This system existed at Marseilles in the 13th cent., but was much abused, and mostly abolished as illegal in

1834. Since 1801 children are admitted to the London F. hospital only after personal examination of the mothers. The previous good character of the mother and her necessity, and the desertion or death of the father, must be known to the committee. Admission is free, and no payment is taken; all children admitted must have had their applications approved before they were 2 months old; some live in the hospital, while others are boarded out. In 1925 the historic site was sold for £1,650,000, and the governors temporarily housed the children in the former Royal Asylum of St Anne's Society, Redhill, Surrey. In 1929 they completed the purchase of the Ashlyns Hall Estate, Berkhamsted, Herts, with 200 ac. of open land at a healthy altitude, for the permanent estab. of the new F. hospital. The London offices are 40 Brunswick Square, W.C.1. The musical traditions inaugurated there by Handel are still kept up. At Moscow and St Petersburg (Leningrad) 2 such institutions were founded by Catherine II (1729-1796). They are to be found also in Italy, Austria, Spain, Scandinavia, China (Canton, 1856), Mexico, Buenos Aires (1774), Rio de Janeiro, and elsewhere. There are many (mostly privately supported) homes in U.S.A., such as the almshouses, Sisters of Charity F. Asylum (1869), Infants' Hospital (1868), Infant Asylum (1871), all at New York. The Dublin Home (1704-1835) was closed owing to the high rate of mortality. The death-rate often ranged from 90 per cent upwards, and averaged 75 per cent. In France and London, especially, this very high figure has now been reduced to about 4 per cent and under. See also CHILD WELFARE AND LABOUR. See R. H. Nichols and F. A. Wray, *History of the Founding Hospital*, 1935; Women's Group on Public Welfare, *Children without Homes: Proceedings of a Conference*, 1945; and H. Donington, *The Care of Homeless Children*, 1946.

Fountain (Fr. *fontaine*, from late Lat. *fontana*, from Lat. *fons*, spring), term applied to places where there is a continual flow of fresh water, by either artificial or natural means. The earliest example known to exist is at Tello (Lagash) in Babylonia, c. 3000 BC, and next comes the Assyrian F. at Bavian, sculptured in the face of the rock and consisting of a series of basins descending in steps to the stream. Anct Gk F.s of any size were usually enclosed, and were common in the cities, springs being plentiful in Greece. They were dedicated to gods, goddesses, nymphs, deities, etc., and were frequently placed in or near temples. The water-supply of Rome was on a large scale, and the remains of the aqueducts form some of the most striking monuments of Italy. These supplied the baths and the public F.s, which were of a large size and numerous. Public and private F.s were some of the most interesting of the Pompeian discoveries; the private ones were of rich and varied shapes, generally in the form of a niche.

Many of the beautiful 17th-cent. F.s in Rome were designed by the architect Bernini (q.v.). Utility was the first object of a F. in early times, and in tns where a number of people might require to draw water at the same time a large basin was erected with a pillar in the centre, from which pipes, each with a separate jet to supply the running water, radiated all round. Many examples of this kind of F. remain throughout Italy and in the old Ger. tns, and a modern reproduction of the kind is to be seen at Holyrood Palace, Edinburgh. Drinking

appeared soon after 1860; in their earliest form most needed to be charged with ink by means of an independent filler. It was difficult to overcome the problem of producing a pen that was fluent for varying speeds of writing but capable of retaining ink without leakage when not in use; ultimately a feed was evolved which is controlled by the sub-reservoirs beneath the nib. To-day all manufacturers can supply a wide range of nibs, from fine to broad, including writing points specially adapted for italic calligraphy. The modern ball-point pen comes into a rather

FOUNTAINS ABBEY

F.s for wayfarers, as well as horses and other animals, are commonly placed in streets and public resorts, and the Metropolitan Drinking Fountain and Cattle Trough Association was formed in London in 1859.

Fountain Pen, instrument for writing in ink (q.v.) in which the penholder takes the form of a hollow shaft containing a reservoir of ink which is released so as to maintain a steady flow during writing. The pen may be designed to be filled in one of sev. ways: by means of a lever on the barrel of the pen; this releases or depresses a small rubber bag contained within the shaft which draws up or expels the ink by suction; by means of a filler button which acts as a piston; or by means of a snorkel device. Some present-day pens may be loaded with an ink 'cartridge.' The first effective F. P.s

different category; semi-solid ink is used and is carried to the paper by the rolling of the ball.

Fountains Abbey, Cistercian A. of West Riding of Yorks, England, 3 m. from Ripon, founded in 1132, and famous as one of England's most glorious ant. monuments. F. A. shows a mellow blending of the Transitional, Early Eng., and Perpendicular styles, and it is not difficult to imagine what it looked like in its heyday. Save for being roofless, the great church, its tower set, curiously, at the end of the N. transept, seems at first sight to be complete, with its long narrow nave, plain and unadorned in conformity with the Cistercian austerity; its chancel enlarged and rebuilt in the 13th cent.; and its beautiful chapel of the Nine Altars or E. transept, which no doubt inspired its only Eng. counterpart at the cathedral of

Durham. The 'great cloisters' vaulted with 2 aisles and 300 ft in length, or more properly the cellarium, is a unique feature of the ruins; there are a refectory and a chapter house, in which latter were interred the remains of 19 abbots.

F. A. has been described as 'the crown and glory of all that monasticism has left us in England.' For 4 centuries it fl. as the greatest Cistercian house in England, and even in its ruined state enables us to recover, better than any other remains of the kind in England, the plan and arrangement of a large Cistercian monastery. F. A., or the A. of the Blessed Virgin Mary at F., originated in a revolt of some monks against the laxity of discipline and worldly tendencies that prevailed at the Benedictine A. of St Mary's, York, and in their determination to withdraw from this A. This they did in 1132, and were provided by Archbishop Thurstan of York with a dwelling-place at F. Very early the monks had applied for admission to the Cistercian order, and this being granted, F. became the spiritual daughter of Clairvaux in Champagne, at that time governed by St Bernard. The little community lived wretchedly for years, but later 3 monks of York (Hugh the dean, and Serlo and Tosti) came to the monastery and bestowed their wealth upon it. Other benefactors followed, and participation in the medieval wool trade brought enormous wealth to the foundation. In 1539 F. A. was surrendered to Henry VIII, who sold the whole estate to Sir Richard Gresham, whose son, the founder of the Royal Exchange, broke up the estate, and sold the A. to Sir Stephen Proctor. The latter used stones from the ruins of the abbot's house to build F. Hall, ruining himself in the process. After many alienations the A. and hall passed in 1768 to the Aislables, ancestors of the earls de Gray and marquesses of Ripon, and for more than 150 years the A. descended from member to member of the family, eventually passing to Commander Vyner, the present owner, 1946. A proposal in that year to restore F. A. as a Benedictine house and an international memorial to all Rom. Catholics killed in the 2 world wars was later abandoned owing to opposition to the sale of the land and buildings. See F. A. Hodges, *Fountains Abbey*, 1904; and C. C. Bell, *The Story of Fountains Abbey*, 1932.

Fouqué, Friedrich Heinrich Karl de la Motte (1777-1843), Ger. writer, novelist, and poet of the Romantic movement, b. Brandenburg. Between 1810 and 1815 F.'s popularity was at its height, and he wrote numerous novels, romances, plays, and epics. The earliest and best known of his works is *Undine*, a classic of romanticism which appeared in 1811. Amongst other vuba. may be mentioned *Der Zauberring*, 1812, and *Die Fahrten Thiodulfs des Isländers*, 1815. See L. Jenthe, *Fouqué als Erzähler*, 1910; J. Haupt, *Elementargeister bei Fouqué, Immermann und Hoffmann*, 1923; and life by E. Reinhard, 1926.

Fouquet, or Foucquet, Jean (c. 1415-

c. 1485), Fr. painter, miniaturist, illuminator, and painter to Louis XI, b. Tours. He travelled to Italy and painted Pope Eugene IV in Rome. His famous portrait of Charles VII dates from 1442. About 1458 he painted the miniatures illustrating *Le Cas des nobles hommes et femmes*, from the Lat. of Boccaccio (later in Royal Library, Munich). Portions of a famous Book of Hours are in the Brentano-Laroche collection at Frankfurt. The Antwerp gallery contains his masterpiece 'Virgin and Child' (tradition says that the Virgin is a portrait of Agnes Sorel). In 1461 F. painted 40 miniatures for Étienne Chevalier, Charles VII's treasurer. A great artist, he united the exquisite manner of the miniaturist with the broader outlook of the dawning Renaissance, and much influenced his contemporaries. See writings of Count Léon de Laborde, Brentano, Count de Bastard; G. Lafenestre, *Jehan Fouquet*, 1905; P. Durrieu, *Jean Fouquet*, 1908; and P. Wechsner, *Jean Fouquet and his Time*, 1948.

Fouquet, or Foucquet, Nicolas, Vicomte de Melun et de Vaux, Marquis de Belle-Isle (1615-80), superintendent of finance in France under Louis XIV, b. Paris, the son of a Fr. nobleman in the confidence of Richelieu. In 1650, through the influence of Mazarin, he was given the important position of procureur-général to the parlement of Paris. As superintendent of finance (from 1653) F.'s fortune, largely acquired by fraudulent operations, surpassed even Mazarin's, and the latter's successor, Colbert, who was instructed to inquire into the state of the finances, secretly influenced the king against F. He was finally arrested at Nantes (1661) and charged with malfeasance in office to the king's detriment, and sentenced to imprisonment for life. It has been suggested that F. was the 'man in the iron mask' (q.v.), but the evidence is against this. See P. A. Chéruel, *Mémoires sur la vie publique et privée de Fouquet*, 1862; and J. Lafr, *Nicolas Fouquet*, 1890.

Fouquier-Tinville, Antoine Quentin (1746-95), Fr. revolutionary, the public prosecutor of the tribunal during the Reign of Terror, b. Hérouel, Aisne. Here, for a time, he practised law, and then came to Paris, where he turned spy. He was one of the most fanatical on the outbreak of the revolution, and his activity earned him the reputation of one of its most terrible and sinister figures. As public prosecutor, he was utterly ruthless. Danton, St Just, and Robespierre were among his victims, but during the reaction to the Reign of Terror he was himself brought to trial, condemned to death, and guillotined in May 1795. See lives by A. Dunoyer, 1913, and J. W. Barwisch, 1944.

Four Freedoms, peace objectives enunciated by President Franklin Roosevelt at a period in the Second World War when the U.S.A. Gov., while not yet at war, was playing a major part in the 'white' warfare of diplomacy in pursuit of its 2 major aims: defence of the W. hemisphere at a

distance, and support for the free values of the 'W. In his ann. message to Congress of 6 Jan. 1941, President Roosevelt answered the Nazi peace drive in relation, especially, to Hitler's real intentions towards Russia, by repudiating a 'peace dictated by aggressors and sponsored by appeasers,' and set forth his famous 'four freedoms'—freedom of speech, of worship, from economic want, and from aggression. He thus offered a basis for the kind of world worth striving for after the war. But the basis was too generalised, having the disadvantage, in addition, of being unilateral, like Wilson's Fourteen Points (q.v.); and further, the F. F. had been launched in a message to Congress. They therefore bound nobody but their authors. Roosevelt envisaged an agreement with the Brit. on broad political and economic principles while America was still at peace, and, above all, he wished to commit the Brit., grimly fighting for survival, to a post-war programme. Whence the negotiations in Aug. 1941 between President Roosevelt, Sumner Welles (foreign affairs), and Harry Hopkins (q.v.) on the one hand, and Winston Churchill and Sir Alexander Cadogan (permanent under-secretary of state for foreign affairs) on the other, for the Atlantic Charter, which incorporated (*inter alia*) the substance of the F. F. See ATLANTIC CHARTER; ROOSEVELT, FRANKLIN DELANO.

Four Lakes, chain of lakes (Mendota, Monona, Waubesa, and Kegonsa) in Dane co., Wisconsin, U.S.A., connected by the Yahara R., a trib. of the Rock R. Upon an isthmus between the lakes Mendota (the largest, 6 m. long by 4 m. wide) and Monona is Madison, the cap. of the state.

Four-year Plans, German, for economic development, prepared in imitation of the Soviet's 5-year plans (q.v.). The first (1933-6), announced by Hitler, was, ostensibly, a limited plan of road construction and public works, but was soon superseded by a huge rearmament programme, which rapidly absorbed all Germany's unemployed. The next plan (1937-40) covered the development of *Ersatz* (substitute) industries designed to make Germany self-sufficient. This plan, too, was accompanied by continued rearmament, and it was still in progress when war broke out (1939), Germany having failed to attain self-sufficiency in any sphere. Oil production had reached only one-third of Germany's peacetime requirements, iron ore and artificial fibre about 20 to 25 per cent, base metal ores 15 per cent, and fats about 50 per cent.

Fourchambault, Fr. tn in the dept of Nièvre, on the Loire. It has mineral springs, and manufs. nails and wire. Pop. 4900.

Fourcroy, Antoine François, Comte de (1755-1809), Fr. chemist, and the son of a druggist, b. Paris. He was one of the earliest converts to Lavoisier's theories, in conjunction with whom, together with Berthollet and De Morveau, he prepared the *Méthode de nomenclature chimique*,

1787. He organised the École Polytechnique, and instituted schools of medicine. In 1801, under Napoleon, he became director-general of public instruction. The Royal Society's *Catalogue of Scientific Papers* enumerates 59 memoirs by F.

Fourier, François Marie Charles (1772-1837), Fr. social philosopher, b. Besançon. He was educ. at the college in his native tn and then travelled in France, Germany, and Holland. He inherited a considerable sum of money on his father's death, but this he subsequently lost at the siege of Lyons, all his property, in which he had invested his inheritance, being destroyed. He then entered the army, but was discharged on account of ill-health. He afterwards turned his attention to mercantile pursuits, and obtained sufficient by this means to satisfy his wants, and devote his leisure time to the elaboration of his first work on the organisation of society. This is entitled *Théorie des quatre mouvements et des destinées générales*, 1808. It contains his whole system, and was later republished under the title *Théorie de l'unité universelle*, 1841, and *Le Nouveau Monde industriel, ou invention du procédé d'industrie attrayante et combinée distribuée en séries passionnées*, 1829-30. *Le Nouveau Monde industriel* is probably the most finished exposition of F.'s views, and on its pub. in 1830 he began to attract some attention, adherents gathering round him.

F.'s system was partly one of co-operation, partly of Socialism. His scheme involved a 'phalanstery' (from the word phalanx), consisting of about 400 families, living in common and combining their labour, upon a dist. of about a square league in area. In 1832 an attempt was made to found an industrial colony on this plan, but it was not successful. His complete works were pub. 1841-8. See R. Maublanc, *Charles Fourier*, 1930; F. Armand, *Les Fourieristes et les luttes révolutionnaires*, 1948.

Fourier, Jean Baptiste Joseph (1768-1830), famous Fr. mathematician, b. Auxerre. He was educ. at the military school in his native tn and afterwards taught mathematics in the same institution. In 1795 he became prof. in the École Normale at Paris, which he shortly left for the Polytechnique. In 1798 he accompanied Bonaparte to Egypt, and took a prominent part in the gov. He returned to France in 1801, became prefect of Grenoble, holding that office until the return of Bonaparte from Elba, when he was dismissed. In 1817 he was elected to the Académie des Sciences, and in 1826 was admitted member of the Fr. Academy. On his return from Egypt he contributed to the *Description de l'Égypte*. In 1822 he pub. *La Théorie analytique de la chaleur*, which had formed part of a thesis awarded a prize by the Académie des Sciences in 1812. *Analyse des équations indéterminées* was pub. in 1831, after his death. A collected ed. of his works was pub. in 1889-1890. F. is best remembered for his development of the series which bears his

name, and which has subsequently become of basic importance in the development of the theory of physics, especially wave motion and heat radiation. The general form of the series is that of the representation of the function of a variable between fixed limits by a series of sines or cosines, as

$$a_1 \sin \frac{\pi x}{l} + a_2 \sin \frac{2\pi x}{l} + \dots + a_n \sin \frac{n\pi x}{l} + \dots \text{ and } b_0 + b_1 \cos \frac{\pi x}{l} + b_2 \cos \frac{2\pi x}{l} + \dots + b_n \cos \frac{n\pi x}{l} + \dots,$$

where the limits are 0 and l . The investigation and criticism of the series were continued by such mathematicians as Dirichlet, Riemann, Cantor, Lebesgue.

Fourmies, Fr. tn in the dept of Nord, on the Helpe Mineure, a trib. of the Sambre. There are textile manuf., ironworks, and glassworks which date from 1599. Pop. 12,700.

Fournier, Henri Alban (Alain-Fournier) (1886-1914). Fr. novelist, b. Chapelle d'Angillon, educ. at Brest and later at the Lycée Lykanal, near Paris. He spent 2 years in military service, followed journalism, and in 1913 pub. *Le Grand Meaulnes* (trans. 1948), his only completed novel, and the basis of his reputation. It is a romantic novel, with an underlying suggestion of deeper significance, and the basic idea is symbolist in character. F. d. in action in the First World War. Fragments of his *Colombe Blanchet* were pub., 1922, and *Miracles*, 1924. See *T. Rivière*, Introduction to *Miracles*, 1924; H. Gillet, *Alain Fournier*, 1948; E. Gibson, *The Quest of Fournier*, 1953.

Fourteen Points, code of allied war aims set forth by President Woodrow Wilson before Congress on 8 Jan. 1918, which for clarity and liberality was in marked contrast to the vagueness and reactionary character of the ideals of the professional diplomatists of 'the balance of power.' The F. P. were instrumental at a critical period in rallying the spirits of many of the oppressed nationalities of central Europe. The P. were (1) open covenants of peace and no secret diplomacy; (2) freedom of navigation in peace and war outside territorial waters, except where seas may be closed by international action; (3) removal of economic barriers; (4) adequate guarantees for reduction of armaments; (5) an absolutely impartial adjustment of all colonial claims, the interests of the peoples concerned having equal weight with the equitable claim of the gov. whose title is to be determined; (6) all Russian ter. to be evacuated and Russia to be given full opportunity for self-development with the aid of the powers; (7) complete evacuation of Belgium and restoration of Belgium without any limit to Belgian sovereignty; (8) all Fr. ter. to be freed, invaded portions to be restored, and the wrong by Prussia in regard to Alsace-Lorraine to be righted; (9) lt. frontiers to be adjusted on lines of nationality; (10) peoples of Austria-Hungary to be given an opportunity of

autonomous development; (11) Rumania, Serbia, and Montenegro to be evacuated, Serbia to have access to the sea, and the relations of the Balkan States to be settled on lines of allegiance and nationality under international guarantees; (12) non-Turkish nationalities of the Ottoman empire to be assured of autonomous development and the Dardanelles to be free to all ships; (13) Polish independence to be restored, the independent state to include ters. inhabited by indisputably Polish pops., and to have access to the sea; (14) a general association of nations to be formed under specific covenants to afford mutual guarantees of political independence and territorial integrity to both great and small states. In Oct. 1918 numerous diplomatic notes were exchanged between Germany and the U.S.A., at a time when the Ger. Gov. realised that their military forces were doomed to defeat, in which Germany endeavoured to obtain some modification of this 'charter of allied aims,' but were gradually brought to realise that Wilson would only recommend a cessation of hostilities on condition of unreserved acceptance by Germany of the F. P. The trans. into practical politics of the F. P. imposed difficulties on the most experienced diplomatists and statesmen, and subsequent events were to prove that world society was not yet capable of putting the ideals embodied in them into practice. The F. P. inspired the creation of the League of Nations (q.v.), while the map of Europe was remade in 1919 on lines which appeared to conform as far as practicable to the principle of self-determination. See also COVENANT; EUROPE; PEACE CONFERENCE (1919); VERSAILLES, TREATY OF. See R. S. Baker, *Woodrow Wilson and World Settlement*, 1922.

Fourteenth Army, largest single A. of Second World War. It held the longest battle-line in the war—from the bay of Bengal northwards to where India and Burma border on China. In 1944 and 1945 the F. A. was about 1,000,000 strong (including all its ancillary formations), and just before the fall of Rangoon it had 500,000 fighting men at its disposal. The divs. that served with it were 2nd and 36th Brit.; 3rd Indian (the Chindits), and the 5th, 7th, 17th, 19th, 20th, 23rd, 25th, and 26th Indian; 11th E. African, and the 81st and 82nd W. African. One-third of each Indian div. consisted of Brit. troops, and the African divs. had Brit. officers and N.C.O.s. The A. was grouped into 3 corps: the 4th, 15th, and 33rd Indian Corps. Later the 15th Corps was detached from the F. A. for the 1945 Arakan and Rangoon offensives. Again, a 4th corps—the 34th—was formed for the invasion of Malaya. The F. A. was the A. which broke the myth of Jap. invincibility on land; which denied the enemy the road to India, and finally threw him back in 2 great thrusts—from Kohima to Mandalay and from Mandalay to Rangoon. Its victory was not only over the Japanese, but over the terrain,

the jungle, and the climate. It was the first A. to plan and execute the movement of whole infantry divs. by air. It was the only A. in the war to develop air supply to the extent of maintaining its front-line troops entirely by air; and from the time of crossing the Chindwin to the fall of Rangoon the whole campaign was based on air supply, which reached a rate of 3000 tons a day. Lt.-Gen. (later Gen., and F.M.) Sir Wm Slim commanded the F. A. from its formation until just before the Jap. surrender. See Sir W. Slim, *Defeat into Victory*, 1956. See also BURMA, SECOND WORLD WAR CAMPAIGNS IN.

Fourth Estate. Edmund Burke, in alluding to the 3 E.s of the realm, viz. lords, clergy, and commons, constituting the Brit. Parliament, termed the public press the F. E., by reason of the enormous influence journalism exerts over both imperial and domestic affairs.

Fourth Party, name applied to a small opposition group within the Eng. Conservative P. about 1880, under the leadership of Lord Randolph Churchill in the House of Commons. The F. P. made itself conspicuous in 1880 and the succeeding years by its vigorous attacks upon the recognised leaders of both P.s. See W. Churchill, *Life of Lord Randolph Churchill*, 1906; and H. E. Gorst, *The Fourth Party*, 1905.

Fourth Republic, of France, came into official existence 24 Dec. 1946. After the liberation of France from the Germans in 1944, the country was governed as a rep. under a provisional gov. headed by de Gaulle (q.v.). The 2nd Constituent National Assembly approved the constitution of the F. R., 29 Sept. 1946; it was then approved by a national referendum (by a majority of under a million, with over 8,500,000 abstentions), 13 Oct. 1946, and came into force 2 months later. The constitutional law of 7 Dec. 1954 made some modifications to the constitution. See further under FRANCE, History.

Foussel Oil, see FUSEL.

Foussa, see FOSSA.

Fouta Djallon, see FUTA-DJALON.

Fowey, port and tn of Cornwall, England, situated on the R. F., 28 m. SW. of Devonport, and 280 m. from London. In early times it was an important seaport, and ships for the crusades were fitted out here. In the reign of Edward III the tn equipped a fleet of 47 vessels, and about 800 men, for the siege of Calais. The inhab. were in later times convicted of piracy, and were deprived of their vessels. Queen Victoria and the prince consort visited the tn in 1846. The prin. industry is the export of china clay, and there is a deep and sheltered harbour. There is a coast-guard and lifeboat station. 'Q.' Sir Arthur Quiller-Couch (q.v.), settled here in 1891, and described F. in his *Troy Town*. Pop. 2300. See W. Macarthur, *The River Fowey*, 1948.

Fowl, see POULTRY.

Fowler, Henry Watson (1858-1933), lexicographer and linguist, son of the Rev. Robert F. of Tonbridge. Educ. at

Rugby school and Balliol College, Oxford. Assistant master at Sedbergh School, 1882-89. In 1905 he produced, in collaboration with his brother F. G. F., a trans. of Lucian, which was pub. by the Oxford Univ. Press. The following year the brothers brought out *The King's English*, which was most successful. They were then commissioned by the Oxford Univ. Press to prepare an abridgment of the *Oxford Dictionary*, which was pub. in 1911 as *The Concise Oxford Dictionary*. Both brothers served with the B.E.F. in the First World War, F. G. F. losing his life. F. then finished alone the *Pocket Oxford Dictionary*, which they had begun in collaboration. The work by which F. will, perhaps, be chiefly remembered is his *Dictionary of Modern English Usage*, 1926—highly original in treatment, and valuable as an aid to correct expression in Eng. This was followed in 1929 by the 2nd ed. of *The Concise Oxford Dictionary*, embodying changes in the language since 1911—the purpose of the work from the first being to 'present as vivid a picture as the small dictionary could be made to give of the English that was being spoken and written at the time.' He also prepared much of the 3rd ed., 1934, which was pub. with a supplement by H. G. Le Mesurier shortly after his death. His various linguistic speculations appeared in the pubs. of the Society for Pure English. Other pubs.: *If Wishes were Horses*, 1929, and *Some Comparative Values*, 1929.

Fowler, John (1826-64), inventor, b. Melksham in Wilts. He is chiefly famous for his steam plough, in which the plough is moved by traction of a stationary engine. This was first employed with satisfactory results in 1850 in the drainage of Hainault Forest in Essex. F. was also the inventor of other improved agric. machines.

Fowler, Thomas (1832-1904), philosopher, b. Lincs. He received his education at King William's College, Isle of Man, and at Merton College, Oxford, where he graduated in 1854. In 1881 he was elected president of Corpus Christi College, which position he filled till his death; and from 1873 to 1888 he was prof. of logic at Oxford. From 1899 to 1901 he was vice-chancellor of the univ. His pubs. include *The Elements of Deductive Logic*, 1867; *The Elements of Inductive Logic*, 1870, *Bacon's Novum Organum*, ed. 1878, *Locke* (in Eng. Men of Letters), 1880, *Francis Bacon*, 1881, *Progressive Morality: an Essay in Ethics*, 1884, *History of Corpus Christi College*, 1898.

Fowling, hunting and catching of birds and wild fowl generally, viz. swans, geese, and the different varieties of duck—canvas-backs, redheads, mallard, teal, pintail, and wood duck, etc. F. is performed in a variety of ways, such as by concealment of the hunter, by decoy, or occasionally, in some parts, by the training of dogs and of ponies to attract the birds. See also WILD FOWL.

Fox, Charles James (1749-1806), Eng. statesman, 3rd son of Henry F., 1st Baron

Holland, educ. at Eton and Hertford College, Oxford. As a boy, encouraged by his father, who desired to make a man of him, to ape the vices of those older than himself, he became a heavy drinker and a reckless gambler. F. entered parliament when he was in his twenty-first year, and in 1770 Lord North made him a lord of the Admiralty, which office he held only until 1772, when he resigned in order to be at liberty to oppose the Royal Marriage Act. He proved himself so excellent a debater that North persuaded him to rejoin the ministry at the end of the year as a lord of the Treasury, but his independence was so marked that the king insisted upon his dismissal. In opposition he vigorously attacked the ministerial policy which cost England her Amer. colonies.

CHARLES JAMES FOX

In 1782 he became secretary of state under Rockingham, but on the death of his chief refused to serve under Shelburne. In the following year he formed a coalition with North, becoming joint secretary of state with him under the duke of Portland, but was dismissed in Dec. when, by the king's intervention, his India Bill was thrown out. The king, who disapproved of F.'s opinions and resented his friendship with and influence over the prince of Wales, was determined never again to let him take office, and he managed to exclude him from the Coalition ministry of 1804, but 2 years later, when Grenville became prime minister, had to accept him as secretary of state. Thus, in the ministry of all the talents, F., who had been in opposition for more than 23 years, *d.* in office. F. had little ability as a constructive statesman, but he was a brilliant leader of opposition. His readiness in reply, his power of speaking at any time and on any subject, made him invaluable to his party, although his words and actions were often inconsistent, and he cheapened his arguments by carrying personal grudges into his public life. His

personal popularity kept his party together, though his attitude to the Fr. Revolution eventually caused a political and personal breach between him and Burke (q.v.). F. was an ardent Whig, opposing all abuses and restrictions of the liberty of the subject. Only shortly before his death he brought in a measure to abolish the slave trade. F. was one of the 2 men of his century who may be described as founders of Brit. parl. Radicalism—the other being Burke. In the hour of their separation F. described in broken sentences the debt he owed to Burke's inspiration. Burke had found the Whigs a world of selfish nobles who cared only for the spoils of office, and begun to create a new Whig party with principles and ideals, and F. soon fell under his spell. He became Burke's chief ally in the battle for justice to the Amer. colonies, justice to Ireland, justice to India, and for the estab. of effective parl. gov. As the advocate of Burke's large ideas F. rapidly made himself the leading popular politician in England. But the great fund of prestige and popularity that he won during his struggle against the king and Lord North during the Amer. war he threw away by a series of sensational blunders. Few would say that F. was well advised in his unquestioning support of the Fr. Revolution, or in his opposition to Pitt during the Fr. wars. But whatever view is taken of his actions, or of the inevitability of the Fr. wars, few can doubt the value of his resistance to the campaign of domestic repression that set in when the war began and lasted for more than 20 years; and in this way F.'s conduct during the Napoleonic wars probably ultimately served the cause of national unity. See Lord John Russell, *Life and Times of Charles James Fox*, 1859–66; Sir G. O. Trevelyan, *Early History of Charles James Fox*, 1889; J. L. Hammond, *Charles James Fox, a Political Study*, 1903; J. Drinkwater, *C. J. Fox*, 1928; and C. Hobhouse, *Fox*, 1934, 1948 (with an essay by H. Nicolson).

Fox, George (1624–91), founder of the religious Society of Friends (q.v.) or Quakers, *b.* Fenny Drayton, Leicestershire, the son of a weaver, Christopher F.; was apprenticed to a shoemaker who also dealt in cattle and wool. Not satisfied with conventional piety, at 19 he left home and wandered for 4 years attending meetings and seeking help from religious people of all kinds. At last, when all his hopes in men were gone, he heard a voice which told him there was one Christ Jesus who could answer to his need. His assurance of this inward presence grew, and soon he began to speak of Christ as the inward teacher of all men who would heed, independently of institutions, priests, rites, or forms of creed. From about 1647 he preached at fairs, in churches after the regular preacher had done, and quickly found followers. His rejection of all mediated religion earned the hostility of ministers, to some of whom he seemed a blasphemer. In Commonwealth times he suffered 4 imprisonments

either for heresy, blasphemy, or as a disturber of the peace. By 1654 Fox and his first converts had created a nationwide movement, but often suffered violent ill usage from crowds. After the Restoration, F. and his followers, who now numbered many thousands, were uncompromising dissenters from the Anglican Church, refusing also to pay tithes. They would not take any oath, even in court, having a single standard of truth. Nor would they, in sincerity, use titles or gestures of social flattery, but addressed all men with the *thee* and *thou* of the common people, and doffed the hat only in prayer. This social radicalism made them suspect as a subversive influence, or as plotters, though in daily life their conduct strove to appeal to the best, the Light of Christ, in all men, and they shunned resort to arms because it was inconsistent with their attitude to men. The systematic persecution of dissenters fell especially heavily on the Quakers, and soon over 4000 of them were in prison. In 1664, F., on the evidence only that he refused the oath of allegiance, entered his 7th and harshest imprisonment, 3 years in Lancaster and Scarborough castles. When released he began 3 years of continuous travel over England, Wales, and Ireland, in spite of disabilities resulting from imprisonment. In that time he instituted a system of church gov. which developed the Quaker movement into a society. In 1671-3 he travelled through the West Indies and the Amer. colonies, where were many Quakers. In 1673-5 he suffered his last imprisonment, at Worcester. He paid visits to Holland and Germany in 1677 and also in 1684. The last years of his life were spent in and about London in the interests of the society he had founded. His friend Wm Penn testified of him that 'his authority was inward and not outward and he got it and kept it by the love of God and the power of an endless life . . . I never saw him out of his place, or not a match for every service or occasion.' His *Journal* was pub. 1694, and many times reprinted. The list of F.'s writings, mainly pamphlets, occupies over fifty pages in Joseph Smith's *Descriptive Catalogue of Friends' Books*, 1867.

EDITIONS.—*Journal*, 1911, and *Short and Itinerary Journals*, 1925, give various MSS. re-ed. verbatim by N. Pennoy. *Journal* (abridged), Everyman's Library, last reprinted 1948; *Journal*, definitive text, ed. J. L. Nickalls, 1952. See J. S. Rowntree, *Life and Character of George Fox*, 1894, *New Appreciations of George Fox* (foreword by J. Rendel Harris), 1925; Baron F. von Hügel, *Essays and Addresses*, 2nd series, 1926 (essay entitled 'On the place and function within Religion of the Body, of History, and of Institutions'); and Vernon Noble, *The Man in Leather Breeches*, 1953.

Fox, Henry, see HOLLAND, 1st BARON.
Fox, Henry Richard Vassall, see HOLLAND, 3rd BARON.

Fox, John (1862-1919), Amer. novelist, b. Paris, Kentucky. Educ. at Transyl-

vania Univ. and Harvard, he was a special correspondent in the Sp.-Amer. and Russo-Jap. Wars, and in 1887 was in the mining business in Virginia. His novels, which were very popular, were largely idealised pictures based on his mining experiences. They include *The Little Shepherd of Kingdom Come*, 1903, *The Trail of the Lonesome Pine*, 1908, which sold well over a million copies, *The Heart of the Hills*, 1913, and *Erskine Dale*, *Pioneer*, 1920.

Fox, or Foxe, Richard (c. 1448-1528), bishop and statesman, b. Ropesley; probably educ. at Oxford. He was a trusted adviser of Henry VII, and held the posts of secretary of state, privy seal, bishop of Exeter (1487), of Bath and Wells (1492-4), of Durham (1494-1501), and of Winchester (1501-28), besides performing many diplomatic missions. He negotiated the marriages of Margaret Tudor and James of Scotland, and of Prince Arthur and Catherine of Aragon. After the accession of Henry VIII, however, his cautious policies were out of favour, and in 1516 he retired from court. He founded Corpus Christi College, Oxford in 1516.

Fox, 2 rivs. of the U.S.A. One, 176 m. long, rises in the lake area to the N. of Madison, Wisconsin, is connected by the Portage Canal with the Wisconsin R., and continues NE. to Lake Winnebago at Oshkosh and beyond this to Green Bay. The other, 185 m. long, rises near Waukesha, Wisconsin, and flows SSW. to the Illinois R. at Ottawa, Illinois.

Fox (Dutch *vos*; Ger. *fuchs*), name properly applicable only to the Brit.

Mirrorpic

representative of the family Canidae, but now used to include many other species. The feminine form, 'vixen', represents the O.E. *fuken* (fox plus the feminine termination *-en*). The genus *F.* (*Vulpes*) is distinct from the genus *Canis* by the slighter build, the long and bushy tail, and

the large ears of the members of the former. Also the projection behind the eye-socket has its upper surface concave, with a raised ridge, instead of regularly convex as in the genus *Canis*, and there is not a hollow chamber within the frontal bone of the forehead. The range of the F. extends eastwards across Europe to Japan, and to the S. across North Africa, Persia, NW. India, and the N. Amer. side of the Atlantic. Naturally over such an area many local differences are found, and the red F. of NW. Europe differs considerably from the white-footed F. of Persia and Arabia, whilst both are in many respects dissimilar to the black F. of N. America. Among other species may be mentioned the Himalayan F. (*Vulpes montanus*), the Tibetan F. (*V. ferrilatus*), the Alaskan F. (*V. harrimani*), the largest species, the Indian F. (*V. bengalensis*), the *V. famelicus* or *acgyptiacus* of Egypt, the Arctic F. (*Alopex lagopus*), etc. The Amer. grey F. (*Urocyon cinereo-argenteus*) is a separate sub-genus of *Canis*, whilst the long-eared F. of South and East Africa (*Otocyon megalotis*) forms a distinct genus. The skins of many varieties of the F. are valuable, and are largely imported into this country for furs. The cunning of the Eng. F. is well known. The vixen brings forth a litter of from 5 to 8 cubs in April, the period of gestation being 60 to 65 days. The cubs take 18 months to grow to their full size and strength; the average life of the F. is about 13 years.

Fox-bat, see FRUIT BAT.

Fox-hunting, as practised at the present time, is not of very great antiquity. Foxes existed in this country from early times, and they were hunted in the days of Edward I., but such hunting was as different from F. proper as light from dark. Wm. the Twin, who was head huntsman to Edward II., mentions the fox as belonging to the inferior class of animals that should be exterminated by any means, and again in the *Records of the Chase*, written in the time of Edward III., the fox is named with contumely. In those times foxes were pursued with no ceremony or methods, but caught in nets, or shot, or dug up from their earths and slaughtered at every possible opportunity. Such views prevailed until the 18th cent., when F. began to take its place as a sport. It is not possible to say with exactitude when the first pack of hounds was maintained in England entirely for F., but the following facts throw some light on the matter. In a letter from one of his descendants, it is stated that Lord Arundale, between 1690 and 1700, kept a pack of fox-hounds which were maintained in the family until they became the property of Hugh Maynell in 1782. The *Field* of 6 Nov. 1875 describes a horn, which later became the property of Thomas d'Avenante, Esq. The inscription on this reads: 'Thomas Boothby, Esq., Tooley Park, Leicester. With this horn he hunted the first pack of foxhounds then in England for fifty-five years. Born 1677. Died 1752.' These statements are not

conclusive, as the packs mentioned may not have hunted foxes exclusively, but they serve to indicate the probable truth of the statement in Lord Wilton's *Sports and Pastimes of England*, 1868, that hounds began to be entered solely to fox about 1750. In the early days of F. the procedure was somewhat different from the present. The meet took place in the early hrs of the morning, and the fox was traced by his 'drag,' that is, the line he had taken on his return from a foraging expedition on the previous night. The disadvantage of such a course was that a fox was very liable to be scared by the hounds on the drag scent, and make good his escape before they caught the real scent.

Now, owing to the decrease in woods, etc., it is considered the better way to find the fox in his kennel, and the hr of the meet is retarded until about 11 in the forenoon. When the fox breaks away from the covert he is allowed to travel for some little distance before the alarm is given, in order that he may not retrace his steps into the covert. The rules which govern scent are as little understood to-day as ever. On some days when all things seem propitious the scent will fail, and vice versa. It is thought by some that the manner in which hounds come out of covert may be taken as an indication; if they dwell for some moments before settling to the line the scent is good, but if the scent be poor they will make all haste not to lose it. An easterly wind is probably the best for scent, in spite of the poet who sings of 'a southerly wind and a cloudy sky.' An extraordinary circumstance is that if the fox is coursed at any period of the run by a dog, the scent falls after that point. The most dreaded foe of the fox-hunter is of course frost. The hunting season proper begins in Nov.; but during part of Sept., the actual date of starting varying according to the time of harvest in different parts of the country, and during the whole of Oct. cub-hunting is carried on. The object of this is indicated by the name, to blood young hounds, teach them their business, and scatter the cubs. Cub-hunting is commenced in the early morning, about 7 a.m. The size of packs naturally varies from very large estabs. in the Shires to small kennels in the N. of England. If a pack hunts for 5 days in the week, or possibly 6, as some do, about 75 or more couples of hounds will be required; if 4 days are hunted, from 50 to 60 couples; or if only 2 days, from 25 to 30 couples. A new entry begins cub-hunting at the age of about 18 months, and is then probably of the first class for 3 or 4 more seasons. Many hounds last longer than this, and it is recorded of 'Potentate,' a noted hound belonging to a duke of Beaufort, that he hunted for 11 seasons. The pick of the hunting in Great Britain is supposed to be in the Shires, a somewhat arbitrary term, which conventionally means Leicestershire, Northants, and Rutlandshire, but does not exactly correspond with these. The packs which hunt the

Shires are the Belvoir, the Cottesmore, the Quorn, and the Pytchley.

Despite various agitations and remonstrances, the sport of F. has not declined in popularity of recent years; but the active work of the National Society for the Abolition of Cruel Sports (101 Chandos House, Westminster, S.W.1) and the League against Cruel Sports (58 Mud-dox Street, Bond Street, W.) has forced the F. fraternity into forming a society called the Brit. Field Sports Protection Society. A Bill for the banning of blood sports, including F., was introduced by a private member in 1949, but met with no great support in the Commons so far as F. was concerned.

In 1955-6 there were 236 packs of hounds in the Brit. Isles—194 in England and Wales, 32 in Ireland, and 10 in Scotland. As regards the cost of hunting, it may be taken as a rough estimate that for every day in the week that hounds hunt the cost per annum will be between £1250 and £1750; various local circumstances will influence the cost in each case, but it will not as a rule fall below £1000. Any price may be given for hunters, from £30 to £800; sev. hundreds of horses, ranging in price from 200 guineas to 650 or 700 guineas, passing annually through the hands of Tattersall's in London and Warner Sheppard and Wade's in Leicester. If a man wishes to hunt regularly with a pack in the Shires, he must, of course, have a far greater estab. than a man who hunts in the N. The sums of money that are spent on hunting every year in this country in normal times are very large, and many persons are employed in connection with the sport. The officials of a hunt comprise the master (M.F.H.), 1 or 2 'whippers-in,' and a kennel huntsman or 'feeder.' If the huntsman is an amateur, he is also invariably the master; if the master does not hunt his own hounds a paid huntsman is employed. In large packs 2 whippers-in are employed, but in some packs only 1. The duties of whipper-in and kennel huntsman are often performed by one person, especially if the master hunts his own hounds. The kennel huntsman proper is the man who looks after the hounds in kennel, feeding them and attending to them, and who also walks them out. It was, however, the opinion of Lord Willoughby de Broke, one of the foremost authorities, that the man who hunts the hounds should also feed them. It is the first duty of a huntsman to gain the confidence of his hounds; the sagacity and resource of a well-trained pack are remarkable. The whipper-in, or whippers-in, when the hounds are drawing a covert, should be neither too near to nor too far away from the hounds; when they have found, he should get to them as soon as possible, and take a line parallel to that of the huntsman, and prevent the pack from dividing. The quality of the hunting enjoyed at the present day is probably as good as ever it was. Great care is exercised in the breeding of hounds and of horses, and the pace is set, on the whole, faster of late years.

F. is by no means confined to England at the present time, but has been transported to various quarters of the globe. Manitoba has had a pack since 1826, and the Peshawar Vale hounds in India are as celebrated as the Belvoir or Quorn in England. The enthusiasm of the garrisons at Alexandria and Cyprus caused hunting to be instituted there, and among other places where the sport is carried on may be mentioned Florida, where meets are held in moonlight, other parts of the U.S.A., Bechuanaland, and New Zealand. There are 96 packs of hounds hunted in the U.S.A.

See Peter Beckford, *Thoughts on Hunting*, 1820; 'Cecil,' *Records of the Chase*, 1854; Lord Willoughby de Broke, *Hunting the Fox*, 1920; S. Reeve, *Fox-hunting Recollections*, 1928; A. H. Higginson and J. A. Chamberlain, *Hunting in the United States and Canada*, 1928; L. D. R. Edwards, *Huntmen Past and Present*, 1929; S. Sassoon, *Memoirs of a Fox-hunting Man*, 1929; A. H. Higginson, *Two Centuries of Fox Hunting*, 1946; Frances Pitt, *Hounds, Horses and Hunting*, 1948; G. T. Burrows, *Gentleman Charles*, 1951; and *Baily's Hunting Directory* (pub. annually).

Fox Indians, North Amer. Indian tribe of the Algonquian linguistic family and closely allied to the Sauk (q.v.). They were defeated by the Fr. and to-day number about 500, mostly in Wisconsin.

Fox-shark, or **Thresher**, name given to *Alopias vulpes*, a common species of sharks found in the Mediterranean and the Atlantic and in most subtropical and temperate seas. Its chief characteristic is a very long tail, nearly half of its own length, which is from 15 to 20 ft. The F. follows the shoals of small fish, such as herrings or pilchards, driving them together by the lashing of its tail. Hence its name.

Fox-terrier, small dog which used formerly to run with the hounds; it is probable that the modern F. has developed from these small hunting dogs. They were used to unearth foxes from holes, but since the speed of hounds has increased it has been found impossible for them to keep up with the chase. Smooth-haired terriers were first exhibited about the middle of the 19th cent., and have become very popular as house dogs. The rough-haired variety were exhibited in 1872. Fs make intelligent and affectionate companions. Though not snappy and quarrelsome, they are always ready for a fight, and make excellent ratters. The chief points are: Head long, flat, and narrow, with very strong teeth, small ears, small keen eyes, black nose, and clean cheeks; shoulders sloping; forelegs very straight and bony, with firm, compact feet and arched toes; chest and fore-ribs narrow; hocks strong; stifles well bent; tail, which is usually cut short in puppyhood, is held erect; colour, white with black or tan markings, brindle spots being objectionable. The smooth-haired variety should have a thick, dense, and smooth coat; the rough-haired, coarse,

of a bent and splintered bone: this is an incomplete F., as are also depressed and fissured F.s. Multiple is when more than one F. is present. F. is rendered more likely by any morbid condition which weakens the bone, by the condition of old age, when bone becomes more brittle. F. may be recognised by the helpless condition of the limb, the extreme pain on movement of the affected part, and, frequently, a visible deformity. When the signs are present further investigation must be carried on with the minimum of movement. An unmistakable symptom is *crepitus*, by which is meant the grating sensation of the broken pieces passing over each other; this symptom should never be looked for except by a doctor. The treatment aims at aligning the broken ends accurately together to restore the normal anatomy of the bone, and the part is secured by splints or other apparatus to secure immobility. Sometimes fixation of the broken fragments is secured by surgical operation and plating, pinning or screwing them together. When the bone has joined, gradually increasing movement is advocated in order to accustom the muscles, tendons, etc., to the resumption of their functions.

For F.s in horses, see under HORSES (DISEASES).

Fragaria, or **Fragaria**, see STRAWBERRY.

Fragmental Volcanic Rocks, see PETROLOGY; AGGLOMERATE; TUFF.

Fragonard, Jean Honoré (1732-1806), Fr. painter, b. Grasse, Provence; studied under (Chardin and Boucher (q.v.)), and in 1752 won the Prix de Rome. He then went to Italy, and was much influenced by the work of the Venetian painter Tiepolo. He illustrated St Non's *Voyage de Naples et de Sicile*. In 1765 he returned to France, and executed 'Callirrhoe', commissioned by Louis XV for reproduction in tapestry. After the Revolution he d., almost forgotten, in Paris. He produced sev. decorative paintings and many landscapes, and also worked in pastel and water-colour and engraved. Among his best works are *genre* paintings of contemporary life. A masterpiece of charm is 'The Swing', 1767 (Wallace collection). Many pictures are in the Louvre, including 'Bacchante Asleep', 'Nymphs at the Bath', 'Music Lesson', 'The Guitar Player', 'Cupid and a Girl', 'The Happy Mother', and 'The Cradle.' See G. Grappe, *La vie et l'oeuvre de J.-H. Fragonard*, 1929; E. and J. de Goncourt, *French 18th century painters*, (trans. 1948).

'Fram' (Norwegian, 'forward'), ship especially designed for Arctic exploration by Dr Fridtjof Nansen, and used by him in 1893. The strength of the ship, combined with the sloping sides, successfully withstood the pressure of the ice. She was used again by Sverdrup during the second Norwegian North Polar Expedition, 1898-1902, and by Amundsen during the Norwegian Antarctic Expedition, 1910-12. F. is now laid up in a special museum near Oslo. A model exists in the Scott Polar Research Institute (Cambridge).

Framboesia, see YAWS.

Frameries, tn in the prov. of Hainaut, Belgium, 4 m. SW. of Mons. There are important coal-mines here, and also a chalk quarry. It has manufs. of chicory and ropes, breweries, distilleries, brick-works, and limekilns. Pop. 12,300.

Framingham, tn of Middx co., Massachusetts, U.S.A., on Sudbury R., 19 m. WSW. of Boston. It includes S. F. and Saxonville. Automobile manufacturing and assembling, and the manuf. of paper, rubber, and metal products, also shoes and carpets, are carried on. There is truck, dairy, and poultry farming. It was settled in 1650 and incorporated as F. in 1700. A state teachers' college is situated here. Pop. 23,100.

Framlingham, tn of Suffolk, England, 22 m. NE. of Ipswich. The tn is built round a spacious market-place, and contains a fine flint-work church (in which are tombs of sev. notable members of the Howard family), and the Albert College, 1864. The 14-cent. castle, largely destroyed in 1650, was the refuge of Queen Mary after Edward VI's death. Pop. 2100.

Frampton, Sir George James (1860-1928), sculptor. He studied under W. S. Frith, entered the Royal Academy schools in 1881, gained the gold medal and travelling studentship in 1887, and studied in Paris under Mercie and Dagnan-Bouveret. In 1894 he exhibited at the Royal Academy and was elected an associate. In 1900 he gained the *medaille d'honneur* at the Paris Exposition. He was elected R.A. in 1908, and knighted in the same year, and during 1911-12 was president of the Royal Society of Brit. Sculptors. Among his works are 'Peter Pan' in Kensington Gardens, the Edith Cavell memorial in Westminster, 'Lamia,' the Mitchell memorial at Newcastle, the Keene memorial, statues of Queen Victoria at Calcutta, Winnipeg, etc., and the sculpture on many famous buildings, such as the Constitutional Club and the Glasgow Art Galleries, and the figures on St Mary's spire, Oxford.

Franc, unit of money in France and other countries. The name dates back to the 14th cent., when, in 1360, a gold coin was struck bearing the effigy of King John II on horseback, and the legend *Johannes Dei gracia Francorum rex*. This particular coin went out of use in the latter half of the 15th cent., but the name continued to be used for the livre (tournois) (q.v.), and a sum of money was referred to indiscriminately as, e.g., 'trois francs' or 'trois livres.' From 1578 onwards silver F.s were struck. These pieces were worth about 2fr. 60c. of Fr. money at pre-1914 value. After the Fr. Revolution, the F. assumed the value (about 25 to the £ sterling) which it bore with slight variations until 1914. The F. is divided into 100 centimes, and in its present form as the official Fr. monetary unit, and as a unit of the decimal system, dates from 1795. In 1865 an agreement was signed by which sev. European countries bound themselves in the Lat.

Monetary Union to adopt the decimal system of the Fr. F. In Switzerland the unit is called the F. In Italy the lira, and in Greece the drachma. Like the moneys of the other European belligerents, the Fr. F. fell seriously in value during the First World War, eventually dropping to one-fifth of its value as against gold. Through the energetic measures of Raymond Poincaré the value of the F. was stabilised at 124·21 to the £ in June 1928. On the liberation of Fr. in 1944, the F. was fixed at 200 to the £, but by 1948 had been devalued to as low as 1060 to the £. Since Sept. 1949 the value has been pegged at 980 fr. to the £ sterling, and 350 fr. to the \$ U.S.A. Coins in circulation are 50 and 20 F.s in copper-aluminium, 10 F.s in copper-nickel and in copper-aluminium, and 5 F.s, 2 F.s, and 1 F. in aluminium. See METROLOGY.

Francavilla di Sicilia, tn in Sicily (q.v.), 30 m. SW. of Messina (q.v.). Pop. 6000.

Francavilla Fontana, It. tn in Apulia (q.v.), 19 m. SW. of Brindisi (q.v.). It has a cathedral and a royal palace. Textiles and leather are manufactured. Pop. 26,900.

France, Anatole (Jacques Anatole Thibault) (1844-1924), Fr. writer, b. Paris. His father kept a bookshop and specialised in rare vols. and MSS. He was sent to the Jesuit Collège Stanislas, where he became strongly attracted to the anc. classics—especially Homer; and he learned medieval hist. at the École des Chartes. When he was 15 he dedicated to his parents his first literary work, *La Légende de Sainte Radegonde*, 1859. He contributed verse and articles to the smaller reviews; it was in the *Revue théâtrale* that he first signed himself A. F. For Pierre Larousse's *Grand dictionnaire* he wrote articles on masterpieces of antique art. His first pub. vol. was *Étude sur Alfred de Vigny*, 1868. Later appeared some vols. of his verse. In 1876 he became an assistant in the library of the Senate under Leconte de Lisle. In 1879 he pub. in 1 vol. 2 little novels, *Jocaste* and *Le Chat maître*, which show the influence of Daudet and Dickens. His originality was manifested in *Le Crime de Sylvestre Bonnard*, 1881, 'a model of prose, harmonious and winged.' *Les Désirs de Jean Servien*, a sad tale of the Commune, came out in 1882. *Le Livre de mon ami*, 1885, is a delightful assortment of childish recollections.

On 21 Mar. 1886 he joined the staff of *Le Temps*, succeeding Claretie as writer of 'Vie à Paris.' The following year he succeeded Scherer as writer of 'Vie littéraire' in the same paper. His conduct of this dept illustrated his famous definition of the office of a critic: 'Raconter les aventures de son âme au milieu des chefs-d'œuvre.' In 1889 appeared a vol. of stories entitled *Balthazar*. In 1890 came *Thaïs*, a story of a courtesan of Alexandria converted by the monk Paphnutius. About 1891 A. F. had a literary dispute with Leconte de Lisle, and was obliged to leave the Senate library.

In 1892 appeared *L'Étui de nacre*, containing 15 stories that had come out separately in different pubs., one of them the famous *Procureur de Jude*. In 1893 he left *Le Temps*; and in the same year appeared *La Rôtisserie de la reine Pédauque*, 'a story of magic, somewhat baroque, a little too erudite in places,' but introducing the Abbé Jérôme Coignard, who has been called 'the most graciously eloquent of the author's mouthpieces,' and who reappears in *Les Opinions de Jérôme Coignard*, 1893. Some change of style is noted in *Le Lys rouge*, 1894, a story of passion and jealousy. A return to meditativeness marked *Le Jardin d'Épicure*, 1894, and *Le Puits de Sainte-Claire*, 1895.

In 1896 A. F. was elected to the Academy. Soon afterwards the Dreyfus affair became a national scandal, and engaged much of A. F.'s activity for the next few years. It is the main theme of *Histoire contemporaine*, whose hero, the immortal M. Bergeret, voices the ideas of the author throughout 4 vols., *L'Orme du mail*, 1897, *Le Mannequin d'osier*, 1897, *L'Anneau d'améthyste*, 1899, *Mon-sieur Bergeret à Paris*, 1901. About this time he wrote sev. political works: *Opinions sociales*, 1902, *L'Église et la république*, 1904, *Vers les temps meilleurs*, 1907. The very well-known *L'Île des pingouins*, 1908, is a hist. of modern France in fable recalling Voltaire.

Les Dieux ont soif, 1912, had appeared serially as *Feuariste Gamelin*. It is among A. F.'s masterpieces, reproducing the atmosphere of the end of the 18th cent. He visited England in 1913, fraternising with his Socialist comrades there.

In the First World War, A. F.'s occupation being wellnigh gone, he retired to Saint-Cyr-sur-Loire, near Tours. He pub. *Sur la voie glorieuse*, 1915, a collection of patriotic articles; and he protested against the idea of a peace without victory. But the peace as settled was hateful to him, and made him an anti-militarist. In 1921 he received the Nobel prize for literature. His last 2 works, *Le Petit Pierre*, 1918, and *La Vie en Fleur*, 1921, were in continuation of his autobiographic, half-true, half-romantic sketches of a past epoch. His eightieth birthday brought him the homage of all the literary world; 6 months later he d. at La Béchelleraie, Saint-Cyr-sur-Loire. See G. Truc, *Anatole France, l'artiste et le penseur*, 1924; J. L. May, *Anatole France: the Man and his Work*, 1924; N. Séguir, *The Opinions of Anatole France* (trans. by J. L. May), 1928; L. P. Shanks, *Anatole France*, 1932; E. Seillière, *Anatole France, critique de son temps*, 1934; E. P. Durgan, *Anatole France*, 1937; J. Sufel, *Anatole France*, 1946.

France (La République Française), rep. of W. Europe, lying between 51° 5' and 42° 20' N. lat., and 4° 42' and 8° 11' E. long. It is bounded on the NW. by the Eng. Channel and the Strait of Dover, on the NE. by Belgium, Luxembourg, the Saarland, and Germany, on the E. by Switzerland and Italy, on the S. by the

Mediterranean Sea and Spain, and on the W. by the Bay of Biscay. It is well defended by its natural boundaries, the Vosges Mts and the Rhine being on the Ger. frontier, the Jura Mts on the Swiss, the Alps on the Italian, and the Pyrenees on the Spanish (q.v.). Only on the frontier with Belgium is there no natural protection. In shape F. is something like an irregular hexagon. Its greatest length is 600 m. and its greatest breadth 540 m. Area (including Corsica, q.v., and the 4 small frontier dists. added to Fr. ter. by the It. peace treaty of 10 Feb. 1947) 212,659 sq. m.

The coastline of F. is some 1750 m. in length, and is washed by 3 seas: the Mediterranean, the Bay of Biscay, and the Eng. Channel. The Mediterranean coast has sev. good harbours in the E. part, but the W. part is flat and not easy of access. The W. coast generally is deficient in good natural harbours, many of the harbours existing having been constructed at great outlay. The Riviera (q.v.) coast is bold and lofty, but, by contrast, that of the Bay of Biscay is low, with a chain of sand dunes near the shore and many lagoons. In the NW. peninsula of Brittany (q.v.) the coast is rugged and fringed with small is. F. has, however, no is. of importance; Corsica is, geographically, rather a part of Italy, though politically belonging to F., and the Channel Is. (q.v.) belong to England. The biggest is. are Belle Île, Île de Ré, and Île d'Oléron (q.v.). The surface of F. is generally level. High lands are found in the E. and SE. only. The N. and NW. parts, exclusive of the heights in Brittany, consist of low lands which form part of the great central plain of Europe. E. of the dunes, between the Pyrenees and the Gironde, are stretches of infertile, sandy country (see LANDS).

In the S. central part of the country lie the Auvergne Mts. a cluster of heights of volcanic origin rising to between 5000 and 6000 ft, and forming a watershed whence rise the Loire, the Allier, and the Dordogne (q.v.). Between the Auvergne Mts and the Mediterranean is a chain known as the Cévennes (q.v.), which rise to some 6000 ft. Their S. slopes are fertile and sunny, while the N. slopes are high-lying and dreary. N. of the Cévennes and skirting the Rhône and the Saône lies a low range of hills some 2000 ft in height, known as the Côte d'Or (q.v.), while to the E. of the N. portion of the Côte d'Or rises the lower end of the Vosges Mts, some 4000 ft in height. The slopes of the Vosges are covered with thick forests. To the S. of the Vosges are the Jura Mts, separated from the former by a narrow depression through which runs the Saône-Rhine Canal. The Jura Mts are over 5000 ft in height, clothed with forests, and supporting a dense pop., engaged mainly in cattle breeding and agriculture. S. of the Jura Mts, and separated from them by the valley of the Rhône, which here widens out into Lake Geneva, are the Alps, containing Mt Blanc (15,732 ft). The Alps

are divided into sev. chains, including the Pennine Alps in Savoy, with Mt Blanc and the Graian, and the Cottian Alps further S. The Savoy Alps are much visited by tourists, Chamonix being a well-known resort, but the Graian Alps are thinly populated. The Pyrenees on the S. frontier rise to a height of 10,000 ft (Mt Nethon, 11,168 ft) and possess but few passes. The prin. is the pass of Roncevaux (see RONCEVAUX). Other passes are those of Perche and Pertuis in the E., near the Mediterranean coast. Owing to the height of the passes railways do not traverse the Pyrenees, the routes between F. and Spain lying close to the seaboard. In the E. Pyrenees is the little rep. of Andorra (q.v.).

The prin. rivers of F. are the Loire, Garonne, Dordogne, and Adour (q.v.), flowing into the Bay of Biscay, the Seine and Somme (q.v.), flowing into the Eng. Channel, and the Rhône (q.v.), flowing into the Mediterranean. Of these the Loire is the largest, draining—with its tribs.—an area of some 45,750 sq. m., a fifth part of the whole of F.

Climate.—(Owing to its proximity to the sea, the climate of F. is, on the whole, temperate. It feels the moderating effect of the Gulf Stream, not, however, to so great an extent as England. The winters are mild and the summer not overbearing hot. The prevailing wind is westerly, and brings many rainy days, especially on the coast of Brittany, where it rains some 170 days during the year. The rain is, however, very slight, and the ann. rainfall is therefore small, being only some 20 in. Snow is not very heavy in the plains, but is, of course, abundant on the Pyrenees and Alps, as well as in the mountainous dists. of the centre. The NE. highlands have a climate resembling that of central Europe. The climate of Brittany corresponds closely to that of the SW. coast of England, and is more moderate than the rest of F. In Paris the extremes are greater, but even here the average temp. during the winter is 36° F., and the hot spell during the summer is not of long duration. The rainfall in Paris is 50 days per annum. The climate of the Mediterranean seaboard is of a sub-tropical character, the winter being temperate and the summer intensely hot. It is moderated, however, by the 'mistral' (q.v.), a cold, boisterous wind which blows with great force from the central plateau, and which, by driving off the moist air from the Mediterranean, lessens the frequency of rainfall along the Riviera.

Agriculture and Land Tenure.—The soil of France is, on the whole, very fertile, and there are some 12,000,000 workers employed in agriculture. Of a total area of 55,160,000 hectares, 18,669,000 are cultivated, 12,340,000 are pasture lands, 11,352,000 are forested, 5,404,000 are uncultivated, and 1,564,000 are devoted to viticulture (1955 figures). The areas, in hectares, given over to the production of the chief crops are as follows (1955 figures; provisional figures for 1956 in parentheses): wheat, 4,554,000 (3,714,000);

rye, 387,000 (372,000); barley, 1,313,000 (3,290,000); oats, 2,077,000 (2,293,000); potatoes, 1,040,000; beet, 374,000 (379,000). The ann. output of wine is 50-60 million hectolitres, of which some 2-5 per cent is exported. The greatest wine-producing areas are Bordeaux, Burgundy, and Champagne (q.v.), but much *vin ordinaire* comes from the Midi (q.v.). Only in the NW. is no wine produced. Cider and perry are made in Normandy, Brittany, and Maine; and in Nord and Alsace hops are grown for beer. The brandy of Cognac (q.v.) is famous, and there are also the brandies of Armagnac, the marc of Burgundy, the eau-de-vie of Calvados, and a large number of liqueurs (Cointreau, Benedictine, Chartreuse, etc.). Much wine is imported from Algeria, Spain, and Italy. Large quantities of apples, pears, peaches, plums, cherries, apricots, and nuts are grown. In the S. of F. mulberry-trees are specially cultivated for silkworms; the silk industry is encouraged by the gov., and production is carried on mainly in 17 depts, chiefly Gard, Drôme, Ardèche, Var, and Lozère. In 1955 there were 7382 producers, and the yield was 24 metric tons. The chief industrial crops are tobacco, which is a state monopoly, largely grown in the basins of the Garonne and the Rhône, oilseeds, flax, and hemp. Fisheries are important, and the numbers of livestock in the country are (1956 provisional figures): horses, 2,093,000; cattle, 17,792,000; sheep, 8,355,000; pigs, 7,728,000; mules, 91,900 (1955).

Industry.—In mineral wealth F. is poorer than England. Coal and iron are widely diffused, but are found far away from each other, which greatly increases the cost of production. In 1956 the mines of F. produced some 55,000,000 metric tons of coal, and 2,200,000 metric tons of lignite. The prin. coal-fields are in the NE., near Belgium, in the valley of the Upper Loire, around St Etienne, and around Creuzot. The production of iron-ore in 1956 was about 52,680,000 metric tons. The prin. producing dist. is in the valley of the Moselle, near Nancy, Longwy, and Briey; other deposits are worked near Creuzot and in the W. Copper, zinc, lead, tin, nickel, and gold are also produced, but not in nearly sufficient quantities to satisfy the nation's demands. Uranium is mined in Haute-Vienne. Salt is produced from brine pans on the shores of the Mediterranean and the Bay of Biscay, while rock salt is found in great quantities near Nancy. The output of petroleum in 1954 was 505,185 metric tons, of which the greater part came from the Lacq oilfield in the Pyrenees. The important oil-refining industry of the country (Dunkirk, Le Havre, Rouen, Marseilles) is fed with imported crude oil. The production of electrical power in 1955 amounted to 49,827 million kilowatt hrs, of which 52 per cent was hydroelectric power, chiefly from waters in the Alps, Jura, Vosges, and Pyrenees.

F. ranks as one of the leading manufac-

turing countries of the world, and the growth of industry has been encouraged by the rapid increase, post-war, in electrical power. Chemicals, machines and machine tools, motor-vehicles, aircraft, rubber goods, wood products, paper, sugar, porcelain (Limoges, Sèvres), food-stuffs, and leather goods are among the prin. manufs., but the main industry of the country remains the production of textiles and goods made from textiles. The centre of the silk industry is Lyons; other important silk manufacturing tns, apart from Paris, are Nîmes, Tours, and St Etienne. Woolen and cotton goods are chiefly made at Tourcoing, Roubaix, Lille, St-Quentin, and Rouen. Linen goods are made at Lille, Amiens, and other N. tns. The carpets and tapestry of Aubusson have long been world famous. After Belgium F. is the leading country for lace, which is largely manufactured in the NE., especially at Valenciennes. F. is the chief glove-making country of the world, Paris and Grenoble being the centres of the industry. Paris is still looked upon as the fashion centre of the world, and it is also the home of a great number of small industries, particularly the manuf. of perfumes and other luxury goods. The dyeing and calico-printing industries are highly developed, as is the sugar industry (1955, 108 works employing 47,000 people). In 1946, the gov. ordered the creation of a 'First Over-all Plan for the Modernisation and Economic Equipment of the Metropolitan and Oversea Territories,' and the subsequent plans produced under the direction of M. Jean Monnet have led to marked industrial expansion.

Foreign Trade.—The Fr. mercantile marine in 1955 possessed 722 vessels of over 100 tons, with a gross tonnage of 3,597,218. (At the end of the Second World War the gross tonnage of the mercantile marine was 611,000, compared with some 3,000,000 tons pre-war and 2,500,000 tons at the end of 1945.) In 1954 the figures for shipping in foreign trade were as follows: entered 22,470 vessels; cleared 20,933 vessels (39,901,227 net tons). The prin. imports are wine, coal and coke, wool, raw cotton, cereals, oil, chemicals, oleaginous fruits and seeds, machinery, raw skins, timber, rubber, copper, and coffee. The prin. exports are chemical products, iron and steel, textiles, motor cars, wine, soap, perfumes, and glass. In 1956 the value of Fr. foreign trade was (in thousand million francs):—Fr. Union: imports 462.1, exports 521.1; foreign countries: imports 1,514.2, exports 1,100.9. Imports from Great Britain were valued at (in thousand million francs) 109, and exports to Great Britain at 97. The prin. countries from which F. imports are, in order: U.S.A., Federal Rep. of Germany, Great Britain, Iraq, and the Netherlands; and to which F. exports: Federal Rep. of Germany, Switzerland, Great Britain, U.S.A., and Italy.

Communications.—The compactness of Fr. ter. is favourable to the development

of good communications. The country possesses all kinds of stone and road-making materials, and, owing largely to the energy of Napoleon I (q.v.), it has a fine system of highways. There are over 80,300 km. of national roads, 263,500 km. of departmental and intercommunal roads, and 306,100 km. of local roads. The central position of the cap. has made it possible to plan a convenient system of railways radiating to all parts of the country. In 1938 all independent railway companies were incorporated with the existing state railways to form the *Société Nationale des Chemins de Fer Français* (S.N.C.F.), in which the State holds 51 per cent of the shares. The system is divided into 5 regions: Nord; Est; Ouest; Sud-Est (formerly the Paris-Lyon-Méditerranée line); and the Sud-Ouest (formerly the P.O.-Midi lines). The railways converge on Paris from the S. by the Rhône-Saône valley, from the SW. by the Gate of Poitou, from the E. and Switzerland by the Burgundian Gate, and across the Côte d'Or through the junction of Dijon. In 1955 there were 39,800 km. of track, of which 4780 km. were electrified. 509,000,000 passengers were carried, and 191,000,000 metric tons of goods. The country's important system of internal waterways, co-ordinated with those of Belgium and Germany, totals (1955) 8215 km., including 4814 km. of canals, and carries some 50,000,000 tons of freight yearly. Bordeaux and Marseilles are joined by the Canal du Midi, linking the Rhône and the Garonne (q.v.); the Rhône-Rhône Canal connects Strasbourg, Basel, and Dijon, and extensions connect Strasbourg with Calais and the Somme, and Dijon with Paris and the Loire.

The national airline, *Air France*, had, in 1956, 125 aircraft. It is centred on Paris, the 2 chief airports being Le Bourget and Orly, and services Europe, North America, South America, West, Central, and East Africa, Madagascar, the Near, Middle, and Far East, Australia, and Oceania. In 1955 *Air France* flew 56,000,000 ton/km., and carried 1,792,233 passengers.

In 1956 there were 3,116,697 telephone subscribers, of whom 861,778 were in Paris. The receipts on account of posts, telegraphs, and telephones amounted (1954) to 181,101,000,000 francs.

Population.—The soil of F. was occupied in early historical times by a mixture of races, of which the Celtic Gauls (see CELTS) preponderated. The shores along the Mediterranean were occupied by the Ligurians, the SW. by Iberians, and the NE. by the Boigae (q.v.). Subsequently came the invasion of the Phoenicians (see PHOENICIA) and the Greeks, the latter of whom founded Marseilles, the present Marseilles. Caesar subjugated the land and laid it open to Rom. influences. At the end of the 4th cent. began the invasion of the Teutonic tribes (see TEUTONS), and in the 9th cent. those of the Norsemen (q.v.) or Normans. This mixture of races has produced the Fr. nation. The Bretons of Brittany,

descended from the anct Celts, have only in recent times become assimilated to the rest of the nation, and some 1,250,000 still use Breton as their native tongue, although about half of them also speak Fr. (see BRETON LANGUAGE). In the S., near the Pyrenees, some 125,000 persons speak Basque (see BASQUES), while Flem. is spoken in Fr. Flanders (q.v.), Walloon in the NE. of F. (see WALLOONS), and German in Alsace and Lorraine. Considerable differences are to be found in the inhab. of the various parts of F. The N. Frenchman is taller in stature, less vivacious than the S., the latter being darker in complexion and of more volatile disposition. The natives of different provs. exhibit different characteristics. The Gascons are loquacious and boastful, the men from the central uplands reserved and slow to make friends; the Breton melancholy and mystical; the Norman tall and self-controlled. As a nation the Fr. are gay and vivacious, renowned for politeness and sociability, artistic in their tastes, frugal and thrifty, capable of periods of great enthusiasm and liable to corresponding periods of depression. They are of great practical sense and extremely good organisers. The pop. of F. at the census of May 1954 was 42,777,174 (including Corsica but not Algeria). The density of pop. was 78 per sq. km.

The following is a list of the 90 depts, with their areas in sq. m. (in parentheses), and their pops. in 1954: Ain (2248) 311,941; Aisne (2866) 487,068; Allier (2848) 372,689; Alpes, Basses- (2697) 84,335; Alpes, Hautes- (2178) 85,067; Alpes-Maritimes (1443) 515,484; Ardèche (2144) 249,077; Ardennes (2027) 280,490; Ariège (1892) 140,010; Aube (2326) 240,797; Aude (2448) 268,254; Aveyron (3385) 292,727; Belfort (235) 99,427; Bouches-du-Rhône (2025) 1,048,762; Calvados (2197) 442,991; Cantal (2229) 177,065; Charente (2305) 313,635; Charente-Maritime (2791) 447,973; Cher (2819) 284,376; Corrèze (2272) 242,798; Corse (3367) 246,995; Côte-d'Or (3390) 356,839; Côte-du-Nord (2786) 503,178; Creuse (2163) 172,702; Dordogne (3550) 377,870; Doubs (2052) 327,187; Drôme (2532) 275,280; Eure (2330) 332,514; Eure-et-Loir (2291) 261,035; Finistère (2730) 727,847; Gard (2270) 396,742; Garonne, Haute- (2457) 525,669; Gers (2425) 185,111; Gironde (4140) 896,517; Hérault (2402) 471,429; Ille-et-Vilaine (2697) 586,812; Indre (2664) 247,436; Indre-et-Loire (2377) 364,706; Isère (3178) 626,116; Jura (1951) 220,202; Landes (3604) 248,943; Loir-et-Cher (2478) 239,824; Loire (1852) 654,482; Loire, Haute- (1930) 215,577; Loire-Inférieure (2693) 733,576; Loiret (2629) 360,523; Lot (2017) 147,754; Lot-et-Garonne (2078) 265,549; Lozère (1996) 82,391; Maine-et-Loire (2811) 518,941; Manche (2475) 446,860; Marne (3167) 415,141; Marne, Haute- (2420) 197,147; Mayenne (1986) 251,522; Meurthe-et-Moselle (2036) 607,022; Meuse (2408) 207,106; Morbihan (2738) 520,978; Moselle (2403) 769,388; Nièvre (2658)

240,078; Nord (2228) 2,098,545; Oise (2272) 435,308; Orne (2371) 274,862; Pas-de-Calais (2606) 1,276,833; Puy-de-Dôme (3090) 481,380; Pyrénées, Basses- (2977) 420,019; Pyrénées, Hautes- (1750) 230,544; Pyrénées-Orientales (1598) 230,285; Rhin, Bas- (1848) 707,934; Rhin, Haut- (1354) 509,647; Rhône (1104) 966,782; Saône, Haute- (2014) 209,303; Saône-et-Loire (3330) 511,182; Sarthe (2410) 420,393; Savoie (2388) 252,192; Savoie, Haute- (1744) 293,852; Seine (185) 5,154,834; Seine-Inférieure (2448) 941,684; Seine-et-Marne (2275) 453,438; Seine-et-Oise (2184) 1,708,791; Sèvres, Deux- (2337) 312,842; Somme (2443) 464,153; Tarn (2231) 308,197; Tarn-et-Garonne (1440) 172,379; Var (2333) 413,012; Vaucluse (1381) 268,318; Vendée (2690) 395,641; Vienne (2711) 319,208; Vienne, Haute- (2119) 324,429; Vosges (2303) 372,523; Yonne (2892) 266,410. See the individual articles on the depts.

At the 1954 census there were 24 tns with pops. of more than 100,000. They were: Paris (2,850,189); Marseilles (661,492); Lyons (471,270); Toulouse (268,863); Bordeaux (257,946); Nice (244,360); Nantes (222,790); Strasbourg (200,921); Lille (194,616); St Étienne (181,730); Toulon (141,117); Le Havre (139,810); Nancy (124,797); Rennes (124,122); Reims (121,145); Rouen (116,540); Grenoble (116,440); Clermont-Ferrand (113,391); Dijon (112,844); Le Mans (111,891); Brest (110,713); Roubaix (110,067); Limoges (105,990); Angers (102,142) (see separate articles on these tns).

The div. of the pop. according to occupation in 1954 was as follows: out of an active pop. of 19,182,000 there were 6,443,000 manual workers (1,358,000 engaged in building and public works, 1,153,000 in agriculture, and 1,090,000 in textile and allied industries), 3,984,000 farmers, 1,450,000 shopkeepers, 736,000 artisans, 85,000 industrialists, 2,074,000 clerical workers, 1,139,000 intermediate employees, 1,004,000 workers in salaried services, 554,000 members of the liberal professions or senior employees, and 525,000 miscellaneous (including armed services, police, and clergy).

The 1954 census showed that there were 1,453,479 foreigners in the country.

Religion.—Since 1905 no religion has been officially recognised by the State. By the 'Law of Separation' of that year, the Churches were separated from the State, and, in the case of the Rom. Catholic Church, the Concordat of 1802 was abolished; the adherents of all creeds were authorised to form religious associations (*associations cultuelles*). By a law of 2 Jan. 1907 it was provided that, failing *associations cultuelles*, buildings for public worship would continue at the disposition of the ministers of religion and their congregations, but in each case an administrative act would be required from the civil authorities. There are at present about 12,000,000 Rom. Catholics, and about 800,000 Protestants. The seats of the Rom. Catholic archbishops are at Aix,

Albi, Auch, Avignon, Besançon, Bordeaux, Bourges, Cambrai, Chambéry, Lyons, Marseilles, Paris, Reims, Rennes, Rouen, Sens, Toulouse, and Tours. The Protestants of the Augsburg Confession are governed by a General Consistory, and the Reformed Church is under a Council of Administration.

Education.—The beginning of the present century saw the triumph of the State in its long struggle with the Church for the control of education in F. Previous to 1880 the Church controlled its own primary and secondary education, and had the power of granting univ. degrees; after 1880 primary education under State control became free and compulsory, and the privileges of the Church were taken away. Religious teaching was abolished in the schools at the same time.

The State elementary schools, the basis of Fr. education, are divided into primary, secondary, and higher classes. There is a Supreme Council (52 members) with administrative and deliberative functions, and a Consultative Committee to advise on the functioning of the school system, but the inspectors-general are in direct communication with the Minister. For local administration the country is divided into 17 academic areas, each of which has an Academic Council which deals with all grades of education. The law of 9 Aug. 1879 made it obligatory for each dept to maintain 2 *écoles normales* for training elementary teachers. Future teachers, after spending 3 years in a secondary school, receive professional training at *Instituts de Formation professionnelle*. The law of 16 June 1881 made education free in all elementary state schools, and that of 28 Mar. 1882 made it obligatory for all children from 6 to 13 years of age; the law of 9 Aug. 1936 extended the upper age limit to 14 years. The law of 30 Oct. 1886 estab. the position of private schools under State supervision, and provided that teachers should be lay. In 1942 the higher elementary schools (*écoles primaires supérieures*) were transformed into modern schools (*collèges modernes*), and are now part of the system of secondary instruction. Higher elementary education is given also in continuation schools (*cours complémentaires*) attached to the elementary schools. In 1953-4 there were 4287 infant schools (including 211 private schools) with 642,500 pupils, and 80,857 elementary schools (including 10,691 private schools) with 5,282,500 pupils. Secondary education is free (since 1934) and is given in state *lycées*, in colleges belonging to the coms., and in schools belonging to associations or private individuals. The course of study lasts for 7 years. In 1953-4 the number of pupils at secondary schools was 871,421, of whom 372,974 were at private schools.

The law of 18 Mar. 1880 granted the State faculties the exclusive right to confer univ. degrees. The 17 univs., with their dates of foundation and, in parentheses, the numbers of students attending them in June 1954, are as follows:

Aix-Marseille, 1409 (8906); Algiers (5950); Besançon, 1485 (1074); Bordeaux, 1441 (9057); Caen, 1432 (3469); Clermont-Ferrand, 1808 (2391); Dijon, 1722 (2277); Grenoble, 1339 (4271); Lille, 1530 (7077); Lyons, 1808 (8989); Montpellier, 1289 (6695); Nancy, 1572 (4949); Paris, 1150 (62,395); Poitiers, 1432 (4486); Rennes, 1735 (6613); Strasbourg, 1567 (5497); Toulouse, 1230 (7709).

In 1954 the numbers of students in state institutions, by faculties, were:

the *École Pratique des Hautes Études* (hist. and philology, science, and theology); the *École Normale Supérieure*, which prepares secondary teachers; the *École des Chartes*; the *École des Langues Orientales vivantes*; the *École du Louvre*; the *École des Beaux-Arts*; and others. There are also a number of institutions of higher or technical instruction dependent on other ministries, giving courses in applied sciences, social economy, commerce, forestry, colonial agriculture, veterinary science, engineering, mining,

A FISHING BOAT AT THE VIEUX PORT, MARSEILLES

law, 41,368; medicine, 29,603; science, 32,493; letters, 39,700; pharmacy, 7638; theology, 313.

The *École libre des Sciences Politiques* in Paris became the *Institut d'Études Politiques* of the univ. after the Second World War, and other schools of political science were estab. (e.g. at Bordeaux, Toulouse, and Strasbourg). One of the functions of these schools is the preparation of entrants for the *École Nationale d'Administration* which trains the higher grades of the home and foreign civil service. Other institutions of higher learning are the *Collège de France* (founded 1530), which has courses in literature, the sciences, and economics; the Museum of Natural History, which has courses in science and natural hist.;

etc., besides military and naval schools. Technical schools of a lower grade under the Ministry of Public Instruction are numerous.

Finance.—F. favours indirect rather than direct taxation, i.e. on commodities rather than on persons. Before 1914 the old direct tax system, the *Quatres vieilles Contributions*, was in operation—taxes on real estate, on doors and windows, on business, and on presumptive income. Only the first exists to-day, and only in a modified form. In 1907 Caillaux, finance minister in the Clemenceau Cabinet, proposed the suppression of the old taxes and the creation of a new income tax. Fiscal reform was still under discussion on the declaration of war, which found F. as financially unprepared as she was in

1939. By 1914 the public debt had grown to 33,000,000,000 fr., and was to become 300,000,000,000 fr. by 1926. Half the public debt was floating or short-term debt, but whereas before the war the service of the debt took about 1,000,000,000 fr. (20 per cent of the Budget), after the war it amounted to 18,000,000,000 fr. out of a State expenditure of some 40,000,000,000 fr., while civil and military pensions accounted for 5,000,000,000 fr. During the war F. lived on borrowing, and a war profits tax, instituted in 1916, failed to compensate for the expenditure. The pre-war income tax scheme was not applied until 1917. Immediately after the armistice Fr. financial policy was based on the assumption that Germany could pay a sum estimated at the huge figure of 100,000,000,000 gold marks. By the Act of June 1920 the tax system was revised and the business turnover tax introduced, together with higher rates of income tax. After 1921 F. entered on a period of inflation in order to meet the cost of reconstruction, and the policy of borrowing continued until, in 1923, the net borrowings amounted to nearly 16,000,000,000 fr. During the occupation of the Ruhr the value of the franc declined, and the Morgan bank of New York put at the disposal of F. 100,000,000 dollars' worth of credits. In 1924 the Poincaré Gov. proposed an all-round increase of taxes and drastic economy cuts, but in the May elections of that year Poincaré was defeated on his financial policy. The franc was then at 67 to the pound sterling; by 1926 it was at 250 to the pound. Poincaré was again called upon to form a ministry of national union, and later that year the franc was stabilised at about 160 to the pound and 33 to the dollar. A Bill was put through the chamber providing for 100,000,000,000 fr. of fresh taxation, and an independent sinking fund was established.

In 1938 the Fr. internal debt was 384,849,000,000 fr., and the foreign debt (as at 1934) was 3,863,650,000 dollars, owed to U.S.A., and 2755,875,000 sterling owed to Britain. The commercial debt to the U.S.A., England, Japan, Holland, Argentine, etc., was about 5,000,000,000 gold francs. In 1928 the stabilisation law was passed, fixing the franc at a fifth of its normal value, i.e. at 65.5 mg. of gold instead of 322.6 mg. Fr. financial policy, as formulated in 1937, was opposed to all forms of exchange control, and adhered to the principles of the 3-power monetary agreement of 1938 between Britain, F., and the U.S.A., which was, in itself, a condemnation of such control. At the end of 1944 the internal debt was: consolidated, 581,110,000,000 fr., floating, 1,028,444,000,000 fr.; total, 1,609,554,000,000 fr. On 8 Feb. 1944 a financial agreement between the Brit. Gov. and the Fr. Committee of National Liberation fixed the rate of exchange at 200 fr. to the pound. A financial agreement between Great Britain and F. was concluded in Paris (27 Mar. 1945) containing 'the necessary financial foundation

for the resumption and development of commercial intercourse' between the franc and sterling zones, including reciprocal credits (£100,000,000 in London for F. and 20,000,000,000 fr. in Paris for Great Britain) to finance imports.

At the end of 1954 the total Fr. national debt was 5,648,770,000,000 fr. Since 1949 the fr. has been pegged by the gov. at 450 fr. to \$1 U.S.A. On the devaluation of sterling in Sept. 1949 the rate was made 980 fr. to £1.

Justice.—The laws of F. were codified at the beginning of the 19th cent. at the instigation of Napoleon Bonaparte, and are still in force with but few amendments (*see CODE NAPOLEON*). The administration of justice in F. is organised under 4 systems, known as *juridiction civile*, *juridiction commerciale*, *juridiction administrative*, and *juridiction correctionnelle et criminelle*. Within the first system come all civil cases between individuals, and these are adjudicated upon by the *tribunaux civils*. All commercial suits within the usual category are judged by the *tribunaux de commerce*, which adjudicate also upon cases of bankruptcy, there being no separate bankruptcy courts. The third system, *juridiction administrative*, comprises all actions against the gov., these being submitted to the *tribunaux administratifs*. The fourth system *juridiction correctionnelle et criminelle*, covers all application of the penal law—by the *tribunaux correctionnels* for the repression of misdemeanours and by the courts of assize for criminal cases. The jury system is adopted for these latter only. Minor civil cases are tried before a justice of the peace (*juge de paix*), one being appointed to each canton. Civil cases outside the jurisdiction of the *juge de paix* are tried in the first instance before *tribunaux civils* of first instance, which exist in every *sous-préfecture*. The *tribunal civil* may also adjudicate in commercial cases where a separate *tribunal de commerce* does not exist. Appeal against the decisions of civil and commercial tribunals is made to one of the courts of appeal, of which there are 25. The special jurisdiction over commercial cases is administered only in those districts, where a *tribunal de commerce* has been established by the gov. Fr. law does not allow any act of the administration to be submitted to the ordinary courts. Special tribunals, called *conseils de préfecture*, exist in every *préfecture* to adjudicate in all cases between individuals and gov. agents. Appeals against the decisions of these tribunals are made by the *conseil d'état* in Paris. Appeal against the decisions of the correctional tribunals and the courts of assize can be made only to the court of cassation, which exists to ensure the proper application of Fr. law. It has authority over all the tribunals of F., civil, commercial, administrative, and criminal. There is a special system of law for and special tribunals for the adjudication of questions in which the State or its officials are concerned (*see DROIT ADMINISTRATIF*).

Defence.—The armed forces are under the supreme command of the President of the Rep. The national defence is the responsibility of the President of the Council; he is assisted by the Staff of National Defence. The Army is composed of regular officers, long-term non-commissioned officers and soldiers, conscripts serving a period of 18 months, and reservists. The High Command comprises the chief of the general staff and the chief of the army staff. There are 9 military regions in metropolitan F. Peace-time units are divided into tactical groups and territorial units, and are composed of infantry, armoured troops and cavalry, artillery, engineers, pioneers, transport and supply troops. There are also the commissariat, and the medical and veterinary services. The *Gendarmerie* (see GENDARMES) is a separate arm. Officers are trained first in the school for all arms at Coët-Quidan (Brittany), and later in separate technical schools according to their arms of the service. There are also staff colleges (the *École d'État-major* and the *École Supérieure de Guerre*), and the *Institut des Hautes Études de Défense Nationale*, where defence problems are studied jointly by high-ranking officers and civilians. In 1953 the effectives were fixed at 565,000 officers and men, including 57,000 gendarmerie.

The Navy is manned chiefly by volunteers, but partly by conscription. It is administered by the secretary of state for navy, the chief of naval staff, deputy chief of naval staff, and deputy chief of naval staff (air). In 1956 the active personnel numbered 67,935. The strength of the fleet in 1956 was: 4 aircraft carriers, 2 battleships, 5 cruisers, 24 destroyers, 50 frigates, and 16 submarines. The estimates for 1957 included a helicopter carrier, 4 frigates, and 3 submarines.

The *Armée de l'Air* and the Naval Air Service are under reorganisation. Their strength in 1953 was 117,000 officers and men.

French Oversea Possessions.—The status of oversea depts and ters. within the Fr. Union is governed by Articles 73-82 of the Fr. Constitution. These possessions are classified as follows (see individual articles):

1. Algeria.
2. Oversea Departments.
 - (i) Martinique.
 - (ii) Guadeloupe.
 - (iii) Réunion.
 - (iv) Guiana.
3. Oversea Territories.
 - (i) French West Africa.
 - (a) Senegal.
 - (b) Sudan.
 - (c) Mauritania.
 - (d) Guinea.
 - (e) Ivory Coast.
 - (f) Upper Volta.
 - (g) Dahomey.
 - (h) Niger.

(ii) French Equatorial Africa.

- (a) Gabon.
 - (b) Middle Congo.
 - (c) Ubangui-Chari.
 - (d) Chad.
 - (iii) Madagascar.
 - (iv) Comoro Archipelago.
 - (v) French Somaliland.
 - (vi) New Caledonia.
 - (vii) French Oceania.
 - (viii) St-Pierre and Miquelon.
 4. Fr. Togoland and Fr. Cameroons.
 5. Anglo-French Condominium.
 - New Hebrides.
 6. Cambodia.
- Political Parties.**
1. Parti Communiste Français (P.C.) (*Fr. Communist party*).
 2. Union Progressiste (*Progressive party*).
 3. Section Française de l'Internationale Ouvrière (S.F.I.O.) (*Socialist party*).
 4. Parti Républicain Radical et Radical-Socialiste (*Radical party*).
 5. Union Démocratique et Socialiste de la Résistance-Rassemblement Démocratique Africain (U.D.S.R.-R.D.A.) (*A Republican and Socialist party*).
 6. Rassemblement des Gauches Républicaines et du Centre Républicain (R.G.R.).
 7. Mouvement Républicain Populaire (M.R.P.) (*A Progressive Right-Wing party*).
 8. Indépendants d'Outre-Mer (I.O.M.) (*Affiliated to the M.R.P.; asks for electoral reform in overseas ters., and a federal constitution for the Fr. Union*).
 9. Indépendants et Paysans d'Action Sociale (I.P.A.S.) (*A Right-Wing party*).
 10. Groupe Paysan (*Affiliated to the I.P.A.S.; special interest in status of agric. workers*).
 11. Groupe des Républicains Sociaux (G.R.S.) (*Formerly the Rassemblement du Peuple Français; opposes present part. system as unstable and ineffective*).
 12. Union et Fraternité Française (U.F.F.) (*the Poujadist party*).

Local Administration.—The country is composed of coms., each of which elects a mayor and communal council to control its affairs. Every group of 10 or more coms. forms a canton, and the cantons are further grouped into arrons. Each arron. elects a council which controls local taxation. The arrons. are grouped into depts, each of which contains on an average some 4 arrons. The depts have replaced the old historical provs. into which F. was formerly divided, and are 90 in number, including Corsica. The following is a list of the old Fr. provs., together with the depts to which they roughly correspond: Alsace-Lorraine (Moselle, Rhin-Bas, Rhin-Haut); Angoulême (part of Charente-Maritime); Anjou (Maine-et-Loire, parts of Sarthe, Mayenne,

and Indre-et-Loire); Artois (part of Pas-de-Calais); Aunis (part of Charente-Maritime); Auvergne (parts of Puy-de-Dôme, Cantal, and Haute-Loire); Avignon (part of Vaucluse); Béarn (Basses-Pyrénées); Berri (Cher and Indre); Bourbonnois (parts of Puy-de-Dôme, Creuse, and Cher); Brittany (Finistère, Côtes-du-Nord, Morbihan, and Loire-Inférieure); Burgundy (Saône-et-Loire, Côte-d'Or, and parts of Yonne and Nièvre); Champagne (Ardennes, Marne, Aube, and Haute-Marne, and parts of Aisne, Seine-et-Marne, and Yonne); Dauphiné (Drôme, Hautes-Alpes, and Isère); Flanders (Nord); Foix (part of Ariège); Franche-Comté (Doubs, Haute-Saône, and Jura); Gascony (Landes, Gers, Hautes-Pyrénées, part of Basses-Pyrénées); Guienne (Gironde, Dordogne, Lot-et-Garonne, Lot, Tarn-et-Garonne, Landes, Gers, parts of Hautes-Pyrénées, Haute-Gironde, Ariège, and Basses-Pyrénées); Île de France (Seine-et-Oise, Seine-et-Marne, Aisne, Oise, parts of Eure-et-Loir, Loiret, and Yonne); Languedoc (Tarn, Aude, Hérault, Gard, Ardèche, parts of Haute-Loire, Haute-Garonne, and Tarn-et-Garonne); Limousin (Corrèze, part of Haute-Vienne); Lorraine (Mourthe-Moselle, Meuse, and Vosges); Lyonnais (Rhône and Loire); Maine (Mayenne); Marche, La (Creuse); Nivernais (Nièvre, part of Cher); Normandy (Seine-Inférieure, Calvados, Manche, and Orne); Orléannais (Loiret, Loir-et-Cher, and parts of Eure-et-Loir, Nièvre, and Yonne); Picardy (parts of Pas-de-Calais, Somme, Nord, Oise, and Aisne); Poitou (parts of Vienne, Vendée, and Deux-Sèvres); Provence (Bouches-du-Rhône, Var, Basses-Alpes, and part of Vaucluse); Roussillon (Pyrénées-Orientales); Saintonge (part of Charente-Maritime); Touraine (part of Indre-et-Loire).

Constitution and Government.—The preamble to the constitution of the Fourth Rep. (in force 24 Dec. 1946; modified by the Constitutional Law of 7 Dec. 1954) reaffirms the declaration of 1789 and the fundamental principles recognised by the laws of the rep., and proclaims, besides, a number of political, economic, and social principles as especially necessary to-day. These include equal rights for women with those of men; the right of asylum for those persecuted in their struggle for liberty; the right to work; freedom from victimisation in employment on account of beliefs, opinions, or origins; the liberty to defend one's rights and interests by syndicalist action; the right to strike within the law; collective ownership of any undertaking which has acquired the character of a national public service or *de facto* monopoly; national assurance to the individual and his family of the conditions essential to their development; guarantee to all, especially children, mothers, and the aged, of safeguards for health, material security, leisure, and rest; the solidarity and equality of all Fr. people in sacrifices resulting from national calamities; equal educational and cultural opportunity for all; and the organisation

of free, public, lay education at all stages to be a State obligation. The preamble further declares that F. will undertake no war of conquest nor use its armed forces against the freedom of any people; subject to reciprocity F. assents to restrictions on her sovereignty essential to the organisation and defence of peace; and enters with her overseas peoples into a union founded on equal rights regardless of differences of race or creed—this Fr. union to comprise nations and peoples who pool their resources and efforts to develop their respective cultures and ensure their security. The preamble concludes with the declaration that F. intends to promote self-gov. among her dependent races so that they may manage their own affairs democratically; and, avoiding any arbitrary system of colonisation, guarantees to all equality of access to public office, and to the exercise of the rights and liberties set out in this regard in the constitution. Many of the provisions of the constitution which follow the preamble are reaffirmations of the constitution of the Third Rep. prior to 1940 by way of repudiating the reactionary principles of Marshal Pétain (q.v.); thus is reaffirmed the principle of 'government of the people for the people and by the people.' In matters constitutional the people exercise their sovereign rights through the votes of their representatives and by referendum. The franchise is given to both sexes. Parliament consists of the National Assembly and the Council of the Rep. The assembly is elected by direct universal suffrage, the council by indirect suffrage through cons. and depts. The assembly can itself elect councillors to a number not exceeding one-sixth of the total number of members of the council. The number of members of the council may not be less than 250, or more than 320. The council is re-eligible to the extent of one-half. Sessions may not be interrupted by adjournments for a longer total period than 4 months. Both Houses sit at the same time. Sessions are public. Each chamber elects its committee annually, and when the Houses are in joint session for the election of the president of the rep. their committee is that of the assembly. When the assembly is not sitting its committee can convene Parliament; and it must do so on the demand of a third of the deputies or on that of the president of the council of ministers. Legislation is initiated by the president of the council of ministers and the members of Parliament. Propositions of law formulated by the Council of the Rep. are transmitted without debate to the assembly, but are not valid if they involve a reduction of revenue or increased expenditure. Budgets are the prov. of the assembly, but the budget Bill may contain no other than strictly financial provisions. The initiation of expenditure is vested in the deputies in the National Assembly. The Council of the Rep. advises on Bills and propositions of law transmitted by the assembly after first reading, and if its opinion is unfavourable

or not given within a specified time, the law will be promulgated in the text as voted by the assembly. If remitted with amendments the assembly will give the measure a second reading, accepting or rejecting the council's amendments in whole or in part; the vote on second reading is then taken publicly, and, on an absolute majority, after a further vote by the council in the same conditions, the measure becomes law. No one may be a member of both the National Assembly and Council of the Rep. An economic council examines Bills within its competence, as submitted by the assembly. The president of the rep. is elected by Parliament for 7 years, and is only re-eligible once. He appoints the council of ministers and the councillors of state. He communicates with Parliament by messages addressed to the assembly. The functions of the president are incompatible with the exercise of any other public functions. The president, after the customary consultations, chooses the president of the council of ministers or Premier, who submits to the assembly the programme and policy of the Cabinet he proposes to constitute. The Premier and Cabinet cannot be appointed until the Premier has received the confidence of the assembly by an absolute majority. Confidence can only be refused by an absolute majority, and the passing of a vote of censure involves the resignation of the whole Cabinet. The constitution provides for dissolution of the assembly following 2 ministerial crises within a period of 18 months. General elections take place at earliest in 20 days and at latest in 30 days after the dissolution. Ministers are criminally responsible for crimes and offences committed in the exercise of their duties; they may be charged by the assembly and sent before the high court chosen by the assembly at the beginning of each new chamber. The organisation and procedure of this court are determined by a special law. There is provision for a superior council of the magistracy composed of 14 members under the presidency of the president of the rep. and vice-presidency of the minister of justice, 6 members chosen by the National Assembly and the others including 4 magistrates. Revision of the constitution is decided by resolution of an absolute majority of the assembly. After a second reading within 3 months the assembly frames a Bill, which is then submitted to Parliament, and voted on as an ordinary law. It is then submitted to a referendum, except where it has been adopted on its second reading by a two-thirds majority of the assembly, or voted by a majority of three-fifths by each of the 2 Houses. No constitutional revision respecting the existence of the Council of the Rep. can be effectuated without the consent of the council, or by recourse to a referendum. A constitutional committee, presided over by the president of the rep., and comprising the presidents of each House, 7 members chosen by the assembly, and others,

decides whether any law voted by the assembly in effect revises the constitution. If it does the law is sent back to the assembly for fresh deliberation. If Parliament adheres to its original vote the law cannot be promulgated before the constitution has been revised by the process described above. The republican form of gov., however, cannot be the subject of any proposed constitutional revision.

The Fr. union is formed, as to one part, of the Fr. rep., comprising metropolitan F. and the depts and ters. overseas, and, as to the other part, of the associated ters. and states. The gov. of the rep. co-ordinates their combined defensive resources and directs the policy appropriate to that defence. The central organs of the union are the presidency, the high council, and the assembly of the union. The president of the Fr. rep. is president of the union. The council consists of a delegation of the Fr. Gov. and of the representatives of the associated states, and its function is to assist the gov. in the general conduct of the union. The assembly of the union consists, as to half, of members representing metropolitan F., and as to the other half of members representing overseas and associated ters. The members are elected by the territorial assemblies so far as concerns overseas depts and ters.; and, as concerns metropolitan F., as to two-thirds by the members of the National Assembly, and as to the remaining third by the members of the Council of the Rep. The associated states may designate delegates within the limits and conditions fixed by the legislation of each state. The president convenes the assembly of the union, and closes the sessions. He must convene it on the requisition of half the members. The assembly has cognisance of Bills and proposals submitted for its advice by the National Assembly or the gov. of the Fr. rep. or the gov. of the associated states. In the overseas ters. the legislative power belongs to the Parliament as regards criminal legislation, public liberties, and political and administrative organisation: in all other matters Fr. law is applicable only by express provision, or if extended to the overseas ters. by decree on the advice of the assembly of the union. One of the chief criticisms of this constitution is that the president of the rep. ought to be in the position of an arbiter, and therefore elected by secret ballot, for the president should have no personal power and power should rightly be vested nowhere else but in the assemblies. M. Edouard Herriot (q.v.) thought that, as regards the assembly, the constitution gave no political powers, but rather privileges, so that the House was merely a kind of academy of moral and political science, rather in the position of a doctor called in for consultation, but without authority to sign a prescription. Another fundamental objection is that there is no separation of powers such as will be found, for example, in the Brit., Amer., and other democratic constitutions. It is open to doubt whether the constitution is con-

sistent with an independent judiciary or an administration above party; for, as to the former, the council of the magistracy comprises only 4 magistrates out of 14 members; and as to the latter it might seem that the country is split into a series of departmental compartments, separated from each other by different administrations. Extreme left-wing critics objected that in 1945 the people had condemned the Senate by an overwhelming majority, whereas in the new constitution the Senate reappeared under a new name. The objection that the constitution

BRETON PEASANT GIRL

E.N.A.

institutes indirectly gov. by assembly is, however, hardly consistent with a president of the rep. elected by both Houses who, after 18 months of a new legislature's existence, can dissolve the assembly; which body confers on him, in accord with the president of the Council of the Rep., the exceptional right to suspend a law for unconstitutionality; nor is such criticism consistent with a constitution which gives to the Council of the Rep. the initiative in legislation, and the power to nominate an important fraction of the assembly of the Fr. union and committee of constitutional control. Finally it may be objected that the Council of the Rep. is deprived of all powers, and that by the very manner of its election it does not represent the coms. of F., and is merely the pale reflection of an omnipotent assembly.

History.—The Phoenicians and Greeks had left their trade mark in Gaul by the estab. of the trading station which afterwards developed into the tn of Marseilles, but that was all. With the invasion of Gaul by Julius Caesar, however, the recorded hist. of F. begins. The Gauls rapidly assimilated the civilisation and culture of Rome; they adopted a form of its language, they accepted its laws and its administration. But with the decline of the Rom. Empire Gaul's prosperity rapidly disappeared. She began to suffer from the invasions of the outside barbaric tribes, and the burdens placed on the peasantry by the native aristocracy and clergy led to the outbreak of many revolts which were cruelly suppressed. From c. 395 onwards the Goths, Vandals, and Burgundians, who had long been pent up E. of the Rhine, began their attacks upon the W. The Burgundians were the first to settle, and they founded a kingdom which stretched down the Rhine valley from the Vosges to the sea. The Vandals founded a Visigothic kingdom in Spain, a kingdom which, however, included that part of Gaul which Caesar had called Aquitaine, together with a part of the Celtic domain. In 451 at the great battle of the Catalaunian plain Aetius, the last of the Romans in Gaul, defeated the Huns of Attila. The most important of the barbaric invaders of Gaul was Clovis I (q.v.), the Merovingian king of the Franks. The Franks were a Teutonic tribe who had lived in Belgium (the Salian Franks) and on the banks of the Sambre and the Meuse (the Ripuarians). Led by their king (Clovis, 481-511), the Franks invaded Gaul and quickly overran it, advancing rapidly towards Paris, which they made their cap. The master-stroke of the Frankish king Clovis was his adoption of the Christian faith. He was recognised by Rome; he was made a consul and patrician by the emperor of the E. The Franks maintained their old Salic law, but at the same time they adopted the civilisation of Rom. Gaul. Clovis was the founder of the Merovingian line of kings. Up to the time of the conquest of Gaul the Merovingians had been but chieftains of roving tribes; now, however, they aspired to the monarchy of F., and with it inherited to a very great extent the imperial ideals which were kept up by the officials who represented their power throughout the land, and who were chosen from the native inhab. of the land. The king held in his own hands the reins of justice, finance, and administration. But the Merovingian line soon spent much of their time quarrelling amongst themselves, and so grew up the power of the mayors of the palace, who gradually won for themselves a position

which was greater than that of the king himself. A long line of puppet Merovingians followed; then for a short time a struggle between mayor and king would take place, but the mayors of the palace won, and the line of *rois fainéants* continued only as long as the mayors of the palace cared to let them. The Merovingian line was maintained nominally until 751. The greatness of the Carolingian dynasty begins with the mayor of the palace, Charles Martel. Charles Martel was responsible for the overthrow of the Arabs at Tours (732). In 741 he d., and was succeeded by his sons, Carloman, who shortly retired to a monastery, and Pepin, known as Pepin the Short, who finally, in 751, took the name as well as the power of king. The bishops of Rome were at this time just rising to a full realisation of their power and claiming recognition as the heads of the Church. The rising powers of the papacy, joined to the rising power of the Carolingians, were wellnigh unconquerable, and Pepin was not slow to recognise the benefits of such an alliance. He made himself the protector of the Church; twice he invaded Italy and forced the king of the Lombards to cede him possessions which he in turn ceded to the papacy, and thus gave the papacy its claim to temporal greatness, which was to persist up to 1870. Pepin d. in 768, and was succeeded by his son, Charlemagne (q.v.). He continued and improved on the policy of his father: he crossed the Alps to the help of the papacy; he restored the gift of Pepin the Short; he crushed the Lombards. Then he turned his attention to the Saxon and the Arab, and after many campaigns he finally crushed their power too. He fought the Avars of Hungary; he defeated the Danes; and he was to all intents and purposes overlord of W. Europe. On Christmas Eve of the year 800 he was crowned with the imperial crown by the pope. Thus was re-established the medieval ideal of a united Church and empire: the domination of the world by pope and emperor working together for its good. The immediate results of this coronation were that the papacy became the greatest power in Italy, and the title of Charlemagne to the Frankish kingdom was considerably strengthened. Charlemagne, although he had realised the very real danger which threatened the empire from the incursions of the Danes, nevertheless helped in the disruption of his own empire by the diva. he himself made. This empire was split up and divided between his sons Charles, Pepin, and Louis. The 2 former d. very shortly after their father, but Louis the Pious partitioned his empire whilst his sons were yet alive, and this led to constant quarrelling and revolt. Finally, after his death, the empire was definitely partitioned between his 3 sons, and the 3 kingdoms of F., Germany, and Italy may be said to have been founded by this partition (treaty of Verdun, 843). For the next century and a half the hist. of F. and of the Holy Rom. Empire is the story of constant war and

rebellion. The great enemies of order and the power of the crown during this period were the baronage and the Northmen. Rouen, Bordeaux, and Aachen all fell into the hands of the Northmen. Paris itself in 886 underwent a terrible siege. The king (Charles the Fat) tried to buy them off, but they came again and again, each time with fresh demands. The Northmen settled at the mouths of the rivers, and from there ravaged the country. Charles the Fat was driven from the throne, and Count Odo elected king of F., but he owed his election solely to the need of driving away the Northmen, and he was kept on the throne only by the influence of the nobles. In 911 Charles the Simple, who had succeeded Odo, made peace with the Northmen, and ceded to them Normandy (the mouth of the Seine). Their leader, Rollo (q.v.), became a Christian, paid homage to the king, and settled in his own ter. The Northmen soon showed that they were easily able to assimilate the culture, language, and customs of the Fr., and before long had become a Fr.-speaking nation while still retaining the vigour of their original race. Charles the Simple showed himself as incapable as Charles the Fat, and rapidly the Carolingians became as weak as the Merovingians had been, but they still retained some of their former power. Louis IV tried hard to win back prestige for the crown, and to put down the power of the nobles, but Hugh, count of Paris, overshadowed him. Although Hugh could easily have declared himself king of F., he maintained the old Carolingian line, leaving it to his son, Hugh Capet, to found the Capetian dynasty. In May 987 Louis V d., the last of the direct line of the Carolingians, and Hugh Capet was recognised king by the Church and the baronage. It was the victory of the feudal system over the monarchy. The first few Capetian kings were merely great feudal nobles who were given the royal title and a nominal allegiance. Hugh Capet added to an effete power the Ile-de-France and Paris, and he was the first Fr. king with *national* ideals. But the power of these early Capetian kings was but nominal. The influence of Normandy must not be overlooked. The Normans had taken part in all the great movements of the time; they had supported the Cluniac Reformation, they had supported the Capetian dynasty, and although they owed allegiance to the Fr. king, they were in reality much more powerful than he. Henry I tried conclusions with Normandy and was defeated. Baldwin of Flanders, father-in-law of the Conqueror, and regent for Philip I, did not hinder William, duke of Normandy, from invading England. In the meantime the Fr. kings had revived the anct Carolingian claims to the middle kingdom and to sovereignty over the Church, but the great struggle of empire and papacy was within sight, and Hildebrand, with his ideals of the universal power of the papacy, was preaching them during the reign of Philip. Philip I struggled against William of Normandy toward the end of

his reign, and quarrelled with the papacy, being excommunicated. During his reign occurred the First Crusade.

Under Louis VI the Capetian monarchy began to expand rapidly. Louis V had quarrelled with the papacy; Louis VI by an alliance with the Church strengthened the power of the crown. He attacked the power of Henry I of England in Normandy, and attempted to check the power of the counts of Blois. The house of Blois, however, was strengthened by the accession of Stephen of Blois to the crown of England; this was temporarily

rebellious sons of Henry II he prepared the way for the break-up of the power of the Angevins. In 1191 he took part in the Third Crusade. Before Richard of England's return he had attempted to seize the greater part of Normandy, but had failed, and Richard built up a strong alliance against him. But in 1199 the death of Richard and the accession of John made clear the way for the overthrow of Angevin power in F. The battle of Bouvines (1214) consolidated the power of F. in the N. Finally the Albigensian Crusades gave Philip a hold

neutralised by the marriage in 1137 of Louis's son to the heiress of Aquitaine. Louis VII's reign saw a reaction of the feudal baronage against the power of the Crown, which was, however, repressed. In 1152 Louis VII divorced Eleanor of Aquitaine, who 6 weeks afterwards married Henry of Anjou, king of England and ruler of the Angevin Empire. Henry II's power was by far the greatest danger which the monarchy in F. had yet to face. By his marriage Henry II had estab. an empire, which extended from the Pyrenees to the Cheviots; he ruled in F., Normandy, Maine, Anjou, Touraine, Gascony, Aquitaine, and Poitou. The accession of Philip Augustus (1180-1223) marks the highest point to which the monarchy had risen. By skilful attacks on the house of Blois he consolidated Fr. power in the N., and by alliances with the

on the S., a hold which was strengthened by his son and grandson. Administration, justice, law, had all been firmly estab. during his reign, and in 1223, when Philip d., he left a F. strong, consolidated, and powerful in the councils of Europe.

Louis VIII (1223-6) continued the work of his father. His son, Louis IX (1226-1270), usually known as St Louis, was only 12 years of age when his father d. His mother, Blanche of Castile, ruled for him, and during the period of the regency there was a feudal reaction. The power of the Crown was greatly extended during this reign in the S., and Henry III's attempts to reconquer the former Fr. possessions of his house were a failure. One of the most important features of Louis IX's reign was the development of the Parlement de Paris, and the subjugation of the feudal nobles by depriving them of their

rights to judicial combat and private war. During his reign also was developed the univ. of Paris. He was succeeded by Philip III (the Bold) (1270-85), during whose reign progress continued steadily. Events outside F. influenced its hist. to a very great extent. The Sicilian Vespers put an end to the power of the Fr. in Italy, where Charles of Anjou, a clever and unscrupulous brother of St Louis, had estab. a kingdom, whilst the provs. of Anjou, Toulouse, and Auvergne, together with Provence, fell into the hands of the Crown. Champagne was also united to

of the monarchy in F. During Louis X's reign there was a feudal reaction and the nobles increased their power. On his death his daughter was declared incapable of ascending the throne by reason of the Salic law. His brother therefore succeeded him, and finally, with Charles IV who ruled only 6 years, the Crown passed from the main line of the Capetians to the cadet house of Valois. Almost at once, Edward III claimed the throne of F. by right of his mother, and so caused the Hundred Years War (q.v.). He had a number of concrete reasons for wanting

The Rank Organisation

the Crown during this reign. Philip IV (1285-1314) was cunning, unscrupulous, and ambitious. He desired to weld F. into one compact kingdom, and to extend her power. In 1286 he had recognised Edward I's claim to Gascony and Aquitaine, but taking as a pretext the quarrels between the sailors of the Cinque Ports and the men of Normandy, Gascony and Aquitaine were declared forfeited.

Edward now built up an alliance against Philip, and Philip in turn allied himself with the Scots, and so began the traditional alliance which lasted down to 1560. In 1300 he annexed Flanders to F., but was 2 years later defeated at Courtrai (1302). This victory was important, because it showed the beginning of the overthrow of the feudal cavalry by an efficient infantry. The death of Philip saw the beginning of a rapid decline in the power

an excuse to crush an apparently weak F.; chief among these were the constant Fr. interference in Flanders, which threatened the Eng. woollen trade, and Fr. aid to the Scots. But Edward's chief motive was personal ambition. At first England scored a number of significant victories. Sluys was won in 1340, Crécy in 1346, and in the following year Calais surrendered. For 3 years war was stopped by the outbreak of the Black Death (1347-50), and in 1350 Philip VI *d.* He was succeeded by John II (1350-64), who was defeated and captured by the Black Prince at Poitiers (1356). The regency of the Dauphin Charles during the imprisonment of King John led to an attempt on the part of the states-general to control the policy of F., and this, being opposed by the baronage, led to civil war and the peasant rising known as the

Jacquerie (q.v.). In 1360 peace was made with England. By this treaty Edward gave up his claim to the Fr. throne, and received large tenns. to the S. of the Loire. In 1364 John d. Charles V (1364-80), who succeeded John, was fairly successful in establishing again the power of the Crown.

Charles, however, failed to annex Brittany, although he was successful against both the Eng. and Spaniards. However, he depended largely for his success upon the generalship of Bertrand

Mansell

du Guesclin (q.v.), who had adopted defensive tactics. The regency which was necessary owing to the minority of Charles VI (1380-1422) saw another feudal reaction. Charles became definitely insane in 1392; this led to the quarrels between the powerful families of the Orleanists (Armagnacs) and the party of Burgundy. The dukes of Burgundy had by this time become powerful princes, whose ambitions tended to make them less and less Fr., until Charles the Bold actually attempted to found an independent kingdom. The Burgundians allied themselves with the Eng., and obtained control of the mad Charles. Henry V, renewing the quarrel with F., won the battle of Agincourt (q.v.) (1415), and later, with the help of the Burgundians, overran the N. of F. and forced the Fr. to sign the treaty of Troyes. By this treaty Henry V became regent of F., married the king's daughter, Catherine,

and was to succeed to the Fr. throne on the death of the king. Henry, however, d. before Charles VI, and his young son, Henry VI, was proclaimed king on the death of Charles. Simultaneously with the proclamation of Henry VI in Paris, Charles VII was proclaimed at Bourges. Although the duke of Bedford ruled capably as regent, he was able only to control the N. of F., and the conduct of the other Eng. regents soon drove the Burgundians into the arms of the Fr. national party. The encouragement which Joan of Arc's (q.v.) victories gave to the Fr. had also helped in bringing about the ultimate downfall of Eng. power. In 1435 the treaty of Arras was concluded between the Burgundians and the Fr. In the following year Paris was recaptured. Gradually the conquests of the Eng. were won back until by 1453 Calais alone remained in the hands of the Eng. king.

Louis XI ultimately did much to strengthen royal power in F., though the beginning of his reign was hardly propitious. He alienated Charles the Bold of Burgundy, his nobility, and his clergy, and drove his enemies to join together in the league of Public Weal. Later, however, he fomented rebellions in Flanders, and whilst Burgundy was occupied in putting them down he won back Normandy, which by the treaty of Conflans he had ceded without interference. After 1467 he successfully opposed the schemes of Charles the Bold. He managed to hold his own until the failure of Warwick and the Lancastrians in England brought his fortunes to a low point. He was already at war with Burgundy. Charles aimed at occupying the ter. of Lorraine and extending his possession down to the Mediterranean. He found that his scheme evoked considerable opposition and tried to occupy the attention of Louis by encouraging an Eng. invasion of F. Edward IV, however, was bought off by Louis at the treaty of Pequigny and returned to England. Charles the Bold was finally killed at the battle of Nancy in 1477. Louis then seized Burgundy and Artois, and finally it was arranged by treaty between Maximilian and Louis that Margaret, the heiress of Burgundy, should marry the Dauphin Charles and bring as her dowry the country of Burgundy and Artois. Louis had at last triumphed. He d. in 1483. F. was governed immediately after his death by the regent, Anne of Beaujeu. The great achievement of the regency was the marriage of Charles VIII to Anne of Brittany, in face of the opposition of the powers of Europe and her marriage by proxy to the Emperor Maximilian.

The hist. of modern F. really begins with the reign of Louis XII. The death of Charles VIII had again raised the vexed question of the succession in Brittany, and this was solved by the marriage of Louis XII to Charles's widow, Anne. He remitted much taxation, and gave the country an opportunity of becoming prosperous and wealthy. His reign was

one long pattern of tortuous diplomatic intrigue; first in the league of Cambrai (1508) he fought with the papacy against the growing power of Venice; next by the Holy League (1511) he found himself deserted by his one-time allies, and although Gaston de Foix won for him some successes in Italy, he was forced to make peace. England had once more come to the front as a European power, and by the battle of the Spurs (1513) helped to weaken the power of F. Louis I. in 1515. The reign of Francis I (1515-47) marks the beginning of the struggle between the house of Hapsburg and the Fr., the estab. of the Fr. military prestige, the beginning of the alliance between F. and Turkey, and the origin—due to the growing influence in F. of Calvinism—of the religious wars. Francis won the battle of Marignano (1515), and forced from the papacy a concord which gave him practical control of the Church in F. He became a candidate for the empire in 1519, but was unsuccessful, and in 1525 was defeated at Pavia, captured, and taken a prisoner to Spain. Here he signed the treaty of Madrid, but failed to keep the terms of that treaty, and so the war dragged on during his reign. Many attempts were made to end it, e.g. at Cambrai, but it was not until towards the end of the reign that the treaty of Cr py recognised the actual facts. Francis had inaugurated the royal policy of being Catholic in his policy at home and Protestant abroad. Under his successor, Henry II (1547-59), the Protestants were persecuted bitterly in F., although Henry's struggles with Charles V made a continuance of the pro-Protestant policy necessary abroad. Charles attacked Metz, but was unsuccessful, and finally he resigned the crown of Spain to his eldest son. But the war with F. dragged on, chiefly owing to the influence of the Guises in F. Calais was won back in 1552, and in 1559 the treaty of Cateau-Cambr sis put a period to the struggles of the Hapsburgs and the Fr.

The next decades of Fr. hist. are dominated by the wars of religion. During the succeeding 30 years the real power lay in the hands of the nobility. Chief amongst the leaders of the nobles were the family of Bourbon, which was Huguenot, and which was represented by Antony of Bourbon and his brother Cond ; and the family of Ch tillon, represented by the statesman and warrior Coligny, adm. of F., also Huguenot; on the other side were the Guises, who, during the reign of Francis II (1559-60), gained great influence, partly owing to the fact that the queen (Mary Queen of Scots) was their niece. The power of the Guise family declined when Francis II. d. Charles IX (1560-74), a boy of 10, succeeded, and the regency was exercised by the queen-mother, Catherine de' Medici (q.v.). In 1562 the Guises precipitated the religious wars by killing a number of Huguenot soldiers, and the fighting thus started dragged on from 1562 to 1598. Though religious prin-

ciples were involved and though many sincere Catholics and Protestants fought and d. for those principles, the wars were at least partly a struggle for power between 2 opposing court factions, and the last Valois rulers attempted, with varying success, to maintain the balance between them in order to preserve the monarchy itself. Between 1562 and 1570 the civil war broke out 3 times. Each time war was ended by a promise of toleration to the Huguenots, and finally, in 1570, the Huguenots were given good terms in the treaty of St Germain. This treaty was due largely to the growing feeling in F. that the real enemy of Fr. national unity was Spain, and Charles IX. planned a united attack of Protestants and Catholics on Spain. Charles IX., between 1570 and 1572, was under the influence of Coligny, and to counter this Catherine de' Medici swung over to the Guises. Her jealousy of Coligny led her to instigate his murder, and this in turn led to the notorious massacre of St Bartholomew (1572) (q.v.), though it is now generally acknowledged that Catherine had no conscious intention of precipitating a slaughter of Protestants on this scale. The fifth civil war saw the rise to power of that body known as the Politique. This was an association of men who desired only the peace of the realm, and who supported the Huguenots with that aim during this war. Henry III (1574-89) declared at first for toleration, and later against the Huguenots. Finally he acknowledged the Protestant Henry of Navarre his heir, and had Guise assassinated. Further fighting followed. Paris rose in revolt against the king, who joined with Henry of Navarre and besieged it. Henry III was, however, assassinated himself, and the Catholic League, whose avowed object was to prevent Henry of Navarre ascending the throne, was victorious for the time being. Henry of Navarre (1589-1610) was now lawful king, but the league for the time being refused to recognise him. Henry defeated the league at Arques (1589) and at Ivry (1590). He next besieged Paris; dissensions were already breaking up the league, and in 1593 Henry, who for a long time had refused to change his creed, became a Catholic, and was recognised by the states-general as king of F. In 1598 was signed the treaty of Vervins, by which Spain kept but little, and Calais was restored to F. With the aid of Spain taken away, the Catholic League collapsed, and order was restored in F.

The reign of Henry IV, the first of the Bourbons, saw the rehabilitation of the monarchy and the country after the prolonged civil wars. The Edict of Nantes was issued in 1598. By this edict toleration was granted the Huguenots. Henry's minister Sully (q.v.) reformed the finances and justice, and helped to curb the power of the nobles, thus helping forward the aggrandisement of the Crown. Henry IV was assassinated in 1610, and was succeeded by his son, Louis XIII (1610-43). The regency

was left in the hands of Marie de' Medici, the queen-mother, and the nobles began to gain power again. Finally Condé headed a rebellion which resulted in the calling of the states-general for the last time before 1789 (1614). The central figure of interest during the reign of Louis XIII is Richelieu (q.v.), who from 1624 to 1642 dominated the policy of F. Richelieu's foreign policy was directed towards establishing F. as the greatest country in Europe; his domestic policy aimed at the aggrandisement of the Crown. The age of Louis XIV is the logical conclusion of both the foreign and domestic policy of the cardinal. The Thirty Years War broke out in 1618, and although F. was not directly concerned, nevertheless, in order to aim a blow at Austria and Spain, Richelieu supported Gustavus Adolphus of Sweden in his attacks against the Catholics. In 1635 F. intervened actively in the fighting, with decisive effect. In his domestic policy Richelieu was equally successful. He crushed the right of private war, he summoned no states-general, he took away many of the extraordinary privileges of the Huguenots. The Parlement de Paris was subordinated to the royal will and the power of the Crown was centralised. During the first 18 years of the reign of Louis XIV Mazarin (q.v.) was the chief minister, and followed in the footsteps of Richelieu, but he was unable to exercise quite the same firm control. Abroad the victory of Condé at Rocroi made F. the greatest military power in Europe, and this victory was followed in 1645 by the victory at Nordlingen. The result of these victories was that in the treaty of Westphalia, which was signed in 1648, F. was given Lorraine, the bishoprics of Metz, Toul, and Verdun, together with Pinerolo in Italy. At home, however, matters were more disturbed. Two civil wars broke out, known as the first and second Fronde. The first or *parli*. Fronde aimed at obtaining various concessions from the Crown. This was ended by the treaty of Rueil. Immediately afterwards the second or aristocratic Fronde broke out. This was led by Condé, and was at first strikingly successful. It was aimed against Mazarin, and was, in fact, an attempt on the growing powers of the Crown. But eventually the Crown and the minister triumphed, and in 1658 the second Fronde was finally put down. The treaty of Westphalia, while it had ended the struggle between the empire and F., had, nevertheless, extended the war into Spain. In 1659, however, was signed the treaty of Paris, by which the Spaniards ceded some ter. on the Pyrenees.

A marriage alliance was arranged between Louis XIV and Maria Theresa, the daughter of the Sp. king. This marriage was celebrated in 1660. In the following year Mazarin d. and Louis XIV became his own chief minister. Louis had resolved to be absolute. He adopted Richelieu's foreign policy of territorial aggrandisement. To Colbert (q.v.), who

had charge of the finances of the country during the early part of Louis's reign, F. owed much. He fostered trade and commerce; the East and West Indies were exploited, settlements were made in India, and the colonies in North America were extended. To a great extent Louis XIV owed the success of his foreign policy to the financial reforms and the increase of trade and wealth for which the wise administration of Colbert was responsible. But Louis had hopes of dominating Europe which were destined to lead F. into a series of wars from which her economy was not to recover until after the Revolution. The war of Devolution broke out in 1667, just after the death of Philip IV. The extension of the power of Louis XIV over the Netherlands, however, alarmed England and Holland, who formed an alliance with Sweden to prevent Louis from carrying out his aim. Louis, however, who had already agreed with Austria that when Charles II of Spain d. the Sp. dominions should be divided, made peace and withdrew from the Netherlands (1668). His next war was with the Dutch (1672-8). By the treaty of Nimegen, which ended it, the Fr. made great gains in the N. Louis now turned his attention to acquiring the Rhine as the boundary of F. By means of *chambres de réunion*, he estab. claims to all Alsace, Lorraine, and Luxembourg, and by the treaty of Ratisbon (1684) he was allowed to keep what he claimed for 20 years.

But Louis's policy of blatant aggression had raised up for him enemies all over Europe. The *réunions* had made the empire and Spain unfriendly; Holland was, of course, still hostile; and England after 1688 became, under William III (q.v.), the centre of opposition to the ambitions of F. In 1685 he made a terrible blunder in his domestic policy in deliberately revoking the Edict of Nantes. The immediate result was that tens of thousands of her most industrious citizens left F. In the meantime the policy of James II in England had brought on the revolution of 1688. The appearance of a fugitive James II at the Fr. court was a crushing blow to Louis. F. was now surrounded by enemies. The war of the Protestant Succession immediately broke out. The war was waged in Germany, where Louis cruelly laid waste the Palatinate; in Ireland, where the last hopes of the Jacobites were crushed; on the sea, where, by the battle of La Hogue (1692), the sea power of England was finally estab.; and in the Low Countries, where the war rapidly became simply a war of sieges. By the treaty of Ryswick, Louis gave up all conquests, with few exceptions, gained since 1678. But the treaty was merely a truce. The king of Spain was dying, and the still ambitious Louis turned to the definite estab. of Bourbon power in Europe. William III and Louis signed 2 partition treaties, both of which, however, were broken, one by the death of the Electoral Prince Joseph and the second by the acceptance of the will of Charles

II (leaving his dominions to Louis's grandson, Philip of Anjou) by the Fr. king. Louis immediately overran the Sp. Netherlands with Fr. troops, and when James II d. recognised his son as James III of England. England immediately put herself at the head of the alliance against F., and the war of the Sp. Succession (q.v.) broke out. It lasted from 1702 to 1713. The Fr. military power was broken by the great victories of the allies at Blenheim, Ramillies, Oudenarde, and Malplaquet, but the successes of the allies in Spain were but transient, and the capture of Gibraltar (1704) was the most important event. The Fr. fought bravely, and by their rally at the end of the war, and also owing to the desire of the Tory party in England for peace, they gained terms at the treaty of Utrecht which their earlier performances in the war had certainly not justified. Philip of Anjou was given Spain, the Barrier was restored to Holland, and Austria was given the Sp. Netherlands, together with the It. possessions formerly belonging to Spain. Louis d. in 1715.

Louis XV, his great-grandson, succeeded him. It was not until after 1729 that the birth of a Dauphin finally dispelled the hopes of succession to the Fr. throne which Philip V had, and drew together the Fr. and Sp. Bourbons into a family alliance. The early rule of Louis XV was complicated by the Polish Succession war and the struggles of Austria and Russia against Turkey. F. was still true to her old policy of alliance with Turkey. Fleury had just succeeded in regaining for F. a foremost place amongst the powers of Europe when the war of the Austrian Succession broke out. Whether England or F. was to be supreme in India and America was the question which had now to be decided. The war had begun as an attempt on the part of F. still further to injure the power of the house of Hapsburg in Europe, but after 1743 it became a struggle with England for the colonies. F. and Spain declared war against Austria and England. The war was fought in Germany, America, and India. In 1745 Fontenoy was won by the Fr. Frederick of Prussia withdrew from the war in 1746, and the peace of Aachen was signed in 1748. The peace was in truth but a truce, and simply restored the *status quo*. The period between the end of the war of the Austrian Succession and the outbreak of the Seven Years War was filled with dissensions in F. itself. The minister, Machault, attempted to break down class privileges, but failed. The power of the Church and of the nobles was increased, and it was only war that saved F. from revolution. By 1756 India had practically been lost by the recall of Dupleix, and war was going on in America. In 1756 was accomplished that diplomatic revolution which united the interests of the Hapsburgs and Bourbons, and opposed them to England and Prussia. Such was the state of affairs when the Seven Years War broke out. The Fr. were successful in Europe and America up to 1758, but

during 1759 the series of Eng. victories at Lagos, Quiberon Bay, and the Heights of Abraham (Canada) brought the colonial power of F. down to the lowest level it had yet reached. Her power in India was overthrown by the surrender of Pondicherry. In Europe she had been almost equally unsuccessful, and the battle at Rossbach broke the military power of F. until the revolution. By the treaty of Paris F. ceded Canada and North America to England. Minorca passed into Brit. hands, and she had to compensate Spain with Louisiana. Between 1763 and 1774 F., under the ministry chiefly of Choiseul, was engaged in internal reform and also in an attempt to raise afresh the strength of the navy for a renewed struggle with Brit. power. At home a struggle was also going on between the Jesuits and the minister, supported by the Parlement de Paris, both of whom held Jansenist views. The Society of Jesus was abolished in F. in 1762. F. maintained her alliance with both Austria and Spain, and in 1770 Marie Antoinette, archduchess of Austria, married the Dauphin. Before the end of the reign (1774) Choiseul had been dismissed. F. was fundamentally weak; the monarchy decadent and distrusted, the nobility privileged and hated, whilst the abuses in the Church had made it unpopular with a large section of the people. Louis XVI (1774-93) attempted reforms; but the influence of Marie Antoinette during this period was pernicious. The reforms of Turgot were frustrated by her, whilst Necker was dismissed in 1781, after having attempted to manage the finances of the country for 6 years. During the Amer. War of Independence F. supported the colonies. Her minister, Vergennes, directed her policy with such effect that her intervention won the Americans recognition of their independence, and restored to F. some of the lost prestige.

After the Amer. war Fr. ministers tried various means of reform to stave off national bankruptcy, but finally public opinion in F. became so strong that the king was obliged to call the states-general for May 1789, and to restore Necker as his minister. The literary influences which had operated to bring about the revolution were many. The writings of Montesquieu, the Encyclopédistes, Voltaire, and Rousseau had concentrated public opinion on the feudal abuses of F., and, most important of all, the *Contrat Social* of Rousseau had been widely read and as widely influenced the Fr. intelligentsia, from whom the leaders of the Revolution sprang. The states-general met on 5 May 1789. The third estate immediately demanded that the assembly should meet together and not in its 3 orders. In June they adopted the title of the National Assembly and banded themselves together by an oath to make a new constitution. The king, unnerved by the tendency of events, concentrated his troops round Paris. Mirabeau demanded the disbandment of the troops;

the king refused and dismissed Necker; the National Guard was formed by the people, and the Bastille stormed and taken (14 July). The fall of the Bastille led to the recall of Necker, whilst all over the country it influenced the formation of national guards and attacks on the castles of the feudal nobility. The assembly now debated the Rights of Man, and proceeded to abolish all feudal privileges. The gov. was to be by means of a single chamber, and the royal veto was only potent for 6 months. In Oct. the assembly moved to Paris, whither the king had been conducted by the mob. In June the king attempted to flee the country, but was captured at Varennes and brought back. In 1791 a new constitution was promulgated. The assembly then passed a self-denying ordinance and dissolved itself (Sept. 1791). The new assembly met in Oct. It was composed chiefly of Girondists (the Moderate party) and the Mountain (or Extremists), who were divided into 2 factions, the Jacobins, led by Robespierre, and the Cordeliers led by Danton and Desmoulins. In 1792 war broke out between Austria and F. The ill success of the Fr. arms at the beginning of the war infuriated the mob, who on 10 Aug. stormed the royal palace, slaughtered the Swiss guards, and overthrew the monarchy. A new ministry at once came into office, the war was pursued with more vigour, and Dumouriez won the battle of Valmy (20 Sept.). The National Convention declared F. a rep., and the Austrians were overthrown at Gemappes. European war was imminent. F. soon found herself opposed by Spain, Portugal, and Austria, together with England and Holland. The Sept. massacres of 1792, the work of the Extremists, were condemned by the Girondists, who, however, were finally outvoted by their opponents, who tried and executed Louis XVI (Jan. 1793). In July of the same year the Girondists were overthrown, and the Committee of Public Safety was instituted. F. was now in the grip of the Jacobin Robespierre (q.v.) and a reign of terror followed. At first Robespierre's policy was successful both at home and abroad. La Vendée (q.v.) was crushed, the allies were overthrown, and F. was freed from threats of invasion; but the revolutionaries quarrelled amongst themselves, and Robespierre himself was guillotined. After the death of Robespierre affairs in F. became less violent. In 1795 the Directory was formed. This was the first attempt to set up a reactionary gov. The gov., opposed by the forces of the Moderate as well as the Extremist party, was soon faced with another revolution. After putting down the insurrections by means of Napoleon's famous 'whiff of grapeshot,' it estab. the constitution of the year III, and set up a republican form of gov., which consisted of 50 directors and 2 councils. The policy of the Directory was at first successful at home and abroad; the reaction of the Royalists, who were in the majority in the councils, was put down, and the 11.

campaign ended in the advantageous peace of Campo Formio (1797). England was now left alone to fight F., and Napoleon (q.v.), the Directory's general, left Europe to fight in Egypt. When he returned he found that a second coalition had been formed against F., and the Fr. had been driven out of Italy. F. was on the verge of civil war when Napoleon, aided by Sieyès and Barras, carried out the revolution of 19 Brumaire (1799), destroyed the Directory, and set up the consulate. Napoleon estab. himself as first consul and was soon virtual dictator of F. He undertook his spectacular It. campaign, where, by the victories of Marengo and Hohenlinden, he forced Austria to accept the peace of Lunéville (1801). The armed neutrality of the N. was initiated to overthrow the power of Britain; but this failed, and after the accession of Alexander I the Russians withdrew from their Fr. alliance. England and F. made peace by the treaty of Amiens. During the short interval of peace Napoleon reorganised the central gov., estab. a sound system of education, and healed the schism in the Church by his concordat with the papacy. He also reduced the Fr. law to order by means of the Code Napoléon. In 1804 Napoleon was declared emperor by the Senate, and crowned himself at Notre Dame. In 1803 the war broke out again, and the life of Napoleon for the next 12 years is the hist. of Europe. Trafalgar was fought in Oct. and Austerlitz in Dec. 1805; Austria was forced to make peace at Pressburg (1805); Germany was split up and divided into states such as the confederacy of the Rhine; Prussia was destroyed at Jena and Auerstädt; and Russia reduced to terms by the victories at Eylau and Friedland (treaty of Tilsit, 1807). Napoleon, by means of the continental system, tried to overthrow the power of Britain, but eventually failed, because F. herself could not ultimately do without Brit. supplies (see CONTINENTAL SYSTEM). Finally, when Napoleon emerged from the Russian campaign, he was plunged into the War of Liberation (1813). The battle of the nations (16-18 Oct. 1813) saw Napoleon's forces utterly defeated by a combination of Germans, Austrians, and Russians. Still Napoleon refused to make peace, and the allies entered F. from the N., whilst Wellington routed the Fr. in the S., and proclaimed Louis XVIII. Napoleon abdicated, and was exiled to Elba, whilst the first treaty of Paris was signed (1814). The settlement of Europe was still under discussion when Napoleon escaped from Elba, landed in F., and rallied the Fr. around him. The campaign known as the Hundred Days took place, and Napoleon, finally defeated at Waterloo (18 June 1815), abdicated, surrendered to the Eng., and was exiled to St Helena, where he d. in 1821. F. became a monarchy again under Louis XVIII. Almost immediately there was a Royalist reaction in F., and in 1830 the reactionary ordinances of Charles X led to the revolution of July, and the Bourbon monarchy fell in F. for

ever. Louis Philippe was declared king of the Fr., and the policy of the Fr. ministry under him was relatively liberal in tendency. England, F., Spain, and Portugal united together in the Quadruple Alliance, which was brought to a close by the Near E. problem, in which Thiers, whilst nominally allied to Britain, worked against her interests in the Mediterranean.

Guizot succeeded Thiers, and remained in office until 1848. Although he acquired Algeria, he did much to foster bad feeling between England and F. The question of the marriage of the queen of Spain brought open rupture between the 2

gave Napoleon. But there was still much opposition to Napoleon from the Republicans, and this opposition was met by repressive measures which really weakened Napoleon's power. In 1858 he went to war in alliance with Italy against Austria, but having defeated the Austrians at Solferino he withdrew from the alliance and made peace, leaving the question of It. unity to be settled later by Cavour and Garibaldi. The Prussian-Austrian war was viewed at first with equanimity by Napoleon, but the victory of Prussia and the knowledge that Ger. unity was a probability of the near future filled him

countries, and F. found herself practically isolated in Europe. Domestic discontent culminated in the revolution of 1848, when Louis Philippe abdicated, and a rep. was set up. Finally a constitution which gave a president elected by the people was estab. Louis Napoleon, a nephew of Napoleon I, was elected president (1848). In 1851 Louis Napoleon carried out his *coup d'état*. A new constitution was issued. The president was to be elected for 10 years; there was to be a senate (nominated by the president) and a legislative council (elected by the people). In 1852 Louis Napoleon re-estab. the empire and proclaimed himself emperor as Napoleon III (q.v.). In 1854 England and F. in alliance fought the Crimean war. In 1856 the treaty of Paris ended the war, and declared the Danube free and the Black Sea closed to warships, but nevertheless neutral. Turkey was to carry out various reforms, but the most important result was the prestige which it

with dismay. F. was again isolated in Europe. The succession question in Spain and the putting forward of a candidate of the house of Hohenzollern (who was, however, speedily withdrawn) led to the Franco-Prussian war. The Fr. were unprepared, and were defeated at Worth and Sedan, when Napoleon III was taken prisoner.

The empire in F. fell, and under the gov. of national defence tried to oppose the Germans. Metz, however, where Bazaine was holding out with 170,000 men, surrendered, and Paris was besieged. In 1871 Paris capitulated, and peace was signed. A huge war indemnity was demanded, and Alsace and E. Lorraine ceded. The Commune was set up in Paris: the prov. gov., under Thiers, had difficulty in obtaining possession of the cap. For the next 2 years Thiers ruled F., and succeeded in establishing order and restoring the finances. Much quarrelling ensued, however, as to the constitution

which F. ought to adopt, and Thiers was driven by opposition from a conservative position to an extremist one, and was then driven from power (1873). He was succeeded by MacMahon. The period of the Third Rep. was definitely inaugurated by the decree of Jan. 1875, which organised the rep. under what was called the constitution of 1875. MacMahon, however, was considered too conservative in sympathy, and in 1879 he was succeeded as president by Grévy. The Republican party after this victory split into divergent groups—the Democratic Liberals, the Radicals led by Gambetta, and the Radical-Socialists of whom Clemenceau was spokesman. In opposition the Monarchists, Bonapartists, and Clericals formed a coalition, and exploited the ambition of Boulanger (q.v.) to overthrow the rep. Grévy resigned in 1887, and was replaced by Carnot. Boulanger was charged with high treason, and fled. The Moderate Republican party hoped for the support of the Catholics, but gov. prestige was weakened by the scandal connected with the bankruptcy of the Panama Company, 1892. Meanwhile, Socialism was becoming an organised force in F. and Jaurès became the Fr. Socialist leader in 1893. In the next year Carnot was assassinated. A wave of anti-Jewish feeling surged over F. during the Dreyfus affair (1894–1906) (q.v.), which acquired so great a political significance that the very stability of the rep. was threatened. The Waldeck-Rousseau ministry settled this affair with Loubet as president in succession to Faure, the anti-Dreyfusard. A major problem confronting Waldeck-Rousseau and his successor was that of the Church, and this resulted in 1905 in the separation of Church and State.

One feature of pre-1914 Fr. politics was the growth of syndicalism, especially within the Confédération Générale du Travail, formed in 1895. The Clemenceau ministry of 1906 was faced with extreme labour troubles, and fell in 1909, a new Cabinet being formed by Briand (q.v.), who continued in office until the elections of 1910. Fr. foreign policy to this date had been one of colonial expansion, which in Tunis provoked a dispute with Italy (1881–3), in the Congo and in Egypt with England, especially the Fashoda (q.v.) incident in 1898, and in Morocco with Germany in 1905 and 1911. The conquest of Tunisia caused Italy to form the Triple Alliance with Germany and Austria (1882), and this was countered by the Dual Alliance between F. and Russia in 1891. Fr. politics in the early 20th cent. were divided over reconciliation with Germany, advocated by Caillaux, and *rapprochement* with England. The latter policy, supported by Clemenceau, resulted in the Entente Cordiale between F. and England (1904). The Agadir incident of 1911, which F. regarded as an attempt to establish Ger. influence in a Fr. sphere, nearly led to hostilities. The elections of 1910 had been fought over proportional representation, and

electoral reform was accepted by the Caillaux Cabinet of 1911. In 1912 Caillaux was defeated over his policy of reconciliation with Germany, and in opposition a Poincaré ministry was formed. In 1913, however, Poincaré was elected president in succession to Fallières. The prospect of war found F. neither morally nor materially ready. With the Austro-Serbian crisis and the murder of the Archduke Ferdinand (see FRANCIS FERDINAND) at Sarajevo on 28 June 1914 war became imminent. President Poincaré visited the Tsar Nicholas II at St Petersburg in July, and immediately after his return Austria presented Serbia with an ultimatum which was followed by a declaration of war on 28 July. Russia had been forced into partial mobilisation by Austria's attitude, and Germany demanded Russia's complete demobilisation without putting similar pressure on Austria. Russia refused, and Germany declared war on Russia on 1 Aug. The Ger. mobilisation was directed against F. and Germany declared war on 3 Aug. (for fuller details of the war in F. see WORLD WAR, FIRST; and the various military campaigns listed separately). The Ger. invasion of Belgium caused England to declare war on Germany on 4 Aug. The Fr., who had organised their defensive line on the Lorraine frontier between Germany and F., were not prepared for the violation of the neutrality of both Belgium and Luxembourg. In Paris a truce was called to party politics by a *union sacrée*, and Viviani reconstructed his Cabinet.

Paris was soon threatened by the Ger. advance, and on 2 Sept. the gov. withdrew to Bordeaux. Gen. Gallieni (q.v.), military governor, was left in control of Paris, and by dispatching the 'army of Paris' to the front in taxi-cabs he contributed to Joffre's success in the battle of the Marne (5–12 Sept.). The hist. of F. for the next 4 years is that of the war itself. Fr. industries were concentrated in the N. and NE., and the Ger. occupation crippled their activity. Nearly all the iron and half the coal resources were also under Ger. control, but F. developed her industries in the unoccupied regions with amazing energy. But internal political dissensions weakened F. during the first 3 years of the war. In Dec. the Fr. Gov. returned to Paris. The fall of the Viviani ministry followed upon the failure of allied diplomacy in the Balkans, and in Oct. 1915 a new ministry was formed by Briand. Gallieni succeeded Millerand (q.v.) as minister of war. The Briand Cabinet was reorganised in Dec. Lyautey became minister of war, but resigned in Mar. 1917. Under a new ministry formed by Ribot, who succeeded Briand, Painlevé was made minister of war. Painlevé continued the Balkan policy of supporting Venizelos. In Sept. the whole Cabinet was reorganised, Painlevé becoming premier. Defeatism at this time was assuming serious proportions, and this brought about the fall of the Painlevé Gov. in Nov. 1917, and

Clemenceau was invited to become premier and minister of war. Energetically he fought defeatism and was soon regarded as a national hero. His authority was almost unquestioned (see CLEMENCEAU). By the treaty of Versailles, 28 June 1919, F. recovered Alsace-Lorraine (q.v.), but failed in the desire to fix the Rhine as the Ger. frontier, although the Rhineland was to be occupied by Fr. and allied troops for 15 years. F. was also given a mandate for Syria, and, in addition, acquired Togoland and part of the Ger. Cameroons (q.v.). With the Fr. realisation that the treaty was giving them neither the security nor the reparations on which they had counted, Clemenceau became unpopular, and in the 1919

gave way to a *bloc des gauches*, with Herriot (q.v.) at its head. Poincaré's retirement rendered Millerand's position as president untenable; he resigned, and was succeeded by Gaston Doumergue (q.v.), who, in 1931, was followed by Doumer (q.v.). Herriot, the new premier, found himself in agreement with MacDonald, prime minister of Britain, and the Entente Cordiale was re-established. At the London Conference, 1924, the Dawes plan (q.v.) was accepted. Fr. evacuation of the Ruhr was completed in 1925. Herriot played a foremost part in the framing of the Geneva protocol at the League of Nations Assembly in Sept. 1924, and although the protocol was not ratified, it led the way to the Locarno

D. McLeish

THE PALACE OF VERSAILLES, SCENE OF THE TREATY OF 28 JUNE 1919

elections he was superseded by Millerand, who formed a Conservative *bloc national*. Moreover, not Clemenceau but Deschanel was elected to the presidency when Poincaré retired in 1920. When Deschanel fell ill, Millerand was elected president. Leygues became premier for a short time, but at the beginning of 1921 he was succeeded by Briand.

The problem before Fr. statesmen was that of the reconstruction of F., and it was hoped to effect this by making Germany pay, as Germany had made F. pay in 1871. Fr. war casualties included nearly 1,400,000 killed, and nearly 450,000 missing. One-tenth of the country had been laid waste. The cost of reconstruction was reckoned at about £350,000,000. At the Paris Conference of 1921 the amount to be paid was reduced to 226,000,000,000 gold marks. By 1922 Germany had defaulted seriously on her payments, and Poincaré, who had succeeded Briand, ordered Fr. troops to occupy the Ruhr. In the elections of 1924 Poincaré was defeated over the financial question. The *bloc national*

Pact, which was negotiated during 1925 by Briand, Fr. foreign minister, with Austen Chamberlain and Stresemann.

Although the Herriot ministry brought a new spirit into international affairs, it was forced to resign over the acute financial question. Poincaré then formed a ministry to stabilise the franc. He set up an autonomous fund commission to deal with the floating debt, and in 1926 the budget was balanced for the first time since 1913. The value of the franc was increased by 100 per cent and fluctuations were prevented. In domestic affairs the Poincaré Cabinet withstood repeated attacks from the Radical Socialists, while in foreign affairs the Briand-Kellogg Pact was concluded in Aug. 1928 (see KELLOGG PACT), and the following year Poincaré secured ratification of the Young plan, together with the Churchill-Caillaux Accord with England and the Mellon-Béranger Accord with the U.S.A. in respect of the Fr. debts. In July 1929 Poincaré resigned through ill-health, and Briand continued as premier of the Poincaré Cabinet until defeated in Oct.

Briand, however, remained as foreign minister in the new gov. formed by André Tardieu.

Briand next served as foreign minister under Pierre Laval (q.v.), who 9 years later was destined to prove F.'s evil genius. Over the next few years gov. succeeded gov. rapidly. It was a period of political and economic instability and contained a number of events which suggested a general decline in public morality. In 1934, for example, Europe was startled by the Stavisky scandal. The scandal, which involved the flotation by Stavisky, in the name of the municipal credit estab. of Bayonne, of a very large sum in bogus bonds, plainly revealed much political corruption. To restore political stability Doumergue was recalled to office, with Barthou at the Quai d'Orsay. Barthou, however, fell, with Alexander of Yugoslavia, at the hands of a Czech assassin, an event which brought back Laval as foreign minister. But F.'s main preoccupation at this time (1935) was Ger. rearmament in defiance of the Versailles Treaty. At the Stresa Conference the Brit. delegate tried to secure the return of Germany to the League of Nations, but the Fr. representative made that course impossible through striving to enhance his country's security by inducing the League Council to denounce Germany's violation of the treaty; a course that might have been justified had the council followed up its resolution by using the full machinery of the League covenant, even by the use of force, to stop Ger. rearmament. In the result Germany, having rejected the League's resolution and denied its jurisdiction, demanded air parity with F. and full equality of status with other sovereign powers.

F. was now losing the dominating position in Europe which she had held after the First World War—a position she had buttressed by a system of alliances with the E. European states. After the Nazis had seized power in Germany, F. for long abstained from open opposition to Germany's policy of rearmament and expansion, though, prior to Hitler's rise to power, she had successfully opposed an understanding between Germany and Austria, whether in the guise of a trade agreement or otherwise. But, in 1936, internal problems pre-occupied her. The so-called 'front populaire,' formed by Communists, Socialists, and Radicals under the leadership of the Socialist, Léon Blum (q.v.), exactly reflected the mutual class jealousies which stultified Fr. policy in the ensuing years. This gov. carried out a number of urgent social reforms; but, faced with economic difficulties, its influence soon declined, especially when its counterpart in Spain was defeated, partly through lack of any effective help from F. to counteract the aid given to Franco by Germany and Italy. The Popular Front in F. finally disappeared in 1938 when Daladier, supported by a radical and right-wing majority, succeeded Blum. Under Daladier a policy

of appeasement was pursued, Daladier being in Sept. 1938 a party to the Munich agreement which left F.'s ally Czechoslovakia to the mercy of Hitler. After this the position of F. in Europe deteriorated rapidly. Mussolini, emboldened by Fr. weakness, advanced impudent claims to Corsica, Tunis, Nice, Savoy, and Djibouti. But even then few in Britain believed that F. was really the decadent nation which Ger. propagandists described. When, in Sept. 1939, she took up arms with Britain in defence of Poland against Ger. aggression it was popularly believed in Britain that she would display her traditional valour and resourcefulness. But though the Fr. armies offered a brave resistance in the opening stages of the offensive on the W. Front, a total collapse followed late in June 1940. (See EUROPE, HISTORY; WORLD WAR, SECOND; WESTERN FRONT IN SECOND WORLD WAR.)

The military collapse of F. came as a thunderbolt to her Brit. ally. Brit. public opinion was still thinking of Fr. arms in terms of the dramatic Fr. resistance on the Marne, the Chemin des Dames, and at Verdun in the previous war. But the probability is that, while the Fr. soldiers of 1940 were in no way inferior to their predecessors, Fr. generalship was, with a few exceptions, extremely feeble. Many of her military leaders seemed to have little conception of the character of a modern war. After the gap had been torn in the Fr. lines at Sedan there was no real attempt at a co-ordinated scheme of resistance.

The causes of this historic tragedy are numerous and have their roots in tendencies operative over many years; and it is impossible to assign to any one or more of these causes the greater weight of responsibility. But apart from the political and social weakness of F. in the period before June 1940, the completeness of the military defeat supplies the essential factor in the tragedy. It is beyond doubt that the nation was divided against itself, that its constitution was defective and that the corruptibility of many prominent Fr. politicians sapped the country's vitality. Yet even the most united and best organised nation could hardly have withstood the tremendous military odds which confronted F. in May 1940. While Germany for at least a decade previously had concentrated on perfecting a modern military machine, combining weight and mobility, for offensive use against the defences that had defeated her in 1918, and on formulating a scientific strategy, F., worn out by the previous war, staked all on the Maginot line. There is a strong element of truth in the charge that the 'Maginot mentality' wrought the ruin of F. The idea of a purely defensive strategy reflected the pacific and war-weary mind of the Fr. people and made it impossible for the Fr. high command to appreciate the change which modern scientific advance had brought about in the art of war. Moreover, even had her general staff been more fully alive to modern military progress, it is doubtful

whether they would have obtained before 1939 the enormous financial credits without which adequate mechanisation of the army could not have been achieved. In this manner F. suffered an annihilating military defeat. Against 60- and 70-ton Ger. tanks and dive-bombers the traditional bravery, *elan*, and resourcefulness of the Fr. soldier were powerless. The mass of the people of Paris had no conception, until too late, of the gravity of the situation, and when the city was raided by some 300 Ger. aeroplanes and the imminent advance on it of the Ger. tanks could no longer be concealed, every road issuing from the metropolis was choked with an unending stream of refugees in cars, carts, and on foot, hampering hopelessly all military activity and leaving in the city only settled despair.

Political and social weaknesses also contributed to the defeat of F.; and the politicians who played their part in her humiliating capitulation did not belong to any single political party. Their variety of origin shows how widespread was the collapse of Fr. morale. Furthermore, it is difficult to avoid the inference that a considerable number of the Fr. bourgeoisie had for many years been undermined by the activities of the 'Fifth Column' (q.v.).

Daladier's administration was followed by that of Reynaud in Mar. 1940. In the May crisis the aged Marshal Pétain (q.v.) and other pro-Fascists were brought into the gov. When Paris fell in mid June Reynaud discussed with the Brit. Gov. the question of a separate armistice, the existence of a Franco-Brit. agreement forbidding such a course. In reply Churchill offered common citizenship between the 2 nations, emphasising that cost what it might Britain would continue the fight. When this offer was refused the Brit. Gov. agreed to consider the release of F. from her obligation provided the Fr. Fleet were prevented from falling into Ger. hands. But the danger of this last contingency was enhanced by the overthrow of Reynaud and his replacement by Pétain as premier. Pétain surrendered unconditionally to Hitler and left the Germans in occupation of the N. part of F. and of the entire coast to the Sp. frontier. The Germans were thus free to use the Fr. coast and its ports as bases against Britain. Churchill, however, acted swiftly against the Fr. Fleet, which was now ready to act under Ger. dictation, and many of its battleships were either brought into Brit. ports, sunk, or damaged, while a number of other warships were put out of action (see NAVAL OPERATIONS IN SECOND WORLD WAR). The immediate consequence of this operation was that the Pétain Gov. broke off relations with Britain, and moving from Bordeaux to Vichy became the puppet of the Ger. Gov., its most influential member being not the aged Pétain but his deputy, Laval (q.v.). A rump Chamber of Deputies voted for the promulgation of a new constitution to be founded on the sombre basis of 'work,

family, fatherland' in place of the Republican 'liberty, equality, fraternity.' President Lebrun resigned, and Pétain assumed the title of chief of state. De Gaulle (q.v.), the one general in F. who had striven to mechanise the Fr. Army, and who had made good his escape to Britain, formed a Fr. National Committee in London to continue the war effort. The Brit. Gov., while continuing its recognition of the Vichy Gov., accorded every assistance to de Gaulle, who, assuming the title leader of all free Frenchmen, began to organise a Fr. Army and Navy in Britain. Soon afterwards Fr. Equatorial Africa and the Chad region transferred their allegiance to him.

Thus perished the Third Fr. Rep. The constitutional laws of 1875, which were the basis of the rep., were formally abrogated in Aug. 1940. Only in the unoccupied zone and the African colonies governed from Vichy did the ghost of the old rep. still linger on. Gradually Hitler separated the nation from the state: Alsace and Lorraine were administered from Berlin as part of the Reich, the 'prohibited zone,' nearest Britain, was governed by the military authorities from Brussels, the rest of occupied F. was governed from Paris. Under Pétain the rep. survived in 2 forms: the chief of state exercised his legislative functions in the council of ministers pending the formation of new assemblies, and both senate and deputies were to remain in being until the new assemblies were formed. But even after their formation the chief of state was empowered 'in the event of tension from abroad or grave internal crisis' to wield legislative power by himself, and he alone could declare a state of siege. In Feb. 1941 a *conseil national* was set up to assist the chief of state in a purely consultative capacity, and its sessions were secret; but the avowed scheme was to create a corporative state somewhat on the It. model. The exigencies of collaboration with Germany and the dislocation of economic life made necessary a high degree of state control of industry. Organised resistance to Vichy soon became apparent. In Aug. 1941 Pétain banned all political parties, all public or private political meetings. After the collapse of 1940, many Frenchmen believed that Pétain's actions had at least saved them from a worse fate; for at that time public opinion considered a total allied defeat only a matter of weeks. But subsequent events—the Battle of Britain, and the Russian resistance to Ger. invasion—coupled with a growing realisation that Pétain's regime was nothing but a Ger. puppet state, soon brought a change of attitude. Founded on the assumption of total defeat and the death of Fr. national consciousness, the Vichy Gov. at the end of 1941 found that defeat was not certain, and that the national consciousness was reawakening, and having equipped F. with all the machinery of a Fascist regime it now failed to find the support to drive the machine.

The re-emergence of the traditional spirit of F. was dramatically reflected by the scuttling of the Fr. Fleet at Toulon (27 Nov. 1943) soon after the allied landing in Fr. North Africa. This act was the climax of increasing Ger. pressure and spoliation. Laval had returned to office in 1943 as 'head of the Government with special powers,' superseding Darlan (q.v.), who was appointed commander of all the forces. To all intents and purposes Laval was now Hitler's agent. Assuming dictatorial powers, albeit under Ger. patronage, he undertook to hand over skilled Fr. labour to Ger. war factories against the release of a small number of Fr. prisoners-of-war. Laval destroyed the last vestiges of the parl. system, by abolishing the offices of president of the Senate and the Chamber. But throughout these violations of Fr. liberties, sabotage and the killing of Ger. soldiers continued, notwithstanding the penalties which followed, and scores of hostages faced the Ger. firing squads. It was in the same defiant spirit that the Fr. Fleet sacrificed itself at Toulon. When the Anglo-Amer. forces landed in Fr. North Africa, the Germans at once overran Vichy F. Hitler, to gain time, designated Toulon a special area which Ger. troops were not to enter. His real intentions were shown on 27 Nov., when the Germans began to march in. The many warships were then either scuttled or damaged—an act of immolation which restored Fr. honour and reasserted Fr. sovereignty. Under an arrangement with Eisenhower (q.v.) Darlan assumed responsibility for the civil administration in North Africa as a temporary measure. On Christmas Eve, however, Darlan was assassinated in Algiers and Giraud (q.v.), who had opposed compromise with the Germans, was appointed his successor. The stand which de Gaulle and his colleagues had sustained since the days of capitulation in June 1940 assumed a wider and more corporate form after the landings in North Africa; and through the efforts of Catroux an agreement was reached between de Gaulle and Giraud in June 1943 for the setting up of a Fr. Committee of National Liberation to direct the Fr. share in the campaign of reconquest, and also of a consultative assembly in Algiers and a unified administration for the Fr. Empire, soon wholly in the war on the allied side except for Indo-China, the possession of which Vichy had allowed to pass to Japan. De Gaulle and Giraud shared the co-presidency of the committee for a time, but soon Giraud devoted himself to the duties of commander-in-chief of the Fr. forces; these now included the Fr. fleet at Alexandria, which had joined the Allies on 31 May 1942 after having been neutralised since 1940. Notwithstanding savage repression by the occupying Germans, and the apathy of Vichy, resistance inside F. grew. Wreckings increased, Germans were shot, and traitors struck down. A remarkable enterprise was launched when thousands of young men,

scheduled for deportation to Germany under an arrangement between Laval and Sauckel, Hitler's director of man-power, took to the *maquis* and maintained a sacrificial fight for freedom.

On 19 Mar. 1943 Gen. Catroux, the Fr. delegate general in Syria, proclaimed the restoration of the free constitution of the Lebanon; but soon afterwards a crisis arose over conflicting views on the continuing validity of the Fr. mandate, and the dispute was only settled at the end of the year. Both this incident and the equivocal attitude of the assembly in Algiers reflected the indisputable fact that at this time the Allies were still paying the costs of the comparative success of Ger. policy in F. The gov. of Vichy, if always feeble, did represent a Ger. success, however limited. For the creation in F. of a gov. which professed to accept Ger. leadership in Europe, and which professed to be able to protect Fr. interests outside Europe by its own diplomacy and its own arms, was a real success. It confused the issue inside F., inside Europe and over a great part of the world, notably in the U.S.A., and for a time the national committee and the assembly did not claim to be a sovereign gov., and were, in fact, not recognised as a gov. at all. It was soon evident, however, that the Fr. national committee and the assembly were the spokesmen of a highly organised revolutionary movement, the resistance movement, and the Allies' recognition of the international status of the committee was therefore ultimately inevitable.

The following year (1944) saw the liberation of F. through the invasion by the Anglo-Amer. forces under Eisenhower, which were landed in Normandy on 6 June. By early Sept. these and other allied forces landed in the S. had overrun most of F. and expelled the Ger. Armies (see WESTERN FRONT IN SECOND WORLD WAR). When in Dec. de Gaulle went to Moscow to sign a treaty of alliance and mutual assistance with Stalin the act showed how far F. had advanced towards re-establishing herself as a great power. But the path had not been an easy one: and even up to the moment of the allied assault in Normandy Amer. and Brit. recognition of the Fr. Committee of National Liberation was still withheld. With the Allies firmly estab. in Normandy it was at once apparent that the authority of Vichy was not acknowledged by any large section of the nation. On the other hand, the resistance movement emerged as a vigorous fighting force commanding popular support. The movement was recognised by the allied supreme command as a regular combatant army and named the Fr. Forces of the Interior, and it co-operated with considerable effectiveness in the allied campaign in Normandy. The Fr. people gave de Gaulle a fervent welcome, and in Paris, where he was popularly acclaimed, he took firm control of affairs, and Lebrun, president at the time of the armistice, formally resigned. On 23 Oct. 1944 Great Britain, the U.S.A., and Russia recognised de Gaulle's

administration as the Provisional Gov. of the rep. At the same time the greater part of F. was declared no longer a combat zone and was transferred to Fr. authority. The leaders of the Vichy regime disappeared into Germany or into hiding. As the Germans and their Fr. collaborators saw their power ending in F. terrorism was intensified, and in 4 months, from June to Oct., scores of men, women, and children were massacred (see ORADOUR-SUR-GLANE).

Paris was physically undamaged in the war, but, on the other hand, no Eng. city,

Fr. rule altogether. In Indo-China the Communists soon launched a full-scale war against F. (For fuller details see articles on the countries concerned.) These colonial problems were to drain F.'s economy severely in the post-war years, and had considerable repercussions on internal Fr. politics.

A Constituent Assembly charged with the duty of drawing up a constitution for the Fourth Rep. was elected in the following year (1945) (women voting in F. for the first time). The Communists were returned as the strongest party,

'New York Times' Photos

THE LIBERATION OF PARIS: 25 AUGUST 1944

with the possible exception of Coventry, was smashed like Brest, Rouen, Lorient, Havre, and Caen. The Fr. had suffered considerable economic privations during the years 1940-4; and Paris in 1944 was in the midst of an inflation which was threatening the liquidation of the middle class. The Communists were the largest single political force. It was obvious that the political and economic hist. of the next few years was to be of vital importance to the future of Fr. democracy. F.'s internal problems were not her only ones. The pre-1939 Fr. colonial empire no longer existed. Syria and the Lebanon had already achieved independence; the Fr. West African possessions were demanding at least a measure of self-gov., and extreme nationalists in Fr. West Africa were calling for independence from

closely followed by the Socialists and a new political organisation known as the Mouvement Républicain Populaire (M.R.P.). This last party drew its main driving force from the men and women who were in the resistance, and from Catholics who favoured large social and economic changes in the State; but it also derived support from the older parties of the right, which saw no political future in isolation. The prestige of the M.R.P. was enhanced too by its close association with de Gaulle himself. When the Constituent Assembly met, de Gaulle returned to the people the powers he had exercised and, having been given a new mandate, formed a gov. drawn from the 3 main parties and pledged to a far-reaching social programme.

De Gaulle resigned in Jan. of the

following year (1946). His provisional gov. had denounced the constitution of 1940, and restored the Third Rep. and its constitution, as in force in 1939. This *modus vivendi*, however, did not reflect the views of the majority of the people of F., and throughout 1946 F. was searching for a new constitution. The reconciliation of a sovereign legislature with a stable executive was the stumbling block, though the seriousness of the country's financial position clearly pointed to the need for a strong gov. A first Constituent Assembly entrusted the task of devising a draft constitution to a representative committee, which produced proposals reflecting advanced democratic thought. Though this draft was approved by a majority of the assembly it was rejected on a referendum (May). A second assembly was elected whose revised draft modified the more stringent provisions of the first draft. Under this constitution, which was approved in a referendum in Oct., a second chamber, the Council of the Rep., with members chosen by indirect election, was given a voice, though not a decisive one, in the legislation; while the president was to be elected by the 2 Houses in joint session. There were also provisions for revision of the constitution by adequate majorities, for the possible dissolution of the assembly, and for the political organisation of the Fr. Union—the new term for F.'s depleted colonial empire.

In the Nov. 1946 elections, which created the first National Assembly of the new Fourth Rep., the Socialists fell to the third place among the 3 leading parties. The Communists were still the strongest single party, but the majority in the assembly was strongly anti-Communist. Paradoxically, when the Socialists dropped from second to third place they strengthened their tactical position; for in the new conditions of equipoise between Communists and the M.R.P. they secured the vital position in the middle of the political see-saw, and it was in these circumstances that in Dec. Blum formed a purely Socialist gov. His stop-gap gov. launched a decisive attack on the price rises and on financial instability; sent out Moutet to attempt final settlement of the Indo-Chinese problem; went far to reach agreement with Great Britain on the settlement of W. Europe, Blum coming himself to London; and, above all, laid the foundations of a new Anglo-Fr. entente. On 16 Jan. 1947, despite popular indifference to the choice of the first president of the new rep., the assembly installed in office the Socialist Vincent Auriol (q.v.), a close friend and colleague of Blum and author of *Hier Demain*, 1945, which expressed similar political views to those of Blum himself.

Blum resigned for reasons of health and was succeeded by Ramadier (also Socialist). The change of gov., however, did not interfere with the negotiations for a treaty of alliance with the U.K., and the treaty was eventually signed at Dunkirk (4 Mar.). Ramadier's gov. was a coalition. The main features

of the first 4 months of the year were the formation of the *Rassemblement du Peuple Français* (R.P.F., Rally of the Fr. People), the deterioration of the economic situation, and the deepening div. in the gov. between the Communists and the rest of the ministers. The R.P.F. was an organisation fostered by Gen. de Gaulle as a nation-wide movement of national union, and though he was accused by the left, especially the Communists, of favouring the reactionary or Fascist elements, the movement constituted a new and popular force which for a time materially affected the political balance in F., achieving a sweeping victory in the municipal elections. But meanwhile the economic situation was growing steadily worse. The political situation was further weakened by the refusal of the Communists to vote the military credits required for operations against the rebels in Indo-China and to suppress a revolt in Madagascar. The Communists then left the gov. A series of strikes throughout the year threatened to paralyse the national economy and seemed to threaten at times the very structure of the rep. There were sev. gov. crises; and at the end of the year Ramadier was succeeded by Schuman (q.v.) as premier. Drastic measures were initiated in an attempt to halt the inflationary spiral. There were 3 changes of gov. between Jan. and Sept. in the ensuing year (1948), showing that the country was more sharply divided than ever between Communists and non-Communists and that the 'Third Force' evoked by the Socialists and the M.R.P. had ceased to exist as an effective political factor, despite its majority within Parliament. This weakness of Parliament made the search for social and economic stability increasingly difficult.

In Sept. a coalition under the Radical Socialist Queuille (q.v.) took office, and a period of relative political stability followed. There were further serious strikes; but Communist threats to public order were suppressed by calling in troops. Meanwhile, de Gaulle emerged as an open challenger to the republican regime in its existing form. In Nov. his party was highly successful in elections to the second chamber, the *Conseil de la République*. By this time, events abroad were overshadowed by the widespread popular fear in F. that W. Germany might appear once more as a dominant member of the European community, a situation the majority of Frenchmen were anxious to prevent however illogical their opposition to it might be. Fear of Germany after 2 world wars had become a major influence in Fr. political life. In 1949 F. joined the North Atlantic Treaty Organisation (q.v.).

In July 1949 Queuille's gov. fell. There was a series of rapid changes of gov. before political stability returned with Bidault (q.v.) as premier. By early 1950 the Indo-China situation was becoming extremely serious. De Lattre de Tassigny (q.v.) was appointed commander-in-chief

of the Fr. Army and Fr. high commissioner there in an attempt to retrieve the situation; his subsequent premature death probably put the seal on certain Fr. defeat in the area. Public opinion was much exercised over Indo-China, and also over the Saar problem. F. still hoped for an autonomous Saar, linked economically to herself, a hope based on the strong Fr. fear of the rebirth of a powerful Germany. In May 1950 the Fr. foreign minister put forward his 'Schuman plan' which eventually developed into the European Coal and Steel Community (q.v.). The

the Indo-China crisis and the pressing question of a European army including W. Ger. forces, which involved, of course, the re-creation of a Ger. army, regarded by many Frenchmen as synonymous with the re-creation of Ger. 'militarism.' Plevien became premier in Aug. 1951, and was succeeded at the beginning of 1952 by Faure (q.v.), a Radical-Socialist.

Faure reopened the Tunis question, but his gov. lasted only a few weeks, and in Mar. 1952 Pinay succeeded him. Popular agitation against the European Defence Community (q.v.) was by this time

THE HOSPICE OF GREAT ST BERNARD

The district of Savoy in which the hospice stands was ceded to France by Italy in 1947.

Fr. president paid a state visit to London in Mar. 1950 and was enthusiastically received.

In spite of a number of short-lived govts. the period 1950-1 marked an improvement in F.'s internal affairs, her economic position becoming much stronger. In Indo-China the Fr. position worsened. Queuille was again premier in Feb. 1951 and in April 1951 a programme of electoral reform was carried through the Assembly. In the general elections in June 1951, the Communists lost seats but still remained strong. But the Gaullists were the strongest party in the Assembly.

Many observers believed that de Gaulle's return to power was imminent. The economic situation was weakening again: a bitter domestic battle was raging on the question of state aid to confessional schools; abroad, there was

intense in F., the Communists and Gaullists being especially vocal in their opposition to it. In May the arrival in Paris of Gen. Ridgway (q.v.), supreme allied commander in Europe, was the occasion for serious Communist rioting. In July the Gaullists split on a question of party discipline, and after this time de Gaulle's prospects of a return to power receded rapidly. The split helped Pinay, who now had the support of the dissident Gaullists, but in Dec. 1952 he was defeated on a domestic issue and resigned. Soustelle, the Gaullist leader in the Assembly, failed to form a gov., and eventually, early in 1953, Mayer became premier.

The anti-E.D.C. campaign in 1953 increased, causing some deterioration in relations between F. and Federal Germany. In April the Gaullists lost

heavily in the municipal elections, and in May de Gaulle resigned from the leadership of the R.P.F. Meanwhile an acute political crisis had arisen. After a prolonged period without a gov. Laniel became premier in June 1953. His gov. pursued a strong policy at home and abroad. At home, the economic restrictions imposed in an effort to control the inflationary situation caused a wave of strikes. Abroad, the sultan of Morocco was deposed and a pro-Fr. sultan put in his place. In Oct. 1953 the Assembly voted in favour of continuing the Indo-China war. The Fr. position there was rapidly becoming untenable; nevertheless, the fall of Dien Bien Phu in May 1954 shocked Fr. public opinion deeply, and the following month the gov. was defeated on an Indo-China issue.

The new premier was the Radical-Socialist Pierre Mendès-France (q.v.). He faced serious problems in Indo-China and North Africa, and tackled these with a realist radicalism which created a sensation both in F. and elsewhere. In July the fighting in Indo-China was ended by agreement reached at Geneva. This really marked the end of 80 years of Fr. rule in Indo-China and was generally regarded in F. as a crushing surrender: the Fr. occupation of Indo-China came formally to an end on 29 April 1955. Mendès-France's North African policy eventually led to his defeat in the Assembly in Feb. 1955, and he was succeeded by Faure. Before this, however, F. had rejected E.D.C. (Aug. 1954), but the London-Paris agreements of Oct.-Nov. which followed its rejection laid the foundations of Western Union and ensured a Ger. contribution to a European defence force, with safeguards against possible future Ger. aggression which were considered satisfactory to F.

Faure's premiership was marked by considerable advances towards a solution in North Africa, as well as by the signing of the Austrian Peace Treaty (May 1955). The Franco-Tunisian Home Rule agreements were signed in Paris in June; in Oct. the former Moroccan sultan, deposed by the Fr. 2 years earlier, was restored to his throne. But by this time the situation in Algeria was becoming menacing too, and at home political stability and possibly the Fourth Rep. itself were temporarily threatened by the rise of a violently right-wing movement under Poujade; but its popularity was only transient. The Saar referendum in Oct., with its overwhelming victory for the pro-Ger. parties, was another blow to F. In Nov. Faure's gov. was defeated on a question of electoral reform. Faure decided on a dissolution, and was thereupon expelled from his party. The general elections of Jan. 1956 produced an indecisive result: in Feb. Mollet (q.v.) became premier. Though governing with a precariously-balanced coalition, he was premier longer than any previous holder of the office under the Fourth Rep.

Moroccan independence was announced in Mar. 1956; but the Algerian situation

was now tantamount to civil war and was causing severe economic and political stresses in F. Throughout 1956 unsuccessful efforts were made to reach a solution there, but it became increasingly evident that the Algerian leaders demanded considerably more than F. was prepared to give them.

In July 1956 Egypt nationalised the Suez Canal. Fr. concern was considerable, and there were high-level

Anglo-Fr. talks in early Oct. Following the outbreak of fighting between Israel and Egypt later in the month came the Anglo-Fr. ultimatum to both sides, stipulating that fighting must stop. Egypt rejected this, and, after sev. days' bombing of Egyptian military objectives, Anglo-Fr. troops landed at Port Said. Subsequently, Britain and F. complied with the U.N. directive and withdrew their forces from Egypt; but Fr. public opinion was more wholeheartedly in favour of armed intervention in Suez and more critical of the withdrawal than that in Britain. (See further under UNITED NATIONS ORGANISATION; EGYPT; SUEZ CANAL.)

The Suez affair demonstrated the close relations existing between F. and Britain; and Anglo-Fr. friendship was convincingly demonstrated in the fervent welcome which Queen Elizabeth II received on her state visit to Paris in April 1957.

Meanwhile, a deteriorating economic situation threatened the Mollet gov.'s survival, and the Algerian position remained extremely critical. In May 1957 Mollet was defeated on a vote of confidence. He was succeeded in June by Bourges-Maunoury (q.v.), who was defeated in Oct. on the Algerian issue. He was in turn succeeded by Gaillard (q.v.). It could be said in 1958 that the Fourth Rep., despite its frequent gov. changes and obvious structural defects, had weathered 12 years of considerable political and economic stress with surprising success, and had withstood serious threats to a continuance of democracy from both left- and right-wing opponents.

France and Flanders, First World War Campaign in. 1914. *German Invasion of Belgium.*—Preparations for a war between France and Germany had been actively made for many years before the actual outbreak in 1914. Germany's plan provided for a swift defeat of France which would enable her to transfer an adequate number of troops to her E. front and overwhelm Russia whilst that country was still in process of mobilisation. The destruction of the Fr. forces was to be accomplished by the envelopment of their left flank and, as this would probably require the passage of a large force through

Belgium, the violation of that country's neutrality (of which Germany herself was one of the guarantors) was duly provided for in Germany's plan. Such were the military factors which operated to make F. and E. the W. front during the First World War.

Germany declared war on France on 3 Aug. 1914, and it being early evident that the Germans would violate Belgian neutrality, the Belgian Army was deployed to resist the invasion. On 4 Aug. Ger. troops crossed the border into Belgium and commenced an attack on the fortresses of Liège. This violation caused Great Britain to declare war on Germany, and the Brit. mobilisation was ordered at once. Gen. von Emmich (q.v.) was in command of the Ger. invading force, the Belgians being under the command of Gen. Leman. The Germans could make little progress against the Belgians until they brought up their heavy howitzers. These quickly pounded the fortifications, which were unprepared for projectiles of such weight (see FORTIFICATIONS). This delay gave Great Britain time to transport her army to France and take up its position on the left of the Fr. line near Mons. By the 3rd week in Aug. the Ger. Armies had overcome the Belgian obstruction and, pouring through unopposed, were threatening the Fr. left. Whilst the operations in Belgium were in progress the Fr. and Ger. Armies had deployed, facing each other along the frontier. As a set-off against the Ger. advance on his left wing, Marshal Joffre (q.v.), the Fr. commander-in-chief, tried on 20 Aug. to penetrate the Ger. line on his right flank, about Sarrebourg and Morhange. The Fr. were defeated with heavy loss and driven back to the frontier. About the same time the Fifth Fr. Army, under Lanrezac, also sustained defeat at the hands of von Bülow (q.v.), commanding the Second Ger. Army at Charleroi.

Von Kluck's Enveloping Manoeuvre.—With Metz as the pivot, the whole of the Ger. right wing was now making a great sweeping movement to envelop the Fr. left. As soon as Belgian opposition had been disposed of, the First Ger. Army, under von Kluck (q.v.), advanced rapidly and, by 23 Aug., was in a position which imposed a hasty retreat on the allied left wing to enable it to escape attack by overwhelming odds. At this time, however, thanks to the Allies' counter-espionage service, von Kluck was unaware that the Brit. expeditionary force (B.E.F., q.v.), under the command of Gen. Sir John French, was in position on the Fr. left; nor was this fact known at Ger. G.H.Q. The B.E.F. was actually in the perilous position of having both its flanks exposed to an overwhelming adversary; but notwithstanding these difficulties the Brit. 2nd Corps, under Gen. Sir Horace Smith-Dorrien, faced the Germans at Le Cateau (q.v.) on 26 Aug. and not only held up von Kluck's victorious march, but also inflicted great loss on the Germans. A few days later Lanrezac checked von Kluck at Guise, but the vast superiority

in numbers of the Germans compelled the B.E.F. and Lanrezac's Fifth Army to retreat rapidly to avoid annihilation—a movement which exposed Joffre's left wing to attack. In order to avert this threat, Joffre threw back the whole of his line from Nancy to the left, and created a new army under Gen. Maunoury on the extreme left about Paris.

One of the decisive features of the war occurred when von Kluck's right flank reached the R. Somme about Amiens. Being under the impression that the B.E.F. had been annihilated, and in ignorance of Maunoury's new army about Paris, he changed his direction from practically SW. to S., in order to envelop the Fr. left wing. When he arrived at the R. Oise he again changed to SE., thereby leaving Paris some m. away on his right flank, which was exposed to attack by Maunoury and the troops of the Paris defences. As the envelopment of the Fr. left was now regarded as a certainty, the Germans endeavoured to 'roll up' the right flank also and thus complete the destruction of the entire Fr. Army. To this end Prince Rupprecht tried to break through at Nancy but was heavily repulsed.

Battle of the Marne.—During the preceding few days Joffre had also formed another army under Foch, also towards his left flank, to fill up the gap in the retreating Fr. Armies. Joffre now waited until von Kluck had crossed the R. Marne, and then gave the famous order for a counter-offensive to begin on 6 Sep. Maunoury attacked von Kluck on his flank and rear, and forced him to recross the Marne precipitately and to face W. to meet this unexpected assailant. Foch held up von Bülow and Hansen. On 8 Sept. the B.E.F. pressed forward towards the Marne (see MARNE, BATTLE OF THE) in the gap between von Kluck and von Bülow, compelling the latter to retreat towards the Aisne. Von Kluck was ordered to conform to Bülow's movements, for otherwise he would have been completely isolated. This retreat was the deathblow to Ger. hopes of enveloping the Fr. Armies.

During these early movements in the First World War the direction of the Ger. armies was under Gen. von Moltke, chief of the general staff; but he was now removed from his appointment and succeeded by Gen. von Falkenhayn (q.v.).

Although the Ger. invasion had been arrested, and their right wing forced back, on the remainder of the front their line seemed immovable. The Belgian Army was still holding out at Antwerp (q.v.), to which it had withdrawn after the fall of Liège, and being in rear of the Ger. right, was, although small, a force to be reckoned with as calculated to interfere with the Ger. communications. It therefore forced the Germans to detach a force sufficient to guard against any offensive action it might be capable of taking. During its occupation of Antwerp the Belgian Army was reinforced by Brit. naval and royal marine brigades. The ten

tell on 9 Oct.; the Brit. garrison reached Ostend, where it embarked for England, and the remnant of the Belgian Army escaped along the coast and eventually joined some Fr. marines holding the Yser at Nieuport.

The Race to the Sea. First Battle of Ypres.—The Germans having been pushed back on his left, Joffre now intended to carry his counter-offensive round their opposite flank, but the Germans countered this by bringing up reserves which completed the line to the sea. They also planned a 'break-through' in N. France in order to gain the Channel ports (q.v.), which would provide submarine and aircraft bases within easy striking distance of

miniscent of the Crimean war. During the winter of 1914-15 both sides were occupied in repairing their losses and preparing for the ensuing spring campaign. In Great Britain Lord Kitchener had become secretary of state for war, and had begun forming the new armies, the first of which he intended for dispatch to France by the spring of 1915. The W. front was therefore comparatively quiet after the first battle of Ypres.

British Attack at Neuve Chapelle.—*Poison Gas Used.*—The successes gained by the Russians on their S. front against Austria caused Germany to transfer troops from the W. to the E. front, and this circumstance led Joffre to decide to

THE MENIN GATE

The gate erected in 1927 as a memorial to British soldiers killed in the Ypres salient during the campaigns in Flanders. It replaced the old gate reduced to ruins by German artillery

England. The Allies' line in this region was also strengthened, while offensive operations to test the strength of their opponents were maintained by both sides until 9 Oct., when the Germans began the first battle of Ypres. This battle continued until 31 Oct., when the Germans made a supreme effort to break through at Gheluvelt. Here the allied line was strung out to breaking point, but the situation was saved by the Worcestershire Regiment, who filled a gap made by the Germans and drove them back with great bravery. Although these operations, culminating in the first Ypres battle, virtually destroyed the *élite* of the Ger. Army, they also saw the end of the original B.E.F., the world-famed 'Conspicuous Little Army.'

1915. *Trench Warfare.*—Up to this point the campaign had been conducted on the lines of open warfare or war of movement; but thenceforward it resolved itself into trench warfare, somewhat re-

attack the enemy in Artois (q.v.). Sir John French launched an attack against Neuve Chapelle between 10 and 13 Mar. 1915, but achieved little. A month later an Anglo-Fr. attack was made about Ypres, in which the Germans sprung a surprise by using poison gas for the first time.

Second Battle of Ypres.—Foch was in charge of the allied operations in this region, and another offensive was commenced on 22 April, lasting until 25 May (known as the second battle of Ypres), but it failed to achieve any other result than to inflict enormous casualties on the Brit. forces. The allied spring offensive proper or general offensive commenced on 9 May with the Brit. attack on the Aubers ridge. Here the Ger. defences were very formidable and no progress was made. Further S. the Brit. had also commenced the battle of Festubert (q.v.), and although the main objectives were gained, further allied action was held up

by a shortage of shells, a circumstance which directly led to a political crisis in Great Britain and to the formation of a ministry of munitions. In the autumn further attacks were undertaken for political reasons in Artois, Champagne, and about Loos.

The Battle of Loos.—The mining centre of Lens was the final objective of the Loos operations, the main attack of which was along a 7-m. front about La Bassée. It opened on 25 Sept., following an artillery bombardment and a discharge by the Brit. of asphyxiating gas. One of the most violent operations was that connected with the capture of the famous Hohenzollern redoubt, situated just SW. of La Bassée. The final result of the battle was that the allied line was advanced to the E. of Loos, thence N. to just W. of Hulloch. The Fr. attack in the Champagne (q.v.) was launched on 25 Sept.; the Ger. positions were penetrated on a front of about 20 m. between Auberive and Ville-sur-Tourbe. Fighting in this region continued until the end of Nov. These gains in ground, however, were not commensurate with the great losses in men, the Brit. casualties alone, in the battle of Loos, being 50,000. One of the chief reasons why the Allies obtained no decisive result in this fighting was the lack of available reserves at the critical moment. The year 1915 was throughout a black one for the Brit. forces, who suffered over 280,000 casualties.

Sir John French Superseded.—In Dec. Sir John French, who had fulfilled his difficult command with no little ability, resigned his appointment, the military authorities being dissatisfied with the progress made, and he was succeeded as commander-in-chief by Gen. Sir Douglas Haig (see HAIG, EARL). The magnitude of Sir John French's task was, however, enhanced by inadequacy of munitions, the lack of guns of heavy calibre, and the disparity between the numbers of his troops and of those opposed to him. During his command the Fr. military authorities had been responsible for the formulation of plans for the prosecution of the war on the W. front, the Brit. commander conforming thereto, and this system was maintained on the change of command.

Results of 1915 Campaign.—Generally speaking the Germans were on the defensive during 1915, so that in the matter of defensive works they were considerably ahead of the Allies at the beginning of 1916. The provision of labour for unskilled work in and behind the lines was also an important factor; for, whereas the Germans could call on the Belgians and inhab. of the occupied Fr. ter. to do forced labour in connection with their defences, the Allies employed exclusively military labour, so that their combatant ranks were to a great extent depleted on that account.

In Dec. an inter-allied conference, presided over by Joffre, passed a resolution to the effect that a decision could be

obtained only on those fronts where the greatest number of enemy troops was employed, a resolution inspired by the disastrous termination of the Gallipoli campaign (q.v.). The W. front was naturally one of these, and plans were accordingly made for an allied offensive on the Somme as soon as the new Brit. Armies (composed of 'service' or Kitchener battalions) were ready to take their place in the line.

1916. Battle of Verdun.—The first operation of consequence in 1916 was the battle of Verdun (q.v.). Von Falkenhayn, giving the reasons for the Ger. attack on this famous fort, states (see his memoirs) that in the first place it was hoped to deal an effective blow against Britain's chief ally, and secondly to improve the Ger. strategical position in this area. His opinion was that, as Verdun was situated at the angle of the Fr. NE. and E. frontiers, and was less than 12 m. from the Ger. communications, it formed a powerful *point d'appui* for any action of the Allies against those communications, which if broken would render untenable the whole Ger. front in France and Belgium. Another important consideration was that such an attack would forestall the Allies' projected attack on the Somme. Twenty-five divs. were employed by the Germans, but even this colossal force proved insufficient to carry the forts. The Allies had early intimation of the intended move. The imminence of a Ger. attack at Verdun became apparent in the middle of Jan., and Gen. Herr, the Fr. local commander, reported that he considered the defences to be inadequate to withstand the strain. Gen. de Castelnau (q.v.) (chief of the staff) immediately went to Verdun to make a personal reconnaissance, and gave orders for certain works to be carried out which would strengthen the defensive area. There was not time, however, for these orders to be completed before the Germans launched the attack. This was at 6 p.m. on 21 Feb., and on that day they gained Haumont wood and on the 23rd the whole of the first position was in their hands. On the 25th the Germans occupied Fort Douaumont (q.v.), which the Fr. had failed adequately to garrison in spite of the importance which Joffre attached to it. Gen. Pétain was then placed in command of the operations at Verdun, with 12 divs. at his disposal. The first Ger. attack on the l. b. of the Meuse began on 6 Mar., and although operations were continuous for nearly a fortnight they made but little progress. On the r. b. the Germans were making desperate efforts to capture Fort Vaux to facilitate their general attack on the second line of defence; but in spite of the employment of unprecedented artillery bombardments and the use of liquid flame (*Flammenwerfer*) they failed to take the fort. In April Gen. Nivelle assumed command of the Fr. troops on the r. b., and the spirit of the offensive now imbued the Fr. A month later Nivelle was promoted to the chief command of the army of Verdun.

Exasperated by recent reverses at the hands of Berthelot and Mangin (q.v.) the Germans increased their efforts to secure victory on the l. b., but made no appreciable progress after practically a whole month's fighting.

The imminence of the Allies' Somme offensive was now beginning to weigh with the Ger. high command, and the offensive against Verdun was intensified. The first week in June saw vigorous attacks launched against Fort Vaux, which resulted in its capture on the 7th. Another great Ger. onslaught commenced on 23 June, and although active operations were maintained until 8 Aug little advantage was gained. On 29 Aug. von Hindenburg succeeded von Falkenhayn as chief of the Ger. general staff, and he ordered all offensive operations at Verdun to cease. On the Fr. side, however, Gen. Mangin had been largely responsible for the recent Fr. gains on the r. b. of the Meuse, and he at once planned the recapture of the lost forts. Operations were begun in Oct., and by the end of the year nearly all the lost ground had been regained. Verdun had an important bearing on the campaign; it was a great victory for the Fr. and a correspondingly disastrous defeat for Germany, whose armies could not repair the enormous losses sustained, in the abortive attacks, from the fire of the celebrated Fr. 75-mm. guns and mitrailleuses.

The First Battle of the Somme.—The year 1916 also saw the great battle of the Somme (or first battle of the Somme) (see also SOMME BATTLES) which had as serious consequences for the Germans as those of the Verdun battle. As previously stated, this Somme offensive had been decided on at the end of 1915, but it could not be launched until the Brit. forces had been adequately reinforced. The object of the offensive was to obtain a military decision at one colossal blow. The offensive failed of its purpose; yet it effected much in exhausting the Ger. military resources. In addition to wearing down the Germans, it was necessary to arrest their progress at Verdun, and this could only be achieved by compelling them to transfer their reserves to some other and dangerously threatened point. But it would be erroneous to regard the Somme battle as a mere large-scale 'sympathetic' action; it was projected before the battle of Verdun, and without relation to the threat in that quarter: it was indeed hoped to secure by this sustained and co-ordinated advance on a 30-m. front a result which should have really decisive consequences. The relief of the situation at Verdun was a secondary and later consideration. The battle of the Somme saw 2 important innovations: (1) the invention of the 'creeping barrage' (see also BARRAGE) of artillery fire by Gen. Horne; and (2) the employment of tanks (q.v.). The work of the allied air forces was of the greatest importance in this battle, in destroying enemy aircraft and in taking photographs of enemy positions.

The tactical objective of the Allies was

the ridge N. of the Somme, extending through Thiepval, Pozieres, Bazentin-le-Petit and Morval, beyond the Ger. line, for this ridge dominated the country towards Bapaume, and from it the allied artillery could command an extensive area. The general plan was to administer a succession of hammer-blows, alternately Brit. and Fr., in order to distract the enemy, so that he might not know at what point to expect an attempt to pierce the line. The battle was carried out in 3 main phases. The first phase commenced on 1 July, with an attack by the Brit. Fourth Army, under Gen. Rawlinson, between the Somme on the right and Gommecourt on the left. Although the attack was preceded by a very heavy artillery bombardment, some of the Ger. defences were subsequently found to be still intact and many proved fully equal to the extraordinary pressure to which they had been subjected. On the left of the line attacked (i.e. from the Ancre to Gommecourt) the Allies made very little progress; but between the Ancre and the Somme, where the Ger. artillery were in less strength, a definite hold on the enemy positions was obtained in many places. The fighting on both sides was extremely fierce. The difficulties of supply, transport, communications, and evacuation of casualties were increased for the Allies the further they advanced, because, although their artillery fire had done its work effectively, it had at the same time destroyed the roads and other routes. After 3 days' fighting a 16-m. breach was made in the Ger. line, such places as Montauban, Mametz, Fricourt, and La Boisselle falling into Brit. hands. On 7 July the Leipzig redoubt was captured, and 4 days later Contalmaison and Trones wood fell. The attack was renewed on the Bazentin-le-Petit and Longueval front a few days later: then on 16 July Ovillers was captured and the Australians stormed Pozieres on the 23rd. A few days afterwards Delville wood (q.v.) was captured, and on the 27th, after a tremendous effort and at great sacrifice on both sides, the first phase was concluded with the capture of Longueval. The Allies had broken through the first and second Ger. defensive systems, and between the Ancre and the Somme the allied line formed a great salient to the N.E.

The second phase began with an advance by the Fr. on the Somme coupled with determined efforts by the Brit. to improve their tactical position near the Ancre, about Thiepval and Pozieres. The strenuous resistance of the Germans had stopped the advance at this point, thus making a sharp angle in the Brit. line and also preventing the use of the Albert-Bapaume road. Moreover, guns at this point could enfilade the new Brit. line about Bazentin and Longueval, so that a rectification here was essential to any advance further E. The highest point of the ridge had not yet been reached, so that visibility from the ground was still restricted, and although the Allies had gained the supremacy of the air in this

region, security could not be assured until the ridge was wholly in their possession. A general advance was made by Brit. troops from Guillemont to Thiepval on 18 Aug. The fighting was desperate, particularly round Guillemont, which did not fall until 3 Sept. On the left of the line the Germans tenaciously defended Thiepval, and many heavy counter-attacks were launched in their anxiety to hold this position at all costs. Ginchy was also the scene of much bloodshed, but eventually, the Brit. advance prevailed, and the place was captured on 9 Sept. Being now in possession of Guillemont, Ginchy, Delville wood, and Longueval, the Allies were on an equality with the Germans from the standpoint of visibility and in a position to command Comblès on their right and enemy positions about the Albert-Bapaume road on their left. The Fr. had, in the meantime, gained Cléry and Le Forest. The Ger. resistance, however, N. of the Ancre was still not only sustained, but most costly to the attackers, who, in consequence, suspended the advance in this area.

The third phase commenced on 15 Sept. with an advance on a 6-m. front from Ginchy to Courcellette. It was on that day that tanks were first employed in battle, and, speaking generally, they proved a failure at this stage of their development largely through foundering in the mud. They came, however, as a complete surprise to the Germans, and they gave great assistance to the infantry by breaking up machine-gun nests and small posts which either had not been or could not be touched by artillery fire. Ger. resistance began to weaken; on the left the Germans were still holding stubbornly to Thiepval, but even here cracks were becoming noticeable in the defence, and when Pozieres fell, and the victorious Brit. troops advanced beyond it, threatening Thiepval from the E., the Ger. line broke. On the right Comblès was gradually becoming surrounded by the Brit. on the N. and the Fr. on the S., and by 26 Sept. the Fr. were in possession of the place. By the end of July the very definite angle at Thiepval had been flattened out, and the Allies' line ran along the lower N. and E. slopes of the ridge, so that their tactical objective had at length but at great cost, been gained.

Battle of the Ancre.—In Oct. and Nov. further offensive operations were undertaken by the Allies in order to realise more fully such advantages of position as were gained in the Somme battle. As previously stated, Sir Douglas Haig could make little impression on the Germans N. of the Ancre, about Gommecourt and Beaumont Hamel. He now decided to advance in this particular area—an operation known as the battle of the Ancre (q.v.). The Ger. defences had been further improved as a result of experience gained in the course of the Somme battle. The Brit. began operations on 11 Nov. with 2 days' terrific bombardment, and on the 13th captured their first objectives. Steady progress continued to be made

until bad weather brought the operations to a close on 19 Nov., by which time the Brit. line ran E. from N. of Beaumont Hamel and to near Grandcourt, Le Sars, Gueudecourt, and Sailly-Saillies, where it joined the Fr. line which ran S. to just N. of Péronne.

In contrast with 1915 the year 1916 ended on a note of optimism and confidence for the Allies. Their successes at Verdun and on the Somme, albeit costly and, in the nature of modern warfare, inconclusive, had gone far towards establishing a definite superiority over the Ger. war machine and to hold out a prospect of ultimate victory.

Marshal Joffre Superseded.—In Dec. 1916 it had been agreed that the Germans should be given no rest throughout the winter and that the Somme battle should be 'continued' in Feb. 1917. Marshal Joffre advised that the Brit. troops should, in such event, be required to take an even larger share in the operations than heretofore. When this advice became generally known in the Fr. Army it provoked resentment, being interpreted as an aspersion on their valour. The outburst of public criticism resulted in Joffre's supersession on 16 Dec. by Gen. Nivelle, who had become a popular figure by reason of his success at Verdun. At the Ger. H.Q. there was apprehension lest the battle should be renewed at points which would give them no time whether for recuperation or for the accumulation of material. But although it had been agreed among the allied commands that the enemy should be given no rest throughout the winter, this agreement was now ignored. The relations indeed between the allied higher commanders were not at this time the most cordial. Nivelle had prepared a plan which presupposed that Haig should be placed under his orders. To his astonishment Haig found that this plan had been acquiesced in by the prime ministers of both Great Britain and France. It was, however, eventually agreed that the Brit. Army should be 'regarded as allies and not subordinates by Nivelle.' This agreement was not reached until the middle of Mar., with the result that the enemy obtained the respite of which he was in such sore need. During this valuable interval the Germans had been preparing a new defensive system from La Fère on the R. Oise to Arras on the R. Scarpe—a line which gained notoriety among the troops as the Hindenburg line (q.v.). This new line was some m. in rear of the area covered by the Somme offensive of 1916, a point which is to be borne in mind in the light of subsequent events, and particularly Nivelle's supersession by Pétain.

1917. German Retreat to the Hindenburg Line.—The operations on the Ancre, which were brought to a close in Nov. 1916, were opened again in Jan. 1917. The Germans fell back from the commencement, and Gen. Sir Hubert Gough (q.v.), who was in command of the Brit. troops in this area, ordered the attack to be pursued with all possible speed. On

11 Jan. the Brit. captured a spur N.E. of Beaumont Hamel, which enabled them to command the entire Beaucourt valley and the W. slopes of the spur beyond the valley from Grandcourt to Serre. Operations were at once begun to clear the remainder of the valley S. of Serre hill, and to push the line forward to the crest of the spur. On the night 3-4 Feb. an important Ger. line on the S. slopes of this spur, forming part of the enemy's original second-line system N. of the Ancre, was captured after desperate fighting, and by 5 Feb. Gen. Gough had gained his objective. On 7 Feb. the Gers.' great withdrawal to the prepared Hindenburg line began. In some cases tns were evacuated without any fighting, but in others key positions were defended with the enemy's usual tenacity. By 17 Feb. Miraumont, N. of the Ancre, and Baillecourt farm, S. of the riv., were taken. On 25 Feb. the Germans fell back about 3 m. on an 11-m. front, leaving Serre, Pys, and Warlencourt in Brit. hands. On 28 Feb. the strong Ger. pivot of Gommecourt was captured. By 10 Mar. the important position of Irles fell, and 3 days later the enemy abandoned his main defensive position on the Bapaume ridge. Here the Brit. drove in his rearguards and occupied Gréville and Loupart wood. Bapaume fell on 17 Mar., and by the 18th the Germans were in full retreat from Soissons to Monchy. A rapid Brit. advance gave them Nesle, Chaumes, and Péronne, while further S. the Fr. captured Damery and Noyon. The Germans delayed the allied pursuit by systematically destroying everything along the path of their retreat, and it was not until the allied armies had reached the Hindenburg line, and the pressure became general, that they could develop plans for the future conduct of the campaign.

In Nivelle's original plan for an offensive he had allotted to the Brit. forces a front which included the area from which the Germans had withdrawn. It was naturally expected that the Ger. retreat would necessarily profoundly modify this original plan; but Nivelle decided to make no change. This decision raised misgivings over his capacity for leadership and, coupled with his failure to break through with the Fr. Army on the Aisne between 16 and 20 April, practically decided the Fr. Gov. to supersede him. This was effected on 15 May, when Pétain became commander-in-chief of the Fr. Armies. At this time the morale of the Fr. troops was very low, and mutinies broke out in sev. places. Pétain set to work to eradicate these evils, and in order to keep the Germans occupied while the reconditioning of the Fr. Army was in progress, Gen. Haig was asked to continue the battle of Arras, which had been commenced on 9 April (see ARRAS, BATTLE OF).

Battle of Arras.—The battle of Arras had for its purpose the removal of pressure on the Fr. in Champagne, so that Nivelle's plan for breaking through the Ger. line could be accomplished. The original objectives were the Vimy ridge and Douai.

The ridge was brilliantly captured by the Canadian troops and, generally, the advance was successful at all points during the first few days. The bitter struggle for Lens opened on 14 April, the environs being reached only after the sternest fighting. After a short pause the battle was resumed on 23 April, on both sides of the Scarpe, E. of Arras. Here the pressure increased owing to the bringing up of Ger. reserves. Progress E. of the Vimy ridge was also made between 28 April and 3 May. On the latter date, following a great spurt, the Canadians captured Fresnoy. By the beginning of July the Allies' line had been advanced in this region to just W. of Lens, thence S. to Chérisy. The battle of Messines had already begun on 7 June, the signal for which was the explosion of 19 huge mines under the Ger. line. Gen. Plumer's Second Army carried out the attack, which was launched at 3.30 a.m. The Messines-Wytschaete ridge was stormed, and, before noon, both Messines and Wytschaete were captured. In the afternoon Oostaverne was taken, together with its rearward defences over a 5-m. front, and some 5000 prisoners. Further progress was made on 12 June E. and N.E. of Messines.

Third Battle of Ypres.—Passchendaele.—On 31 July a series of operations commenced known as the third battle of Ypres, which had for their primary purpose the driving of the Germans from their bases on the Belgian coast so as to thwart their submarine campaign. The secondary purpose was to ease the pressure on the Fr. further S. Progress was made S.E. of Ypres, and particularly on the N., where St Julien and Pilckem were captured, thereby depriving the Germans of the ridge from which they commanded Ypres. After the first onset, however, bad weather set in, which made movement impossible. The attack was resumed on 9 Aug. and in the first week the Brit. captured Langemarck. The Fr. troops on the left had also made some progress and had captured Graschten. General progress continued E. and N.E. of Ypres until 27 Aug. Three weeks later the battle was resumed along the Menin road, and particularly heavy Ger. counter-attacks were repulsed on 22 Sept. A few days later the Brit. cleared Polygon wood and stormed Zoonebeke. Again the Germans heavily counter-attacked, but were repulsed with the heaviest losses. On 4 Oct. another push was made from E. of Ypres to Langemarck, where all tactical objectives were gained. On 9 Oct. a great combined Franco-Brit. attack was made N.E. of Ypres between Passchendaele and Houthulst forest. The Canadians gained the rising ground S. of Passchendaele by the 26th, and the Fr. advanced along the Bixschout-Dixmude road and captured Luyghem. After very gallant fighting the Canadians captured Passchendaele on 6 Nov., and the protracted battle closed with the Franco-Brit. positions well advanced N., E., and S.E. of Ypres.

British Attack at Cambrai.—The Germans were given very little respite before the Brit. Third Army, under Gen. Byng, attacked them on 20 Nov. near Cambrai. The Germans had at this time been pressing hard on the It. front with troops drawn from the W. front, and the battle of Cambrai was designed to stop the transfer of Ger. troops to that front. The battle is particularly noteworthy for its novel opening, in that the usual artillery bombardment was dispensed with, tanks being employed instead (see CAMBRAI, BATTLE OF). This revolution in tactics was completely successful, and a deep penetration was made into the strong Ger. positions for 5 m. on a 10-m. front. The prisoners taken numbered over 10,000. Among the places captured were La Vacquerie, Flesquières, Marcoing, Havrincourt, Graincourt, Anneux, and Ribécourt. The next day the Brit. line was advanced S. and SW. of Cambrai. The important position of Bourlon wood still remained in Ger. hands. Hence on 23 Nov. a large number of tanks, supported by infantry, were launched against it, and by nightfall it had been taken, although the vil. still remained with the enemy. Heavy Ger. counter-attacks, however, succeeded in regaining Bourlon wood for the enemy, and the Brit. were withdrawn to a less exposed line. Ger. casualties were about 100,000.

Results of 1917 Campaign.—Thus ended the year 1917 on the W. front, where the allied armies had not only made deep incursions into the Ger. line, but far deeper into their man-power. Nevertheless, owing to the Russian Revolution and the elimination of the Russian Armies as a fighting force, the Germans were rapidly building up their forces on the W. front with accessions of troops from the E. France had reached the limit of her reserves, and Great Britain was approaching that point. The U.S.A. had, however, declared war on Germany, and it was to this source that the Allies looked with confidence for that necessary increase of strength which would bring the war to a victorious conclusion. The control of the war on the Allies' side entered a new era when, as a result of the defeat of the Italians in Oct. 1917 (see CADORNA: CAPORETTO), a conference of allied ministers took place at Rapallo on 6 Nov., at which it was decided to set up a supreme war council at Versailles with military representatives to advise it. Gen. (later Marshal) Foch was appointed president of the military representatives, and was given executive power. Difficulties, however, arose at once, as the new council was not popular with the commanders-in-chief. The Brit. were asked to take a larger section of the front from the Fr., and, in spite of protests from Sir Douglas Haig, the Brit. front was increased.

1918. German Preparations for Final Offensive.—As in the winter of 1916-17, so now a change of command brought misunderstanding and delay in offensive action, during which interval the Germans were preparing for their great and

final offensive in the spring of 1918 on the W. front. Their most important consideration was at any cost to defeat the Allies before the Amer. troops arrived to reinforce them. The most extraordinary precautions were taken to ensure secrecy, for success depended on surprise. No change was made in the troops holding the front nor were they told of the projected offensive. Troops for the assault were assembled well in rear of their line, and all large movements were carried out at night. On 21 Mar. 1918 the Germans attacked on a wide front from La Fère on the S. to Arras on the N. They employed over 60 divs., two-thirds of which were opposed to Gough's Fifth Army, which was covering Amiens, the remainder being launched against Byng's Third Army, which prolonged the line northward. The Fifth Army was widely strung out, and being opposed by such overwhelming numbers, was forced to withdraw. On the other part of the front the Germans met with such obstinate resistance that little progress was made.

Second Battle of the Somme.—The Germans attacked in massed formations, and their casualties were on a colossal scale. Before the offensive had opened the Brit. and Fr. commanders-in-chief had come to an agreement that if one were attacked and not the other, the latter would send reinforcements to the former. Although the attack was launched with the object of 'beating the British,' Ludendorff changed the whole plan as soon as he learned that his Eighteenth Army (von Hutier) had gained a tactical victory over the Brit. Fifth Army, which was in touch with the Fr. He now wished to exploit this victory and separate the Brit. and Fr. Armies by driving a wedge between them. He proposed to do this by rapid advances on both sides of the Somme. He ordered the Fourth, Sixth, and Seventh Armies to attack the Brit. N. of the Somme 'in order to drive them into the sea'; and further ordered that, 'S. of the Somme, the operation was to be carried out offensively against the Fr. by a wheeling movement into the line Amiens-Montdidier-Noyon, followed by an advance south-westward,' direct on Paris. Whilst the Allies were thus being separated the Ger. Second Army was to march on Amiens on both sides of the Somme. In view of the threat to Amiens, it was found impossible for Pétain to carry out his promise to Haig, although the latter was heavily attacked on a 50-m. front. This lack of co-ordination between the Fr. and Brit. in their efforts to resist the Germans was calculated to lead to the most serious consequences, and it was in these circumstances that Foch was given the necessary powers to co-ordinate these operations. He at once began to exercise his personal influence over the various commanders, and to such good effect that the Germans were brought to a standstill on the line Oise-Arras by 4 April, and touch between the 2 armies was maintained. This masterly strategy unquestionably retrieved a most menacing situation. Before this

date, however, the original scope of the Ger. attack had been widened again so as to include the terrain as far S. as the Aisne.

The Battle of the Lys.—The Threat to Amiens.—The second Ger. offensive was launched against the Brit. on the Lys. For some time it had been apparent that an attack was in course of preparation in this area, the evidence being gathered mainly from air photographs. On 7 April the Brit. learned from a prisoner that it was due to start on 9 April. This warning was very opportune to the Brit., for it gave them time to move their reserves into a selected position. Compared with the first or Somme offensive it would seem that the Ger. high command did not intend this later offensive to be on so large a scale, as they employed only 17 divs. Prince Rupprecht was in command, his objective being Armentières in the Ypres sector, as a stepping-stone to reaching the Channel ports. It was therefore essential for the Brit. to defend *d'outrance* every foot of ground. The Ger. pressure was, however, as overwhelming as in their first offensive, and gradually they gained ground, although at great cost. One very important gain was Kemmel hill, which they took on 25 April, but all attempts to pierce the Ypres defences were vigorously repulsed. Further S. the Germans made desperate efforts to reach Amiens, but their way was barred at Villers-Bretonneux by the Australians, who fought with great gallantry. At Givenchy and Festubert, on the left of the Lys offensive, the Germans suffered a severe reverse. This occurred on the day the offensive began. On the Brit. side this part of the line was held by the 55th (W. Lancs) Div. of territorial soldiers, and the attacking troops were the 4th Ersatz Div. The tactics employed by the Germans were those of the successful infiltration type. However, in the result not a yd of the Brit. position was lost, whereas over 750 Ger. prisoners and 70 machine-guns were taken. The Ger. reserves were crowded 3-deep in trenches just in rear, and these were killed almost to a man by Brit. artillery. Fresh reserves sent up in support could not find cover in the trenches already filled with their dead comrades, and so met the same fate above ground. The Brit. had held their ground by small self-contained posts, organised for all-round fire with intervals well laced with barbed wire. Independent platoon counter-attacks had completed the Ger. confusion. This system of defence was found to be the most effective counter-move to the Ger. system of infiltration tactics. As a set-off against this disaster the Germans had occupied the Messines-Wytschaete ridge and the outskirts of Armentières and Merville. Foch had been made commander-in-chief of the allied armies in France and Flanders on 14 April with power to direct their strategical movements, but not their tactical handling. During the third week of April the Ger. supply system became faulty, and Prince Rupprecht asked for permission to break

off the battle, to which Ludendorff agreed.

Final German Offensive Ended.—On 30 April all movement came to a standstill. In Mar. and April the Brit. Army had suffered terrible losses, their casualties amounting to 303,000, including over 28,000 killed.

The third phase of the last Ger. offensive of the war was now being considered. Ludendorff was still of opinion that the Brit. must be beaten, but he could not do this until the allied reserves had either been destroyed or attracted elsewhere. It was therefore decided that the Fr. should be attacked by the Crown Prince William on the Chemin des Dames (q.v.) in order to draw off the allied reserves from the Brit. front. Although the Germans had plenty of ammunition, they were feeling the want of men both in quantity and quality. Thirty divs. took part in this attack, 26 of which had already been employed in previous assaults. The attack opened on 27 May between Rheims and Soissons. It took the Fr. entirely by surprise, and was completely successful, penetration being made on an 18-m. front, and within a few days the Marne was reached between Dormans and Château Thierry. Designed merely as a diversion, it had become a great battle. It was, however, brought to a standstill on 5 June, but not until it had, in the words of von Kuhl, 'gone fatally too far,' for nothing more than a great salient had been created in the Ger. line. They had, however, captured 50,000 Fr. prisoners and 500 guns. On 9 June the Germans launched an attack against Metz, but owing to stubborn resistance it soon subsided.

The topographical result of these offensives of 1918 was the creation of deep salients in the Ger. line, and there were divided counsels at Ger. H.Q. regarding the further action to be taken. Some thought it advisable to go back to the positions held before the first offensive on 21 Mar., but before any scheme could be finally decided the Allies had seized the initiative and launched the counter-offensive which brought the war to a close.

The Final Allied Offensive or Advance to Victory (15 July to 10 Nov.).—In the great allied offensive battle of 1918, or rather series of battles, 2 periods may be distinguished: the first (15 July–26 Sept.), during which the allied high command baffled the enemy's attacks, began to strike in its turn, and forced the enemy to put himself on the defensive; the second (26 Sept.–10 Nov.), when the Allies passed to the general offensive, hit the enemy without respite on the entire front from the sea to the Meuse and so exhausted him that he was compelled to ask for an armistice in order to escape the disaster which the next succeeding attack would have brought on him without hope of being in a position to reply.

The first period comprises the second battle of the Marne; the battle of Picardy. The second, the battle of Champagne, the battle of Cambrai, the battle of Flanders.

The nomenclature of these battles is that of the Fr. general staff. In Eng. records the prin. battles fought during this period by the Brit. Armies are known as the battle of Amiens, 8-12 Aug.; battle of Bapaume, 21-31 Aug.; battle of Arras, 26 Aug.-3 Sept.; battle of Epéhy, 18-19 Sept.; battle of Cambrai-St Quentin, 27 Sept.-10 Oct.; battle of Ypres, 28-29 Sept.; battle of Courtrai, 14-31 Oct.; battle of the Selle, 17-25 Oct.; and the battle of Maubeuge, 1 Nov. The last Ger. offensive, as already indicated, was in the middle of July, when the Germans began an assault on the Fr. on a front of 55 m. E. and W. of Rheims, their right wing operating on the line of the Marne. From the Fr. side the right of the attack stretched from the vil. of Prunay, E. of Rheims, to the hills known as the Main de Massiges, just W. of the Argonne forest in the Champagne. The left extended from Fossey vil., S. of the Marne and E. of Château Thierry, to Coulommies vil., SW. of Rheims.

As far back as 12 June the rush of the Ger. Armies, on Villers-Cotterets on the one side and on Compiègne on the other was stopped. But everything led the high command to suppose that the enemy, after a period of rest for reconstituting his reserves and supplies, would undertake a fresh and powerful effort. Foch was in a position to know at every moment the precise strength of the Ger. Army, to follow its progressive wastage, and to adapt his decisions according to the enemy's situation. At the end of June the Ger. Army was estimated to comprise a total of 207 divs.: 130 in line, 77 in reserve, of which 31 were fresh, 26 reconstituted, and 20 fatigued. It was at first believed that the enemy would attack on the Brit. front, and that the attack would be before the beginning of July; but by 10 July it was clear that the prin. assault would be in Champagne. The Fr. Army, reinforced by divs. of young Amer. soldiers, awaited in confidence the expected attack, and Foch already saw in the 'attack for Rheims' a favourable occasion for turning to the offensive.

From the openings days of July Foch decided to deliver a counter-attack on the front between the Aisne and the Oureq, this counter-attack to be combined with a second attack on the opposite side of the Château Thierry 'pocket,' so as to close this pocket, or at all event- to compel the enemy to evacuate it. At the same time a counter-offensive in E. Champagne was contemplated, to be delivered on the E. flank of the main Ger. attack in the event of the Germans making progress southward. With this end in view, forces were concentrated to the S. of the Argonne. On the same day that the Ger. divs. set out towards the starting points of their assault, allied divs. were concentrating to attack them in flank. This was the first time the Allies had acquired the initiative over the Ger. command. Thenceforth they kept it throughout.

On 14 July, of the 81 divs. of the enemy 30 were disposed behind the troops

in the sector from Château Thierry to the Argonne; and on the morning of 15 July they too combined in the assault.

In the Champagne the Ger. attack gave way in front of the foremost Fr. positions; between Rheims and the Marne it was repulsed in front of the second positions; to the S. of the Marne it secured a foothold on the heights between Jaulgonne and Dormans, forming a pocket from 6 to 8 kms. in depth. Throughout 16-17 July the enemy's whole effort was directed towards Eprenay; but, counter-attacked without cessation, the Germans could make only slight progress. From the evening of 17 July their advance was completely held up. Instead of breaking the Franco-Amer. front and forming a vast pocket in Champagne and Brie, the enemy's attack resulted in nothing better than tactical successes of a purely local character.

The French Offensive begins on the Marne.—On 18 July the Ger. command began to be conscious that they were defeated. It was at this precise moment that Foch launched the offensive with the Tenth and Sixth Fr. Armies. The Tenth Army at one rush reached the approaches to the road from Soissons to Château Thierry. The result of this success was that the knot of roads from Soissons, the branch railroads from Nissey-sur-Aisne over which were passing the supply columns for the masses of enemy troops congested in the Aisne-Marne loop, fell under the fire of the Fr. guns. The Fifth Army, assisted by the 16. Army Corps, took up the offensive between the Marne and Rheims, in liaison with the operations of the Tenth and Sixth Armies. Thus, both flanks of the enemy's line were shaken, and the Ger. high command saw that they could no longer engage battle in the pocket, where their communications were threatened. A retreat was ordered.

The Beginning of the German Retreat from the Marne.—The retreat was slow and methodical, but was very costly, by reason of the fact that in order to save the great accumulation of material and stores between the Marne and the Aisne the Germans were continually compelled, by reason of the extraordinary tenacity of the allied attacks, to engage new units. From 18 July the high command had to call for reinforcements from all parts of their front—Gen. Gallwitz had to dispatch 3 divs. and the crown prince of Bavaria 6. This was not sufficient, for the tired divs. which had delivered the attack in Champagne on 15 July were called upon for a fresh effort, while orders were given to countermand the attack projected against the Brit. in Flanders.

On 19 July the Germans had recrossed the Marne. Before the incessant attacks of the Fr. and Amer. troops they were falling back by the 27th on the Oureq; and on 4 Aug. they were on the Vesle. Things had therefore gone directly contrary to the Ger. plans. The Ger. front had been pushed back on the Aisne and Vesle; while the Fr. reserves had assumed a brilliant counter-offensive; and only a

very small part (2 divs.) of the Brit. reserves had up to this time been employed in the battle. The reserves of the Bavarian crown prince, on the other hand, were perforce rushed down precipitately from Lille towards the Aisne. Finally the Ger. command had to renounce its cherished plan of an offensive in Flanders, and it was thenceforth open to the Allies to assume the initiative in a new battle between the Oise and the sea.

The Battle of Picardy.—Marshal Foch, in order to retain the initiative and to leave the enemy no opportunity of recovery, perfected his plans for delivering

an attack for the flattening out of the St Mihiel salient. So that the counter-offensive of the Marne was hardly organised and set in motion before 3 other distinct operations, each on a large scale, were in course of preparation.

On 23 July the Fourth Brit. and First Fr. Armies attacked on a 15-m. front astride the road from Amiens to Roye and between Albert and Moreuil. In 48 hrs they had advanced over 10 m., reached the outskirts of Chaumes and Quesnoy and were threatening to outflank the Eighteenth Ger. Army from the N. On 10 Aug. the Ger. Army began to fall back

LORD HAIG, GENERAL WEYGAND, MARSHAL FOCH, AND KING GEORGE V ON A VISIT TO THE BATTLEFIELDS AFTER THE WAR

separate attacks in as rapid succession and with as large an element of surprise as possible, to the end that he might bring about the progressive disorganisation of the enemy's armies—and to continue in this manoeuvre until such time as he should order a general attack upon the whole Ger. front. Having verified the fact that, as from 12 July, the enemy was maintaining in line between the sea and the Oise tired troops of poor quality, Marshal Foch meant to derive every advantage from this weakness by undertaking important offensive actions; and he accordingly directed the attention of F.-M. Haig to the Festubert-Robecq front, an attack on which would allow of the liberation of the mining basin of Bruay. He planned, in addition, a joint and simultaneous operation by the Fourth Brit. Army (Gen. Lord Rawlinson) and the First Fr. Army on the Amiens salient in order to free the Paris-Amiens railway; and finally he arranged for the Amer.

on the 1917 positions between Chaumes and the Oise, but, surprised by a sudden attack by the Third Fr. Army, it executed the movement in disorderly haste. By 15 Aug. the Ger. troops were back once more in their 1917 positions on the Chaumes-Ribécourt front, and thus, within the space of a month, the Allies had reduced the 2 biggest salients of the enemy's line—the one towards Paris, the other towards Abbeville—the 2 great objectives of the Germans in 1918.

A serious drain had now been made on the Ger. Armies, but the Amer. Army was not ready to attack at full strength. Hence Foch, instead of pressing the Albert-Oise front, where the enemy had not been sufficiently shaken in his solidly organised positions, carried the attack on the Ger. wings and notably on the N. wing, where the enemy's reserves were known to be diminishing. Whilst the First and Third Fr. Armies were tenaciously engaging the enemy to prevent

him from drawing men from his centre, the Tenth Army was ordered to attack in the direction of Chauny so as to outflank the massif of Noyon-Guiscard-Tergnier; the Third Brit. Army (Gen. Byng) prepared to attack in the direction of Bapaume and Péronne to outflank the Somme defences and constrain the enemy to a more accentuated retreat; and the First Brit. Army (Gen. Horne) was to attack still further N. Between 18 Aug. and 20 Sept. these 3 attacks were all in full motion. As to the first, by 26 Aug. the Tenth Fr. Army had reached the Oise and Ailette Rs.; the Brit. Armies had broken the Ger. front between Croisilles and the Somme; and the Eighteenth Ger. Army was falling back on the Canal du Nord. As to the second, the Tenth Fr. Army, crossing the Ailette, had reached the Hindenburg line, and the enemy was withdrawing to the Aisne. The Brit. First Army in the space of 48 hrs had carried the Drocourt-Quéant (q.v.) switch, and, by rendering the Siegfried line untenable, compelled the Germans to retreat between Arras and the Oise towards the Hindenburg line. As to the third, which began on 18 Sept., the Third and Fourth Brit. Armies, supported by the First Fr. Army, carried the outposts of the Hindenburg line, between Cambrai and St Quentin, and gained their point of departure for the next attack on that celebrated line of defence. Finally, while these last phases of the battle of Picardy were in progress, the Amer. Army in the Wœvre had brilliantly executed its first big attack, reducing the entire St Mihiel salient between 12 and 15 Sept. (see also ARGONNE).

General Offensive of the Allies.—The Battles of Champagne, Cambresis, and Flanders (26 Sept. to 10 Nov.).—Marshal Foch, from the end of Aug., concluded that the time was approaching when the disorganisation and fatigue of the Ger. Armies were such that a general attack would bring about their final defeat. He therefore planned 3 great converging attacks, to be begun simultaneously or at all events at intervals of a few days only. These were (1) *In Flanders*, where the attenuation of the Ger. line from the Lys to the sea, their fatigue and lack of reserves, were offering a favourable situation for exploitation by the Allies. This operation, begun by the Belgian Army supported by Fr. and Brit. divs., had for its first tactical objective the capture of a *point d'appui* or starting point, by carrying the front Clerken forest-Houthulst ridge-Passchendaele-Gheluvelt-Cornines; and, for its second objective, to follow this up at once by an attack on Bruges to free the coast, and, by another attack eastward in the direction of Thielt and Ghent. (2) A central operation in which the Brit. Armies and the left of the Fr. Army should attack in the direction of St Quentin and Cambrai, in order to force the Hindenburg line before the enemy should have time to organise, while simultaneously the Fr. centre should carry on energetic operations to drive the enemy

beyond the Aisne; and (3) an operation in the Argonne in the direction of Mézières, in which all the available Amer. troops should attack between the Meuse and the Argonne, supported on the W. by the Fourth Fr. Army, which latter should attack between the Argonne and the Souain road.

The various attacks comprised in this general plan were to set aflame at least two-thirds of the Ger. line on the entire front from the sea to the Meuse, and they were to begin about 25 Sept. In fact the battle of Champagne began on 26 Sept., and after a struggle lasting a week the enemy was compelled to fall back on the Aisne and the Aire, which latter positions were reached by the Allies on 12 Oct. The battle of Cambresis began on 27 Sept.: the First and Third Brit. Armies attacked in the Cambrai region; and on 30 Sept. the battle had extended as far as the Oise by reason of the coming into line of the Fourth Brit. and First Fr. Armies. By 9 Oct. the Second and Eighteenth Ger. Armies had lost the Hindenburg line—a line which their leaders deemed impregnable—and were forced to fall back on the whole front between Douai and St Quentin, and take up new positions behind the Selle R. and on the Bohain-Bernot line. While these 2 armies were falling back the Seventh Ger. Army further S. was evacuating the massif St Gobain-Laon, which, as a result of the allied advance in Champagne and Cambresis, now formed a vast salient, and was retreating to the Serre and taking up positions beyond the Sissonne marshes. (These positions were known as the Hunting line.) This movement was followed by a fresh retreat by the Second and Seventeenth Armies, which, hard pressed by Franco-Brit. attacks on 18 and 19 Oct., were retreating across the Oise and the Sambre Canal. The battle of Flanders, begun on 28 Sept., gave the Allies the hills to the E. of Ypres and threw open in 2 days the Roulers-Menin road. After a short interval it was resumed on 14 Oct. and from the 17th the enemy was compelled in the N. to evacuate the whole Belgian coast and fall back on the Terneuzen Canal, and, in the S., to evacuate the regions of Lille and Lens and to retreat to positions beyond the Scheldt and the Canal du Nord.

Between 10 and 20 Oct. the enemy's retreat had become general on the whole front. Foch gave orders for a prompt renewal of the general offensive from the sea to the Meuse so as to dislodge the enemy from his last defensive organisations (viz. the Hunting and Hermann defences and those of the Lys). On this line Foch calculated that the final battle would be fought. Accordingly simultaneous and converging attacks by the Allies—namely, by the Belgians and Brit. in the direction of Brussels, by the Brit. between the Sambre and Scheldt, by the Fr. Armies in the direction of Givet, and by the Franco-Amer. Armies in the direction of Mézières and Sedan, begun early in Nov.—forced the enemy line into a general retreat between the Scheldt and

Meuse. On 9 Nov. this retreat had stretched northward, and the enemy was abandoning the course of the Scheldt between Oudenarde and Tournai. So that on 11 Nov., the day of the Armistice, all the Ger. Armies between the sea and the Meuse were in full retreat.

The British Victories.—The prin. battles fought by the Brit. Armies in the course of these operations achieved the results indicated:

Battle of Amiens (q.v.) (8-12 Aug.).—Freed Amiens and the Paris-Amiens railway. The attack was then transferred to the N. in the *battle of Bapaume* (21-31 Aug.), which, outflanking the Ger. position on the Somme, obliged the enemy to withdraw to the E. bank of the riv. The new Ger. positions were then turned from the N. by the *battle of Arras (q.v.) (28 Aug.-3 Sept.)* by which the Drocourt-Quéant (q.v.) line was broken and the enemy forced back on the outer defences of the Hindenburg line. As the direct result of these 3 battles the Lys salient was evacuated by the enemy, and Lens, Merville, Bailleul, and Kemmel hill were regained, and Hazebrouck and the railways in that vicinity were freed. At the *battle of Epéhy (18-19 Sept.)* the Brit. broke through the outer Hindenburg defences and took up positions for attack on the main line in the *battle of Cambrai-St Quentin (27 Sept.-10 Oct.)*, the biggest Brit. victory of all. At the close of some 10 days of victorious fighting the attacking troops broke through the last and strongest of the enemy's fully prepared positions—positions manned by the very best of his troops. This now opened the way at last to a war of movement and an advance on the Ger. main lines of communication. The Ger. prisoners taken in this battle were more numerous than in any other engagement in the war. This was really the psychological moment of the great campaign of 1918 in the truest sense, for the Ger. morale never recovered from the blow. The victorious Brit. now stormed the Canal du Nord and advanced on Cambrai, turned the formidable defences of St Quentin, and developed all these successes by delivering a general attack on the last of the solidly organised defences in rear of the Hindenburg line. In this, the *second battle of Cambrai*, that in and St Quentin were evacuated by the enemy, who then took up fresh positions on the Selle R., the Brit. having in the battle retaken the double railway line from St Quentin to Cambrai and the important railway junction of Douai.

Even before the close of the first battle of Cambrai the Brit. Second Army, together with the Belgian Army, were forcing the enemy back from Ypres, and driving a salient into his lines which threatened his coastal positions (28-29 Sept.). This success had its sequel in the *battle of Courtrai (14-31 Oct.)*, which forced the Germans to abandon the Belgian coast, and with it their submarine base of Zeebrugge. With Courtrai, Menin and Halluin also fell, and the stretch of road between Ypres and Menin

—that veritable mausoleum of Brit. dead in the previous 4 years of fighting—had now for ever ceased to haunt the life of the Brit. soldier and the waiting people at home. The great salients formed to the S. by the *second battle of Cambrai* and to the N. by the battles of *Ypres* and *Courtrai* led indirectly to the evacuation of Laon and the loss of the famous massif of St Gobain (captured by the Fr. Armies). The penultimate of the great Brit. victories was at the *battle of the Selle (17-25 Oct.)*, and this was speedily followed by the *battle of Maubeuge (1-11 Nov.)*, in which the triumphant armies of Gens. Horne, Byng, and Rawlinson broke the last important lateral communications, turned the Scheldt positions, and sent the enemy in rapid retreat from the vicinity of Courtrai. The strategical aim of the great series of battles was now accomplished, for the enemy's line was now split into 2 parts, one on each side of the great natural barrier of the Ardennes. The pursuit of the beaten enemy all along the line was only stopped by the armistice.

France and Germany Star was instituted for operational service on land, in France, Belgium, Holland, or Germany, from 6 June 1944 until 8 May 1945. The ribbon is in the red, white, and blue of the Union flag, and these colours are also used as a symbol of France and the Netherlands. The 1939-45 star was earned by 6, or for air crew 2, months' service in operations before a candidate could qualify for the F. and G. S. The star was not awarded in addition to the Atlantic Star (q.v.) or the Air Crew Europe Star (q.v.). If a candidate qualified for all 3 stars or 2 of them, the star first earned was awarded.

'France-Soir,' Paris daily newspaper. It was first pub. clandestinely as a monthly in 1941 by a group of Parisian students during the Ger. occupation, under the title of *Défense de la France*. The paper rose in circulation from 5000 to 300,000 in 1943, when it was suspended and 15 of the members arrested. It reappeared publicly a year later, and

after the liberation of France changed its name to *F.-S.* It continually increased the number of copies, reached half a million in 1947, and with 1,400,000 in 1957 is the largest continental daily, with 7 eds. each day. Politically *F.-S.* is independent, and it has a great number of permanent correspondents in France and abroad.

Francesca, Piero della, see **PIERO**.

Francesca da Rimini (d. c. 1285), daughter of Guido da Polenta, lord of Ravenna. She was married c. 1275 to Giovanni the Lame (Ghiandotto or Sciancato), son of Malatesta, lord of Rimini, when peace was concluded between the houses of Ravenna and Rimini. The elder brother of Giovanni, Paolo the Handsome, was sent to Ravenna to fetch Francesca, and the two fell in love. Giovanni found them together, and killed them both. The story, which has many modifications, is treated in literature in Dante's *Inferno*, and also by Leigh Hunt, Silvio Pellico, Stephen Phillips, and Gabriele d'Annunzio; and in art by Ingres, Ary Scheffer, G. F. Watts, and Cabanel. There are also ballets and operas based on it.

Francesco dei Rossi, see **SALVIATI**.

Franche-Comté, or the co. of Burgundy, and prov. in the E. of France, now forming the depts of Doubs, Haute-Saône, Jura, and part of Ain. Known to the Romans as *Maxima Sequanorum*, it was detached from Burgundy (q.v.) in 843, and became part of the empire in 1032. Charles V (q.v.) gave it to the Sp. branch of his family, and it finally became Fr. under the treaty of Nijmegen in 1678. The inhab. of F.-C. were considered to be hurdy and independent. Colonies of emigrants from the prov. were to be found in Rome, Milan, Madrid, and other European cities. The cap. was Dôle, and later Besançon.

Franchet d'Espèrey, Louis Félix Marie François (1856-1942), Fr. general who gained a reputation during the First World War. After the battle of Charleroi (Aug. 1914) he was appointed to the command of the Fr. Fifth Army. In Sept. 1914, in co-operation with Foch, he brought to a standstill the Ger. counter-attack from the valley of the Suipe. In June 1918 he was appointed commander-in-chief of the allied forces in Macedonia, and he at once infused his characteristic vigour into the operations on that front, which hitherto had been regarded as stagnant. He organised an offensive against the Bulgarians and in the autumn attacked and broke up their army as a fighting instrument. This success, which threatened Constantinople and hastened Turkey to conclude an armistice, undoubtedly influenced the general collapse of the central powers.

Franchise: 1. An exceptional right or privilege granted by the sovereign, e.g. exemption from ordinary jurisdiction; the right to a manor or lordship, to hold a fair, to have a forest, warren, or fishery, treasure-trove, wafes, and estrays. Such F.s often arise by prescription assumed to have been founded on some original and

lost royal grant. All such F.s belong to the class of incorporeal hereditaments (q.v.).

2. The right of voting for a member of parliament or councillor of some municipal body. (For the qualifications of co. and bor. electors see **ELECTORATE**; **ELECTIONS**.) Generally speaking an action for damages lies for every wilful interference with the exercise of a F., and it is immaterial whether the defendant acted in good faith or under a mistaken notion of duty or not. An elector is entitled to sue a returning officer for refusing his vote.

Franchise, Local Government. Up to the passing of the Representation of the People Act, 1945, the L. G. F. was based on the occupation of rateable property, but that act assimilated the L. G. with the parl. F. by making the normal basis that of residence. Any person in residence of premises on the qualifying day (10 Oct.) is entitled to be registered therefor. There is, however, an additional non-resident qualification for local elections which does not apply to the parl. F. Any person occupying rateable land or premises of not less than £10 yearly value, and not being in his or her area of residence, may claim registration therefor. Only 1 vote is allowed in any area. Joint occupation of non-resident premises will provide a qualification for as many joint occupiers as there are units of £10 yearly value. Limited companies do not qualify for this purpose in this country.

Disqualifications from voting at local elections include: persons under 21 years of age on 15 June before the election; aliens (but not citizens of the Rep. of Ireland, who may vote if otherwise qualified); idiots (but not lunatics); and persons convicted of corrupt and illegal practices during the previous 5 years. Persons undergoing a term of imprisonment for treason or felony are disqualified. Any patient in a mental hospital or person detained in legal custody cannot be treated as resident there. Members of the House of Lords are not disqualified.

See also **ELECTIONS** and **ELECTORATE**; **LOCAL GOVERNMENT**; **LOCAL AUTHORITIES**, **OFFICERS OF**.

Francia, or **Francesco Raibolini** (c. 1450-1517), It. painter, b. Bologna; originally a goldsmith and engraver of dies for medals, and became mint-master at Bologna, not taking up painting till middle age, when he made the acquaintance of Mantegna. He was much influenced by Perugino and Raphael, and Lorenzo Costa (q.v.), with whom he worked. Among his works are 'Virgin enthroned, with Augustine and five other saints' (Bologna Gallery); 'Virgin and Child and St Anne,' and 'Pieta' (National Gallery); 'Virgin' (Munich); 'St Peter, Martyr' (Borghese Gallery, Rome); and the frescoes in the church of St Cecilia, Bologna. See G. C. Williamson, *Francia*, 1901; A. Venturi, *La pittura del cinquecento*, 1925.

Francia, José Gaspar Rodríguez de (1766-1840), dictator of Paraguay, b.

Asuncion, of Portuguese origin, his father, Garcia Rodriguez F., being a native of Brazil who came to Paraguay to manage a tobacco plantation for the gov. F. studied theology at the univ. of Córdoba de Tucuman, and took his doctor's degree, but later turned to the law, and for 30 years was an able and successful jurist and public official. In 1810 the revolution against Spain broke out at Buenos Aires. Though Paraguay at first opposed the movement, it declared its independence in 1811; and F., who had been a leading revolutionary, was made secretary of the national junta. In 1813 he was made joint consul with the Gaucho general, Yegros; in 1814 he secured his own election as dictator for 3 years, and at the expiration of that period obtained the dictatorship for life. He was far from being a mere figure-head and, like Louis XIV, might well have said 'L'état c'est moi.' The accounts of his administration show him to have been a remarkable blend of ability and caprice, of far-sighted wisdom and reckless infatuation, and, withal, a man who, while seeming to aspire to the highest ideals, would yet violate the most elementary principles of justice. His life was one of extreme simplicity, yet he punished with Draconian severity the slightest want of respect. His economic policy was to sacrifice foreign commerce and encourage domestic industries. In eccles. policy he was a bitter adversary of the Church, and abolished both the inquisition and the College of Theology. Much that was arbitrary in his actions was due to his being strongly influenced by the principles of the Fr. Revolution. His death was much regretted by his countrymen, who forgot his extravagance and remembered only his merits. See T. Carlyle, *Critical and Miscellaneous Essays*, vol. iv. 1840; R. F. Burton, *Letters from the Battlegrounds of Paraguay*, 1870; and C. A. Washburn, *History of Paraguay*, 1871.

Francis I (1494-1547), king of France, the son of Charles, comte d'Angoulême, b. Cognac. He married Claude, daughter of Louis XII, in 1514, and succeeded him on the throne, 1515. Immediately after his accession he recaptured Milan, and in 1516 signed a concordat with the pope by which the Fr. Crown acquired extensive Church privileges lost only at the Fr. Revolution. On the death of Maximilian, 1519, F. was a rival claimant with Charles of Spain to the imperial crown, and after the election of the latter, F. prepared for Henry VIII the 'Field of the Cloth of Gold,' 1520, but was unsuccessful in securing an effective alliance with England. The Holy See, Venice, and the emperor united to drive France out of Italy, and in 1525 F. was defeated at Pavia and taken captive to Madrid. War continued till 1529, when, by the treaty of Cambrai, F. lost his It. possessions. Hostilities were soon renewed against Charles V. F. allying with the Ger. Protestants and with the sultan in his attempts to crush the imperial power; but no conclusive result had been reached

when F. d. In domestic affairs he greatly strengthened the power of the Crown. His court was notorious for its licentiousness; but F. was, also, an outstanding patron of art and literature, and founded the Collège de France; and, by the acquisition of masterpieces of It. painting and sculpture and in the superb structures of Fontainebleau, Chambord, and Amboise, he had a permanent

FRANCIS I OF FRANCE

influence on Fr. art. See lives by J. d'Orliac, 1933, and F. Hackett, 1934.

Francis II (1544-60), king of France, eldest son of Henry II and Catherine de' Medici, b. Fontainebleau. He married Mary Stuart, queen of Scotland, 1558, whose uncles, the duke of Guise and cardinal of Lorraine, virtually ruled during F.'s brief reign (1559-60).

Francis I (1708-65), Holy Rom. emperor, eldest son of Leopold, duke of Lorraine, b. Nancy. He succeeded to the dukedom in 1729, but in 1735, at the end of the Polish war of Succession, he received Tuscany in exchange for Lorraine. In 1736 he married Maria Theresa, who succeeded her father, Charles VI, to the Hapsburg dominions in 1740. He was elected emperor in 1745, but though nominally head of the state, the prin. political decisions were made by his wife.

Francis II (1768-1835), last Holy Rom. emperor (1792-1806), and 1st emperor of Austria (1806-35), the son of Leopold II, b. Florence. He succeeded his father in 1792. By the peace of Campo Formio (1797) he exchanged the Netherlands and Lombardy for Venetia and Dalmatia. In 1804 he assumed the title of Emperor of Austria, which was confirmed by the Confederation of the Rhine in 1806, when he abandoned the title of Holy Rom. Emperor. By the treaty of Vienna (1809), Austria lost further ters. to France, but was victorious at the battle of Leipzig, 1813, and by the treaty of Vienna (1815), her position in Europe was firmly estab. His chief minister was Metternich (q.v.); but F. himself controlled much of his

country's policy, and was generally reactionary in opinions.

Francis, Sir Philip (1740-1818), politician, *b.* Dublin and educ. at St Paul's School, London. He entered the civil service, and in 1774 went to India as a member of the council of the governor-general. There he was a bitter opponent of Warren Hastings, with whom in 1779 he fought a duel and was wounded. He returned to England in the following year with a considerable fortune, and entered Parliament. He still took an active interest in Indian affairs, and in 1787 assisted Burke and the managers of the impeachment of Hastings to prepare their charges. He is best known as the reputed author of the *Letters of Junius*, but there has never been produced any definite evidence as to the truth of the assumption. See JUNIUS, LETTERS OF. See his *Memoirs* (ed. J. Parkes and H. Merivale), 1867.

Francis Borgia, St, see BORGIA, FRANCESCO.

Francis de Paola, St (1416-1507). It. religious founder, *b.* Calabria. In 1430 he became a hermit near Paola, and the disciples who gathered round him formed a community known as the Minim friars, which was confirmed as an order by Pope Sixtus IV (1474). F., by command of the same pope, attended the death-bed of Louis XI of France. He remained in that country at the request of Charles VIII, and *d.* at Plessis. Canonised in 1519, his feast is on 2 April.

Francis Ferdinand of Austria, Archduke (1863-1914), nephew of the Emperor Francis Joseph, the son of Archduke Charles Louis, *b.* Graz. After the suicide of Prince Rudolf, 1889, he became heir apparent, but in 1900 made a morganatic marriage with Countess Sophia Chotek, created Princess von Hohenberg, and renounced the right of his future children to the thrones of Austria and Hungary. His assassination at Sarajevo on 28 June 1914 was the immediate cause of the rupture between Austria-Hungary and Serbia, which resulted in the First World War. Very various opinions of his powers as an administrator are held. He was popular in Austria-Hungary, but intensely disliked by the Serbs and Bosnians. This is easily explained by the belief that he was the protagonist in a project to unite the Bosnian Serbs and Croatia-Slavonia with Austria and Hungary into a triple monarchy, a project which involved Austro-Hungarian opposition to any further territorial expansion of the already independent Serbian kingdoms lest such complications should thereby be introduced as would render the project impracticable. It is therefore not surprising that the official Austrian investigation into the murder of F. F. and of his wife by youthful Serbian conspirators having estab. that the outrage was at the instigation of secret revolutionary societies and with the connivance of Serbian Gov. officials, intense indignation was aroused among both Ger. and Magyar elements in Austria-Hungary, who saw in

the murder, and not without reason, a shattering blow at the very existence of the dual monarchy. See monograph by V. Eisenmenger, 1929; and A. J. P. Taylor, *The Habsburg Monarchy*, 1941, 1948.

Francis Joseph (1830-1916), emperor of Austria, the eldest son of the Archduke Francis Charles, 2nd son of the reigning Emperor Francis I, *b.* Vienna. He became emperor in 1848 on the abdication of his uncle, Ferdinand I. At this time Hungary was in a state of open revolt, and declared itself a rep. in the course of the following year, with Kossuth as governor. However, aided by von Brück, F. J. inaugurated a series of fiscal and commercial reforms favourable to the interests of

THE EMPEROR FRANCIS JOSEPH I

the middle classes, and for some years the empire seemed to recover something of its old position. In 1853 the emperor tried without success to induce the Tsar Nicholas to abandon his designs against Turkey, and in 1859 he had to face a war with France and Sardinia, ending in the loss of Lombardy. In 1866 began the disastrous 7 weeks' war with Prussia, ending with Austria being driven from the Ger. confederation. It was now inevitable that the relations of Austria and Hungary should be rearranged and a reconstruction of the monarchy on a dualistic basis was effected by the *Ausgleich* of 1867, the Emperor F. J. being crowned at Pest. This form of monarchy existed up to the time of the First World War, but, although Hungary proved from 1867 a most loyal Hapsburg possession, Magyar influence tended towards the repression of the Slavonic pop. of the empire, and was thus fundamentally a force destructive to the dynasty.

The emperor's personal life contained v. tragedies. He married Elizabeth of Bavaria in 1854, but the marriage was unhappy, and the empress eventually left him and was assassinated in 1898. Their only son, Rudolf, committed suicide in 1889.

In 1914 F. J. took the fatal step of attacking Serbia, after the murder of his nephew, Francis Ferdinand (q.v.). It may be conceded that he strove in his long reign to maintain a constitutional and parl. regime in Austria-Hungary; but, though he reigned for 68 years, the longest effective reign of modern times, memories of this aged emperor faded away with astonishing rapidity as events in the First World War followed one another in swift succession. Cold, impersonal, stubborn, and unimaginative, and surrounded by reactionary advisers, he nevertheless had a certain popularity, and worked

remained a captive till the following year. The rest enforced by a serious illness in his twenty-second year made him dwell upon his mode of life. On his recovery he attempted to take up arms once more, but was struck down by a second illness at Spoleto. For a time he threw himself half-heartedly into the pleasures of his fellows, though the spiritual conflict was still waging within him. He determined to cast off his old life and to obey explicitly the counsels of the N.T. He adopted the attire of a poor mendicant, took a vow of poverty, and devoted himself to prayer and to helping the poor.

THE PORTIUNCULA, ASSISI, ABOUT THE TIME OF ST FRANCIS

This illustration is from a print in the *Collis Paradisi*, 1704. The largest hut, a little to the right of the chapel, was the infirmary where St Francis died, and the one behind was his cell. The other mud huts and the wall were added after St Francis's death.

conscientiously to hold a disintegrating empire together. Before the First World War it was frequently prophesied that the empire would fall apart on his death. In the event, Charles, grand-nephew of F. J., was crowned with every mark of popular acquiescence on F. J.'s death in 1916. The collapse of the empire, however, was a reality less than 2 years later. See E. von Glaise-Horstenau, *The Collapse of the Austro-Hungarian Empire*, 1930; and A. J. P. Taylor, *The Habsburg Monarchy*, 1941, 1948.

Francis of Assisi, St (1182-1226), founder of the Franciscan order. He was b. at Assisi, a member of the upper middle class, his father, Pietro Bernardone, being a prosperous merchant of that city. As a youth he was a prominent leader of nightly revels, and fought with great spirit in a petty feud between the tns of Assisi and Perugia. Assisi was defeated; F. was taken prisoner in 1201, and

He went on pilgrimage to Rome, and on his return to his native place he worked among the lepers at Gubbio, and gave alms profusely. In spite of the angry remonstrations of his relatives, he continued to walk the streets dressed in the meanest garb, and was frequently pelted with mud by his former companions. At last, in 1206, his father disinherited him publicly, and F., having already united himself to 'holy poverty,' his bride, now renounced his earthly relatives and declared that 'henceforth he had but one Father, Him that is in heaven.'

While praying one day in the ruined chapel of Sta. Maria degli Angeli, known as the Portiuncula, or 'little inheritance,' he had a vision which confirmed him in his vocation. Clad only in a rough woollen garment, girt with a hempen cord, he went out and preached to the poor of Assisi, though only a layman. By 1209 he had gathered round him 11 disciples,

the first 2 being Bernard Quintavalle and Peter Cattano. In the following year the band of 12 went to Rome, where they persuaded Innocent III to sanction their preaching and their mode of life, his authorisation being formally granted in 1215. On his return to Assisi in 1212 F. drew up the constitution of the order. He laid greatest stress on poverty, the other vows of the order being chastity and obedience. Great numbers of disciples flocked around him. F. organised his men and sent them out in bands as missionaries to France, Italy, Spain, and Africa. In 1223 he himself went out to Egypt, and obtained from the sultan promises of better treatment of Christian prisoners and the guardianship for his order of the Church of the Holy Sepulchre. He had to contend with opposition from Rome, where new regulations had been forced upon his order, and the vow of poverty, which to him was so essential, had been relaxed. On 14 Sept. 1224 F. received the stigmata of the very wounds of Jesus Christ upon his own person, while praying on Monte Alverno, near Assisi. Two years later, on 4 Oct., feeling that death was drawing near, he was carried to the Portiuncula, and *d.* on the bare ground. Pope Gregory IX canonised him in 1228. The chief sources for the life of F. and for the beginnings of the Franciscan order are 2 lives by Thomas of Celano, 1228 and 1248 (Eng. trans. by A. G. Ferraers Howell, 1908); and the *Speculum perfectionis* (Mirror of Perfection), discovered by P. Sabatier (ed. in 1898; Eng. trans. by De la Warr, 1902; and in the Everyman's Library, in which issue are also included *The Little Flowers* and the *Life of St Francis*). According to Sabatier the *Speculum* was the first of all the lives, and was written in 1227 by Brother Leo of Assisi, F.'s favourite disciple; while the *Legenda* 3 Soc. (the legend of his three companions) was a forgery. Thomas of Celano's lives, in Sabatier's opinion, were written in opposition to the *Speculum*. W. Goetz, in a critical review of the whole ground, *Die Quellen zur Geschichte des hl. Franz von Assisi*, 1904, refutes Sabatier's assertions, and comes to the conclusion that the *Speculum* is a 14th-cent. compilation, and largely a forgery. The official life of F. is St Bonaventura's *Legenda*, pub. by the Franciscans of Quaracchi, 1898 (Eng. trans. in Everyman's Library, 1910).

The works of F., including hymns, proverbs, sermons, and letters, were printed in folio in 1739. An ed. in Lat., with an It. trans., was pub. by B. da Fivizzano (Florence, 1880). See Brother Leo of Assisi, *Saint Francis of Assisi* (trans. by S. Evans), 1899; A. Barine, *S. François d'Assise et la légende de ses trois compagnons*, 1901; J. Herkless, *Francis and Dominic*, 1901; P. Sabatier, *Acta Beati Francisci et Sociorum ejus*, 1902; G. K. Chesterton, *St Francis of Assisi*, 1926; W. Seton (editor), *St Francis of Assisi, Essays in Commemoration, 1226-1926*, 1926; *The Little Flowers and the*

Life of St Francis, 1928; H. Goad, *Greyfriars*, 1948; also lives by C. Haase, 1856; Margaret Oliphant, 1871; St Bonaventura, 1888; P. Sabatier, 1893; P. Henry, 1903; and Fr. Cuthbert, *Life of St Francis of Assisi*, 1912. See also FRANCISCANS.

Francis of Sales, St (1567-1622), Fr. bishop and devotional writer, b. of noble family at the castle of Sales, near Annecy, Savoy. After studying at the colleges of La Roche and Annecy, he entered the Jesuit school in Paris (1578) and subsequently studied civil law in Padua (1584-91). Soon after taking orders he went on a missionary expedition to the Calvinists of Chablais, and met with great success. Sev. attempts to murder him were frustrated. He was appointed to the bishopric of Geneva in 1602. He founded a congregation of nuns of the order of the Visitation, of which his friend Madame de Chantal became first superior. His famous work, *Introduction à la vie dévote*, pub. 1609, has been trans. into most European languages. He also wrote a *Traité de l'amour de Dieu*, and *Entretiens spirituels* (pub. posthumously). Canonised in 1665; declared a Doctor of the Church, 1877; and patron saint of journalists, 1923. His feast is on 29 Jan. See the ed. of J. P. Migne, 1861; also lives by C. A. de Sales, 1635; A. J. Hamon, 1856; H. Bordeaux, 1924; F. Strowski, 1928; J. Leclerc, 1928; and F. Ehrenborg, 1937.

Francis Xavier, see XAVIER, FRANCIS. ST.

Franciscans, or Friars Minor (Lesser Brethren), are a religious order of the Rom. Catholic Church founded in 1212 by St Francis of Assisi (q.v.). The order was founded, like most of the early orders, on the threefold vow of chastity, poverty, and obedience. St Francis laid special stress upon the vow of poverty, so that it was not only forbidden to individuals to possess riches, but also it was unlawful for the community to possess property. The vow of poverty was extremely stringent, and the brethren did not even possess the clothes they wore. The order grew rapidly, but the poverty enjoined occasioned much dissension. During the life of St Francis his authority was sufficient to prevent any substantial modifications of the rule in this matter, even after he had abdicated from the post of minister-general. After his death his successor, Brother Elias, attempted to institute changes, but a reaction set in towards St Francis's ideals. Many years of dispute followed, and the order was split into 3 parties. Under Pope Leo X 2 separate divs. were formed: the Conventuals, who by a papal dispensation were released from the extreme poverty originally enjoined, and secondly the Observants, who were strict followers of St Francis. In 1528 Brother Matteo di Bassi formed a new div. called Capuchins (q.v.), because of the peculiar peaked hood which they wore. The Capuchins claim to be the closest followers of St Francis. The F. are under a democratic form of gov. The final authority is

vested in the minister-general, who resides in Rome. Under him are the provincials, each presiding over all the brethren in a prov. The head of each monastery is called the 'custos,' or guardian.

The Conventuals, Observants, and Capuchins constitute the First Order. The Second Order consists of nuns—the nuns of St Clare or Poor Clares, the Capuchin nuns, the Urbanist nuns, etc. The Third Order or Tertiaries consists of sev. millions of members who live in the world, not taking the vow of celibacy, but are bound by the spirit of the rule of the order. More recently certain active congregations of men and women have adapted the principles of the Tertiaries to a conventual regime and are known as the Conventual Third Order. The F. have been foremost in foreign missionary work, and throughout all their internal dissensions they have faithfully continued St Francis's work of ministering to the poor. There are many notable names in the order. Most of the great medieval Eng. theologians were F., as for example John Peckham, Alexander of Hales, Duns Scotus, Wm of Ockham. In the world of letters Roger Bacon (q.v.) was a prominent member of the order. Of the popes, Nicholas IV, Alexander V, Sixtus IV, Sixtus V, and Clement XIV were F. The F. reached England in 1220. At the Reformation there were 65 monasteries in England. After the dissolution of the monasteries the order was restored by the foundation of an Eng. convent in Douai in 1617. There are now 12 houses in Great Britain, and 17 in Ireland; statistics pub. in 1941 gave the number of 24,814 members in 2093 monasteries in 30 countries of the world. See L. Wadding, *Annales Fratrum Minorum*, 1650; P. Gratien, *Histoire de la fondation et évolution de l'ordre des Frères Mineurs du XIII^e siècle*, 1928; A. Masseron, *The Franciscans* (trans.), 1931; V. D. Scudder, *Franciscan Adventure*, 1931; P. Cowley, *Franciscan Rise and Fall*, 1933.

Francium, symbol Fr, atomic number 87. It has long been known that actinium of atomic weight 227 loses electrons spontaneously, but it has also been found to emit α -particles, leaving an element of atomic number 87 and atomic weight 223. It was first called actinium K, but later F. Fr(223) occurs naturally, but 4 other isotopes have been obtained artificially. They are Fr(221), a member of the neptunium series, and Fr(218), Fr(219), Fr(220), which are members of other artificial disintegration series. Its properties so far appear to be those of a typically alkali metal element.

Franck, César (1822–90), Belgian composer and organist, b. Liège, on his father's side of a family which had lived for generations at Gemmenich; his mother was a German, and came from Aachen. He became a naturalised Frenchman in 1873. After an academic career of unusual brilliance in Paris, he began an arduous life of composition and teaching, a life which, although uneventful, was destined to bear great fruit. He

was organist at Notre-Dame de Lorette, then at Saint-Jean-Saint-François (1851), and finally at Sainte-Clotilde—where he had already been choirmaster in 1858. This rendered his financial position more secure, besides enabling him to establish his reputation as an organ soloist. His improvisations left an impression of something unique and profoundly moving. F. gathered together a circle of young, eager students, including d'Indy, Chausson, Lekeu, Bordes, and Duparc, and with them pursued the study of polyphonic and symphonic music; he was indeed the father of a special branch of modern Fr.

E.N.A.

CÉSAR FRANCK

music. His compositions abound in rich harmonic innovations and complicated progressions and modulations, and (except for some early insincere works which are fortunately forgotten) are imbued with a spirit of deep reverence and mysticism, particularly the oratorio *Les Béatitudes*, 1870, and the D minor symphony, 1889. His orchestration often betrays the organist and his treatment of form is highly original, especially his use of recurrent 'motto' themes; and the concerted works for piano and orchestra are full of poetry and romantic charm. In chamber music, besides the famous piano quintet, 1880, and the string quartet in D, 1889, he left the superb violin and piano sonata in A, 1886. Pianists and organists are also indebted to him for sev. fine solo compositions. His writing for the organ is both brilliant and congenial, and the organ works show all his characteristics and supply the instrument with a much-needed enrichment of its repertory. Yet during his lifetime he

was very little appreciated except by his immediate circle. Later, opinion changed so completely that he was for a time venerated to excess; but he is one of those who have inaugurated fresh eras in the hist. of music. See lives by V. d'Indy, 1906, 1930; M. Emmanuel, 1928; C. Tournemire, 1921; N. Demuth, 1949; L. Vallas, 1951.

Franck, Sebastian (1499-1542), Ger. writer, b. Donauworth. He studied theology, and became a Lutheran parson. His treatise *Vom Laster der Trunkenheit*, 1528, became very popular. Later he drifted away from the school of Luther, and was banished from Strasburg in 1531 because he advocated religious toleration in his *Türkenchronik*, 1530. He also wrote *Paradoxa*, 1534, *Das Weltbuch*, 1534, and pub. a collection of Ger. proverbs. As a religious thinker he was ahead of his times, opposing the rigid adherence to Church forms. See A. Heilmann, *Sebastian Franck als Geschichtsphilosoph*, 1922; and W. E. Peuckert, *Sebastian Franck*, 1943.

Francke (formerly Dalp), Swiss publishing house, founded in Bern by Johann Felix Jacob Dalp (1793-1851), 1831, who gave his name to the firm. First pubs. were Swiss historical and educational works. Carried on by Karl Schmid (1827-1902), who was particularly active in map-publishing, and also started a number of new magazines, the firm later passed into the hands of Alexander F. (1853-1935), and adopted its present name. F. has become a leading publisher of scientific, historical, and philological works, and is also known for books—in Ger.-Swiss dialect—of outstanding Bernese writers.

Francken (sometimes Franck), Flem. family of painters, in 4 generations, beginning with *Nicolaes* († 1520-96). His 3 sons who painted were *Hieronimus I* (1540-1610), *Frans I* (1542-1616), and *Ambrosius I* (1544-1618). The next generation was 3 sons of Frans I, viz. *Hieronimus II* (1575-1629), *Frans II* (1581-1642), and *Ambrosius II* (d. 1632). The generation after that supplied *Frans III* (1607-67) and *Hieronimus III* (b. 1611), sons of Frans II. The list is completed by *Constantius* (1661-1717), son of Hieronimus III. The foremost in fame is Frans I. All the family except Constantius painted biblical scenes chiefly; Constantius painted sieges and battles. They were all b. in or near Antwerp. Frans I learned painting at the school of Frans Floris; his father Nicolaes is also said to have learned it there; and the rest of the family painted very nearly in the same style. The other Flem. painters named F. belong to other families—the chief being *Sebastien F.* (or *Francz*) (1578-1647), who painted battles; and his son *Jan Baptist* (1599-1653), an exquisite painter of interiors.

Franco y Bahamonde, Francisco (1892-), Sp. dictator and leader of the Sp. rebel forces in the Civil war 1936-9, b. in Galicia, and entered the army, where he spent most of his early military

service in Morocco. As commander of the foreign legion, he rebelled, at Ben Tleb, against Primo de Rivera's decision to give up Morocco and the disastrous unpopular war for its conquest. This proved a successful move, for the dictator entrusted F., now colonel (1926), with the control of operations, and the war was now fought to its end. F. now became director of the military academy. At this period the Sp. monarchy was breaking up, and in 1931 F. swore the oath of loyalty to the rep. In 1933 he was in command of the Balearic Is., and, in 1935, became chief of staff of the Sp. Army. Later he was sent by the Lerroux Socialist Gov. as governor to the Canary Is., whence he flew to Morocco to organise the military uprising, in July 1936, that led to the Sp. Civil war. F. assumed the leadership of the rebel forces after Gen. Sanjurjo, their original head, was killed in a plane accident. On 1 Oct. 1936 he proclaimed himself 'Caudillo,' or chief of the State and commander-in-chief. At the close of some 3 years of bitter fighting, in the course of which he received material help in men, planes, and munitions from Italy and Germany, he crushed the Republicans, who had received some support from Russia, and became master of Spain. F. joined the Anti-Comintern Pact (q.v.) in 1939. At the outbreak of the Second World War in 1939 he declared Spain's neutrality, though until well into 1944 his speeches and general policy were markedly pro-German. In 1947, on the 8th anniversary of his seizure of power, F. announced that Spain was to become a monarchy again, with himself as chief of state. The Bill defining the new constitution, however, made it clear that there would be no restoration of a king until the death or disability of F. Since the Second World War F. has successfully maintained his internal position in Spain, despite economic difficulties, and, latterly, difficulties with the Falangists, who have sometimes considered his policy to be veering away from their principles. The pact signed with the U.S.A. in 1953 has been the beginning of Spain's acceptance among W. nations. F.'s rule remains a dictatorship and it is difficult to estimate whether he has in fact been able to acquire any really broad basis of positive popular support.

Franco-Prussian War, The. This war arose out of the candidature of a Hohenzollern prince for the throne of Spain, but was mainly due to the intense jealousy that was excited in France by Germany's rise as a military power, consequent on the defeat of Denmark in 1864 and of Austria in 1866. Though the Hohenzollern candidature was withdrawn, the Fr. emperor, Napoleon III, was not satisfied, and required his ambas. Benedetti to obtain an assurance from the king of Prussia that it would not be repeated. The interview between the Fr. ambas. and the king of Prussia was deliberately reported by Bismarck in such a way as to make it felt in France that a national insult had been received, and war was

declared (15 July 1870). Napoleon had hoped that the S. Ger. states would not support Prussia, and intended to advance into Germany in order to force them into neutrality. In spite of the assurance of the Fr. war minister that the army was ready, it was found (as Bismarck already knew) that no adequate preparations had been made. On the contrary, the Ger. Army was in the highest state of preparation, and by the end of July more than 500,000 men had been mobilised on the Fr. frontier. The Fr. could only offer an opposition of some 250,000 men, inferior in artillery and equipment. The Ger. Army was divided into 3 corps, under Gen. Steinmetz, Prince Frederick Charles, and the crown prince, respectively, while the Fr. formed 2 armies under Bazaine near Metz, and MacMahon in the E. Vosges Mts. The first fight was at Wissembourg (Weissenburg) on 4 Aug., and the Prussians rapidly gained the battles of Wörth over MacMahon, and Forbach over Frossard, thereby preventing the junction of the 2 Fr. armies. Bazaine's army retired to Metz, where its further retreat was prevented by the battles of Rezonville, Gravelotte, and St Privat, while MacMahon marched on Sedan, where he was defeated and compelled to surrender, Napoleon being also taken prisoner. The Ger. armies then hurried on to Paris, which was invested on 19 Sept. In spite of the desperate efforts of the Gov. of National Defence under Trochu, Favre, and Gambetta, which succeeded the empire, disaster followed on disaster. Bazaine surrendered at Metz on 27 Oct. with 100,000 men. D'Aurelle de Paladines gained the battle of Coulmiers near Orleans over the Germans, but was subsequently defeated at Ardenay, Loigny, and Patay. Chanzy succeeded in holding the Germans in check around Le Mans, but Bourbaki's attempt to create a diversion by an invasion of Germany failed completely, and his army was forced over the Swiss frontier, where it had to lay down its arms. On 28 Jan. 1871, Paris capitulated, and peace was signed on 10 May, at Frankfurt-on-Main, by which France ceded Alsace-Lorraine and agreed to pay an indemnity of 5,000,000,000 francs. The last stages of the war were marked by the revolutionary outburst of the Paris Commune, quelled by the regular army on 20 May. See F. B. Maurice, 'The Franco-Prussian War, 1870-71' (*Cambridge Modern History*, vol. II), 1909.

Frankolin, name given to birds of the genus *Francolinus*, which belong to the *Pediciidae*. They belong to the Ethiopian region, Arabia, Asia Minor, India, and S. China, and like the common partridge feed on insects and seeds. See **PARTRIDGE**.

Francia (Ger. **Franken**), medieval Ger. duchy, between the Upper and Lower Rhine, Upper Saxony, Swabia, Bavaria, and Bohemia (q.v.), looked upon by the Ger. people as the cradle of the Frankish race (see **FRANKS**). At the close of the 5th cent. it was conquered by Clovis, king of the Salian Franks, and at

a later period came under the rule of Charlemagne (q.v.). After the treaty of Verdun (q.v.) in 843 it was the centre of the Ger. kingdom, and was divided into cos., which were ruled over by counts. Conrad, who was duke in F. about 906 was chosen Ger. king in 911. Shortly afterwards F. became immediately subject to the imperial crown, and the region itself was split up into a great number of lordships, countships, and eccles. domains, these last belonging chiefly to the bishops of Würzburg, Worms, Speyer, Bamberg, and Mainz (q.v.). These bishops were very powerful, and in 1268 the bishop of Würzburg successfully asserted his claim to the title of duke in E. F. In 1501 Maximilian I, when dividing the empire into circles, restricted the title to a circle which included Würzburg, Bamberg, Eichstätt, the abbey of Schönbühl, the dist. of Mergentheim, and the principalities of Bayreuth and Ansbach. The name, however, fell in abeyance after 1806, but was revived in 1837 by Louis I, king of Bavaria, who gave the names of Upper, Middle, and Lower F. to the 3 N. portions of his kingdom. The ter. of F. now forms part of the *Länder* of Bavaria, Baden-Württemberg, and Hesse (q.v.).

Franc-tireurs (free-shooters), bands of Frenchmen, mainly peasants, who took up arms against the Ger. invaders during the Franco-Ger. war. They carried on guerrilla warfare and (except towards the close of the war, when Gambetta organised them) were not recognised by the Germans as regular combatants, being summarily shot when captured.

Franker, small tn in the prov. of Friesland, Netherlands, 5 m. ENE. of Harlingen. It was the seat of a univ. from 1585 to 1811, which was suppressed by Napoleon, and possesses a tn hall dating back to 1591. The chief industries are silk-weaving, shipbuilding, and the manuf. of woollen goods and pottery. Pop. 9060.

Frangipani, see **PLUMERIA**.

Frank, Bruno (1886-1945), Ger. novelist, dramatist, and poet, b. Stuttgart of Jewish parentage. His first work was poetry, *Gedächte*, 1907, and *Die Kelser*, 1920. His first novels were less successful than his later ones, full of life and action, and often dealing with historical figures, as *Trenck*, *Roman eines Günstlings*, 1926, *Cervantes*, 1934, and his drama *Zwölf-tausend*, 1926. He also used contemporary personages in *Der Magier*, 1925, and *Der Reisepass*, 1925. With the advent of Hitler in 1933, F. left for the U.S.A. See H. von Hofe, 'Literature in Exile: Bruno Frank,' in *German Quarterly*, xviii, 1945, 56-61.

Frank, Hans (1900-46), Ger. jurist and administrator, member of the Reichstag from 1930, and head of the legal dept of the National Socialist party. Reich commissioner for justice, 1933-5; minister without portfolio, 1934. He was appointed head of the civil administration in conquered Poland, 1939, and his name became a byword for sadistic cruelty there. He was one of the major figures

tried at Nuremberg after the war, and was found guilty on 2 counts: war crimes, such as murder and ill-treatment of prisoners of war, deportation of inhab., killing hostages, etc., and crimes against humanity, including murder, extermination, etc. (see NUREMBERG TRIAL). Executed 16 Oct. 1946.

Frank, Johann Peter (1748-1821), Ger. physician and public hygienist, b. Rodalben. He studied medicine at Heidelberg and Strasburg, qualifying in 1766. After practising at Rodalben for some years he was appointed prof. at Göttingen (1784) and Pavia (1785-95). He then became director of the general hospital, Vienna, and prof. of clinical medicine of the univ., where he greatly improved the teaching methods. He spent a period at St Petersburg as director of the medical-surgical academy, returning in 1817 to Austria, where he passed his remaining years. Early in his career he commenced work on his great *System einer vollständigen medicinischen Polizei* (9 vols., 1779-1827) and continued working on it throughout most of his life. It was the first systematic treatise on public hygiene, and estab. him as the 'father of public hygiene.' He believed it to be the duty of the State to safeguard the health of the people and to preserve a healthy race by appropriate laws. It dealt with water supply, sanitation, school hygiene, sexual hygiene, maternity and child welfare, vital statistics, etc. He also pub. a work on therapeutics in 7 vols., 1792-1825. See life by K. Doll, 1910, and memoir in *Annals of Medical History*, by L. Baumgartner and E. M. Ramsey, vols. v-vi, 1933-4.

Frank, Sebastian, see FRANK.

Frank-almoigne, or Free-alm, name given to a system of tenure in A.-S. times whereby a religious corporation held land. The ordinary feudal conditions were not imposed, but those who held lands in F. were bound before God to offer masses and prayers for the souls of the grantors. See TENURE.

Frank-marriage, species of estate tail in old Eng. law whereby a freeholder granted land to his daughter or cousin or near blood relation on her marriage, to be held by her and her husband and the heirs begotten of their 2 bodies, free from all manner of service, except fealty to the donor or his heirs.

Frank Slide, Alberta, Canada, tn and slide, one of the first communities opened in the Crow's Nest Pass upon the discovery of coal by H. L. Frank of Montana. The tn of F. was situated at the base of Turtle Mt., so named by the Indians because it crept slowly, where the coal mine was operated. On the morning of 29 April 1903 the whole face of the mt came crashing down on the sleeping vil. of F. and wiped out the entire mine buildings, blocked the main tunnel of the mine, destroyed houses in its path, and buried 86 people in its debris. The main line of the Canadian Pacific Railway through the Crow's Nest Pass was buried to a depth of 100 ft. Sixty-six million

tons of rock fell during the slide. In 1931 F. was declared officially closed because of the danger that the mt might fall again. There is a motor highway through the rocks left by the slide and the main line of the Canadian Pacific Railway has been raised about 35 ft from its former level. Pop. 240.

Frankau, Gilbert (1884-1952), novelist, b. London; his mother, Julia F., wrote novels under the name Frank Danby (q.v.). Educ. at Eton, he entered his father's cigar business, of which he became managing director. After the pub. of his first book, *One of Us*, 1912, he went for a business trip round the world. In the First World War he served with the Royal Field Artillery, in the Second with the R.A.F. *The Guns*, 1916, is a book of war poems, and his *Poetical Works* were collected in 1923. He made his reputation as a novelist with *Peter Jackson, Cigar Merchant*, 1919, and followed this with *Seeds of Enchantment*, 1921, *Gerald Cranston's Lady*, 1924, *Martin Make Believe*, 1930, *Wine, Women, and Walters*, 1932, *Three Englishmen*, 1935, *The Dangerous Years*, 1937, *Winter of Discontent*, 1941, and *Oliver Trenton, K.C.*, 1951. *Self-Portrait*, 1939, is an autobiography.

Frankau, Julia, see DANBY, FRANK.

Frankau, Pamela (1908-), novelist, daughter of Gilbert F. (q.v.), was educ. at Stapleton. She took up journalism, then for a time was a copy-writer in an advertising agency. Her novels, which show increasing seriousness as her craftsmanship developed, include *Threc*, 1929, *She and I*, 1930, *Born at Sea*, 1932, *Foolish Apprentices*, 1933, *Tassel-Gentle*, 1934, *The Devil We Know*, 1939, *A Democrat Dies*, 1940, *Shaken in the Wind*, 1948, *The Willow Cabin*, 1949, *The Winged Horse*, 1953, *A Wreath for the Enemy*, 1954, and *The Bridge*, 1957. During the Second World War she was a major in the A.T.S. She married Marshall Dill, and since 1945 has lived in the U.S.A. In 1942 she became a Rom. Catholic.

Frankel, Benjamin (1906-), composer, b. London. He was early apprenticed to the watch-making trade, but his success in winning a scholarship at the Guildhall School of Music decided his future career. He studied composition there and the violin at the Trinity College of Music. He then continued his studies abroad at Cologne and Berlin. Launched on a musical career, he specialised in light music and acquired a reputation as an expert in jazz and comedy music. His reputation in the film world grew with the music for *The Seventh Veil*, 1945, *The Years Between*, 1946, and *Dear Murderer*, 1947. Meanwhile in the sphere of chamber music his early work showed great promise, fulfilled by his later works, particularly his Trio for clarinet, piano, and cello (Op. 10) and his 4 string quartets, the 2nd of which was selected for performance at the festival of the International Society of Contemporary Music at Copenhagen in 1947. His

musical powers also found expression in his setting for poems by Robert Nichols, a work for voices, string orchestra, trumpet, and drums, entitled *The Aftermath* (Op. 17).

Frankenberg, Ger. tn in the dist. of Karl-Marx-Stadt, on the Zschopau, 8 m. NE. of Karl-Marx-Stadt (q.v.). It has an anct castle and has textile and metal industries. Pop. 15,000.

Frankenhausen, Ger. spa in the dist. of Erfurt, on the S. slope of the Kyffhäuser (q.v.), 25 m. N. by E. of Erfurt (q.v.). The peasants, under Thomas Münzer

centre in the Bluegrass region. The prin. manufs. are boots and shoes, twine, furniture, truck bodies, and concrete pipes; it is also a sawmilling and whisky-distilling centre. F. has a fine state capitol, a state penitentiary, and a state normal school for coloured children. The grave of Daniel Boone is here. It is served by 3 railways. Pop. 11,916.

2. City, cap. of Clinton co., Indiana, U.S.A., 40 m. NNW. of Indianapolis. It has meat-packing plant, an oil refinery, and foundries, and manufs. enamel and porcelain ware. Pop. 15,000.

FRANKFURT

D. McLeish

The old market-place and town hall (Römer)

(q.v.), were defeated here by Saxon, Brunswick, and Hessian troops in 1525. The region has salt and potash mines. Pop. 9000.

Frankenstein, see ZABKOWICE SLASKIE.

Frankenthal, Ger. tn in the Land of Rhineland-Palatinate (q.v.), 33 m. S. by E. of Mainz (q.v.). It is near the l. b. of the Rhine (q.v.), with which it is connected by canal. Heavy machinery and furniture are manufactured. Pop. 30,000.

Frankenwald, mountainous dist. of Germany, situated principally in NE. Bavaria (q.v.). It is an undulating plateau of about 2000 ft elevation. See FICHELGEbirge.

Frankfort: 1. City of Kentucky, U.S.A., the cap. of Franklin co. and also of the state. It is situated on the Kentucky R., which is navigable for 40 m. from the city. It is a trade and shipping

Frankfurt-am-Main, Ger. city in the Land of Hessen (q.v.), on the Main (q.v.), 18 m. E. of Wiesbaden. The name means 'ford of the Franks,' and it is said that this place was shown to Clovis (q.v.) by a deer, when he was leading an expedition against the Alemanni in 496. The tn is mentioned in a document in 793, and seems to have been of some importance because Charlemagne (q.v.) resided in it in 794, and convened a meeting there of bishops from Germany, Gaul, and Italy. A royal palace was built in the tn by Louis I, le Débonnaire (q.v.), and after the treaty of Verdun in 843 F. became the cap. of the E. Frankish kingdom. In 1152 it became the place of election of the Ger. emperors, a privilege recognised in the 'Golden Bull' (q.v.) of 1356; the cathedral was chosen as the election church. In 1372 it was made a

free city of the empire. In 1546 it was occupied by the emperor's troops as a reprisal for its membership of the League of Schmalkald (see SCHMALKALDEN). It was occupied by the Fr. during the Seven Years' War, and in 1792, 1796, 1800, 1803, and 1806. Napoleon created a grand duchy of F., 1810-15, after the end of which the city became the seat of the Ger. Confederation. It was seized by Prussia in 1866; it had espoused the Austrian cause. In 1871 the treaty ending the Franco-Ger. War was signed in F. During the First World War the city was bombed sev. times, and in 1920 it was occupied by the Fr. for a short period. During the Second World War it suffered numerous air raids. The first heavy raid was on 20 Dec. 1943. During the following year the city was a frequent target, and between 29 Jan. and 25 Feb. it sustained 5 major attacks. There were 2 day- and 2 night-attacks in the period 18-24 Mar., including one raid in which 3360 tons of bombs were dropped in 30 min. On 12 Sept it suffered the greatest fire raid yet delivered. The Amer. First Army cut the Ruhr-F. road on 16 Mar. 1945, thereby putting the city in imminent danger of capture. On the following day Gen. Eisenhower warned F. and Mannheim that resistance would lead to their being destroyed from the air. F. eventually fell on 26 Mar. Part of the city was by then in ruins.

The Gothic cathedral was begun in the 13th cent., on the foundations of a 9th-cent. church; its very fine Gothic tower was begun in 1415. The building contains many medieval treasures. There are sev. other medieval, Renaissance, and baroque churches of note. Among the interesting secular buildings are the *Römer*, a group of 8 houses (restored after war damage) which together form the tn hall and which date from the 14th cent.; and the Goethe (q.v.) house, which is a rebuilding of the house in which the poet was b.—the original was largely destroyed in an air raid. The univ. dates from 1914, and there are sev. museums and art galleries. Since medieval times the fairs of F. have been important, but in modern times the chief importance of the city has been its pre-eminence as a money market; this has been largely due to the enterprise of the Rothschild family (q.v.). The city is a centre of road and rail communications, has extensive printing and publishing industries, and has metallurgical, chemical, machinery, leather, and foodstuff manufs. Pop. 629,400.

Frankfurt an der Oder: 1. Dist. (*Bezirk*) of the Ger. Democratic Rep. (E. Germany), bounded on the E. by the Polish provs. of Szczecin and Zielona Góra; on the S. by Cottbus; on the W. by Potsdam and Berlin; and on the N. by Neubrandenburg (qq.v.). Area 2760 sq. m.; pop. 650,000. See BRANDENBURG.

2. Ger. city, cap. of the dist. of F., on the l. b. of the Oder (q.v.), 50 m. ESE. of Berlin. In the Middle Ages it was an important trading tn, and belonged to the Hanseatic League (q.v.) after 1368. It

was besieged by the Hussites (q.v.) in 1431, by the Swedes in 1631, by the Russians in 1759, and by the Fr. on 2 occasions during the Napoleonic wars. In the Second World War it was taken by the Russians under Marshal Zhukov (q.v.) on 18 Mar. 1945; two-thirds of the city was then in ruins. The part of F. on the E. bank of the riv. has been incorporated in Poland since 1945 (see SLUBICE). There are engineering, textile, leather, and foodstuff industries. Pop. 60,000.

Frankincense, or *Olibanum*, gum-resin. It corresponds to the Arab *lubān*, the fragrant gum of the *Boswellia thurifera*, a tree plentiful in central and S. India. This aromatic gum-resin is yielded by various trees, though pre-eminently those of the genus *Boswellia*, which grows on the Somaliland and Arabian coasts, whence it reaches Bombay. The chief gum-yielding species of *Boswellia*, besides the Indian *B. thurifera*, are *B. Freereana*, *B. Bhua-Dajama*, and *B. Carterii*, all of Somaliland, and a variety of the last-named which grows in the Hadhramaut. F. was brought into Palestine by the Arabian merchants (Is. lx. 6; Jer. vi. 20) and was among the gifts offered by the wise men (Matt. ii. 11). It occurs in round or oblong tears covered with a white dust, and is of a yellowish-brown colour, but some is colourless. It has a bitter taste, and smells like balsam when heated. It burns with a bright flame and fragrant odour, and is used in incense (Exod. xxx. 34, etc.), fumigating powders, and in the composition of stimulating plasters, etc.

Franking of Letters, term used for the right of sending letters free of charge. This privilege was claimed by the House of Commons in 1660, but it was not until 1764 that an Act was passed which made the practice legal. After this date every member of Parliament was allowed to send 10 letters a day free of charge, and to receive 15. The privilege was abused, and was finally abolished in 1840, on the introduction of the penny postage. In the U.S.A. F. was instituted in 1776, and remained in force until 1873; it was then abolished, but later restored.

Frankland, Sir Edward (1825-99), Eng. chemist, b. Churchtown, near Lancaster. He worked under Hunsen at Marburg. In 1851 he was appointed prof. of chem. at Owens College, Manchester. He was lecturer in chem. at St Bartholomew's Hospital for a time, and in 1863 prof. of chem. at the Royal Institution. He devised new methods of water analysis, publishing on this subject *Water Analysis for Sanitary Purposes*, and when appointed a member of the royal commission on the pollution of rivers in 1868 did good work. He discovered the theory of valency, which played an important part in the subsequent growth of chem.; and jointly with Sir Norman Lockyer was responsible for the conclusion that the external layers, or photosphere, of the sun are composed of gases and vapours, as well as for the discovery of helium. The highest honour of the Royal Society, the Copley Medal,

was awarded to him in 1894. He was knighted in 1897.

Frankland, Percy Faraday (1858-1946), chemist, b. London, educ. at Univ. College School, the Royal School of Mines, and Würzburg Univ. He was prof. of chem. at Birmingham Univ. (1900-18) and became president of the Chemical Society in 1911. He did much research, and his memoirs, pub. in the *Philosophical Transactions of the Royal Society*, etc., deal with chemical aspects of fermentation, the application of bacteriology to air and water, the sand filtration of water, and the bacterial treatment of sewage. He also pub. *Agricultural Chemical Analysis*, 1883, *Our Secret Friends and Foes*, 1894, *Microorganisms in Water*, 1894, and *Life of Pasteur*, 1897.

Franklin, Benjamin (1706-90), Amer. statesman, b. Boston, Massachusetts. He was the 15th child in a family of 17, and after 2 years at school he was apprenticed to a printer at the age of 12. He learnt his trade thoroughly, and at the same time became acquainted with the work of editing a newspaper. In 1723 he left Boston for Philadelphia, where he continued work as a printer. In 1724 he sailed for England, where for 18 months he worked in a printer's office. On his return to America he started business as a printer. In 1729 he bought the *Pennsylvania Gazette*, and was so successful in editing the paper that 3 years later he brought out *Poor Richard's Almanac*, which he continued to issue for 25 years, and which became famous in the Amer. colonies for F.'s pithy maxims on the virtue of thrift and hard work.

About this period of his life he made many scientific investigations. He estab. the identity of lightning with electricity, by means of his famous demonstration with a boy's kite, and suggested the use of lightning conductors on large buildings. Amongst his scientific researches, 2 very useful pieces of work were the discovery of the Gulf Stream and of its course, and the discovery of the course of the storms that cross the continent of North America.

He began to take a prominent part in the political life of Pennsylvania. In 1737 he was postmaster of Philadelphia and from 1751 to 1764 was a member of the colony's legislative body. As early as 1754 he was ardently advocating an inter-colonial union, the better to present colonial claims to the Eng. Gov. In 1757 he was drawn away from his scientific work by the urgency of the political situation in Pennsylvania. In that year he was sent to London to represent the grievances of the colony with regard to taxation. In that mission he was so successful that in 1771, being in England again, he was asked to protest against the Stamp Act. In 1775 he returned to America and helped to draw up the Declaration of Independence. During the war of Independence he represented the states in Europe. In 1778 he was recognised as minister of the U.S.A. by France. He brought about the treaty of

Paris, and was instrumental in obtaining a good deal of help for the states. It was mainly through his diplomacy that France was brought into the war. At the close of the war he remained in Paris as minister of the states, and then returned to take part in framing the constitution of the new nation.

J. Bigelow has ed. a complete ed. of F.'s works. Except for his early journalistic writings and his famous autobiography these are mainly in the form of private letters. Even his scientific discoveries were made known to the world through his letters to his friends. His autobiography was ed. by J. Bigelow and pub. in 1868. The 'Complete Edition' was

BENJAMIN FRANKLIN

Engraving by J. A. Thomson after the original painting by J. A. Duplessis

produced by Bigelow in 1887-9, but the best ed. is the Centennial, by A. H. Smyth (10 vols., 1905-7). See W. C. Bruce, *Benjamin Franklin Self-revealed*, 1917; P. Russell, *Benjamin Franklin, the First Civilised American*, 1926; Bernard Fay, *Franklin, the Apostle of Modern Times*, 1929; C. van Doren, *Benjamin Franklin: a Biography*, 1939; and Everyman's Library ed. of the *Autobiography*.

Franklin, Sir John (1780-1847), Arctic explorer, b. Spilsby, Lincs. He entered the R.N. on board the *Polyphemus*, and took part in the battle of Copenhagen in 1801. Two months later he was appointed midshipman to the *Investigator*, under Capt. Matthew Flinders, and showed remarkable ability for nautical observations on the voyage to Australia. He was present with Commodore Dance in his engagement with *Lincoln* in 1804, and took part in the battle of Trafalgar in 1805. Two years later he joined the *Bedford*, and sailed in that ship in the expedition against New Orleans in 1814, where he was wounded. In 1818 he was appointed to command the *Trent*, and accompanied Capt. Buchan in a voyage of discovery in the Arctic regions. In 1821

he was elected a Fellow of the Royal Society. From 1825 to 1827 he was again occupied in exploring the Arctic regions, and on his return to England was knighted. From 1836 to 1843 he was governor of Van Diemen's Land (Tasmania). In 1845 he set out in the *Erebus* with Capt. Crozier in the *Terror* to discover a N.W. passage to the Pacific, and his ships disappeared into the unknown N., having last been seen near the entrance to Lancaster Sound. In the ensuing 10 years over 40 expeditions were sent to clear up the mystery of their fate, mostly through the efforts of Lady F., and only gradually was their tragic story pieced together (1851). After spending almost 18 months in the ice near King William Is., F.'s party abandoned the ships and tried to march out to safety. Not a man survived. But F. left a name as a great leader in the story of hazardous adventures in the Arctic. He showed the existence of the N.W. passage, and his work resulted in the discovery of a second N.W. passage in 1850. He wrote *Narrative of a Journey to the Shores of the Polar Sea, 1819-22, 1823*, and *Narrative of a Second Expedition to the Shores of the Polar Sea, 1828*. See also ARCTIC EXPLORATION. See A. H. Beesly, *Franklin, 1881*; A. H. Markham, *Life of Sir John Franklin, 1891*; H. D. Traill, *Life of Franklin, 1896*; W. F. Rawnsley (ed.), *The Life, Diary, and Correspondence of Jane, Lady Franklin, 1923*; Mrs Gell, *John Franklin's Bride, 1930*; K. Fitzpatrick, *Sir John Franklin in Tasmania, Melbourne, 1949*; F. J. Woodward, *Portrait of Jane, 1951*; G. F. Lamb, *Franklin, Happy Voyager, 1956*.

Franklin, Miles (1879-1954), Australian novelist, b. near Tumut, New South Wales, of pioneering stock. She grew up on a dairy farm near Goulburn which she used as background for her famous first novel, satirically entitled *My Brilliant Career, 1901* (with preface by Henry Lawson, q.v.). This spirited story of a girl's rebellion against the narrowness of her bush life and the feminine conventions is deeply Australian in feeling and has become a landmark in Australian literature. *My Career goes Bung, 1946*, was considered too daring for pub. at the time it was written. She spent 30 years in the U.S.A. and England as a journalist, social worker, and militant suffragette. On her return to Australia she wrote *Old Blasius of Bandicoot, 1931*, which portrays another bush girl's fight for freedom and deals with the selection of the site for Canberra. *All that Swagger, 1937*, a novel of horse and cattle pioneering from the 1830's in the wild country of the Upper Murrumbidgee R., has given a legendary character to Australian literature in old Danny Delacy: 'I'm free meself and would wish every man-jack, black and white, to be the same.' M. F.'s name has been strongly associated with 3 other novels of epic scope set in the same region and pub. under the pen-name 'Brent of Bin Bin': *Up the Country, 1928*, *Ten Creeks Run, 1930*, and *Back to Bool Bool,*

1931. Also by M. F. are *Joseph Furphy, a biography, 1944* (see COLLINS, TOM), written in association with Kate Baker, and *Laughier, not for a Cage, 1956* (pub. posthumously), a provocative assessment of Australian novel writing. See also AUSTRALIAN LITERATURE. See Miles Franklin: *A Tribute, 1955*, by some of her friends.

Franklin: 1. City in New Hampshire, U.S.A., about 17 m. N. of Concord, at the confluence of the Pemigewasset and Winnepesaukee R.s. to form the Merrimack. The rivs. furnish good water power, which is extensively used in the manufs. The chief are paper and pulp and hosiery. Daniel Webster was b. here, and the house is used as a museum. F. was first settled in 1764 and incorporated as a city in 1895. Pop. 6550.

2. Tn, cap. of Venango co., Pennsylvania, U.S.A., about 35 m. from Erie. It is the centre of the chief oil region of the state, and manufs. boilers, engines, steel castings, and iron goods. Pop. 10,000.

3. Dist. in N. Canada, named after Sir John F., which includes Banks, Prince Albert, Victoria, Wollaston, King Edward and Baffin Land, Melville, Bathurst, Prince of Wales, and Cockburn Is. Area about 500,000 sq. m.

Franklin, landowner of free but not of noble birth in 14th and 15th cents. in England. In status he was above the villeins. There is a F. in Chaucer's *Canterbury Tales*, and the word also occurs in Scott's *Ivanhoe*.

Franklin Institute, Philadelphia, Pennsylvania, was founded in 1824, the oldest society in the U.S.A. for the study of the mechanic arts and the application of science to industry. In 1826 it opened the first high school in Philadelphia; later it abandoned teaching except in technical subjects. It includes the Fels Planetarium, a permanent technological exhibition, halls for mechanical and industrial exhibits, a library with a record of patents granted by the U.S.A. and other countries, and a laboratory for biochemical research. It publishes a scientific jour. and awards medals for distinguished scientific achievement.

Frankpledge. From the earliest times in England there was a custom whereby a man's relations were responsible for his behaviour; out of this grew the principle of forming institutions for mutual security. A number of men formed an association in which they were answerable each for the others; if one committed a crime, the others were liable for his appearance to make reparation, and if he disappeared, the others had to pay the penalty unless they could prove their innocence. These societies were called *frithborhs*, or peace-pledges, and the Normans mistranslated the A.-S. words as F.

Franks, Sir Oliver Shewell (1905-), scholar and diplomat, educ. at Bristol Grammar School and Queen's College, Oxford; Fellow and Praelector there, 1927-37. He was a univ. lecturer in

philosophy, 1935-7, and prof. of moral philosophy, univ. of Glasgow, 1937-45. F. was a temporary civil servant at the Ministry of Supply, 1939-46, and a permanent secretary, Ministry of Supply, 1945-6. He was provost of Queen's College, Oxford, 1946-8. From 1948 to 1952 he was Brit. ambas. in Washington, his period of office being conspicuously successful. He later became chairman of Lloyds Bank Ltd.

Franks, The, name given to a confederation of tribes of Teutonic origin who inhabited the lower and middle Rhine valley during the 3rd cent. AD. The tribe may be divided from about the 4th cent. into 2 main groups, the Salian F. who dwelt on the lower Rhine, and the Riparian F. on the middle Rhine. Towards the end of the 3rd cent. the F. began to move W. About 350 the F. were defeated by the Emperor Julian and became a dependency of Rome, but when Clovis (481-511) became king of the Salian F.s the Rom. yoke was thrown off. Clovis defeated the Alemanni round the R. Seine in 495, and by 501 obtained an ascendancy over the Riparian F., thus considerably extending his empire and forming the nucleus of the kingdom of France. During his rule, also, the F. adopted Christianity, but remained subject to their Salic law. They obtained military supremacy in N. Gaul and founded the 1st dynasty of Fr. kings. By c. 597 they were divided into the Austrasian and Neustrian F., who continually struggled for ascendancy over each other, the Merovingian dynasty being finally superseded (752) by the Carolingian.

Františkovy Lázně (Ger. Franzensbad), Czechoslovak spa in the region of Karlovy Vary (q.v.), at the W. end of the Erzgebirge (q.v.). The waters are exported in bottles. Pop. 2300.

Franz, Robert (1815-92), Ger. composer, b. Halle. He suffered in early life from the opposition of his parents to a musical career, but eventually was allowed to go to Dessau to study organ-playing under Schneider. In 1843 he brought out a book of songs, which subsequently was followed by nearly 50 other books, containing altogether about 250 songs. The songs are mostly for mezzo-soprano voice, lyrical, and finished in execution. Unhappily deafness began to afflict F. before he was 30, while, owing to a nervous disorder, he had to resign his post of organist to the city of Halle and his other offices. But his future was provided for by the proceeds of a concert tour arranged by Liszt and others. He made arrangements of vocal works by Bach and Handel which are now discredited, but lives by his songs, which rank very near the best in Ger. music.

Franz Josef, see FRANCIS JOSEPH.

Franz-Josef Land, see ZEMLYA FRANTSIA-IOSEFA.

Franzen, Frans Michael (1772-1847), Finnish-Swedish poet, b. Uleåborg, Finland. In 1798 he was prof. of literature, in 1801 prof. of hist., and in 1808 was elected a member of the Swedish Academy.

On the cession of Finland to Russia he went to Sweden, and became in 1831 bishop of Härnösand. His earlier verse, as *Skaldestycken*, 1810, was lyrical and sentimental. After his ordination his tone became more philosophical and religious. His idealism and rich imagery link him with the Romantics.

Franzensbad, see FRANTIŠKOVY LÁZNĚ. **Frascati**, It. tn. in Lazio (q.v.), situated on the Alban Hills (q.v.), 10 m. SE. of Rome (q.v.). It is 1050 ft above sea-level, and has long been a popular summer resort. It has a cathedral, sev. other interesting churches, and many beautiful villas and parks. The tn was very severely damaged during the Second World War, but the damage has since largely been made good; one villa, the *Villa Torlonia*, was for a time the H.Q. of Kesselring (q.v.), and was subsequently destroyed. F. is known for its market gardens, and for the white wine to which it gives its name. Near to the tn is the site of the anc. city of Tusculum (q.v.). Pop. 13,000.

Fraser, Peter (1884-1950), New Zealand statesman, b. Fearn, Ross-shire, Scotland, and educ. at a board school. He began his political activities as a local officer of the Liberal party. In 1908 he joined the Independent Labour party in London. He emigrated to New Zealand, 1910, and played a prominent part in the Labour movement there. He was a member of the House of Representatives for Wellington Central from 1918; a member of Wellington City Council, 1919-23 and 1933-6; and of Wellington Harbour Board, 1933-8. He was New Zealand delegate to the Empire Parl. Association Conference, 1935; minister of education, health, marine, and police, 1935-40; and Prime Minister, 1940-9, also minister of external affairs and of Is. ters. of New Zealand during this same period. During the Second World War he attended meetings of the War Cabinet in London, and tried to keep personal contact with New Zealand's forces in all theatres of war. F. led the New Zealand delegation at the San Francisco Conference (q.v.), 1945, and again at the first meeting of the U.N. Assembly, 1946. In a general election at the end of Nov. 1946 F. was returned to office, but only by securing the 4 Maori seats, dividing the others equally with the National party. The result was interpreted as a rebuff to the Radical wing of Labour, and as giving a mandate to F. to pursue his humanitarian policies but not to make any further extension of direct nationalisation. In 1947 F.'s gov. took over for the State all insurance relating to workmen's compensation. An 'aid to Britain' conference was held at Wellington in Aug. and initiated a substantial programme of economy and increased production designed to help the U.K. in its financial difficulties. F., who was chairman of the third commission (social, humanitarian, and cultural questions) at the London session of the U.N. in 1946, also attended the Paris session in 1948; after which he travelled extensively

in Germany. He was defeated at the general election of 1949.

Fraser, Sir Robert Brown (1904-), Brit. journalist and administrator, b. Australia and educ. at St Peter's School, Adelaide, and Melbourne and London Univs. He was leader-writer on the *Daily Herald*, 1930-9, subsequently working in the ministry of information. He was director-general of the Central Office of Information, 1946-54, when he was appointed Director-General of the

around Quesnel and Williams Creek, the F. is now famous for its salmon fishery. The F. valley, which extends almost from Hope to the confines of Vancouver, is notable for its fertility, and supports a large farming and dairying pop. In 1948, when the riv., swollen by melting snows from the Rocky and Cascade Mts, rose some 26 ft above summer level, the valley suffered severely from flood. Named after Simon F., who explored it in 1803, the F. has a length of 785 m. Its chief

Agent General for British Columbia

THE FRASER RIVER AT HELL'S GATE

Independent Television Authority. He was knighted in 1949.

Fraser, Simon, see **LOVAT, LORD**.

Fraser, chief riv. of Brit. Columbia, rises in the Rocky Mts in the vicinity of the Yellowhead pass, and flows in a NW. direction for 277 m. to Giscombe, where it makes a turn almost due S. through the centre of the prov. for 413 m. to Hope. Here it turns again and continues W. for 95 m. to empty at New Westminster into Georgia Strait. At Lytton, 65 m. N. of Hope, the riv. is joined by its largest trib., the Thompson, and from this point lines of the Canadian Pacific and Canadian National Railways run along the riv. to the coast. Scene of the earliest discoveries (1858) in the prov.

tribs. are the Morkill, Bowron, McGregor, Willow, Salmon, Nechako, Blackwater, Cottonwood, Quesnel, Chilcotin, Bridge, Thompson, Harrison, and Pitt.

Fraser Island, or **Great Sandy Island**, off the S. coast of Queensland, Australia, stretching from Wide Bay to Hervey Bay. There is excellent fishing.

Fraser of North Cape and Molesley, Bruce Austin Fraser, 1st Baron (1888-), Brit. adm., son of Gen. Alexander F., R.E. Educ. at Bradfield School. Flag captain, East Indies. Commanded the *Glorious* (see **AIRCRAFT CARRIER**); chief of staff, Mediterranean Fleet; Third Sea Lord and Controller, 1939-42; second in command, home fleet, 1942; commander-in-chief, home fleet, 1943-4; adm., 1944; com-

mander-in-chief, eastern fleet, 1944; of the Pacific fleet, 1945-6; commander-in-chief, Portsmouth, 1947-8. On 26 Dec. 1943 the great Ger. battle cruiser *Scharnhorst* (q.v.) was brought to action and sunk off North Cape, Norway, by units of the home fleet under the command of F., which were escorting to Russia a convoy of exceptional importance. In Aug. 1949 he was appointed First Sea Lord in succession to Admiral of the Fleet Sir John Cunningham.

Fraserburgh, seaport tn in Aberdeenshire, Scotland, on the S. side of Kinnaird's Head, and W. of F. Bay. It is noted for its herring fishery, and has considerable export and import trade. It has a good harbour. Originally called Falthill, the name was afterwards changed to F. in honour of its founder, Fraser of Philorth. Pop. 10,500.

Fraser's Highlanders, see SEAFORTH HIGHLANDERS.

Fraserville, see RIVIÈRE-DU-LOUP.

Fratellini, name of a famous family of Fr. clowns, which has been called the 'dynasty of clowns.' Gustave F. was the first of the family to work in a circus. The elder of his sons, who appeared in London in the first decade of this century, had 2 sons who performed, together with their brother-in-law, as a trio of clowns. Good though they were, they were eclipsed by the world-wide celebrity of their cousins, the family of Gustave's younger son. This latter family appeared in England in C. B. Coolran's revue *Dover Street to Dixie*, the 3 being Paul, Albert, and François F. In Paris they were idolised and were almost an institution at the Cirque d'Hiver. Paul (d. 1940) was the simple fellow with the large red nose, who played the bombardon.

Fraternalities and Sororities, societies of students estab. in nearly all the colleges of the U.S.A. and Canada with the objectives of promoting social intercourse, good scholarship, and participation in college activities. There is little secrecy in their organisation beyond measures taken to protect their constitutions and mottoes. They are called Gk-letter societies, as Gk letters are used to name each. Each has a distinguishing badge bearing symbols and monograms. They are divided into chapters, not more than 1 chapter of a given society being at any college. The first, the Phi Beta Kappa (q.v.), was organised at Wm and Mary College in 1776. There are over 60 men's national F. in the National Interfraternity Conference with total membership of over 3,000,000; 30 women's S., with membership of over 800,000, comprise the National Panhellenic Congress. In addition, there are many local F. not associated with the national organisations, and many men's and women's professional and honorary F. and S. See Baird, *Manual of American College Fraternities* (15th ed.), 1949.

Fratelli, or Frérots (Little Brethren), religious sectaries of the 14th cent. Claiming to be the true followers of Francis of Assisi they refused to submit to

the Church and formed a separate organisation, professing apostolic poverty, and having no settled abode. They were suppressed spasmodically by Church and State in the 15th cent.

Fratres Arvales, see ARVAL BRETHERN.

Fraud, legal term of such wide meaning that it may be said to be implied in every civilly or criminally wrongful act, whereby one person is prejudiced by the deception of another. To sustain an action of deceit or F. the person aggrieved must prove (1) the statement was untrue in fact, and made apparently or in reality with the intent that he should act upon it; (2) the person who made it either knew of its falsity or was ignorant whether it was true or not; and (3) he (the plaintiff) acted upon it and, in consequence, suffered damage. It is not essential to an action of F. that express words should have been used by the defendant, if by his conduct, suggestions, or active concealment of something material he causes the plaintiff to be misled. But a *suppression veri* (suppression of truth) is only regarded as tantamount to F. where the withholding of that which is not makes that which is stated absolutely false. Merely allowing a man to continue to act on an erroneous assumption is not defrauding him if the other person in no way contributed to such error. Generally speaking, F. implies a misrepresentation of existing fact. A principal is liable for the F. of his agent where committed in the cause of the principal's business and ostensibly for his benefit; a husband is liable for his wife's F., and a partner for that of his co-partner. A contract induced by F. is voidable at the option of the defrauded party, for *fraus vitiat omnia* (F. vitiates everything), and besides rescinding the contract he is also entitled to damages, but he may, if he choose, leave the contract subsisting and at the same time sue for any damage he has suffered. In accordance with the above maxim it has long been settled that F. in all courts and at all stages of any particular transaction, if proved, at once vitiates the proceedings.

Formerly, false statements made negligently but without active deceit, or false statements made on insufficient grounds, were held to amount to what was called 'legal F.' But the rule now is that no false statement made with an honest belief in its truth can render the maker liable for F. In consequence of this ruling (which is to be found in the classic case of *Derry v. Peek*) the Directors' Liability Act, 1890, makes directors and promoters of a company liable in damages for misstatements in a company prospectus inviting the public to subscribe to shares only where such statements were made without reasonable grounds for believing in their truth.

In the criminal law many offences necessarily imply F. (for civil remedies for crimes see CRIMINAL LAW), e.g. obtaining by false pretences, embezzlements (q.v.), and all unlawful appropriations by all manner of agents, trustees, and others entrusted with property. In a charge of

falsifying accounts it is not necessary to show that any particular person was intended to be defrauded. For rendering void fraudulent conveyance by a bankrupt as against his creditors, see CONSIDERATION.

Frauds, Statute of, 1677. Although this statute was intended to prevent fraud in contracts, its operation in practice often had the opposite effect and caused great hardship. It made certain classes of contract unenforceable unless evidenced by writing (see CONTRACT) or, where practicable, supported by the equitable doctrine of 'part performance.' That doctrine applies where one party to a contract, usually for the sale or purchase of land, having acted on the other party's promise to perform his part of the bargain, has done something to fulfil his own obligations (part performance) and seeks to enforce the contract. An act of part performance which clearly refers to the transaction in question will be regarded by equity as evidence of the formation of a contract, notwithstanding the absence of writing. Since the passing of the Law Reform (Enforcement of Contracts) Act, 1954, contracts of guarantee and those relating to interests in land are the only classes still required by section 4 of the S. of F. to be evidenced by writing.

Frauenburg, see ERMELAND.

Frauenfeld, cap. of the canton of Thurgau, Switzerland, situated on the R. Murg. It has a 10th-cent. castle. The manuf. are cottons, silks, woollens, and iron and aluminium goods. Pop. 12,300.

Fraueninsel, see CHIEMSEE.

Fraunce, see HEINRICH VON MEISSEN.

Fraunce, Abraham (c. 1558-c. 1633), poet, b. Shropshire. Educ. at Shrewsbury and St John's College, Cambridge, of which he became a Fellow in 1580, he was later called to the Bar at Gray's Inn. He enjoyed the patronage of Sir Philip Sidney and of his sister, the countess of Pembroke, to whom sev. of his books were dedicated, and was one of the group who advocated the use in Eng. poetry of classical metres; all his own poems are in hexameters. He was a close friend of Spenser, who introduced him as Corydon into his *Colin Clout's Come Home Again*. F.'s own works include *The Lamentations of Amintas for the Death of Phillis*, 1585, a series of trans. which he reprinted in 1591 as *The Countess of Pembroke's Irychurch*, named after one of her residences; this was the first of a series continued by *The Countess of Pembroke's Emanuel*, 1591, a poem on the Nativity, Passion, and Resurrection; and *Amintas Dale*, 1592, a medley of poetry and prose somewhat on the lines of Sidney's *Arcadia*. F. also wrote *Victoria*, a Lat. comedy, and 2 prose treatises, *The Arcadian Rhetoric*, 1584, and *The Lamer's Logic*, 1588.

Fraunhofer, Joseph von (1787-1826), Ger. optician, b. Straubing, Bavaria. His father was a glazier, and he was apprenticed to a glass polisher. In his leisure he studied mathematics and optics and at the age of 20 was making original

contributions to the design and construction of optical instruments. Together with Guinand he developed processes for the production of good optical glasses, thereby enabling larger telescope objectives to be made, culminating in the 24.4-cm. diameter Dorpat Refractor. He devised the simple spectroscope and used the dark lines in the sun's spectrum, now known as F. lines, as fixed colours for the measurement of the dispersive powers of optical glasses. Wollaston had noticed 7 of these dark lines a few years earlier (1802), but F. first recognised their value and measured no less than 586 of them. In 1823 he was appointed prof. and conservator of the Cabinet of Natural Curiosities at Munich. See the *Optician*, pp. 535-40, 1951.

Fraunhofer Lines, fine dark lines crossing the solar spectrum, first observed by Wollaston in 1802, and later studied by Joseph von Fraunhofer (q.v.). The lines correspond to the wave-lengths of light absorbed in the reversing layer of the sun, i.e. the outer, cooler layers of gas.

Fraustadt, see WESZOWA.

Fraunus, see ASH.

Fray Bentos, or Independencia, port of W. Uruguay, and cap. of Rio Negro. It is on the Uruguay R., about 170 m. NW. of Montevideo. The tn is engaged in the manuf. of extract of meat and in canning. Pop. c. 18,000.

Frazer, Sir James George (1854-1941), Scottish author, b. Glasgow; educ. at Glasgow Univ. and Trinity College, Cambridge. Elected to a Fellowship at Trinity College in 1879. At first his studies were classical, but he took a new line in 1887 with a book on *Totemism*. In 1890 appeared *The Golden Bough* (2nd ed. 1900; 3rd ed. in 11 vols., 1911; supplementary index vol., 1914; abridged form, 1922), which instantly brought him fame. This masterpiece of anthropology and scholarship has profoundly influenced the modern outlook on belief in the supernatural and on religious ritual. F. went to Greece for the preparation of an ed. of Pausanias, the Gk. geographer, which appeared as *Pausanias's Description of Greece*, translated with a Commentary in 1898, 2nd ed. 1913, and *Pausanias and other Greek Sketches* in 1900. In 1907 he was appointed prof. of social anthropology to the univ. of Liverpool. He delivered his first Gifford lectures at St Andrews in 1911, choosing as his subject *Belief in Immortality and the Worship of the Dead*. In 1912 he ed. a selection of *Cowper's Letters* (with notes by J. E. Drayner). Knighted, 1914. O.M., 1925. Numerous honorary degrees. In 1920 he was elected a Fellow of the Royal Society, having given up his Liverpool Fellowship in 1919. His later work included a trans. of Apollodorus in the Loeb Library and an ed. of Ovid's *Fasti* in 5 vols. in 1929. With F. religious beliefs took their place among other natural phenomena as a subject for dispassionate investigation. His chief anthropological interest was the origin of religion, which in his view developed out of an early belief in magic, the simplest

primitives believing they could control nature by magic. Religious beliefs arose when men conceived of nature as a personal force to be propitiated by sacrifice. F. postulated a 3rd stage, when men control nature by scientific action. This view of man's past was developed at great length and in immense detail in many works. His influence to-day is waning amongst anthropologists, who have nevertheless been greatly affected by it. His other works include *Lectures on the Early History of the Kingship*, 1905, *Adonis, Atis, Osiris: Studies in the History of Oriental Religion*, 1906, 3rd ed. 1914, *Questions on the Customs, Beliefs, and Languages of Savages*, 1907, *Psyche's Task*, 1909, *Totemism and Exogamy*, 1910, *The Relief in Immortality*, etc., 1913, *Essays of Addison* (ed.), 1915, *Folk-lore in the Old Testament*, 1918, *The Worship of Nature*, i., 1926, *Myths of the Origin of Fire*, 1930, *Aftermath: a Supplement to the Golden Bough*, 1936, *The Fear of the Dead in Primitive Religion*, 1936, *The Gorgon's Head*, 1937, and *Totemica: a Supplement to Totemism and Exogamy*, 1937.

Frazer Island, or Great Sandy Island, see FRASER ISLAND.

Fréchet, Louis Honoré (1839-1908), Fr. Canadian poet, b. Lévis, Quebec. He was called to the Canadian Bar (1864), but entered upon a journalistic career in Chicago. In 1874 he was elected to the Dominion Parliament, but was defeated at the election of 1878. He ed. *La Patrie*, made sev. trans. from the Fr., and wrote *Mes loisirs*, 1863, *La Voix d'un exilé*, 1867, *Les Oiseaux de neige*, 1880, and the 2 historical dramas, *Papineau*, 1880, and *Félix Pontre*, 1880. His verse was sev. times crowned by the Fr. Academy. He was elected president of the Royal Society of Canada. See M. Dugas, *Un Romantique canadien: L. Fréchet*, 1934.

Fredegond, Fredegunde, or Fredegunda (c. 545-97), Frankish queen, first mistress and then wife of Chilperic, king of Neustria. She parted Chilperic from his first wife, Audovera, whose servant she had been, but he then married Galsvintha. F. was suspected of murdering her in the same year (567), and became her successor. This caused war between Chilperic and his brother Sigebert of Austrasia, whose wife, Brunhilda, was sister to Galsvintha. F. had Sigebert assassinated at Vitry (575), and made away with all who stood in the way of the succession to the throne of her own son, Clotaire II. After the murder of Chilperic in 584, she carried on war against Brunhilda and her descendants, but failed to kill the queen, and d. during the campaign.

Fredericia, seaport of Denmark, on the S.E. coast of Jutland, at the N. entrance of the Little Belt and the Little Belt bridge. It has iron and silver works, manufs. chemicals, condensed milk, soap, and toys, is an important railway centre, and has considerable shipping trade. The prin. exports are meat, fish, and eggs; it imports pottery, salt, and petroleum. The permanent buildings of the Dan.

Industries Fair are situated here, and so is a college for the deaf and dumb. It has had an exciting hist. The fortress was stormed by Swedes in 1657. In 1849 the Dan. garrison broke a siege by the army of Schleswig-Holstein, but in 1864 the tn was evacuated by the garrison after bombardment and siege by the Austrians. Pop. 27,910.

Frederick I (c. 1122-90), Holy Rom. emperor, 1152-90, surnamed **Barbarossa** or **Redbeard**. He was the son of Frederick II of Hohenstaufen, duke of Swabia, and succeeded his father as duke of Swabia in 1147, and his uncle Conrad III as king of Germany in 1152. He reduced Germany to order during the early years of his reign, and then proceeded to establish the imperial authority in Italy. At Pavia he received the Lombard crown, and in 1155 was crowned emperor in Rome by Adrian IV. Four years later began the bitter contest between F. and Alexander III, Adrian's successor. In the course of this N. Italy was ravaged, F. excommunicated, and finally decisively defeated by the Lombard League at Legnano (1176). The following year he made his peace with the pope, and was able to turn his attention to Germany, where he had to struggle against Henry the Lion, duke of Bavaria and Saxony, head of the house of Guelph. In 1189, having settled the affairs of the empire and estab. universal peace in his dominions, he resigned the gov. to his eldest son, Henry, and put himself at the head of a crusade. He won 2 great victories over the Muslims, but was drowned in Cilicia in 1190. In Germany F. encouraged the growth of tns and took strong and successful measures to establish order. He is popularly remembered as a just and benevolent ruler: but his disastrous lt. campaigns did much to weaken the empire and impoverish its ters. See R. Wahl, *Kaiser Friedrich Barbarossa*, 1941.

Frederick II (1194-1250), Holy Rom. emperor, son of Henry VI and Constance, heiress of Sicily, and grandson of the Emperor Frederick I, thus a member of the Hohenstaufen family, b. near Ancona in Italy. On his father's death he was crowned king of Sicily at Palermo (1198), and on the death of his mother in the same year, Pope Innocent III became his guardian and regent of Sicily. He was elected head of the Holy Rom. Empire in 1212 on the excommunication of Otto IV, and his coronation took place in 1215 at Aix-la-Chapelle. Three years later, on the death of Otto, F. became undisputed ruler of Germany. In 1228 he went on a crusade, and set sail for Palestine, and by a treaty secured the possession of Jerusalem, Bethlehem, Nazareth, and the surrounding neighbourhood, crowning himself king of Jerusalem. During his absence Pope Gregory IX had devastated his possessions in Italy, but F., on his return, had no difficulty in driving back his enemies, and a peace was made between pope and emperor at San Germano (1230). In the last few years of

his reign, however, serious rebellions broke out against F. in both Germany and Italy. He was decisively defeated at Parma, 1248, and when he d. his ters. were in open revolt. See life by E. Kantorowicz, 1931; G. Maasson, *Frederick II of Hohenstaufen*, 1957.

Frederick III (1415-93), Holy Rom. emperor, b. Innsbruck in the Tyrol, son of Ernest of Hapsburg, duke of Styria and Carinthia. In 1440 he was chosen Ger. king at Frankfurt under the title of Frederick IV, and in 1463 he united Upper and Lower Austria under his rule, taking the title of Frederick V, archduke of Austria. He had been crowned emperor at Rome in 1452, the last emperor to be crowned there. During his reign Hungary and Italy were invaded by the Turks, and Vienna was occupied by the Hungarians. The marriage of his son Maximilian with Mary, daughter and heiress of Charles the Bold, duke of Burgundy, made the Hapsburg family one of the greatest dynasties in Europe. F. was an incapable ruler, though he had a real love of learning, and towards the end of his reign handed over the gov. of his lands to his son Maximilian, retiring to Linz, where he passed his time in study.

Frederick I (1369-1428), elector and duke of Saxony, surnamed 'the Pugnacious,' son of Frederick the Stern of Meissen. He won distinction as a soldier, and as a reward for his successes against the Hussites the Emperor Sigismund gave him the duchy of Saxony, 1423, and the title of elector. The Hussites crushed him, however, at Aussig 3 years later (1426).

Frederick III (1463-1525), surnamed 'the Wise,' elector and duke of Saxony, succeeded his father, Ernest, in 1486. He exercised an enormous influence on Ger. politics of the 16th cent. He founded the univ. of Wittenberg (1502), and called Luther and Melancthon to chairs in the faculty. He granted toleration to the creed of the reformers, though he never formally adopted it himself. On the death of Maximilian I he refused the offer of the imperial crown (1519). See P. Kirn, *Friedrich der Weise und die Kirche*, 1926.

Frederick I (1657-1713), 1st king of Prussia, elector of Brandenburg as Frederick III (1688-1701). He was the son of Frederick Wm, the great elector of Brandenburg. His name has become proverbial for vanity and extravagance, but he was a patron of learning, founding the univ. of Halle (1694) and the academy of sciences. F. supported the League of Augsburg against Louis XIV, and helped Wm III in the revolution of 1688 in England. Leopold of Austria granted him the royal title on the eve of the war of the Sp. Succession in return for his support.

Frederick II (1712-86), king of Prussia, known as 'the Great,' son of Frederick Wm I and Sophia Dorothea, daughter of George I of England. As a boy he was principally interested in music and literature: he detested the military

training his father forced him to undergo, and once made an unsuccessful attempt to escape to Paris. Before Frederick Wm's death, however, he and F. were reconciled. F. succeeded to the throne in 1740, inheriting the splendid army his father had collected but scarcely used. In the same year the emperor Charles VI (q.v.) d. F. immediately claimed Silesia for Prussia. When Maria Theresa rejected the claim, he invaded Silesia and in the first campaign gained the victory of Mollwitz. After the Prussian victory of Chotusitz, Austria in effect ceded most of Silesia to Prussia. Further fighting followed, but in 1745, by the treaty of Dresden, Austria relinquished all claims to Silesia. In 1756 the Hapsburgs formed an alliance against Prussia with

FREDERICK THE GREAT

Engraved by E. Scriven from a painting by Carlo Vanloo

France, Russia, Saxony, and Sweden, England siding with France. The resultant Seven Years War taxed Prussia's military strength and basic economy to the utmost. Despite Prussia's military superiority, she would probably have been defeated ultimately without Brit. subsidies. When it was over, F. devoted himself to the internal reconstruction of his country. Agriculture, industry, and trade were encouraged; the judicial system was reformed; communications and education were improved. F.'s own energy and capabilities were enormous; and at his death Prussia was not only vastly larger territorially, but stronger economically. In 1772 F. took part in the partition of Poland with Austria and Russia, and in 1779 an abortive campaign against Austria was ended through Russian mediation. Though he is remembered as a soldier and a politician of great dexterity and utter unscrupulousness, F. retained throughout his life his youthful interest in the arts and his passionate love of Fr. culture, though these were rigorously subordinated to his state duties. He corresponded frequently

with Voltaire. See T. Carlyle, *History of Frederick II.* 1858-65; H. Tuttle, *History of Prussia under Frederick the Great*, 1888; essay by Macaulay and lives by V. Thaddeus, 1930, and G. P. Gooch, 1947.

Frederick (1831-88), 2nd Ger. emperor and king (**Frederick III**) of Prussia (Mar.-June 1888), son of Wm I of Prussia (1st emperor of united Germany), and known as **Frederick Wm** before his accession. He studied at Bonn Univ., and travelled widely. He married Victoria, princess royal of England, in 1858 and became crown prince of Prussia on his father's accession, 1861. F. fought in the war with Denmark, 1864; in that with Austria, 1866, being present at the battle of Sadowa. In the Franco-Ger. war he fought successfully at Weissenburg, Wörth, and later at Sedan. He took part also in the siege of Paris. F. greatly influenced the founding of the new Ger. empire, though his views differed radically from Bismarck's. Had he ruled longer, his pronounced Liberal opinions might have had a considerable effect on Ger. hist; but he d. of cancer only 3 months after his accession. See life by S. Whitman, 1901. His diaries (*Tagebücher*), 1848-66, were ed. by H. Meisner, 1929. See also *The Empress Frederick Writes to Sophie*, ed. by A. G. Lee, 1955.

Frederick V (1596-1632), elector palatine of the Rhine, son of Frederick IV, whom he succeeded in 1610. He married Elizabeth, daughter of James I of England, in 1613, and was grandfather of George I. In 1619 F. headed the Ger. Protestant Union (Calvinists), and accepted the crown of Bohemia. F.'s gen. was utterly defeated by the Imperialists at the battle on the White Hill (near Prague), 1620, and he lost his hereditary possessions as well as Bohemia, and was obliged to go into exile. The electoral dignity was conferred on Maximilian of Bavaria, his cousin, the Catholic leader, in 1623. F. was father of Prince Rupert.

Frederick I (c. 1471-1533), king of Denmark and Norway, 1523-33. He succeeded his nephew Christian II. He was joint ruler of the duchies of Schleswig and Holstein with his brother John. During his reign the Lutheran faith took hold in Denmark and Norway.

Frederick II (1534-88), son of Christian III, and king of Denmark and Norway (1559-88). His reign falls into 2 distinct periods—that of war, 1559-70; that of peace, 1570-88. The war with Sweden lasted 7 years, ending in the triumph of F. at the peace of Stettin, by which time Denmark-Norway had become a great sea power.

Frederick III (1609-70), king of Denmark and Norway, son of Christian IV, becoming bishop of Bremen and Verden, 1634. He succeeded to the throne in 1648. Hoping to regain ter. lost by the treaty of Brömsebro, 1645, F. and his senate declared war on Charles X of Sweden, 1657. But Charles invaded Jutland and besieged Copenhagen, forcing the Dan. people to sign the unfavourable

treaty of Roskilde, 1658. The monarchy was made hereditary and absolute, instead of elective and limited, by a voluntary act of commons and clergy at a Diet, 1660-1.

Frederick IV (1671-1730), king of Denmark, from 1699, son of Christian V. He allied with Peter the Great and Augustus II, king of Poland, in 1700, against Charles XII of Sweden, but was forced to sign the peace of Travendal on the latter's siege of Copenhagen. During the reverses of Charles in 1709, F. again made war, capturing Stralsund and Tönningen. In 1720 F. concluded the treaty of Frederiksborg with Sweden. His reign was notable for numerous domestic reforms.

Frederick V (1723-66), king of Denmark. He succeeded his father, Christian VI, in 1746, and married a daughter of George II of England. A wise and able ruler, he did much to promote commerce, industry, and science. F. sent Niebuhr and others on a scientific expedition to Egypt and Arabia, 1761.

Frederick VI (1768-1839), king of Denmark and Norway, son of Christian VII. He became regent in 1784, owing to his father's insanity, and ascended the throne in 1808. His rule was marked by many internal reforms, including the abolition of serfdom in Denmark and Schleswig-Holstein. But in 1800 Denmark joined the armed neutrality of the N. against England. This caused hostilities with the Brit., resulting in the bombardment of Copenhagen by Nelson and the capture of the Dan. fleet (1807). F. allied with Napoleon, 1808. In 1814 Norway was taken by the allies from Denmark and given to Sweden under Bernadotte.

Frederick VII (1808-63), king of Denmark, son of Christian VIII, whom he succeeded in 1848. The chief events of his reign were the wars arising out of the revolt of the Schleswig-Holstein duchies against a common constitution with the kingdom of Denmark and the separation of Schleswig from Holstein. In 1849 F. signed the democratic constitution which has been the basis of political life (though somewhat amended by the constitution of 1953) ever since. He was the last of the Oldenburg line of Dan. kings.

Frederick VIII (1843-1912), king of Denmark, son of Christian IX, succeeded his father in 1906. He married Princess Louise of Sweden in 1869, and his eldest son, Christian, was b. in 1870. His second son, Charles, became king of Norway in 1905, under the title of Haakon VII. F. worked for the creation of a common policy for the Scandinavian kingdoms.

Frederick IX (1899-), king of Denmark, succeeded his father Christian X in 1947. He married Princess Ingrid of Sweden in 1935, and has 3 daughters of whom the eldest, Princess Margrethe (b. 1940) is heir-presumptive to the throne. In 1917 he joined the Royal Dan. Navy as a rating and attained the rank of captain in the normal course. Later he was promoted

in accordance with his increasing responsibilities as crown prince, and is now, as king, commander-in-chief of his navy, as well as of his army. At 18 F. became a member of the State Council (consisting of the king and his responsible ministers), and for sev. periods before, but chiefly during the Ger. occupation of Denmark, he acted as regent. He has travelled widely, having visited Iceland and Greenland, the Far East, and, with his wife, the United States and Canada in 1939. F. and his queen made a State visit to London, 1951; and welcomed Queen Elizabeth II and Prince Philip on a State visit to Denmark in 1957. F. is an ardent lover of music and himself an accomplished conductor, having often played with the Royal Theatre orchestra, Copenhagen.

Frederick (1676-1751), king of Sweden, 3rd son of the Landgrave Karl of Hesse-Cassel. In 1715 he entered the Swedish service, and on the resignation of her claims to the throne of Sweden of his wife, Ulrica Eleonora, sister of Charles XII, he became king (1720).

Frederick, co. seat of F. co., Maryland, U.S.A., 41 m. W. by N. of Baltimore. It is the seat of Hood College and a state school for the deaf. The manufs. include brushes, clothing, electrical apparatus, pumps, and household hardware; there are railroad shops, meat-packing plants, a canning industry, and a limekiln. There is also an airport. Pop. 18,140.

Frederick Augustus I (1750-1827), king of Saxony, son of the elector Frederick Christian, b. Dresden, becoming elector in 1763. In the Bavarian Succession war he sided with Frederick the Great against Austria, and afterwards joined the league of Ger. princes. In 1806 he joined Prussia against France, but concluded a treaty of alliance with Napoleon after the battle of Jena, and during the subsequent wars of Napoleon he was a faithful ally of the emperor. As a result Saxony lost much ter. at the end of the war. F. A. had taken the title of king in 1806. He attempted many internal reforms, both before and after the Napoleonic wars.

Frederick Charles of Prussia (1828-85), Ger. soldier, nephew of the Emperor Wm I, known as the 'Red Prince' because of the uniform he usually wore. He was educ. at Bonn, and then entered the army, serving with distinction in the first Schleswig-Holstein war in 1848. He also took part in the Austrian war of 1866, and the Franco-Ger. war (1870-1), where his leadership was conspicuous. He did a great deal to improve the Prussian Army, co-operating with Moltke in this.

Frederick Louis, Prince of Wales (1707-1751), eldest son of George II and Queen Caroline. In 1736 he married Augusta, daughter of Frederick, duke of Saxe-Gotha, and had sev. children, the eldest afterwards becoming George III. Frederick was always on bad terms with his parents and, forbidden the court, became the patron of the opposition to George II and Walpole. See life by A. Edwards, 1947.

Frederick William (1620-88), elector of Brandenburg, known as the 'Great Elector,' and son of the elector George Wm, b. Berlin. He was educ. at the univ. of Leyden. On his father's death in 1640 he became ruler of Brandenburg and Prussia (obtaining full sovereignty of the latter in 1657), and immediately set himself to repair the damage wrought during the Thirty Years War, still in progress. In 1648, by the treaty of Westphalia, the area of his dominions was much increased, and in the course of 10 years, with the help of able generals, he had created an army of 27,000 men, organised on the Swedish model. He reorganised the univs. of Frankfurt and Königsberg, and founded the univ. of Duisberg and the Royal Library at Berlin. He improved communications, reformed taxation, and introduced a postal system. He encouraged the immigration of Huguenots who brought their culture and industries to his country, and, though a Calvinist himself, gave toleration to Catholics and Jews. He greatly enlarged and beautified Berlin, leaving a large exchequer, a thoroughly well-organised army, and a developed civil administration. One of his final acts was to urge and back Wm of Orange's Eng. expedition. He ruled autocratically, curtailing the power of prov. assemblies, etc., but his internal rule, though despotic, was benevolent. His foreign policy was totally unscrupulous, based exclusively on a desire for his country's aggrandisement. A Fr. observer called him 'le plus fin renard de l'Europe.' He, not Frederick the Great, was the real founder of the Hohenzollern tradition, the Prussian State, and therefore of Germany, 1870-1945. See A. Waddington, *Le Grand Electeur*, 1905; and F. Schevill, *The Great Elector*, 1948.

Frederick William I (1688-1740), king of Prussia, son of Frederick I and father of Frederick the Great. He was passionately fond of military exercises; but though he formed a large, well-disciplined army, he did not engage in any very important wars. In 1720 he won from Sweden the dist. of Pomerania between Rs. Oder and Peene, including Stettin, Wollin, and Usedom ls. He founded a splendid administrative system, promoted trade, estab. a medical college, and various useful institutions in Berlin, and left a powerful and wealthy kingdom and splendid military machine to his son and successor.

Frederick William II (1744-97), king of Prussia, b. Berlin, nephew of Frederick the Great, whom he succeeded in 1786. In 1792, with Austria, he fought a desultory war against the Fr. rep. which lasted till 1795, resulting in the cession to France, by the treaty of Basel (1795), of the Prussian ters. W. of the Rhine. By the partition of Poland, in which F. W. shared, Prussia received large accessions of ter. During F. W.'s reign, owing to his indolence and lack of political capacity, Prussia's status generally declined. He was devoted to the arts, Beethoven and Mozart enjoying his patronage, but was

easily dominated by unsatisfactory favourites who shared his pseudo-mysticism. See G. Stanhope, *A Mystic on the Prussian Throne*, 1912.

Frederick William III (1770-1840), son of Frederick Wm II, *b.* Potsdam. He became king of Prussia in 1797. In 1806 he was overthrown by Napoleon at Jena and Auerstadt, and on the annihilation of the Prussian Army, the Fr. overran the kingdom. The Russian armies then advanced to the aid of Prussia, but were overthrown by Napoleon at Friedland (1807), leaving Prussia at the mercy of the conqueror. The treaty of Tilsit completed the ruin of Prussia, and during the next few years she remained almost defaced as a European power. At the beginning of 1813, however, the Germans rose against France, and F. W. entered into an alliance with Russia and Austria, and the allies overthrew Napoleon at the battle of Leipzig. At the Congress of Vienna, Prussia regained her lost ter. F. W. did something to advance the material welfare of his realm, but viewed all liberal political tendencies with suspicion.

Frederick William IV (1795-1861), king of Prussia, son of Frederick Wm III. He begun his reign (1840) with sev. liberal measures, but was vacillating and indecisive, with a marked tendency to mysticism. There was a revolutionary outbreak in Prussia and Berlin, 1848, and F. was forced to grant a constitution to his people. In 1849 he declined the offer of the imperial crown by the Ger. National Assembly at Frankfurt, thus postponing Ger. unification for 13 years. He later carried out limited reforms in his own ters. Owing to insanity F. resigned the control of affairs to his brother Wm., 1858, and was succeeded by him as Wm I in 1861.

Frederick William (Friedrich Wilhelm Victor August Ernst) (1882-1951), ex-crown prince of Germany, eldest child of ex-Emperor Wm II (*q.v.*), *b.* Potsdam. He held nominal commands, but showed little military aptitude, during the First World War. After the war he fled to Holland, but returned to his Silesian estate in 1923. He later supported the Nazis but took no positive part in the Second World War. After the war he lived at Sigmaringen, then in the Fr. zone of occupation.

Fredericton, cap. of the prov. of New Brunswick, Canada, on the St John R. It was originally called St Anne's Point. It is an educational centre, with the univ. of New Brunswick and a teachers' college, and there is an Anglican cathedral. It has 3 shoe factories, a boat and canoe factory, 2 woodworking factories, and is the centre of a large dairy industry and a lumber industry. The prov. parliament buildings and prov. gov. offices are also situated at F. F. is served by Canadian National and Canadian Pacific railways, and has a municipal airport. New Brunswick military H.Q. and the Royal Canadian Mounted Police H.Q. for New Brunswick are at F. Pop. 16,020.

Frederiksberg, tn in Denmark, a residential suburb to the W. of Copenhagen. It has a military academy. Pop. (1955) 117,780.

Frederiksborg: 1. Amt in NE. Zealand, Denmark, on the Cattegat and the Sound. Area 520 sq. m.; pop. 162,900.

2. Dan. royal castle built in 1602-20, situated about 20 m. NNW. of Copenhagen. It was destroyed by fire in 1859, and, after being restored (1864-71), was used as an historical museum.

Fredericksburg, tn of Spotsylvania co., Virginia, U.S.A., situated on the Rappahannock R., about 55 m. SSW. of Washington. The riv. affords great water power, the tide ascending as far as F. F. manufs. footwear, clothing, food

PARLIAMENT BUILDING, FREDERICTON

products, cellophane, and furniture. It is a trade centre in an agric. and dairying area. During the Amer. Civil war a battle was fought here, in which the Union forces under Burnside were defeated by the Confederates (1862). Pop. 12,158.

Frederikshald, see HALDEN.

Frederikshavn, seaport of N. Jutland, Denmark, on the Cattegat, 36 m. NE. of Aalborg. It has an excellent harbour, free from ice throughout the year. It is protected by the citadel, Fladstrand, which formerly gave its name to the tn. It has considerable trade in dairy produce. Prin. exports are fish and oysters. There is a regular steamship service running to Sweden, Copenhagen, and England. Pop. 20,020.

Fredeswitha, St, see FRIDESWIDE, St.

Fredrikstad, seaport of Norway, in Østfold co., at the mouth of the Glomma, 58 m. by rail SE. of Oslo. It exports timber, pulp, and paper, and has ship-building, whale-oil refining, and canning works. Pop. 14,000 (with suburbs, 40,000).

Free-alms, see FRANK-ALMOIGNE.

Free Church Federal Council (F.C.F.C.), formed in 1940 by the union of the Free Church Council (estab. 1892) and the Federal Council (estab. 1919). To it are sent representatives from the Presbyterian, Congregational, Methodist, and Baptist Churches. The F.C.F.C. takes action when necessary on behalf of the federated Churches. The monthly magazine, ed. for the F.C.F.C., is entitled the *Free Churchman*. The H.Q. of the Council are at Tavistock Square, London, W.C.1.

Free Church of England, small sect which broke away from the Estab.

Standards of the Church of Scotland as heretofore understood,' that is to say the Westminster Confession and the Longer and Shorter Catechisms, but in 1892 the binding force of these was somewhat modified by a Declaratory Act, which classed some parts of the confession among things not to be considered as literally binding. This is quite in accordance with the Free Church Catechism issued soon after the disruption, in which the right of a Church to alter its creeds and formularies without State sanction is reckoned as one of the essentials of its freedom. The disruption was caused

Royal Danish Ministry of Foreign Affairs, Copenhagen
FREDERIKSBORG CASTLE AT HILLERØD, NORTH ZEALAND

Church in 1844, as a protest against the influence of the Tractarian or Oxford movement. It maintains the episcopal organisation, and claims to have retained the apostolic succession. It is, however, strictly Protestant in doctrine, and seeks to promote evangelical and Reformation principles. Its first church was formed at the vil. of Bridgetown in Devon by the Rev. J. Shore. Its numbers are extremely limited. Gov. is carried on by an ann. convocation.

Free Church of Scotland, body of Scottish Presbyterians who at the 'Disruption' of the Church of Scotland in 1843 separated from the Estab. Church. It claimed, however, and still claims, to be the historical continuation of the National Church which was set up in 1560. It retains the 'Confession of Faith and the

generally by an entire difference of opinion on the whole question of estab. and the authority of the State over the Church. The proximate cause, however, was the question whether a minister could be forced on an unwilling congregation. It is important to recognise that the leaders of the Free Church party in 1843 did not condemn all union of Church and State, but only such as infringed the Church's right of self-gov., committed to her by Christ Himself, of whom the Westminster Confession declares 'the Lord Jesus, as King and Head of His Church, hath therein appointed a government in the hand of Church officers, distinct from the civil magistrate.' Since the 1888 revolution, however, the union between Church and State had been such that all of these eccles. regulations had been made

part of the statute law. A case had arisen in which a minister presented to a living had been rejected by the congregation, and in 1834 the General Assembly passed the Veto Act declaring it to be a fundamental law of the Church that no pastor should be intruded on any congregation contrary to their will. In 1838, however, in the Auchterarder case, the court of session decided in favour of the presentee, and in the next year the case came before the House of Lords. Here the civil power showed but scant respect for the Church's eccles. jurisdiction, and definitely stated the supremacy of the statute law in all cases, denying in fact that it is even possible that there should be such a thing as a conflict between the civil law and the eccles. courts of an estab. Church. In 1842 the General Assembly formally refused to enter on the course of action which the recognition of this principle would involve, and threatened a separation from the State. In 1843 an attempt was made to secure a parl. inquiry, but this failing, at the meeting of the General Assembly (18 May 1843) the major part of the Assembly made their protest and quitted St Andrew's church. They proceeded to Tanfield Hall, Canonmills, and there was held the first Free Church Assembly, with Dr Thomas Chalmers in the chair. By 23 May 474 ministers had resigned their benefices, homes, and incomes, and trusted themselves entirely to voluntary support. The financial system was organised quickly and most successfully, and a central sustentation fund furnished a reasonable income for all ministers. A committee was formed in 1863 to consider the proposal of alliance with the United Presbyterians, but the refusal of the Free Church to give an unqualified condemnation of estab. made it impossible. The proposals, however, were continually renewed, and on 31 Oct. 1900 union between the two was finally completed at Edinburgh, the newly formed body bearing the title of the United Free Church. A small body refused to accept this union, and claimed to be the continuation of the old Free Church. It therefore claimed the possession of all its emoluments, and the House of Lords decided in favour of the small body. The impossible nature of the decision was immediately apparent and an Act of Parliament in 1905 altered this position. A div. of the property, etc., between the 2 bodies was made by a Royal Commission. To-day the F.C. of S. is quite a small body, strongest in the highlands, and commonly known as 'Wee Frees.' The union of the Church of Scotland with the United Free Church of Scotland was effected at a joint meeting of the General Assemblies of both Churches on 2 Oct. 1929. Prior to this union of 1929, Scotland was divided into 16 synods and 66 presbyteries. There have since been added the presbytery of England and the presbyteries of N. Europe, S. Europe, Spain, and Portugal, and a number of Indian and colonial presbyteries, making a total of 84. The

number of communicants on the roll (31 Dec. 1928) was 759,797, and in 1955 the number was 1,307,573. The supreme court is the General Assembly, which meets annually, in May, synchronously with the meeting of the General Assembly of the Estab. Church and of the remnant F. C. of S. See also SCOTLAND, CHURCH OF. See C. G. MacCrie, *Church of Scotland, Divisions and Reunions*, 1901; W. L. Mathieson, *Church and Reform in Scotland*, 1916.

Free Churches, general name given to all those Protestant Christian bodies of England and Wales which are not estab. by the State. They include not only the large group which forms the Free Church Federation, but also many others not thus associated. The point in common between all these bodies is implied in the title. All hold that permanent union between Church and State is impossible, since it leads to the State imposing laws on the Church, and that, therefore, the two should exist separate, the Church being free to make its own rules and carry on its own system of gov. in matters spiritual. Most of the F. C. are democratic in form, and the governing body has the power of changing the conditions of membership, deciding on corporate expressions of faith, etc.

Free Exchange. A paper £ not convertible into gold would exchange for what it was worth from day to day—the rate at any time depending on the number of pounds actually and prospectively on offer and demand. Features of such a F. E. are: (1) F. E. acts as a sort of tariff. If we over-import, the exchange goes against the £ and so discourages imports and encourages exports. This is what is wanted and the remedy has the advantage of being automatic and immediate. (2) The brunt of the adjustment is borne by buyers of foreign goods whereas the brunt of Gold Standard adjustment tends to fall on the internal economy through lower prices. (3) We retain budgetary freedom: we can decide on deficit financing in pursuit of full employment; and we can aim either at a stable £—buying always about the same amount of goods—or a £ which will buy more goods as science and machinery increase production. Under a Gold Standard a nation's freedom to indulge in deficit financing is limited, and it must 'keep in step' as regards what its unit will buy: it must be careful to avoid any risk of inflation as distinct from reflation. (With a universal currency a nation loses all budgetary freedom. Universal currency—i.e. a single currency for the whole world—has an attractive sound and is to-day being suggested as a cure for our currency and trade troubles. A European currency is an alternative suggestion with similar advantages.) The 1914 war forced Britain off the Gold Standard (along with other nations), although formally the break did not come until 1919. A paper currency was introduced and, since the heavy war expenditure was covered only in part by tax and loan, the number of £s steadily increased

—the value of each £ decreasing of course as the total issues rose. Had it been practicable to pay the full costs of the war by means of taxation and savings the paper £ could have retained its full value. In fact the value of gold itself had fallen in May 1920 to 40 per cent of its 1913 value. It rose steeply soon after.

The word 'profiteering' will recall the high prices that prevailed after the First World War; but the gradual increase in goods aided by a deflationary policy raised the value of the £ until in 1925 it could 'look the dollar in the face,' and Britain returned to the Gold Standard but not to a gold currency, i.e. to a Gold Bullion Standard. This was in line with the recommendations of the Genoa Conference of 1922. Assuming the wisdom of an early return to the Gold Standard it remains a question whether it was wise to have imposed deflation with all its dread effects on trade, and whether instead of making the £ look the dollar in the face it would not have been better to have reduced its gold content. It was generally accepted that after 1925 our trade was labouring under the handicap of an over-valued £. Relief was to come in the 'economic blizzard' of 1931-2 when Britain was forced off the Gold Standard after making the most strenuous efforts to avoid that contingency. No sooner were we off the Gold Standard (21 Sept. 1931) than it was discovered that exchange freedom has its compensations; in particular it was found that our main suppliers were most anxious to continue to supply their best customer and were prepared to accord us the most favourable terms rather than lose their traditional market. The freeing of the exchange was soon followed by an expedient which bid fair to give us the best of both worlds: the Exchange Equalisation Account was estab. This provided a fund to steady the exchange by ironing out minor fluctuations. It seemed to offer the quick 'natural protection' of the F. E. with as much steadiness as was permitted by underlying conditions. In fact, the E.E.A. perhaps aimed rather at holding the rate than at merely ironing out temporary fluctuations. In 1936 came the Tripartite Agreement with the U.S.A. and France, aimed at maintaining the basis of international exchange. France was one of the few countries still on gold after 1931 but was finally forced off in 1936 (following the enactment of the 40-hr week), its trade having grievously suffered from the franc's over-valuation. The U.S.A. had itself in 1933 deliberately devalued the dollar—the oz. of gold making \$35 instead of only \$20·67. Meanwhile Hitlerite Germany was manipulating its exchange to provide marks at different rates according to the purpose for which they were to be used.

The Second World War broke out in 1939 and soon led to the pegging of the leading currencies—the £ at \$4·03. It had been pegged in the First World War at \$4·76 (falling afterwards below \$3·50), but much had happened since, includ-

ing the dollar devaluation. Again, the nations failing to pay their way with taxation and savings, the end of the war found all the participants with depreciated currencies in terms of goods. The £ declined to 4/7 of its pre-war value, as measured by wholesale prices. The Cost-of-Living Index did not measure the fall in value since many of the prices were controlled and subsidised. After the First World War Britain began raising the value of the £ and after much effort and many changes in Bank Rate succeeded in restoring the Gold Standard. After the Second World War the position was very different and was dominated by the International Monetary Fund (I.M.F.). Bank Rate was kept at the 'cheap money' rate of 2 per cent until Nov. 1951, and the £ continued (under the I.M.F.) to be pegged at \$4·03, until 1949 when it was devalued to \$2·80. The I.M.F., whose main purpose is to keep exchange rates stable, or reasonably stable, requires every member country to fix the par value of its currency in gold, or gold dollars. The I.M.F. is clearly inspired by the Gold Standard, but, with its machinery for co-operative action, is far removed from the old Gold Standard system, with each country managing its own affairs albeit with regard to the 'rules of the game.' In the past, while all Gold Standard nations might be faithfully keeping in step, the value of gold itself might be unstable—might be going up or down—with good or bad results. Under Article IV, Section 7, the I.M.F. should be able to counter this outstanding defect in the old system. The I.M.F. aims at sustained national incomes all round and its machinery is there both to reduce the need for internal adjustments and to cushion them when inevitable. In the old days unemployment was often the adjusting factor for an over-valued currency, and if the I.M.F. plays a major part in promoting less harsh methods of adjustment it will have deserved well of mankind. Adjustment there must be. No country can go on indefinitely living beyond its means. Equally, no country can, without serious effects on world trade, go on living below its means unless it is prepared to give away the surplus, and that promptly. When it was estab. in 1946, the I.M.F. envisaged a return to the Gold Standard by 1951, each country maintaining the gold value of its currency and making it freely convertible into other currencies. The U.K. made tentative approaches to convertibility, but by early 1958 full convertibility had not yet been estab. See also GOLD STANDARD; INTERNATIONAL MONETARY FUND.

Free Imperial Cities. The *Freie Reichsstädte* of Germany were those medieval towns which enjoyed either complete or partial autonomy. They may in their constitution be compared to the chartered towns of medieval England, the free towns of Spain (see *FUERO*), and the Italian republican cities of the same period. In all or most of these cases the anomaly of such an *imperium in imperio* was due to the

wealth and influence early acquired by tns through industry and commercial relations, and consolidated by defensive leagues like the celebrated confederacy of the Hanseatic League. The number of F. I. C. varied from time to time by reason of the struggle to maintain their privileges in the teeth of eccles. and secular opposition and royal jealousy. Mainz, the head of the Rhine confederated tns, was transferred to the episcopal see in the middle of the 15th cent., while Chemnitz and certain other tns of the Hanseatic League were later taken by the dukes of Saxony. Others were shorn of their privileges by successive emperors, and yet others were conquered by foreign enemies. At the end of the 18th cent. they numbered about 50, divided into 2 benches, the Rhenish and Swabian, as 2 integral members of the Diet. At the beginning of the 19th cent. only 6 possessed any measure of independence, some having been assigned to France while the rest were deprived of privileges of which they had long since ceased to retain anything but the shadow. By the terms of the Ger. confederation only Hamburg, Lübeck, Bremen, and Frankfurt were recognised as F. I. C., but the privileges which the first 3 long preserved were, in later times, of no greater importance than those of various bors. in England. See *The German Free Cities*, 1914.

Free-lances, roving companies of knights and men-at-arms, who wandered about to different states selling their services to any lord who was anxious for aid in the constant feuds of the Middle Ages. They became most famous in Italy as *condottieri*. In Germany they were represented by the *Landsknechte* (land-troopers), mercenary foot-soldiers raised by Maximilian I in 1487. *Landsknechte* were the men of the Austrian lands as opposed to the Swiss mountaineers, but are commonly confused with *Landsknechte* (lance-troopers). They won fame in the 15th- and 16th-cent. wars, but after the Thirty Years War fell into disrepute. The term is now applied in general to all who own no fixed party allegiance, or follow the methods of no particular school, but act independently (and sometimes capriciously).

Free Lovers, see BIBLE COMMUNISTS and PERFECTIONISTS.

Free Port (It. *porto franco*), a port or a zone in a port where goods may be landed, manufactured, and reshipped without intervention by the customs authorities or payment of the usual customs duties. The purpose of such a port or zone is to allow speedier consignment and reshipment of commodities. If, however, commodities are admitted for consumption within the country wherein the F. P. or free zone lies, they are liable to the customs duties of that country. The practice derives from the Middle Ages, when the existence of so many small states, each with its own trading laws, hindered trade, and certain

cities were permitted to grant to foreign merchants trading zones wherein they enjoyed virtual free trade in many commodities. Some of the great Hansa tns (see HANSEATIC LEAGUE), Hamburg, Bremen, and Lübeck, were among the first to grant such privileges.

With the rise of the mercantile system (q.v.) and its correlative practice of erecting tariff barriers, the strangulation of trade was such that it was found necessary to extend the F. P. system. Such was the case of Leghorn, which was followed later by other It. cities. With the resurgence of nationalism in the 19th cent. the existence of these extra-territorial areas was often an embarrassment to the govs. concerned, and, moreover, tns without such facilities complained of the unfair advantages of the F. P.s. with the result that many lost this status or were reduced to zones within ports. An important consequence was the introduction of the bonded warehouse (q.v.) system. The prin. F. P.s in Europe are Copenhagen (1894), Hamburg, and Gdansk (Danzig, 1898), and in Asia Singapore and Hong Kong. There are none in the U.K., and in the U.S.A. the only F. P. zone is on Staten Is., New York Harbour.

Free Reed, see REEDS.

Free Soil Party, The, name given to a political anti-slavery party in U.S.A., formed in 1848, which lasted till 1854, and then became one with the Republican party. It nominated Van Buren for the presidency, but he was defeated in 1848. It was really a combination of the political abolitionists, many of whom had been formerly identified with the more radical Liberty party, with the Barnburners (q.v.) and the anti-slavery Whigs.

Free Trade, economic doctrine which advocates equality of treatment of all commodities for the purposes of taxation, whether produced at home or abroad. Taxes levied on commodities purely for revenue purposes, without differentiation between the home produce and imported goods, are no violation of this doctrine. F. T. was first advocated by Adam Smith (q.v.) in his *Wealth of Nations*, 1776. As the national wealth increases by allowing each individual freely to engage in that occupation most fitted to his capacity, and to exchange his product in order to procure whatever other commodities he requires, so the general prosperity of the world would be enhanced by each nation devoting itself to those branches of industry specially suited to it, and exchanging its commodities, without hindrance, with other nations. The question of trade is, however, regarded from a national and not a universal standpoint, and though it is seldom denied that universal F. T. would be advantageous, it is frequently held that on a national point of view the protection of some home industries is highly necessary. Free traders argue that under F. T. articles are bought at the cheapest prices and therefore produced in the most economical way,

involving saving of labour and capital. Moreover, as a country pays for its imports by its exports, to allow free importation is also to encourage corresponding production along other lines. Again, competition, by bringing the home producer into contact with foreign rivals, stimulates his commercial zeal and forces him to adopt every improvement of process. As a negative argument, it is urged that even though protection might theoretically be defensible, govts. are not sufficiently wise to apply it beneficially. The fact that protected countries have generally found it necessary to impose a constantly increasing tariff against foreign goods is held to prove that such tariffs do not act effectively.

The argument for protection is necessarily urged from a national point of view. It is alleged that a system of protection renders possible the perpetuation of those branches of industry which cannot withstand foreign competition, thus affording greater openings for home capital and labour, and also provides a means of raising revenue. These 2 claims are necessarily, to some extent, antagonistic, as the revenue would diminish in proportion to the cessation of foreign competition. It is also frequently stated that although F. T. is advantageous as a normal condition of industry, nevertheless, in certain circumstances, protection is justifiable. Thus, in a new country, protection is held to foster rising industries. Where a country possesses a limited stock of a valuable commodity, an export duty is advocated as a means of preventing its too rapid exhaustion. The contention is also made that a country which allows free imports is at a disadvantage in dealing with a country which does not do so. Hence the policy of retaliation, which has for its object the imposition of duties upon the goods of a certain country in order to force that country either to abolish or to reduce an unfavourable tariff. The dependence of Great Britain on foreign countries for its food supplies, which would prove prejudicial in case of war, was demonstrated with unpleasant clearness in the First and Second World Wars, was held to be a reason for stimulating home food production.

Great Britain held to the system of F. T. from 1860 until 1932. A campaign was started in 1903 by Joseph Chamberlain, then colonial secretary, for imperial preference (q.v.), based on the necessity of preventing the alleged decline of Brit. trade, and at the same time uniting the colonies more closely to the motherland by mutual commercial interests. The latter part of the scheme involved the imposition of food taxes, which proved to be the least favoured part of the programme. The scheme was, however, accepted by the larger portion of the Unionist party, and gave rise to the fiscal controversy that animated Brit. political life from that date. The First World War necessitated a modification of Brit. F. T. policy, and in 1915 McKenna (q.v.)

imposed duties upon certain imported articles (including motor cars, cinema films, clocks, musical instruments, plate-glass sheets) in order to restrict demands made upon cargo space in vessels needed primarily for the transport of food. In 1917 the gov. agreed to a scheme of 'Imperial Preference within the Empire,' with special reference to 'Key Industries.' In 1921 a rebate of duty on empire goods was granted. In the same year the Safeguarding of Industries Act (q.v.) was passed. The return of the Conservative party to power in 1924 brought with it a mild system of imperial preferences, notably in favour of empire sugar, dried fruits, tobacco, and wine. The McKenna duties were abolished by the Labour Gov. of 1924, but the succeeding Protectionist Gov. reimposed them for a period of 5 years. In 1926 the duties on foreign cars were extended to commercial cars, and a duty was levied on imported artificial and natural silk. Light duties were also imposed on imported gas mantles, cutlery, and a few other articles. After the First World War protection was carried to great lengths in every country, with the result that Britain was placed at a considerable disadvantage. Finally, in 1932, Britain abandoned her time-honoured F. T. policy and adopted a medium-high protective tariff, food, however, being for the most part only lightly taxed, or allowed to enter free. But until the Second World War Britain's fiscal policy remained relatively temperate, and even the much criticised Ottawa agreements involved only a low tariff system.

Other pre-1914 F. T. countries were Belgium, the Netherlands, and the Scandinavian countries, all of which subsequently adopted moderate protective tariffs. Some reciprocal and mutually advantageous arrangements, directed to the substantial reduction of tariffs and other barriers to trade and the elimination of discriminatory treatment in international commerce, were made in the General Agreement on Tariffs and Trade at Geneva in 1947. The schedule to this agreement showed that, in spite of these relaxations, the world was far from being F.-T.; and the wide variation in the amount of protection afforded to different commodities indicated that the duties reflected the fears and pressure of local producing interests. At the conference which resulted in this agreement the U.S.A., occupying the position that Britain occupied at the time of the industrial revolution as the world's workshop, was primarily concerned to push the idea of F. T. and tariff reductions. Britain, on the other hand, having lost the monopoly of manufactured goods and the economic leadership, was chiefly concerned to create openings for her export trade. The U.S.A., emerging from the Second World War with an enormous industrial output far beyond domestic needs, was so far ahead of every other nation in its exportable surplus that it was anxious that tariffs everywhere should be cut down—including Brit.

imperial preferences (though in the result 75 per cent of these latter were unaffected). Britain, moreover, owing to its peculiar dependence after the war on a flourishing export trade, stood to gain exceptionally from a revival of multilateral trading conditions, and so new interest was awakened in the concepts of F. T. For the time being, owing to currency difficulties, particularly the shortage of dollars, Britain supplemented or qualified to some extent these freer trading conditions by bilateral arrangements. *See also* EUROPEAN PAYMENTS UNION; GENERAL AGREEMENT ON TARIFFS AND TRADE; PROTECTION.

Bibliography. The F. T. position is given in F. Bastiat, *Sophismes économiques*, 1844-8; H. Fawcett, *Free Trade and Protection*, 1881; Sir T. H. Farrer, *Free Trade and Fair Trade*, 1885; B. R. Wise, *Industrial Freedom*, 1892; Francis W. Hirst (ed.), *Free Trade and Other Fundamental Doctrines of the Manchester School*, 1903. On the protectionist side, works to be consulted are Carey's *Principles of Social Science*, 1858-9, and the work of Friedrich List, the Ger. economist. Modern fiscal issues are dealt with in Deryck Abel, *A History of British Tariffs, 1823-42, 1945*; Sir Wm. Beveridge and others, *Tariffs: the Case Examined*, 1931; L. Robbins, *Economic Planning and International Order*, 1937; F. C. Benham, *Great Britain under Protection*, 1941; Wilhelm Röpke, *International Economic Disintegration*, 1942; J. B. Condliffe, *Reconstruction of World Trade*, 1951.

Free Trade Area, *see* EUROPEAN COMMON MARKET.

Free Verse, a pattern of verse structure without regular metre and usually without rhyme. It is difficult to draw a hard-and-fast line between F. V. and rhythmic prose. Walt Whitman, usually reckoned a pioneer in F. V., described his compositions, which took inspiration from the rhythms of the A.V. of the Bible, as 'free prose'; and Amy Lowell, one of the most successful modern users of F. V., preferred to call her work 'polyphonic prose.' F. V. dates back a considerable time, for Milton's *Samson Agonistes* is written in F. V., modelled on the rhythms of Gk classical drama, and Matthew Arnold followed his example in such poems as 'The Strayed Reveller.' In France *vers libre* was used in the 18th cent. by La Fontaine, and in 1862 Baudelaire pub. his *Little Poems in Prose*. The extensive use of F. V. dates from just before the First World War, when the Imagist group of poets (q.v.) resolved to abandon rhyme and concentrate on avoiding the hackneyed and seeking always the perfect phrase. They included T. S. Eliot, Amy Lowell, Hilda Doolittle, D. H. Lawrence, and Ezra Pound. The following lines by the last-named illustrate the type of verse and also describe the poet's point of view:

'Go, little naked and impudent songs.

Go with a light foot!

(Or with two light feet, if it please you!)

Go and dance shamelessly!

Go with impertinent frolic.'

F. V. was for long the mark of what may be termed revolutionary groups of poets—Vorticists, Dadaists, Cubists, Futurists, Surrealists—but later it was much more generally employed, especially in the U.S.A., where its users include Carl Sandburg, Wm Carlos Williams, Marianne Moore, Conrad Aiken, Archibald MacLeish, and E. E. Cummings. *See* separate articles on poets cited; also M. M. Dando, *Vers Libre*, 1922; Laura Riding and Robert Graves, *A Survey of Modernist Poetry*, 1927.

Free Will. Whether man is morally a free agent or whether his actions are predetermined by previous events beyond his control has always been a problem of philosophy. Descartes and Hume asserted the absence of contingency in human conduct, while Kant excepted the spiritual realm from the necessity which he observed in the material world. Later 19th-cent. philosophy, under the impulse of physical science, tended to deny human F. W., but at present it is admitted, albeit within a restricted field. St Augustine laid down the principle of F. W. as a fundamental belief of the Christian Church. The doctrine of absolute predestination, however, advanced by Luther and Calvin, exercised a powerful influence on Protestantism at the time of the Reformation. *See also* DETERMINISM; WILL.

Freebench, in Eng. law, the interest which a widow had in the copyhold lands of her late husband, so long as she remained unmarried. The amount to which she was entitled amounted in general to one-third of the lands held by her husband. F. was abolished by the Law of Property Act, 1925.

Freedom of a City, *see* BURGESS; FREEMAN; LOCAL GOVERNMENT.

Freedom of the Press, *see* PRESS.

Freedom of Speech, *see* PARLIAMENT; HOUSE OF LORDS; HOUSE OF COMMONS.

Freehold. A F. estate or interest in land may be strictly defined as an interest which may continue for the whole period of some particular life or lives, or else for some uncertain period included in such life, as, for example, during the time of widowhood, or until bankruptcy. The term necessarily comprises fee simple and fee tail estates or estates of inheritance, and indeed F.s are frequently divided into those of inheritance and not of inheritance, the latter being F.s for life. The term F. (*liberum tenementum*) comes from feudal times, and meant that the tenant held his land by some small services of an honourable as opposed to a base or servile kind. Such services are now long since abolished, and the only feudal incidents of a F. still surviving, or nominally surviving, are (1) escheat or devolution to the Crown on intestacy, there being no heirs; (2) an oath of fealty, never exacted; (3) relief, or a year's rent to the feudal overlord (if there is one) on succession to the deceased tenant; (4) a small chief or quit rent. There were also other F.s of an extraordinary or more

localised kind, viz. grand serjeanty (q.v.), petty serjeanty (q.v.), burgrave tenures (q.v.), gavelkind (q.v.), and frank-almoign or tenure by spiritual services, such as saying prayers for the parishioners, which were abolished in 1925. At the present day F. is mainly regarded as merely the direct antithesis of a leasehold interest, a F. being necessarily an estate for a certain period of uncertain duration, while a leasehold interest is no more than one for a fixed term of years. The third prin. form of land-holding was that of copyhold tenure, which in its origin was a holding by villeins of a lord of a manor; copyholds were abolished in 1926. See also COPYHOLD; KNTAIL; ESTATE, etc.

Freeman, Edward Augustus (1823-92), historian, b. Harborne, and educ. at Trinity College, Oxford, of which he became a Fellow. His first books were *A History of Architecture*, 1849, *An Essay on the Origin and Development of Window Tracery in England*, 1850, and (with W. B. Jones) *History and Antiquities of St David's*, 1856. F.'s *The History of the Norman Conquest of England, its Causes and its Results*, 1867-76, is by far his most outstanding achievement, and is still widely read, although modern scholarship has suggested that F. placed too much emphasis on the Teutonic origins of Eng. institutions. He was regius prof. of modern hist. at Oxford from 1884 until his death. See W. R. W. Stephens, *The Life and Letters of E. A. Freeman* (with bibliography), 1895.

Freeman, John (1880-1929), poet, b. Dalston, Middx. At the age of 12 he left school to become a clerk in an insurance company, of which in 1927 he was secretary and director. His earliest books of verse were *Twenty Poems*, 1909, *Fifty Poems*, 1911, and *Stone Trees*, 1916. His *Poems New and Old* gained the Hawthornden Prize in 1920. After sev. more books of verse his *Collected Poems* appeared in 1928 and *Last Poems* after his death. He also wrote studies of George Moore (q.v.), 1922, and Herman Melville (q.v.), 1926. His *Letters* were pub. in 1936.

Freeman, Richard Austin (1862-1943), writer of detective stories, b. London. He studied medicine and in 1889 took part in an expedition to West Africa, of which he wrote in *Travels and Life in Ashanti and Jamaica*, 1898. In 1907 he pub. his first detective story, *The Red Thumb Mark*, and his detective, Dr Thorndyke became one of the most famous of fictitious investigators, even giving some ideas to the official force. Others of F.'s books are *John Thorndyke's Cases*, 1908, *The Eye of Osiris*, 1911, *The Great Portrait Mystery*, 1918, *Dr Thorndyke's Case Book*, 1923, *The Puzzle Lock*, 1925, *As a Thief in the Night*, 1928, and *When Rogues Fall Out*, 1932. In *The Singing Bone*, 1912, he used the innovation of describing the crime first, before showing how Thorndyke unravelled it. See DETECTIVE STORY.

Freeman, one who possesses the freedom of a city, bor., or company. Prior to the

Municipal Corporations Act, 1835, bor. freedom was regulated by the bor. charter. An admitted F. enjoyed many rights and privileges which varied in different bors. *Inter alia*, a F. generally had the parl. vote, immunity from co. jurisdiction, exemption from tolls, and a share in the revenue accruing from the corporate property. The Act of 1835 does not affect the rights of admitted freemen, and the following are still entitled to be entered on the Freeman's Roll and to enjoy the above noted rights except exemption from tolls, and in some cases share in revenues from corporate property: wife, widow, son, daughter, son-in-law of a F.; apprentices to freemen; and those who before the Act would have been entitled to be admitted, otherwise than by gift and purchase, the 2 latter modes of admission being now abolished. Bor. councils may also admit persons of distinction or persons who have performed eminent services for the bor. to be honorary freemen. Freedom of a city is tantamount to that of a bor. Freedom of the London livery companies is a survival of the guild-merchant system. There are 4 ways of acquiring the freedom of a company: (a) apprenticeship to a F. either of the company or of the City of London; (b) patrimony, i.e. by reason of being the child of an admitted F.; (c) gift (honorary); (d) redemption or purchase, usually limited to members of the guild trade. See also LOCAL GOVERNMENT.

Freeman-Thomas, Freeman, see WILKINGDON, 1st MARQUESS OF.

Freemasonry, system observed by the secret associations of 'free and accepted masons.' Its origin has been traced to the time of the erection of the Tower of Babel, or to that of Solomon's Temple. More modest computations go no further than to place the introduction of F. into England in the 7th cent. and the foundation of the Grand Lodge at York in AD 926. Others allege that F. came into existence at the time of the crusades. But the most unbiased historians seem to concur in relating its origin to the purely utilitarian association of fellow craftsmen in a masons' guild or trade union. There is some warrant for this genealogy, because the art of Gothic architecture and its allegorical meaning were in no small degree the possession of the stone-cutters who were employed by the abbots in eccles. building and repairs. The secret signs used by itinerant masons were devised for the purpose of mutual recognition of each other as experts in their art and not mere impostors. Moreover, the 12th cent. affords something like proof of the existence of an association of Bauhütten (literally 'wooden huts' of masons or stone-cutters) in various parts of Germany, bound together by common craft laws and trade customs, and acknowledging a common ceremonial and set of symbolic forms.

Whatever the origin of F., there is clear enough evidence that modern F. in England dates from the foundation of the Grand Lodge of England in 1717; that of

Ireland being founded about 1725, and Scotland in 1736. But what particular processes were at work in the transition from 'operative' to modern or 'speculative' F. it is hard to say. The traditions of F. seem to warrant the assumption that in spite of the fact that medieval operative freemasons were usually engaged in erecting or repairing church buildings, they had no marked reverence for the Church doctrine, and that though the Church was at first disposed to extend its favour to the association, it eventually grew hostile to it and supported the ineffective prohibition of F. enacted by the statute of 3 Henry VI (1424). It is possible that freemasons, no less than other men, were affected by the spirit of the Reformation and the speculations of Bacon on the possibilities of natural laws in the satisfaction of human needs. Be the psychological connection what it may, F. received a fresh impulse towards the latter part of the 17th cent., when a general assembly of masons resolved to extend masonic privileges to other than operative masons, to adopt ancient symbols of fraternity, and generally to revive the system of F. The antiquary Elias Ashmole is credited with being the first amateur or speculative member 'accepted' (1646), and the name of James Anderson, a Scottish minister, is commonly associated with the work of revival. The constitution of one grand lodge, composed of prov. or other smaller lodges, presided over by a grand master, dates from 1717 (see above), and it is from this time, too, that the prerogative of creating new lodges was vested in the grand master. Later, prov. grand masters were appointed, and the purpose of speculative F. tended more and more to become purely benevolent. Still later, the requirement in members of a knowledge of ordinary masonry was dropped, although even now the association, when laying foundation stones, does so with full masonic honours. Its members as a whole profess benevolence and charity rather than architectural or stone-cutting skill.

F. is less popular on the Continent than in Great Britain. The pope issued a bull excommunicating freemasons in 1738, and F. was one of the errors condemned by the syllabus of 1864. In France, however, F. was from its inception early in the 18th cent. strongly favoured by the nobility, in spite of imperial censure and papal bulls. Notable Fr. masonic orders of the 18th and early 19th cents. were La Félicité, La Grande Loge Anglaise de France and La Grande Loge Nationale (afterwards the Grand Orient), and Le Suprême Conseil; one at least of which was nothing more than a Jacobite combination. It is said that the general atmosphere of Fr. F. was low, and colour is given to this assumption by the fact that admission to membership could be purchased without any inquiry into character. Later, Fr. F. became infected with mysticism and the most grotesque 'degrees.' In France, as in Italy, Hungary, and elsewhere on the Continent, there was a strong tendency

for F. to become involved in politics and thereby to incur the hostility of the State. For this reason, relations between Brit. and Fr. freemasons were never close. Prior to the First World War, the Grand Orient had some 300 lodges; but owing to their political activities, and still more on account of the exclusion from their rules of the familiar reference to the Great Architect of the Universe, the regular grand lodges later seceded from the Grand Orient, and in 1914 there came into existence a new body which styled itself La Grande Loge Nationale indépendante et régulière. In Italy, F. was dissolved by Fascist decree (see also ITALY). In Germany the advance of F. was furthered by the brilliant intellectual support of such men as Lessing, Herder, Fichte, and Goethe, but F. disappeared under the Nazi regime. F. was introduced into the U.S.A. in 1730, when a deputation from the Grand Lodge of England appointed Daniel Cox Prov. Grand Master for Pennsylvania, New York, and New Jersey.

F. received a great increase in membership between the 2 world wars, and it now flourishes amongst all the Eng.-speaking nations; but in countries which are predominantly Roman Catholic or are governed by dictatorship F. has latterly been banned. Within the craft there has grown a marked tendency of late to take a much greater interest than hitherto in the intellectual side of the subject; numerous study circles have been formed in the lodges and lectures have become increasingly popular.

See G. Oliver, *Institutes of Masonic Jurisprudence*, 1859; G. Findel, *History of Freemasonry* (trans.), 1866; A. Churchward, *Origin and Evolution of Freemasonry*, 1920; R. F. Gould, *The Concise History of Freemasonry*, 1920; W. Wilmshurst, *The Meaning of Masonry*, 1922, and *The Masonic Initiation*, 1924; M. Johnson, *Beginnings of Freemasonry in America*, 1924; F. de P. Castells, *English Freemasonry, 1600-1700*, 1931; A. Robbins, *English-speaking Freemasonry*, 1936; and B. E. Jones, *Freemasons' Guide and Compendium*, 1950.

Freeport, city, co. seat of Stephenson co., Illinois, U.S.A., on the Peconic R., 100 m. NW. of Chicago. F. manufs. food products, toys, batteries, machinery, and patent medicines. Here, in the Lincoln-Douglas debates, Lincoln maintained the so-called 'Freeport doctrine' on slavery. Pop. 22,500.

Freesia, genus of South African cormous plants, family Iridaceae, 4 species; grown in gardens and greenhouses for their elegant and fragrant flowers.

Freestone, building stone that is granular in structure and can be split readily in any direction. Stones used as F.s are usually sandstones or limestones. Though fairly compact in structure, they are free from irregularities, and there is no distinct cleavage. They may be quarried in large blocks, and dressed or carved in any fashion without risk of breakage. The F.s of the N. of England are usually

sandstones; those of the S. and W. are limestones.

Freethinkers, name for those who reject belief in divine revelation, applied especially to the Eng. Deists of the 17th and 18th cents. The name was accepted by the rationalists as implying that they thought freely for themselves on all questions, including religion. See also DEISM. See G. Lechler, *Geschichte des Englischen Deismus*, 1841; and A. S. Farrar, *Critical History of Free Thought*, 1862.

Freetown, cap. of Sierra Leone, West Africa, situated at the mouth of the Sierra Leone R., near the coast. It has a fine harbour protected by fortifications and is a strategically important base. It contains wharves, gov. offices, the governor's residence, a cathedral, the supreme court, a technical school, and Fourah Bay College. The chief exports are diamonds, iron ore, palm kernels, and coffee. Since the marshes have been drained F. is much healthier, and there have been few cases of yellow fever since the introduction of a piped water-supply. F. has a mean ann. rainfall of 174 in.

In 1893 the management of F. was put into the hands of a council of 15 members, 12 of whom were elected by the people, and 3 appointed by the governor of Sierra Leone. The council elected a mayor from its members. The African pop. therefore controlled the gov. of the tn, but in 1926 the municipality had to be dissolved following a series of financial scandals. It was replaced by a tn council with an official majority. Pop. 70,000 (estimated, 1952).

Freezing, change from a liquid to a solid state. This can be effected by cooling the liquid to a definite point of temp., which is invariable for the same substance under similar conditions of pressure. So well is this recognised that the F.-point of water is one of the standard thermometric points, the other being the boiling-point of water. In the centigrade and Réaumur scales the F. point of water is 0°, in the Fahrenheit scale it is 32°. The temp. at which a solid melts is theoretically the same as that at which the liquid form solidifies, therefore F.-point and melting point are interconvertible terms. In practice, however, it is often possible to supercool a liquid, i.e. cool it to below the melting-point without F. it. After a solid has been warmed to its melting point, yet remaining solid, further heat must be added before it becomes liquid. The amount of heat which is thus absorbed per unit mass, without change of temp., is called the latent heat of fusion. When a substance solidifies to an amorphous solid, the process of transformation is a gradual one; that is, the liquid gets more and more viscous, until it becomes solid throughout. When a substance solidifies to a crystalline state the change is sudden, and solid and liquid portions remain in contact; this is the case with water. Water is an anomalous substance in that after contracting through a long range of decreasing temp.,

it expands below 4° C. before the F.-point is reached at 0° C. Because it expands on F., ice is lighter than water, and the effect of pressure on the liquid is to lower the F.-point, as expansion is thereby retarded. The addition of an impurity, like salt or sugar, to water also lowers the F.-point. When any portion of the water solidifies, the substance dissolved is separated out, and dissolves in the portion still liquid. This process absorbs heat, so that solidification is hindered. The liquid portion gradually becomes more concentrated until it is saturated, after which the salt or sugar appears in the solid mass. It is not, however, in solution, but is in the form of small crystals embedded in the mass of ice. Such a mixture is called a eutectic (q.v.) and for metal alloys often has special properties of importance in physical metallurgy (q.v.). See PHYSICAL CONSTANTS.

Freezing Mixtures, mixtures of substances which have an affinity for each other, such that heat is absorbed by their combination or solution. The commonest F. M. is ice and salt. The lowering of the temp. is caused by the affinity of salt and water; a solution is formed, both ice and salt being transformed into the liquid state, heat being abstracted from the mixture and surrounding objects to effect this. As long as there is still a supply of ice and salt, the process of solution goes on until a definite limit of temp. (-23° C.) is reached, at which limit the 2 substances become solid together, forming a *cryohydrate*. Other F. M. are: powdered sodium sulphate, or ammonium nitrate with water, temp. -15°; sodium sulphate, 8 parts, hydrochloric acid, 5 parts, temp. -17°; sodium phosphate, 9 parts, dilute nitric acid, 4 parts, temp. -29°; crystalline calcium chloride, 10 parts, snow or powdered ice, 7 parts, temp. -55°. A mixture of solid carbon dioxide and ether is a valuable F. M., while solid carbon dioxide itself ('dry snow') is used in the ice-cream and engineering industries. For very low temps., liquid oxygen, or even liquid hydrogen may be used.

Fregenal de la Sierra, Sp. tn in the prov. of Badajoz. It has an anct castle of the Templars, textile and flour manufs., and has an ann. cattle fair. Pop. 10,200.

Freiberg: 1. Ger. tn in the dist. of Karl-Marx-Stadt, at the N. foot of the Erzgebirge (q.v.), 18 m. ENE. of Karl-Marx-Stadt (q.v.). It was the scene of a Prussian defeat of the Austrians during the Seven Years' War (1762). It has a fine basilica, with a notable S. portal, the 'Golden Gate,' which dates from the 13th cent. There is a radium research institute, and a mining academy founded in 1765. There are mining and smelting industries (lead, zinc, nickel, tin), and manufs. of textiles, machinery, precision instruments, and leather goods. Pop. 40,000.

2. See PÄIBOR.

Freiburg (Switzerland), see FRIBOURG. **Freiburg-im-Breisgau**, Ger. city in the Land of Baden-Württemberg (q.v.), 80 m.

SW. of Stuttgart. It is in the Breisgau, at the W. edge of the Black Forest (qq.v.). It was founded c. 1120, and came into the hands of the House of Hapsburg (q.v.) in 1368. It was in the possession of the Fr. 1679-97 and 1744-8. In 1806 it became part of Baden. During the Second World War a large part of the medieval Inner Tn was destroyed, but has since been rebuilt. The city was taken by Fr. troops in April 1945. From 1946 until 1952 it was cap. of the *Land* of Baden.

FREIBURG CATHEDRAL

The archiepiscopal cathedral, begun in the 12th cent., is one of the most perfect specimens of Gothic architecture in Germany; it is built of red sandstone, and its tower, 386 ft high, is considered one of the finest in Europe. Among other notable buildings are the arcaded Merchants' Hall, the *Kaufhaus*, which dates from 1525; the 18th-cent. archbishop's palace; a 13th-cent. Franciscan church; and anct city gates. The famous univ. was founded in 1457. There are sev. museums and scientific institutions. The chief industries are the manuf. of textiles, metal goods, and wine. Pop. 128,300.

Freienwalde, Ger. tn in the dist. of Frankfurt an der Oder, near the Oder (q.v.), 37 m. NW. by N. of Frankfurt (q.v.). It has chalybeate springs, and there are lignite mines in the dist. Pop. 11,000.

Freight, originally the cargo of a ship, has now come to mean anything carried for payment by water or land, whence the term is used for the price paid the shipowner for the transportation of goods. It was formerly considered that the total F. must cover the wages of the crew and the incidental charges and expenses of the shipping business as well as the interest and depreciation of the capital invested in the shipping. 'Freight was the mother of wages,' but this was modified by the Merchant Shipping Act, 1854. In modern times, owing to the general use of steamers and their increased size, the cost of carriage has been considerably reduced, with a resulting great increase in trade. (See INTERNATIONAL TRADE.) Some bulky articles of cargo are sometimes carried at a very low rate because of their usefulness as ballast.

Freiligrath, Ferdinand (1810-76), Ger. poet, b. Detmold, son of a school-teacher; he was apprenticed to a grocer and was in turn a bank clerk and bookkeeper. He wrote verses for small Westphalian papers and, in 1838, pub. his first vol. of *Gedichte*. Their immediate popularity induced him to turn to literature for a living and he soon found himself one of the favourite poets of his time. Up to 1842 his poetry was free from politics, but his democratic opinions, expressed in the poems *Ein Glaubensbekenntnis*, 1844, and *England an Deutschland*, led to friction with the gov. and he was forced to seek refuge in Switzerland. Here he prepared a vol. of *Englische Gedichte aus neuerer Zeit*, 1846, containing trans. from Tennyson, Longfellow, Southey, and others, and a vol. of political songs entitled *Ca Ira!* The pub. of the last-named led to his flight to London, and in 1848 he was about to emigrate with his family to America when he was allowed to return to Germany. He became leader of the Democratic party in Düsseldorf, but was imprisoned for publishing his poem *Die Tatten an die Lebenden*. His *Neue politische und sociale Gedichte*, pub. in 1850, led to further arrest and a charge of lese-majesty, but he was acquitted and left for London. While again working as a clerk he pub. a trans. of *Hiawatha* in 1857 and also trans. of *Cymbeline* and the *Winter's Tale* for a Ger. ed. of Shakespeare, ed. by Bodenstedt. Following a political amnesty he returned to Germany and at Stuttgart pub. some songs, such as *Hurrah Germania!* and the *Trompete von Gravelotte*, which became very popular. From a literary standpoint his best poems are *Die Auswanderer*, *Prinz Eugen*, *Moos-thee*, *Die Blumenrache* (*Revenge of the Flowers*), and others, written before 1840. An ed. of his collected works was pub. in 6 vols. in 1870 and after. There is also a Tauchnitz ed. The charm of F.'s poetry lay in its originality of subject and sentiment, while in a number of his poems, such as *Skating Negro* and *Revenge of the Flowers*, there is an element of the grotesque and eccentric. See G. Freiligrath, *Erinnerungen an F. Freiligrath*, 1889; E. G. Guddé, *Freiligraths Entwicklung*

als politischer Dichter, 1922; G. W. Spink, *Freiligraths Verbannungsjahre in London*, 1932; H. Eulenberg, *F. Freiligrath*, 1948.

Freising, Ger. tn in the Land of Bavaria (q.v.), on the Isar (q.v.), 19 m. NNE. of Munich. It was made a bishopric in 724, and was later the seat of prince-bishops. The tn is medieval in appearance, and has a fine cathedral (1161-1206). Its former Benedictine abbey (now a school of agriculture and brewing) contains one of the oldest breweries in the world. There are engineering, dyeing, and saw-milling industries. Pop. 27,000.

Fréjus (anc. Forum Julii), Fr. tn in the dept of Var, 16 m. SW. of Cannes. It stands on a hill above an alluvial plain 1 m. from the Mediterranean. It was founded by Caesar, and has Rom. remains, including an amphitheatre, baths, and aqueduct. The Gothic cathedral has a fine 5th-cent. baptistry. The old harbour (built by Augustus and silted up by the R. Argens) is now vine-covered. There are cork, olive-oil, and wine industries. Pop. 13,000.

Fremantle, chief seaport of Western Australia, situated at the mouth of the Swan R., 12 m. SW. of Perth. The harbour has 11,000 ft of berthing space, and has mechanical aids for loading and discharging and the bulk handling of wheat. The prin. manufs. are leather, biscuits, flour, beer, lumber, soap, and iron and steel goods, and there are cold storage works and wool warehousing undertakings. Pop. 32,000.

Frémiet, Emmanuel (1824-1910), Fr. sculptor, b. Paris, nephew and pupil of Rude; he devoted himself chiefly to animal sculpture and equestrian statues in armour, singly and in groups, the best of which are 'Joan of Arc,' 1874, in the Place des Pyramides, Paris; 'Condé,' 1881, 'Joan of Arc,' 1889, at Nancy; 'Velazquez,' in the Jardin de l'Infante at Paris. He also excelled in imaginary groups, chiefly of animals: 'Gazelle,' 1843, exhibited at the Salon; 'Gorilla carrying off a Woman,' 1887. See life by Biez, 1900.

Frémont, John Charles (1813-90), Amer. explorer, b. Savannah, Georgia. From 1842 to 1854 he explored Oregon, New Mexico, and California. In particular he explored the S. pass of the Rockies, and estab. the practicability of an overland route; and the Great Salt Lake and the upper reaches of the Rio Grande. He also rendered valuable service in the Mexican war. He came into national notice again in 1856 when the Republican party was founded. Although it had far abler men in its ranks, it nominated F. for president in the anti-slavery interest, but he was not successful. Without consulting the president, he issued a proclamation confiscating the property and freeing the slaves of all Missourians who took up arms against the gov. President Lincoln removed him from his post, but afterwards gave him a chance to serve in an important command. F. declined. He was ruined in later years in railway speculations and was governor

of the ter. of Arizona 1878-81. He pub. *Memoires of my Life* in 1887. See life by A. Nevins, 1928.

Fremont: 1. City of Ohio, U.S.A., cap. of Sandusky co., on Sandusky R. about 30 m. SE. of Toledo in the midst of an agric. region. The chief manufs. are automobile parts, cutlery, electrical goods, and rubber products. F. has the tomb of President Rutherford B. Hayes. Pop. 16,500.

2. City of Nebraska, U.S.A., and cap. of Dodge co., situated on the Platte R. It is a trade and distribution centre in a prairie region producing grain and livestock. F. manufs. cement and tile products, machine parts, beverages, feed, and dairy and poultry products. Fruit and flour are also produced. Midland College and Western Theological Seminary are here. Pop. 15,000.

French, Daniel Chester (1850-1931), Amer. sculptor, b. Exeter, New York; studied at Boston and had studios at Washington, Boston and Concord, Massachusetts, and New York. His best-known works are a statue of Gen. Cass at Washington; Rufus Choate at Boston Court House; John Harvard at Cambridge, Massachusetts; the Milmore Memorial, Boston; statue of the rep. at Chicago Exposition; 4 groups, Europe, Asia, Africa, and America, in front of New York Custom House; and Abraham Lincoln at Lincoln, Nebraska.

French, Sir John Denton Pinkstone, see YPRES, EARL OF.

French and Indian War (1754-60), last of series of wars between France and Great Britain, the Fr. being assisted by sev. Indian tribes. The prin. events of it were capitulation of Washington and Fort Necessity, 1754; Braddock's defeat, 1755; capture of Oswego and Fort William Henry by Gen. Montcalm, 1756-7; capture of Fort Duquesne, 1758; and of Ticonderoga and Niagara, 1759; battle of Quebec, 1759; surrender of Montreal, 1760.

French Architecture, up to very recent times, has always been strongly influenced by that of Italy, though in both the Romanesque and the Gothic periods the Fr. were innovators rather than followers. So also in the late 19th and early 20th cents. they were the pioneers of reinforced-concrete construction and of 'functional' architecture. The Rom. occupation of Gaul (France) left an important heritage of monumental buildings in Provence, including the amphitheatres at Nîmes, Arles, and Avignon; the magnificent aqueduct near Nîmes known as the 'Pont du Gard' (16 bc); and the little temple at Nîmes known as the 'Maison Carrée.' In Paris there are the remains of a Rom. palace with baths, adjoining the Musée de Cluny. At St Rémy is a Rom. monument, and at Orange and Saintes are Rom. arches. These various buildings range in date from c. 40 bc to c. ad 50.

Even before the evacuation of France by the Rom. legions at the beginning of the 5th cent. ad, a large number of Christian churches had been erected.

partly owing to the energy of St Martin of Tours (c. AD 316-400); but nothing substantial remains of any of them, not even of the large church built to his memory at Tours in 472, or of other large churches at Lyons and Clermont. The oldest surviving church in France, much altered since its erection in 682-96, seems to be the so-called 'Temple of St Jean' at Poitiers, a small rectangular building with apses, incorporating a Gallo-Rom. baptistery. After another long interval of time, we find a rare example in the small but very interesting church at Germigny des Prés (c. 810), which has a Byzantine 'Greek cross' plan, and sundry Muslim details, reminding us that the victorious advance of the 'Saracens' into France was only halted by the great battle of Tours in 732. There are a few other Carolingian churches: at St Philbert de Grandlieu (c. 819, but much altered since), St Martin at Angers, etc.; but Romanesque A. proper in France does not begin till c. 1000. Examples from the 11th cent. include the vaulted crypt of St Bénigne at Dijon (1001), St Hilaire at Poitiers (1018-59), St Front and St Etienne at Périgueux (1047), the Abbaye aux Dames and the Abbaye aux Hommes at Caen (1066), St Sornin at Toulouse (finished 1099), the abbey of Cluny (1089-1131) and Vézelay (1089-1140), and Notre Dame du Port at Clermont.

It will be noticed that few of these examples antedate the 'Norman Conquest' of England; indeed, at that time few Fr. buildings surpassed our own rather primitive 'Saxon' churches. The 12th cent. saw the building of the important abbey of St Denis near Paris (1132-44) and of St Trophime at Arles (1152); but before the end of that century the pointed arch had appeared, and, by 1215 or so, Gothic A. was in full swing. The 12th cent. also saw the erection of many stone-built fortresses (see CASTLE), but few substantial dwellinghouses for ordinary people.

The prin. early-Gothic churches in France are the cathedrals of Amiens, Bayeux, Bourges, Chartres, Coutances, Laon, Paris (Notre Dame), Rheims, and Rouen, and the Sainte Chapelle at Paris (1244-7). Compared with Eng. examples, they are shorter, wider, and loftier. They have a *chevet* (ring of chapels) round an apsidal E. end, whereas in England the typical E. end is square. They usually have W. towers, and seldom a central tower. When tracery came to be introduced into windows, it was composed of geometrical forms until the 'flamboyant' type (possibly derived from Eug. 'flowing decorated' tracery during the Eng. occupation in the 14th cent.) became popular: there are examples at St Wulfram, Abbeville, and at St Ouen, Rouen. The Eng. 'Perpendicular' style had no counterpart in France. Fine examples of late-Gothic houses are those of Jacques Cœur at Bourges (1443), the Hôtel de Bourgtherolde at Rouen (1475), and the Hôtel de Cluny at Paris (1485, now a museum). The Château of Pierre-

fonds (1396) is a magnificent castle, in excellent preservation; as is the noble Palace of the Popes at Avignon (1316-70). Notable fort. tns are Aligues Mortes, Avignon, Carcassonne, and Mont St Michel.

The Renaissance entered France from Italy late in the 15th cent., at first replacing Gothic very gradually, as in England. François I introduced a number of It. architects at Fontainebleau, Amboise, Blois, etc. Among them was Serlio (q.v.). Fr. architects soon acquired the new It. fashions in design, and during the 16th cent. built the first part of the New Louvre in Paris, the *château* of St Germain, and many of the picturesque *châteaux* in the Loire valley, e.g. Chambord, Azay-le-Rideau, Chenonceaux (see BULLANT, DELORME, LESCOT). Early in the 16th cent., Lemercler (q.v.), who had studied in Rome, designed the older part of the palace at Versailles; the Palais Royal, and the churches of the Sorbonne and St Roch—all in Paris; and laid out the remarkable little tn and *château* of Richelieu for the cardinal of that name.

François Mansart (q.v.) enlarged Lescot's Carnavalet Museum and built the fine church of Val-de-Grâce, both in Paris; also the beautiful *château* at Maisons near Paris, his masterpiece, in 1642-51; and the Orléans wing at Blois.

He was followed by his kinsman J. H. Mansart (q.v.), the favourite architect of Louis XIV, who made Versailles one of the largest palaces in the world, designed the cathedral there and the church of the Invalides in Paris; and planned the Place des Victoires and the Place Vendôme—both in Paris. During the 18th cent., the 2 most talented architects in France were J. J. Gabriel (q.v.) and his son A. J. Gabriel. Their work is more scholarly and refined than that of J. H. Mansart. Their prin. buildings, mostly outside Paris, are listed under their respective names.

After the Fr. Revolution, and under Napoleon, there ensued the 'Empire' phase in F. A., when inspiration was derived from Pompeian, Gk. and even Egyptian sources. During the middle years of the 19th cent. France experienced the 'Gothic Revival' (see VIOLETTÉ-LÉ-DUC) and the 'Free Classic Revival,' though still retaining some of her native architectural tradition; but towards the close of that century began to take the lead in Europe in developing reinforced-concrete construction, a form of building which soon began to revolutionise her architecture, notably in the work of A. G. Perret (q.v.). His brilliant pupil, the Swiss architect 'Le Corbusier' (q.v.), settled in Paris in 1922, and became the leader and prophet of the so-called 'Modern Movement' in architecture. The work of both men is summarised under their respective names.

See G. H. West, *Gothic Architecture in England and France*, 1911; Sir R. Blomfield, *A History of French Architecture from 1494 to 1774* (4 large vols.), 1911-21; F. Lavedan, *French Architecture*, 1956.

French Art. Painting.—Miniature painting and illuminating were practised in

the Middle Ages and some of the most famous illuminated psalters came from Paris. France contributed much to the formation of the Gothic style in miniature work. The illuminations of the 14th cent. were in realistic style and the Parisian school was noted. Separate schools grew up also in Burgundy and Avignon. The stained-glass workers of Chartres, inheriting the traditions of St Denis, contributed their beautiful designs to the decoration of eccles. buildings, and also highly decorative in tendency were the metal work and mural painting, which latter imitated the colouring of the stained glass.

Early Renaissance painting in France was inspired by the work of Italians summoned to France by kings and municipalities (Fontainebleau School), though there were traces of a change in Fr. art, transforming the Gothic, even before it felt the influence of such Italians as Primaticcio (1504-70).

Jean Fouquet (q.v.), the greatest Fr. painter of the 15th cent. (*temp.* Louis XI), was also noted for his illuminated work; also notable were Nicolas Froment and the miniaturist Bourdichon.

Fr. painting of the 17th cent. is represented chiefly by the work of Claude of Lorraine (1600-82) (q.v.) and Nicolas Poussin (q.v.) and also, though in much less degree, by Callot (1592-1635) (q.v.), the brothers Le Nain (q.v.) (Louis, 1593-1648) and Georges de la Tour (1593-1653). Poussin was the originator of the classic landscape, in which gods and heroes are depicted in a natural environment. Claude of Lorraine was also a classic landscape painter with a passion for light and he has often been compared to Turner. Of the same period are the portraits of women disguised as Olympian divinities, by Nicolas de Larivière, the decorative work of Charles Le Brun (q.v.) (1619-90), and the graceful frescoes of Pierre Mignard (q.v.). The famous names in Fr. 18th-cent. painting are those of Antoine Watteau (1684-1721) (q.v.), Jean Baptiste Chardin (1699-1779) (q.v.), François Boucher (1702-70) (q.v.), and Honoré Fragonard (1732-1806) (q.v.). Watteau is famous for his *scènes galantes* depicting amorous couples in highly realistic landscapes. Youth, gaiety, iridescent gowns, the play of arms and hands all have their part in the seductive dreams of his terrestrial Olympus. Chardin was, above all, the painter of the *petite bourgeoisie* and the poet of still life. Greuze (1725-1805) (q.v.) is notable for his idyllic studies, but to-day he is remembered, though not over-admired, for his pictures of demure-eyed maidens. Mythology, landscape, and feminine nudes are all subjects of Fragonard's vivacious work. Other names of this period are N. Lancret (1690-1743), Maurice Quentin de La Tour (1708-88), Jean Marc Nattler (1685-1766), and Madame Vigée-Lebrun (1755-1842) (q.v.), chiefly a portrait painter.

The 19th cent. is considered by some the greatest age of Fr. painting and the

names of celebrated artists are legion—David, Ingres, Delacroix, Corot, Millet, Daubigny, Théodore Rousseau, Daumier, Courbet, Manet, Gauguin, Degas, Monet, Renoir, Seurat, Pissarro, Cézanne. Prud'hon (1758-1827) (q.v.), an enthusiast for Gk beauty, is famous for his allegories of love. David (1748-1825) (q.v.) who strongly influenced the period, was a neo-classicist and may be said to have founded a school of historical painting. His greatest pupil was Jean Auguste Dominique Ingres (1780-1867) (q.v.), who, however, also derived much inspiration from Raphael. A main feature of the early 19th-cent. period of Fr. painting was the struggle between Classicism and Romanticism. The leader of the Romanticists' revolt was Delacroix (1798-1863) (q.v.), a place that might well have been taken by Géricault (1791-1824) (q.v.), who d. prematurely. Delacroix looked upon his art as a medium for the reflection of his own intensely emotional temperament. Corot (1796-1875) (q.v.) was the great master of a new school of Fr. landscape painting. No other artist has been so imitated. He enjoyed, especially in his later years, an extraordinary popularity. He is famous for his 'poetic' landscapes—luminous and misty—and for the plastic mastery shown in his figure-places—often a girl reading or a reclining woman, and either a full or half figure. Corot worked at Barbizon but is distinct from the 'Barbizon' (q.v.) group or Fontainebleau school—a school of 'pure' landscape painters, partly inspired by the Dutch painters Hobema and Ruysdael. Fr. painters of this group are Jean François Millet (q.v.), Daubigny (q.v.), Théodore Rousseau (q.v.), and Constant Troyon (q.v.). Gustave Courbet (1819-77) (q.v.) also reacted against the classicists, but, as a realist looking at things as they were, he also reacted against the Romanticists. Manet (1832-1883) (q.v.) may also be regarded as a realist, and his brilliant modern treatment of old master themes, as in his 'Olympie', shocked Paris. Claude Monet (1840-1920) (q.v.) is famous as the head of the Impressionist school. He shows remarkable subtlety in painting the variations of atmosphere and light at different times of day. He began as a member of the group inspired by Manet. One of his principles was that what the subject intrinsically is really does not matter, but only its appearance under light. Other painters of this school are Auguste Renoir (q.v.) and Camille Pissarro (q.v.). Hilaire Germaine Edgar Degas (1834-1917) (q.v.), a famous realist who studied and admired the work of Ingres, tempers atmospheric impression with a sense of structure and form. His themes are generally taken from contemporary Parisian life—particularly dancing girls, *modistes*, and washerwomen. Daumier (1808-79) (q.v.) began as a cartoonist and his paintings attracted only the discerning critics in his lifetime, yet to a greater degree than with most of his contemporaries they reveal the plastic vitality which is associated

with the masterpieces of Cézanne. Cézanne (1839-1906) (q.v.) learned from Manet and Pissarro before his own revolutionary ideas made him a lone iconoclast, violating every law of representation as known to the realists and yet clinging to nature as source and inspiration. He is first among modern artists by reason of both spiritual leadership and achievement in his own art. From his work a new W. aesthetic has been fashioned, schools of painting have derived their inspiration, and a revolution in practice has taken place. Seurat (q.v.) is a neo-Impressionist expert in the *pointillistic* system. Puvion de Chavannes

Some of its famous representatives, like Picasso, came from outside France, but among the notable Fr. painters are such men as Vuillard, Bonnard, Dufrene, Marquet, La Fresnaye, Delaunay, Utrillo, Léger, Rouault, and Dufy. The post-war period seems to indicate a struggle between the tendency towards a purely abstract or non-representational form of painting (Maurice Estève, 1904-) and a somewhat harsh form of realism as in the work of Edouard Pignon (1905-).

Sculpture and Decorative Arts.—The Fr. gift for sculpture was early shown by the Gothic 'imagiers' of the 13th cent. The art of portraiture in sculpture began in

'SOUVENIR DE MORTEFONTAINE': A LANDSCAPE BY J. B. C. COROT (1796-1875)

(1824-98) (q.v.) is important in the technique of decorative painting. Paul Gauguin (1848-96) (q.v.) reverted, for inspiration, to primitive art as illustrated by life in the South Sea Is. Henri Rousseau (1844-1910), also known as Le Douanier, in scenes depicting life in France and memories of Mexico, where he soldiered, revealed a true 'primitive'.

Famous 20th-cent. painters are Georges Braque (1881-) (q.v.), Henri Matisse (1869-1954) (q.v.), and Pablo Picasso (1881-) (q.v.). Braque is notable for his cubist technique; Picasso is supreme as an experimentalist in diverse forms of expression. The work of Matisse is masterly in its summary expression of form and rhythm and has much in common with E. painting. (See also individual names.)

The new ideas of painting successively launched in Paris made that city the unquestioned centre, and seat of an international 'school,' L'Ecole de Paris.

France in the late 14th cent., the masterpieces of Gothic sculpture of the period being the sepulchral effigies at Dijon, effigies which gradually replaced the recumbent figures. A notable sculptor of the Renaissance period was Michel Colombe (1431-1512). Jean Goujon (q.v.), skilled in bas-relief, Germain Pilon (q.v.), and Jean Cousin (q.v.) are all well-known artists who succeeded in moulding the Florentine spirit to Fr. genius. The Renaissance in France also saw brilliant enamelling work, especially by Léonard and Jean Limousin (q.v.); the ceramics of Bernard Palissy (q.v.); and much fine work by Fr. goldsmiths. Themes from classical mythology were generally chosen by these renaissance artists. In the earlier part of the 17th cent. Fr. sculpture was mainly sepulchral, notable sculpture in this kind being François Anguier (c. 1604-69), who modelled the *duc de Montmorency's* tomb at Moulins, and Jacques Sarrazin (1658-1660), sculptor

of Henri de Condé's tomb at Chantilly. A fresh expansion came with the encouragement of a grandiose secular art by Louis XIV. Girardon (1628-1715) (q.v.), whose masterpiece is Richelieu's tomb in the Sorbonne church, was extensively employed on the sculptural decoration of Versailles. The portrait sculptures of Coysevox (1640-1720) are remarkable for their vitality. In the same century a regular school of engraving developed at the Gobelins under Sebastien Leclerc, and the industrial arts were enriched by the cabinet inlaid-work of Boulle (q.v.) and the incised *objets d'art* of the Fr. silversmiths. It is to be noted that most of the 17th-cent. F. A. of the reign of Louis XIV, whether in painting, architecture or sculpture, was 'dictated' art, organised under the direction of Le Brun (q.v.), the king's chief painter, director of the Gobelins workshop, rector of the Royal Academy of Painting and Sculpture, and Colbert's technical adviser. The work of the artists so commissioned suffers to some extent from this official inspiration; but under Colbert's forceful administration Fr. artists of this, the classical period of the *Grand Siècle*, succeeded in profoundly influencing art throughout Europe.

Jean Antoine Houdon (1740-1828) (q.v.) stands out in the 18th cent., but later Fr. sculpture is represented prominently by Rodin (1840-1917). Mention should be made of Rude (1784-1855), Carpeaux (1827-75), and Bartholomé (1848-1928) (q.v.), but Rodin is one of the rare creative geniuses. Believing that the art of the sculptor had fallen into a cold formula, he sought to revive it by infusing a romantic warmth of feeling. Maillol (q.v.) and Despiau, working within the limits of old tradition, have become part of the hierarchy of sculptors whose reputation will endure. Another notable sculptor is Antoine Bourdelle (q.v.) in whom, as in Maillol, there is the grandeur of solid form. Degas, the painter, produced brilliant figurines, and Matisse also is among the modern painters (as also Picasso) who have applied an unconventional outlook to sculpture.

French Canadian Literature. The background of F. C. L. is in some ways similar to and in others different from that of Eng. C. L. (see CANADIAN LITERATURE). One point of similarity is the original isolation of an infant colony in more or less hostile surroundings on a new continent distant from the motherland: a sense of embarrassing immaturity in the face of an older parent civilisation is thus apparent in the thought and art of both

Fr. and Eng. Canada. For Fr. Canada, however, the feeling of isolation was abruptly intensified by 2 major events in the 18th cent.: the Brit. conquest of Canada and the Fr. Revolution. These 2 crises oriented the thinking of Fr. Canada entirely in the direction of survival and are at the root of a strong urge to hold to the past. Devotion to *la survivance* has coloured every aspect of Fr. Canadian endeavour, political, social, religious, literary, and artistic. There is a tendency to equate the ideas 'French,' 'Canadian,' and 'Catholic,' for instance, and a strong feeling of solidarity has maintained the identity of Fr. culture in a predominantly Eng. milieu. In the present century Canada has attained a greater measure of national maturity which is reflected in its literature, both Fr. and Eng.; yet the emotional impact of racial and religious concepts remains strong in Fr. Canada.

Under the Fr. régime there was no original literature; various religious orders pub. accounts in France of their activities in Canada; the most famous of these is the *Relations des Jésuites*. There was no printing press in Canada under the Fr. kings, just as there was none for a long time in the Amer. colonies under the Eng. kings. Since the conquest F. C. letters seem to have developed more rapidly as an autonomous art than Eng. C. letters. The Fr. civilisation is more than a century older than the Eng. in Canada; it was more definitely cut off from its European origins; and the Frenchman seems by nature to be more inclined to philosophy, literature, and art than the A.-S.

For generations after the Brit. conquest Fr. Canada was spiritually numbed. The rebellion of 1837 gave birth to new feelings of pride and enthusiasm, however, and the first stirrings of literary production bear the imprint of Romantic nationalism. This spirit was eagerly seized by journalists and orators, among the most outstanding of whom was Etienne Parent, editor of *Le Canadien* with its fiery motto 'Nos institutions, notre langue et nos lois.' This vigorous spirit has been upheld by a succession of writers, Arthur Buies, L. O. David, Henri Bourassa, J. P. Tardivel, and others. It was Garneau's *Histoire du Canada*, appearing in the middle of the 19th cent., that provided a firm historical basis for the new attitude and inspired the writers of the day. Octave Crémazie, the first important poet, sings the glories of his race and his country; he is strongly under the literary influence of Victor Hugo, the leading Fr. Romantic poet. In *Les Anciens Canadiens*, Philippe Aubert de Gaspé, the first important novelist, lovingly records the traditions of New France that were in danger of disappearing. These two, with Louis Fréchette, are the most prominent names of what is called the 'Patriotic School' which had its centre in Quebec City. They, with others like Pamphile LeMay and Wm Chapman, are characterised by

pride of nation, appreciation of nature, and a Romantic ampleness of expression.

There was not much further development in the novel in the 19th cent. but poetry continued to flourish. Toward the end of the century a new emphasis became more and more evident. In the first place, the literary centre changed to Montreal from which the new school takes its name. Fr. poets are still the models followed, but now it is the Parnassians and the Symbolists who exert influences. The best-known names in this period are Jean Charbonneau, Emile Nelligan, Alfred DesRochers, and the critic 'Louis Dantin.' Their themes are less narrowly patriotic, more universal, and their techniques more polished and delicate. They were consciously appealing to a more intellectual public than their predecessors did.

The spirit of devotion to the land was by no means dead, however, and contemporary with the 'Montreal School'—new group formed at Quebec, devoted to exploiting the themes of regionalism. This 'école du terroir' inspired both poets and novelists at the beginning of the 20th cent. Adjutor Rivard's *Chez nous* gives a sentimental picture of the rural scene; it forms the basis for a whole series of novels of the land which often paint a highly idealised picture. Great impetus was given by the Frenchman Louis Hémon who pub. the novel *Maria Chapdelaine* during the First World War. The most balanced and realistic picture of life on the farm is found in 'Kinguet's' *Trente Arpents* (Thirty Acres). Every aspect of regionalism is developed, however, and its themes have remained fruitful into the 1940's, producing for instance, Germaine Guèvremont's poetic novels and Yves Thériault's cynical and satirical ones. Among the poets of this school we may group Nérée Beauchemin, Blanche Lamontagne, Albert Ferland, and Alphonse Desilets.

At least 3 other types of novel have been developed, the historical, the urb., and the psychological. The first type is represented by Joseph Marmette, who wrote on the Fr. régime, R. L. de Roquembrun, on the rebellion of 1837, and L. P. Desrosiers, on the fur trade. The urb. novel has had a flourishing life, starting from the 1930's when rural themes were running out. The pictures of Montreal presented in Gabrielle Roy's novel *Bonheur d'occasion* (The Tin Flute) and of Quebec in Roger Lemelin's whimsical *Au pied de la pente douce* (The Town Below) as well as Lemelin's other novels on Quebec are the facets of Fr. Canada best known outside its own borders. The earliest proponent of the psychological novel was 'Laure Conan'; more recent psychological novels have been pub. by Robert Charbonneau, F. Loranger, Robert Elie, and André Giroux among others.

Poetry continues to flourish in Fr. Canada. Saint-Denis Garneau is the most recent to have become a national classic; he is among the best of many

good poets: Paul Morin, René Chopin, Robert Choquette. Sev. of the best authors are poetesses: Blanche Lamontagne, Simone Roullet, Eva Sénécal, and Anne Hébert. Groups of young poets such as the 'Hexagone' and the 'Cascade,' both in Montreal, continue to appear and poetry is still the most flourishing F. C. literature. It is characterised by variety of approach, sensitivity, comparative fitness of form, and is full of promise for the future.

The theatre has been neglected in both Eng. and Fr. Canada. The actor Gratien Gélinas made *Tit-Coc* famous, at least across Canada. Radio and television offer increasing opportunities to playwrights, some of whom are Roger Lemelin, Yves Thériault, André Giroux, and Germaine Guèvremont.

Theology, philosophy, and criticism are relatively important in F. C. cultural life; these fields bear the strong imprint of the Catholic tradition. The first important literary critic was Camille Roy. Prominent names in the field to-day are Scraphin Marlon, Robert Itumilly, Guy Sylvestre, and W. E. Collin. Folklore has received much attention from Marius Barbeau and Luc Lacourcière.

See Camille Roy, *Histoire de la littérature canadienne*, 1930; Jules Léger, *Le Canada français et son expression littéraire*, 1938; J. M. Turnbull, *Essential Traits of French-Canadian Poetry*, 1938; D. O'Leary, *Le roman canadien-français*, 1954; L. Riess, *L'âme de la poésie canadienne française*, 1955.

French Equatorial Africa (formerly **French Congo**), a Fr. dependency on the W. coast of Africa, between the Cameroons and the Belgian Congo (qq.v.) and bounded on the N. by Libya and on the E. by the Sudan (qq.v.). The estimated area is 945,710 sq. m. and the pop. (1951) was under 5,000,000, of whom 21,885 were Europeans. Since then the pop. has increased considerably. Bantu tribes, and also pygmies, live in the S., and in the N. are Negroid-Hamitic peoples; nomads live in the desert. The climate is tropical and the rainfall uneven with a drier climate towards the N. The S. is heavily afforested, but gives way to savannah areas, and then to desert N. of Lake Chad (q.v.). The R.s Ogowe, Kulu-Niari, and Nyanga empty into the Atlantic, the Lerini, Alima, Kandeko, and Sangha are tribs. of the Congo, and the Shari empties into Lake Chad. The R. Ubangi, another trib. of the Congo, forms the greater part of the boundary between F. E. A. and the Belgian Congo. Rio Muni (or Spanish Guinea, q.v.) is in Gabon ter., on the Atlantic coast of F. E. A. The fauna of the region includes monkeys, gorillas, and leopards in the forests, and elephants, lions, buffaloes, and antelopes in the savannahs.

History.—Portuguese travellers discovered the coast of what is now F. E. A. in the 15th cent., but little exploration took place until the Fr. began to investigate the Gabon area, 1839–49, and pushed southwards. From 1888 to 1908 the area

French Equatorial

512

French Guiana

was known as Fr. Congo; in 1910 F. E. A. was estab., to include the 3 colonies of Gabon, Middle Congo, and Ubangi-Shari with Chad. Chad became a separate ter. in 1920.

Administration.—F. E. A. is divided into 4 ters.

	<i>Capital</i>	<i>Area</i> <i>sq. m.</i>	<i>Pop.</i>
Middle Congo	Pointe-Noire	132,000	746,193
Gabon	Libreville	103,000	383,410
Ubangi-Shari	Bangui	238,000	1,119,959
Chad	Fort Lamy	496,000	2,519,853

These 4 ters. are a federation and form part of the Fr. Rep. A decree issued in 1956 indicates an intention to pave the way towards self gov. The Federation cap. is Brazzaville (q.v.). In the Fr. Parliament F. E. A. is represented by 6 deputies, 8 senators, and 7 counsellors.

Resources and Trade.—Minerals exist in F. E. A. and those proved include gold, lead, iron, zinc, copper, tin, and manganese ore. Diamonds have been found. Prospecting for oil has been going on for some years. The following crops are grown in large quantities: cassava, millet, and groundnuts. Palm oil is produced. In Gabon, in the vicinity of Port Gentil, there is the world's largest plywood industry according to Fr. claims. Timber production in 1955 exceeded 620,000 tons. Hydro-electric schemes are being developed and a high potential exists. Imports in 1956 totalled 20,527 million francs in value, and exports 14,135 million francs. Indications were that the 1957 figures would not differ significantly from those of 1956.

<i>Main imports, 1956</i>	<i>Tons</i>	<i>Value in millions of francs</i>
Flour . . .	9,506	293
Sugar . . .	10,294	614
Wines . . .	18,833	562
Salt . . .	8,242	71
Cement and lime . . .	74,800	451
Petroleum products . . .	118,119	1,716
Cotton textiles . . .	2,685	985
Manuf. metal products . . .	16,796	594
Tools . . .	2,630	400
Other metal manufs. . .	12,399	957
Electrical equipment . . .	1,756	987
Vehicles and parts . . .	614	1,477
<i>Main exports, 1956</i>	<i>Head</i>	<i>Value in millions of francs</i>
Live animals . . .	18,527	244
Fresh meat . . .	1,637	141
Coffee . . .	5,894	744
Palm oil . . .	3,288	148
Cocoa . . .	2,946	265
Tobacco . . .	549	39
Groundnuts . . .	9,366	356
Lead ore . . .	6,000	135
Rubber . . .	237	28
Hides and skins . . .	844	84
Timber . . .	653,789	5,205
Cotton . . .	37,472	4,681
Sisal . . .	1,322	49

More than 50 per cent of the total trade is between France and F. E. A. Other countries trading with F. E. A. (and the value of their trade) were:

	<i>Millions of francs</i> <i>Imports</i>	<i>Exports</i>
Brit. ters. in Africa . . .	281	390
Belgium . . .	435	155
Belgian Congo . . .	647	216
Netherlands . . .	1,661	337
Portugal and Portuguese colonies . . .	219	7
Union of South Africa . . .	71	100
United Kingdom . . .	523	319

Large funds have been made available from France for the development of F. E. A. and for public purposes. Of some £85 million put into F. E. A., approximately £30 million is invested in long-term loans at low rates of interest. A high proportion of the budget (20 per cent) is spent on education, and in 1955 151,298 children were attending schools.

Communications.—There are 20,000 m. of all-weather roads and 35,000 m. which are open most of the year. A railway runs from Brazzaville to Pointe-Noire, a distance of 320 m. The Ogowe R. is navigable at all times for a distance of 200 m. and the Shari R. from Aug. to Dec. for a distance of 500 m. Approximately 1600 m. of waterways are navigable above Brazzaville on the Congo-Ubangi system. F. E. A. is served by Air France, K.L.M., Sabena, and UAT airlines. There is an international airport outside Brazzaville. There are 3 ports: Pointe-Noire, Port Gentil, and Libreville.

See P. B. Du Chailu, *Exploration and Adventure in Equatorial Africa*, 1861, 1945; H. Ziegler, *L'Afrique Equatoriale Francaise*, 1952.

French Gardening, see GARDENING.

French Guiana, or Cayenne, Fr. overseas dept on the NE. coast of South America, separated from Netherlands Guiana on the W. by the Itani-Moroni R., and from Brazil by the Oyapoc and the Tumuc-Humac Mts. Other rvs. are the Aoua, Approugue, Cayenne, Sinnamary, and Mana, all obstructed by falls. There is no railway; the main road is from Cayenne, westward 82 m. to Iracoubo, and a further 70 m. through Mana to St Laurent. There is an airport on the mainland, at Rochambeau, 10 m. S. of Cayenne. The country is divided into 3 natural belts: the rugged, mountainous, little-known interior, covered in dense forest rich in valuable timber; the grassy savannah-land of the foothills; and a narrow belt of rich alluvial land along the coast. This last is very fertile, and here, though only about 9000 ac. have been cultivated, maize, manioc, rice, sugar-cane, coffee, cocoa, tobacco, and indigo are grown. There are 2 rainy seasons, and the rainfall frequently amounts to 135 or more in. in a year. The country is rich in animal and vegetable life. The minerals exploited include silver, iron, and phosphates, and, most important of all, placer gold. The prin. exports are gold, cocoa, phosphates, hides, woods, rosewood essence, balata,

and spices, of which gold is by far the most important; and the chief imports are Fr. wines, spirits, and liqueurs, silk and cotton stuffs, hardware, flour, and cattle. F. G. is administered by a Préfet assisted by a Privy Council. There is also a Council-General of 15 elected by Fr. citizens resident in the country. Primary education is free in lay schools. There are also a college, founded in 1936, sev. Congregational schools, and private schools.

In the 17th cent. Bertrand d'Ogeron, buccaneer chief and governor of St Christopher, won a foothold in G., but was driven out again by the Spaniards. Richelieu harboured great plans respecting G., and under his protection Chantail, from Lyons, left to explore Cayenne, and numerous Norman shipowners followed in his wake. Pierre de Brétigny settled there, only to perish at the hands of the Indians. Later the Dutch seized Cayenne. Colbert drove them out and, under the provisions of the Black Code, organised the first convoys of manpower from Senegal to G. In 1700 the Dutch again estab. themselves in G., but 2 decades later, after the loss of Acadia, the Fr., under Choiseul, sent 8000 settlers to G., but they were decimated by epidemics. Under the Restoration the Fr. freed the colony from the brief Portuguese occupation, but the emancipation of the Negroes ruined the colony. From 1853 to 1864 an attempt was made to found penal colonies in F. G., but proved disastrous. Since 1854, however, Cayenne has had a penal settlement, though no prisoners were sent there after 1927. In 1945 the pop. of the settlement was little more than 1500, and prisoners were gradually being sent back to France. There are also penal settlements on the Îles du Salut and on the Maroni R. In 1894 Capt. Dreyfus was confined on the Île du Diable. Cayenne is the cap. and chief port of the dept, which sends 1 deputy to the Fr. National Assembly. At Cayenne there are a court of first instance and a superior court of appeal, with jurisdiction elsewhere in the colony. St Laurent-du-Maroni, cap. of Inini, and Oyapoc are the 2 other chief ports. The Pan-Amér. Airways system visits Cayenne weekly. The cap. is connected by motor-car services over secondary roads with centres of pop. in the interior. There are wireless stations at the ports and at Regina. Cayenne has been colonised by the Fr. since at least 1604. Total area 34,740 sq. m.; pop. 27,863. The numbers of the native pop., which dwells in the forested interior, cannot be estimated.

The ter. of Inini includes the hinterland separated from F. G. by a decree of 1930. It is administered by a sub-préfet, as an arron. He is assisted by a small consultative council. The area is 30,301 sq. m. and the pop. 5000. Maroni is the chief centre.

French Guinea, Fr. colony on the W. coast of Africa, formerly known as *Rivières du Sud*; cap. Conakry (q.v.). F. G. lies between Sierra Leone and Portuguese G. The prin. products are

palm oil and kernels on the coast; cotton is cultivated in the higher basin, and millet, rubber, rice, coffee, bananas, pineapples, and wax are produced. Cattle, sheep, and goats are reared, and gold is found in the Sigüiri dist. The chief imports are textiles, machinery, wines, tobacco, petrol, and cement. The prin. exports are gold, hides, coffee, palm kernels, animal wax, rubber, coffee, bauxite, and iron ore. There are 2400 m. of all-weather roads, and 5000 m. of dry-season roads. Good airfields are situated at Conakry and Kankan; telegraphic and radio communications are excellent. F. G. is administered by a lieutenant-governor under the direction of the governor-general of Fr. West Africa. Geographically the colony is divided into 3 dists.—a flat coastal plain, a series of lofty plateaux, and the mountainous dist. of Fouta Djallon, where cattle are reared. In 1882 the Brit. Gov. recognised the treaty France had concluded with the lord of Fouta Djallon, and a commission settled the Fr. frontiers and those of Sierra Leone. F. G. was made a separate colony from Senegal in 1891. In 1896, following disorders, Fouta was annexed and France appointed a governor of F. G., the boundaries of which were finally settled in 1899. Total area 96,800 sq. m. Pop. 2,261,875, of which number 4637 are Fr. and 1500 Lebanese and Syrians. The chief native tribes are the Foulahs, Sousous, and Timenes. See A. Arcin, *La Guinée française*, 1906; F. Rouget, *La Guinée*, 1908; and R. Gouzy, *Visages de l'Afrique*, 1939.

French Honey-suckle, *Hedysarum coronarium*, spreading leguminous biennial of Europe, with deep red fragrant flowers; sometimes used as fodder for horses and mules in Calabria.

French Horn, see HORN.

French India. The Fr. possessions in India were the 5 provs. of Pondicherry, Karikal, Chandernagur, Mahe, and Yanam. All have now been integrated in the Rep. of India.

French Language and Literature. *Language.*—The Fr. language is one of the Romance tongues. It is not a direct outcome of classical Lat., but of the *lingua romana rustica*, the common language spoken by the Rom. legionaries and merohants. The pre-Rom. Celtic tongue of the inhab. of Gaul d. away except in Brittany, leaving extremely few traces. It survives in a few words such as *alouette*, *sac, lieue, braie*, and influenced the form of some words of Lat. origin. The Franks who invaded Gaul during the 5th cent. had more effect upon the language, and many words are of Frankish origin, as *guerre, fief, bière*. The *lingua romana* took different forms in Fr. according to the races and environment. Two main divs. are easily made, in the S. the *langue d'oc* and in the N. the *langue d'oïl*, so called from the words used to denote affirmation. The line of div. would run approximately from La Rochelle to Grenoble, through Limoges, Clermont-Ferrand, and Lyons. Formerly it was

customary to regard the *langue d'oc* as part of the Fr. language, but it is now held to be a distinct branch of the Romance group, allied to Catalanian or Catalan (spoken in E. Spain). Both languages were further sub-divided into numerous dialects and patois. The prin. dialects of the *langue d'oc* were provençal, languedocien, dauphinois, auvergnat, and limousin, those of the *langue d'oïl* picard (Amiens and Arras), burgundian (Dijon), norman (Caen and Rouen), poitevin with angevin and saintongeais (W. France), and especially that of the Île de France, which eventually became the main tongue. Its triumph was mainly due to the accession of Hugh Capet, duke of France and of Orleans, to the throne in 987, thereby making Paris the cap. of the kingdom. Even in Rome itself in classical times there were 2 sorts of languages. There were the Lat. of Cicero and Caesar, taught and spoken by the educ., and the language of the middle and lower classes. The difference lay chiefly in the pronunciation and syntax. The tendency manifested itself to slur over and drop the unaccented syllables. Hence even in classical authors we find *saeculum, vinculum*, instead of *saeculum, vinculum*. This tendency also affected the syntax by obscuring grammatical endings, and led to the introduction of independent particles to denote grammatical relation, such as prepositions and auxiliary verbs. In Gaul classical Lat. was still learnt in the schools and affected by the higher classes, but the invasions of barbarians in the 5th cent. destroyed the culture of the country, and gave freer play to the colloquial tongue. The tendencies already remarked above were intensified. The kernel of each word was the accented syllable, which persisted, while the unaccented ones underwent modification or disappeared altogether. Vowels immediately preceding the accented syllable disappeared if short, but were preserved if long, as *claritatem, clarité; peregrinum, pèlerin*. Vowels following the accented syllable disappeared, or were reduced to *e* mute, as *mortalem, mortel; tabulum, table*. A medial consonant separating 2 vowels of which the second is accented also disappeared, or was modified, as *dotare, dower; debere, devoir*. Words from the Lat. not following these rules are of learned origin imported at later date. The simplification of Lat. case-endings soon led in *lingua romana* to the reduction of the 6 cases to 2 for masculine nouns, the nominative and accusative, and to the accusative only for feminine nouns. Thus *rosam* and *rosas* were the feminine forms in Gaulish Lat. for both nominative and accusative in the singular and plural respectively, and gave the modern forms *rose* and *roses*. The masculine *murus, murum* (singular), and *muri, muros* (plural), gave:

	<i>Sing.</i>	<i>Plur.</i>
<i>Nom.</i>	<i>murs</i>	<i>murs</i>
<i>Acc.</i>	<i>mur</i>	<i>murs</i>

The nominative disappeared from use in the 14th cent., leaving only the accusative

form *mur* and *murs*. Traces of the nominative still remain, however, in *on*, besides *homme* from *homo*, *sire*, besides *seigneur* from *senior*, and in proper names *Jacques, Georges*, etc. The Académie Française, with its 40 members called the Immortals, was estab. in 1635 and is the final authority on all matters connected with the Fr. language.

Fr. was the acknowledged language of diplomacy, and of the cultured from the days of Louis XIV, and particularly from the early 18th cent., but lost its position after the First World War. It is spoken by sev. millions of people outside the Fr. Union, in Belgium, Switzerland, and Canada.

Literature.—As already stated, the Fr. language arose from the *lingua romana rustica*. In course of time the pure Lat. language became no longer recognisable by the speakers of the *lingua romana*, and various glossaries were compiled for the aid of those who wanted to read Lat. texts. Such glossaries afford the earliest monuments of the Fr. language. The glossary of Reichenau belongs to the end of the 8th cent., and contains the Lat. words of the Vulgate with their Romance equivalents. The earliest consecutive monument of the Fr. language is the oath of Strasburg, sworn in 842 by Louis, the grandson of Charlemagne.

The literature of the 10th and 11th cents. consists of the *Séquence de Ste. Eulalie* and the *Vie de St Leger* in *assonanced* verses. The first great achievement of Fr. literature was the production of the *chansons de geste* (q.v.). These are epic poems celebrating chiefly the deeds of Charles Martel and his grandson Charlemagne. In the beginning they were *assonanced*, but from the 13th cent. they were rhymed. The most famous of all the *chansons de geste* is the *Chanson de Roland*, the earliest text of which is found

in the Bodleian MS. at Oxford (1080), but we know that an earlier version was sung at the battle of Hastings (1066). There is a vividness of action and a strength in the delineation of character which make the poem a masterpiece.

The *chansons de geste* gave place to the romances, which are distinguished from them by being the narration of exploits of entirely fictitious heroes, while the former, as we have seen, had always a certain historical content. The material for the romances was taken from the Celtic bards of Brittany, who sang the exploits of Arthur, the last of the Brit. kings, and his knights of the Round Table. To this theme were added such tales as the quest of the Holy Grail and the unhappy love story of Tristan and Yseult. The greatest writer of such romances was Chrétien de Troyes (d. 1195), who wrote *Erec*, *Chigès*, *Lancelot*, *Yvain*, and *Perceval*. These poems are imbued with that feeling of chivalry and mysticism which has come to be associated with the knightly period, and were imitated throughout Europe. To this period belong also the romances of antiquity, such as the *Roman d'Alexandre*, a poem of 20,000 lines of 12 syllables which have ever since been known as Alexandrines, the *Roman de Troie* (30,000 lines) in octosyllables, *Roman d'Enfer*, and *Roman de Thèbes*. As the simplicity of the *chanson de geste* yielded to the erudition of the later romances, so these in turn gave place to the elaboration of the allegory. The most celebrated of these is the *Roman de la Rose*, of which the first part was written by Guillaume de Lorris about 1230. It represents in simple, elegant, and vigorous language the feelings of a diffident lover in courting his beloved. The second part is much longer, and entirely different in its inspiration. The author, Jean de Meung, simply uses the framework left by his predecessor as a vehicle upon which to depict his witty and satirical sketches of the society of his time.

One of the most characteristic forms of Fr. literature is the *fabliau*, which came into great favour in the 13th cent. The *fabliau* is a short simple story in verse, full of pregnant reflections upon society, of wit, satire, and a certain pungent coarseness. Such poems are important as being a manifestation of the *esprit gaulois*, a term used to denote that quality of levity, raillery, satire, and gaiety which is to be found throughout Fr. literature. The *fabliaux* were preceded by collections of fables which bore the name of *ysopet*, from the celebrated Aesop. The best known of these was the *Roman de Renart*, a kind of humorous epic poem dating from the 12th cent., in which the animals are endowed with human characteristics, and the fox's cunning enables him to triumph repeatedly over his less sagacious rivals. Of the *fabliaux* the prin. are *Le Vilain Mire* (The Peasant Doctor), *Estula*, and *Les Perdrix*. The most celebrated writer of *fabliaux* was the poet Rutebeuf (d. c. 1280), who wrote many mordant satires against women, mendicant friars, the

univ. and other subjects. He is more-over worthy of note as being the first Fr. poet to introduce a deep personal tone into his poetry.

The lyrical poetry of medieval Fr. literature was an outcome of the popular song. It was to a great degree imitated from the S. nations, the Italians, and the Spaniards, and from the troubadours of the *langue d'oc*. Lyric poetry developed upon 2 lines; as regards subject it sounded in an increasing degree the personal note; in form it became enslaved more and more to certain fixed forms (ballad, rondeau, chant royal, etc.). It is not until the 15th cent. that lyric poets of enduring reputation are found. Among them must be mentioned Alain Chartier (1386-1440), called the *père de l'éloquence française*; Charles, duke of Orleans (1391-1465), whose poems are full of grave elegance and melancholy; and finally François Villon (1431-80), who gave expression to a new depth of feeling and emotion. His *Petit Testament* and *Grand Testament* relate the excesses of his life, and his *Ballade des Dames du Temps jadis* ranks as one of the finest examples of lyrical poetry.

The earliest historical works were written in Lat. Afterwards hist. was written in the form of verse such as *L'Estorie des Angles* and 2 poems by Wace, viz. *Brut* (the hist. of the Bretons) and *Itou* (hist. of the Normans). The first important prose hist. is the *Conquête de Constantinople* by Villehardouin, 1207, which is a narrative of the events of the 4th crusade. A 100 years after Villehardouin, Jean de Joinville, at the request of Jeanne de Navarre, wife of Philippe le Bel, wrote his account of the 6th crusade. Froissart is a good deal less medieval in tone than Joinville. His *Chroniques*, written towards the end of the 14th cent., deal with the events in England, France, and Flanders between 1325 and 1378. Philippe de Commines was the historian of Louis XI, of Charles the Bold, duke of Burgundy, and of the expeditions to Italy under Charles VIII. His work takes us up to the year 1498.

The drama of the Middle Ages took its rise from the Church ceremonies. The liturgy was developed by interpolation of Lat. verses and canticles, and afterwards by recited pieces, which finally became amplified into such liturgical dramas as *Les Pasteurs* and *Les Vierges sages et les vierges folles*. Here the Lat. tongue gradually gave way to the native language, and as the scope of the pieces increased they were removed from the choir to the porch of the church. The *Jeu d'Adam* (12th cent.) was the first piece played outside the church. In the 13th, 14th, and 15th cents. arose the miracle plays dealing with the lives of the saints, mystery plays concerned with scriptural subjects and certain epic events of profane hist., such as the siege of Troy and that of Orleans. These mysteries often ran to enormous lengths, requiring as many as 100 performers, and sev. days for their presentation. In 1548 they were banned by the

Parlement de Paris on account of their increasing profanity, but they lingered on elsewhere until the end of the 16th cent.

The rise of Fr. comedy is very obscure. It appears to have developed from the *dits*, *monologues*, and *débats* that the wandering minstrels carried from castle to castle. The first known comedy is the *Jeu de la feuilée* by Adam de la Halle, played in 1262 in Arras, while another, *Robin et Marion*, by the same author, a pastoral play with a musical accompaniment, was played in Naples in 1285. In the 15th cent. many societies were formed for the presentation of farces, pantomimes,

borrowing from the various dialects. Unfortunately the less-known poets and their imitators carried these ideas too far and brought ridicule upon the school, which led to the eclipse of the fame of Ronsard. Ronsard during his life was regarded as the greatest of Fr. poets, and his sonnets are of considerable merit (see RONSARD). Du Bellay lacked the variety and force of Ronsard, but was more sincere in his verse. His best poems are contained in *Regrets*, *Antiquités de Rome*, and *Jeux rustiques*. Belleau wrote pastorals in his *Bergeries*, and du Bartas, a disciple of the Pléiade, a pretentious work, *La Semaine*, describing the creation of the world, according to the biblical tradition. Agrippa d'Aubigné (1550-1630), another disciple of the Pléiade, a Protestant, wrote *Les Tragiques*, 1616, a succession of descriptive tableaux dealing with the misery and corruption of the world and with the final judgment.

François Rabelais (c. 1490-1553) is a writer whose exact merit it is difficult to assess. B. at Chinon, he was first a monk and then a doctor. His masterpieces are *Gargantua* and *Pantagruel* (see RABELAIS).

The Renaissance led naturally to the trans. of the ancients, and Amyot's trans. of Plutarch, 1559, is specially worthy of mention. Henri Estienne furthered the knowledge of Greek and at the same time defended the language against the influx of It. words. Montaigne (1533-92) was among the first prose writers of his century. His *Essais* offer an inexhaustible wealth of information upon the varied customs of mankind (see MONTAIGNE).

The drama of the 16th cent. did not show any strong individuality. It consists almost entirely of trans. from Gk. Lat., and It. sources. In 1552 Jodelle produced *Cléopâtre*, the first original tragedy in Fr. Lariève wrote some dozen comedies adapted from the Italian, but wholly Fr. in spirit; and he may be regarded as the forerunner of Molière. Among the historians of the period mention should be made of Brantôme (1540-1614), whose *Mémoires* contain 'Vies des hommes illustres et des grands capitaines' and 'Vies des dames illustres.' He wrote with vigour, wit, and cynicism. Blaise de Montluc (1502-77), one of the foremost soldiers of his time, was the author of the *Commentaires de Messire Blaise de Montluc*, 1592. D'Aubigné, mentioned above, wrote *L'Histoire universelle*, a Fr. hist. from the Protestant standpoint from 1550 to 1601. Among religious works foremost is Calvin's *Institution chrétienne*, 1541, the Fr. version of his Lat. work of the same title. It is important as being the first religious work written in the Fr. language. François de Sales's *Introduction de la vie dévote*, 1608, also belongs to the 16th cent. by its style.

During the 17th cent. Fr. literature reached its zenith. The progress was not, however, greatly marked in the realm of poetry. The outstanding figure is Malherbe (1555-1628), a zealous opponent of all exaggeration. He insisted upon the use of words of undoubted Fr. origin, and

RONSARD (1524-85)

moralties, and *sotties*, such as *Les Clercs de la Basoche* and *Les Enfants sans souci*, in Paris. Of the farces the most celebrated is *L'Avocat Patelin*, 1470, of unknown authorship, which was modernised in 1872 and is still performed.

The 16th cent. ushered in the Renaissance of Fr. literature. The early renaissance found its most complete expression in Queen Marguerite of Navarre. She was the author of *Heptameron*, 1558, an imitation of Boccaccio's *Decameron*. Outstanding among the poets who enjoyed her patronage was Clément Marot (1497-1544), a courtier who produced some very elegant pieces and some *épîtres* which are of deeper inspiration.

In 1549 appeared Joachim du Bellay's *Défense et illustration de la langue française*, which set out the tenets of the new reforming party of Fr. poets. These poets grouped themselves round Ronsard, and were known as the Pléiade (q.v.). They endeavoured to give France a worthy literary language by imitating from the classics, by coining new words, and by

based his verse on the severest models, and thereby founded the classical school.

The classical movement was helped by sev. causes. In 1637 Descartes pub. his *Discours de la méthode*, the first Fr. book upon a philosophical subject. Indirectly the work had a great effect upon Fr. literature. Its theories appealed to Fr. minds, and all the writers of the century were imbued with Cartesian tenets. The unity of the language was further promoted by the estab. of the Fr. Academy, founded by Richelieu in 1634. Another influence upon Fr. literature in the 17th cent. was the famous *salons*, principal among which was the Hôtel de Rambouillet. The result was a refinement of language, a striving after elegance, which subsequently degenerated into affectation or *préciosité*. Vaugelas (1585-1650), one of the early members of the Academy, who had the reputation of knowing his own language better than any one and whose decisions were looked upon as laws, pub. his *Remarques sur la langue française* in 1647. Another prose writer of the period was J. L. Balzac, *le grand épistolier* (1594-1654), whose letters had a wide popularity and were regarded as models of style. Vincent Voiture (1598-1648), poet and letter-writer, was greatly admired in his day, and was for some 20 years the leading spirit of the Hôtel de Rambouillet.

The 17th cent. produced the 3 supreme dramatists of France, Corneille, Racine, and Molière (qq.v.). The first dramatist of the century was Alexandre Hardy (1569-1630), a prolific writer who produced some 700 or 800 plays, of which 40 have come down to us. Though not a great playwright, he nevertheless had a keen sense of dramatic effect, and knew how to marshal his scenes and to set off his characters. After Hardy came Jean de Mairet (1604-86), whose tragedy *Sophonisbe* is remarkable as being the first tragedy which strove to give effect to the unities of time, place, and action.

Pierre Corneille (1606-84), b. at Rouen, produced his first play, *Médée*, a comedy, in 1629. In 1636 *Le Cid* was produced. Its success was immense, and surpassed that of any previous play. In 1640 Corneille produced 2 plays, *Horace* and *Cinna*, and in 1643 *Polyeucte* and *Pompée*, as well as a very successful comedy, *Le Menteur*. Between 1642 and 1652 he wrote *Rodogune*, *Théodore*, *Héraclius*, *Nicomède*, and *Pertharite*. His characters show great firmness and heroism; he portrayed men as they ought to be, not as they are (see CORNEILLE).

Corneille was ultimately overshadowed by Jean Racine (1639-99). In 1667 he produced *Andromaque*, which achieved a great success, and between that date and 1677 sev. other tragedies, *Britannicus*, *Bérénice*, *Bajazet*, *Mithridate*, *Iphigénie*, and *Phèdre*, as well as a comedy *Les Plaideurs*. Unlike Corneille, he presents not the moral qualities but the emotions and passions of his characters (see RACINE).

Fr. comedy before Molière was represented by *Le Menteur* of Corneille and

works by J. Rotrou (1609-50) and P. Scarron (1610-60), imitated from the Spanish and Italian. Jean Baptiste Poquelin, alias Molière (1622-73), founded in 1643 *L'illustre Théâtre*, but was forced by want of success to tour in the provs. from 1645 to 1658. In the latter year he came to Paris, where he produced *Les Précieuses ridicules*, 1659, which estab. his reputation, and then successively *L'École des Maris*, 1661, *L'École des Femmes*, 1662, *Tartuffe*, his masterpiece, 1664, *Don Juan*, 1665, *Le Misanthrope*, 1666, *Le Médecin malgré lui*, 1666, *Les Femmes savantes*, 1672, and *Le Malade imaginaire*, 1673. The influence of Molière in comedy has been immense, greater by far than that of any other writer developing this particular branch (see MOLIERE).

Blaise Pascal (1623-62) was one of the foremost prose-writers of the 17th cent., and in reading him we feel that we have at length arrived at modern Fr. prose. He was a member of Port-Royal, the stronghold of Jansenism (q.v.). His first work, *Les Provinciales*, 1656, is a series of letters against the Jesuits. After his death were pub. his *Pensées*. He closely follows Montaigne in observing the uncertainty of human endeavour, but concludes that the sole refuge for thinking persons is in an absolute faith in God (see PASCAL). The 17th cent. also marked the zenith of the sermon. The 3 great preachers are Jacques Bénigne Bossuet, bishop of Meaux (1627-1704), Louis Bourdaloue (1632-1704), and Jean Baptiste Massillon, bishop of Clermont (1663-1742).

The increase of social intercourse called forth many works dealing with human manners and motives. The most celebrated moralist of the century was François de la Rochefoucauld (1613-80), who pub. his *Mémoires* in 1662 and his *Maximes* in 1665. In the latter he tries to show all human actions to be inspired by self-interest and vanity; his style is terse and antithetical. Jean de la Bruyère (1645-96) was less systematic than his predecessor; his *Caractères*, 1688, show deep penetration and a considerable tinge of misanthropy.

Of the great number of letter-writers of this period it suffices to mention Mme de Sévigné (1626-96), whose letters to her daughter, written in a sprightly and natural style, reveal to us not only her own emotions, but the hist. of the period, and Mme de Maintenon (1635-1719), second wife of Louis XIV, whose letters deal with the education of her young charges at St. Cyr. Memoir-writers are Mme de Motteville, who gives a simple and sympathetic account of the career of Anne of Austria; Cardinal de Retz, the historian of the Fronde; and Saint Simon, who, disappointed as a courtier, has left an account of the court of Louis XIV which is remarkable for the malignity of the portraits of his enemies.

The novel of the 17th cent. was generally an affected tale of chivalrous adventure. Best remembered are Honoré

d'Urfé's *L'Astrée*, 1627, a pastoral romance, and Mlle de Scudéry's *Le Grand Cyrus*, 1648.

The most typical Frenchman of the period was Jean de la Fontaine (1621-85). He pub. a book of *Contes* in 1664, and in 1668 the first 6 books of *Fables*, narrating episodes between various animals and full of penetrating reflections upon human life (see LA FONTAINE).

Nicolas Boileau (1636-1711) was the apostle of classicism. His work is mostly critical, and for more than a century his opinions were regarded as authoritative. His prin. work, *L'Art poétique*, codifies the usage of the great writers, and advocates the imitation of the ancients. In this he was opposed by the modernists, who, led by Charles Perrault, maintained that the age of Louis XIV had surpassed the finest achievements of ancient classical literature. Both sides in the dispute showed lack of critical judgment, but the modernists gained the day, and classical influence gradually waned. François Fénelon (1651-1715), archbishop of Cambrai, is well known as a prose writer. His *Educacion des Filles*, 1689, gives excellent advice upon the upbringing of girls. His *Télémaque*, 1699, is a didactic work, written for his refractory pupil, the duke of Burgundy. His *Explication des maximes des saints* embroiled him with Bossuet and led to his disgrace.

In the 18th cent. Fr. literature freed itself from court influence. Louis XIV d. in 1715, and after his death began the struggle against central authority that ended in the revolution. Literature as such made no great advance, the originality of the age being shown more in historical, scientific, and sociological research. The 2 connecting links between the old and new centuries are Bernard Fontenelle (1657-1757) and Pierre Bayle (1647-1706). The former became the populariser of scientific knowledge in his *Entretiens sur la pluralité des mondes* and his *Éloges des Savants*. The latter was the precursor of the encyclopaedists. His *Dictionnaire historique et critique*, 1697, was one of the indispensable handbooks of the 18th cent. Charles Montesquieu (1689-1755) is the first great writer of the 18th cent. His earliest work, *Lettres persanes*, 1721, is a brilliant and piercing satire on Fr. society and institutions. *De l'esprit des lois*, 1748, is an objective study of the various systems of legislation (see MONTESQUIEU).

Georges Buffon (1707-88) wrote from 1749 till his death his *Histoire naturelle* and *Époques de la nature*, which anticipated later discoveries.

The great name of the century is undoubtedly that of François Voltaire (1694-1778). Though his writings are not perhaps now widely read, his influence lives on. He turned his attention to many branches of literature and stands high in them all (see VOLTAIRE).

The *Encyclopédie* appeared from 1751 to 1772. It was begun by Diderot, who enlisted the collaboration of many distinguished writers. Though the gov.

attempted to hinder the work it was successfully pub., and contributed to the defence of political and intellectual liberty.

The theatre made little progress during the 18th cent. Jolyot de Crébillon (1675-1762) wrote horrific but vigorous tragedies. Jean François Ducis (1733-1816) is noted for his trans. of Shakespeare, and Voltaire's plays were performed with great success. The Molière tradition was continued by Jean François Regnard (1655-1709), Florent Dancourt (1661-1725), and Alain Lesage (1668-1747). The comedies of Pierre Marivaux (1688-1763) were of quite an original character. His prin. plays are *La Surprise de l'amour*, 1722, *Le Jeu de l'amour et du hasard*, 1734, and *Les Fausses confidences*, 1737. Pierre de Beaumarchais (1732-99) is famous for 2 plays, *Le Barbier de Séville*, 1775, and *Le Mariage de Figaro*, 1784. They are full of taunts at the nobility, and reflected exactly contemporary feeling.

After Voltaire the most influential writer of the century was Jean Jacques Rousseau (1712-78). His *Discours sur l'origine de l'inégalité parmi les hommes*, 1751, is the first manifesto of Communism. Rousseau's daring and original thoughts upon society directly influenced the revolution (see ROUSSEAU). His splendid descriptions of nature and his outpourings of personal feeling are among the prin. sources of that flood of romanticism which was to rise in the following century. His chief literary disciple was Bernardin de St Pierre (1737-1814), who wrote *Paul et Virginie*, 1789, a touching story of boy and girl love, full of splendid pictures of nature.

The best novelists of the 18th cent. were Alain Lesage, Pierre Marivaux, and the Abbé Prévost. Lesage wrote 2 works, *Le Diable boiteux*, 1707, an imitation from the Spanish, and *Gil Blas* 1715-35, an original novel whose scene is laid in Spain. Marivaux wrote the novels *La Vie de Marianne*, 1731-41, and *Le Paysan parvenu*, 1735-6. They resemble his comedies mentioned above. L'Abbé Prévost is the author of *Manon Lescaut*, 1732, a passionate love romance.

Turning to lyric poetry we find it represented at the beginning of the century by Jean Baptiste Rousseau (1671-1741), who was held for some time to be the greatest Fr. lyrical poet. Écouchard-Lebrun, nicknamed 'Lebrun Pindare,' wrote odes after the style of Pindar, notably *Le Vengeur*, c. 1800. André Chénier (1762-94), an unfortunate victim of the revolution, wrote elegies, bucolics, and idylls, which are modelled upon the Greek, and breathe the very odour of classical charm (see CHÉNIER).

In the 19th cent. sev. important movements manifested themselves in Fr. literature. The first is the Romantic movement, which took place between 1815 and 1850. The underlying principle of romanticism is the expression of individuality.

First of the romanticists is François de Chateaubriand (1768-1848), whose prin.

works are *Atala*, 1801, *Le Génie du christianisme*, 1802, and *René*, 1805 (see CHATEAUBRIAND). Mme de Staël (1768-1817) brought Shakespeare into the ken of the Fr. nation by her work *De la littérature*, 1800, and turned Fr. thought into a new channel by *De l'Allemagne*, 1810. Alphonse de Lamartine (1790-1869) was the first romanticist to develop the lyrical strain of poetry. Victor Hugo (1802-85) has greater claims to be held as the chief of the romanticists. He used every variety of metre, and revelled in an inexhaustible vocabulary. Hugo's attempts to revolutionise the drama were not successful. His novels, *Notre-Dame de Paris*, 1831, *Les Misérables*, 1862, *Les Travailleurs de la mer*, 1865, are too crowded and exuberant, though of great descriptive power (see HUGO). Alfred de Vigny (1797-1863) writes of the cruelty of nature and the indifference of God. His best poems are *La Colère de Samson*, *La Mort du loup*, and *La Bouclette à la mer*.

Alfred de Musset (1810-57) has a great hold upon Fr. hearts. His poems tell of the regrets of love, and are inexpressibly tender and sad. Best among them are *Les Nuits*, 1835. His dramas rank high in the list. of the Fr. stage (see MUSSET).

During the middle of the century arose the Parnassian school of poetry, whose leader, Théophile Gautier (1811-72), formulated the doctrine of *l'art pour l'art*. Gautier pub. his poems under the title of *Émaux et camées*, 1852, which well characterised the style of his work. His prin. followers were Leconte de Lisle (1820-94), José de Heredia (1842-1906), and Charles Baudelaire (1821-67). Sully Prudhomme (1839-1908) is the most philosophic of Fr. poets, and has a very clear and smooth style. François Coppée (1842-1908) was the poet of mean life. Paul Verlaine (1844-96), with Stéphane Mallarmé (1842-98), founded the symbolist school of poetry, suggestive, and at times obscure.

Hist. and literary criticism showed great virility in the 19th cent. The prin. critics were Abel Villemain (1790-1870), who inaugurated comparative and historical criticism; Augustin Sainte-Beuve (1804-1869), author of *Port-Royal*, 1840-60, *Portraits littéraires*, 1844-52, and *Les Lundis*, 1850-60; and Hippolyte Taine (1828-83). Among historians the most celebrated are Augustin Thierry (1795-1856), whose theory of the rivalry of race is propounded in *La Conquête de l'Angleterre par les Normands*, 1825, and *Le Tiers État*, 1853. François Guizot (1787-1874) studied hist. in a philosophic spirit and paid special attention to it as a social science. Adolphe Thiers (1797-1877) is extremely well-informed, industrious, exact, and clear. His 2 great works are *L'Histoire de la Révolution française*, 1823-7, and *L'Histoire du Consulat et de l'Empire*, 1845-62. Jules Michelet (1798-1874) is distinguished by the poetical quality of his historical writings, which, however, gradually got the better of his historical judgment. Fustel de Coulanges

(1830-89) is the greatest representative of the scientific method of treating hist.

Of the writers of comedies Augustin Eugène Scribe (1791-1861) was the most prolific, producing some 400 pieces. He is an admirable constructor of plots and has a mordant wit. Émile Augier (1820-1889) distinguished himself as the defender of morality and the family. *Le Gendre de M. Poirier*, 1854, is his best-known comedy. Victorien Sardou (1831-1908) was a disciple of Scribe. Alexandre Dumas fils (1824-95) wrote paradoxical comedies, dealing chiefly with marriage and divorce. With Edmond Rostand (*Cyrano de Bergerac* and *Chantecler*) the comedy has again turned towards idealism and poetry.

As regards novelists, George Sand (1804-76) was a prolific female author, who wrote successively romantic, socialist, and pastoral novels (see GEORGE SAND). Stendhal (1783-1842) wrote novels of a psychological and realistic character, such as *Le Rouge et le noir*, 1831, and *La Chartreuse de Parme*, 1839. Honoré de Balzac (1799-1850) is the greatest of Fr. novelists. He is the most fertile creator of types, and excels in delineation of character. His collection of works is called *La Comédie humaine* (see BALZAC). Gustave Flaubert (1821-80) originated the realistic school by his *Mme Bovary*, 1857, which was followed by a historical romance, *Salammbo*, 1862, a story of Carthage. The greatest writer of the naturalist school was Émile Zola (1840-1902), whose style if sometimes tinged with vulgar brutality is yet robust. Guy de Maupassant (1850-93) excelled in the short story. Alexandre Dumas père (1803-70) wrote romantic novels such as *Les Trois Mousquetaires*, 1844, and *Le Comte de Monte-Cristo*, 1841-5. Prosper Mérimée (1803-70) wrote sev. novels in sober and concise style, best known of which is *Colomba*, 1840, the story of a Corsican vendetta. Jules (1830-70) and Edmond Goncourt (1822-96) wrote in collaboration. They are scrupulously exact in their observation. Alphonse Daudet (1840-97) is a humorist whose best character is the celebrated Tartarin of Tarascon.

Summary of French Literature after 1870.—The period of the Third Republic (1870-1940) had but little to do with politics; and in the domain of pure literature the Fr. nation during this disturbed period achieved much. One outstanding name in the period is that of Valéry (1871-1945) who, in 1940, was the official poet of the Third Rep. (see VALÉRY). Paul Claudel represented in this period the important Catholic revival, he having been himself converted in 1886 (see CLAUDEL). The failures of Catholicism became the subject of literary essays by Léon Bloy (1846-1917), Péguy and Georges Bernanos (1888-1948); but the most reliable critics deny that a single great work of art came out of the Catholic revival; for Jules Lemaitre (1853-1914), Maurice Barrès (1862-1923), though Catholics in name, were really sceptics,

while Charles Maurras and Ferdinand Brunetière (1849-1906) did not even make a pretence of believing. With the commercialisation of the novel came the limitations incidental to mass production and the search for popularity. Among the best-sellers of the period in this kind were René Bazin (1853-1932), Paul Bourget (1852-1935), Abel Hermant, and Marcel Prévost. None of these, however, could write with the brilliant objectivity of Pierre Loti (1850-1927); and over all towered the figure of Anatole France (1844-1924), whose novels are admirable exercises in irony and compassion (see ANATOLE FRANCE). Romain Rolland (1866-1944) is important chiefly for one

ANATOLE FRANCE

work, the 10-vol. novel *Jean Christophe*, 1904-12, written as a direct reaction to Nietzsche's superman and ethic, and by way of an attempt to reconcile and unite France and Germany (see ROLLAND). Among literary critics of the period may be named Émile Faguet (1847-1916), notable for his works on the 17th cent.; Ferdinand Brunetière (1849-1907), one-time master of the *Revue des Deux Mondes*, and a scientific materialist; Jules Lemaitre (1853-1914); Rémy de Gourmont (1858-1915), whose criticism is warped by his democratic ideology, though he was the guiding spirit of *Le Mercure de France*; Charles Péguy (1873-1914), known for his great work on—almost by way of rehabilitation of—Victor Hugo; Léon Daudet (1867-1942), and Charles Maurras, who together produced *L'Action française*, but whose political theories destroy much of value in their work. Essayists of the period include Émile Chartier Alain, who writes in the spirit of revolt against authority, as in *Mars ou la guerre jugée*, 1921; Henri Bremond, (1865-1939), whose *Histoire littéraire du sentiment religieux*, 1916, put a new complexion on the age of Louis

XIV; Jacques Maritain, whose *Art et scolastique*, 1930, is a classic of erudition; and Julien Benda, the critic of Bergson.

Fr. novelists of the early 20th cent. are so varied in their outlook that they can hardly be classified. Jules Romains (1885-), primarily a poet of the *groupe de l'abbaye*, is chiefly famous for his remarkable 27-vol. novel, *Les Hommes de bonne volonté*, 1932 ff.; but his earlier fine comedy, *Knock*, 1923, a social satire on the medical profession, was a success, also as a film. André Gide (1869-1951) exercised a deep influence on the first half of the 20th cent. by his intellectual curiosity, outspokenness, and absolute sincerity (see GIDE). Jules Supervielle (1884-) is of the modern school, but without pessimism, as is illustrated in his *Le Forcat innocent*, 1930. Pierre Hamp invented a new type of novel without a hero, spun on an industrial theme, yet entirely human. Other names are those of Jean Richard Bloch; Eugène Montfort, writing novels of his life in the vein of Zola, but still more pronounced; Joseph Rosny, whose stories are really allegories; Alain Fournier, whose chief note is fantasy; Roland Dorgelès; Paul Morand, who exploits the amoral mentality of post-war life; Jean Giraudoux (1882-1944), writer of fantastic dreams and an important dramatist; Jean Schlumberger (1877-), whose *Saint-Saturnin*, 1931, a picture of the domain family life of Normandy, is one of the best novels of the times; Marcel Jouhandeau (1888-), subtle and sadistic in treatment; Jacques de Lacretelle; the Catholic novelist Georges Bernanos (1888-1948), known especially for *Le Journal d'un curé de campagne*, 1936; and François Mauriac (1885-), novelist of the Catholic bourgeoisie and of the Christian problems of the soul.

One of the most popular novelists of the first half of the century was Colette. Other novelists of importance, besides those already mentioned, particularly Gide, Mauriac, Romains, and, of the younger generation, Camus (qq.v.), are Roger Martin du Gard (1881-), Georges Duhamel (1884-), André Maurois (1885-), Jean Giono (1895-), Julien Green (1900-), Raymond Queneau (1903-), and the Fr.-Swiss realistic writer Charles-Ferdinand Ramuz (1878-1947). The realistic and political novels of André Malraux asserting a 'tragic humanism,' deal with the author's experience in the Chinese Revolution of 1926 (*Les Conquérants*, *La Condition humaine*), in the Sp. Civil war (*L'Espoir*, 1937), and in the Fr. Resistance movement (*Les Noyers d'Altenburg*, 1948). Malraux later specialised in essays on fine arts (*Psychologie de l'Art*, 1947-50). André Chamson (1900-), of the Protestant tradition, and also a member of the Resistance during the war, often used political and social events as the background to his novels (*La Galère*, *La Neige et la Fleur*). Another writer who utilised his experience in his novels was the aviator Antoine de Saint-Exupéry (1900-44). Henri de Montherlant (1896-) has turned from the novel to

the theatre (*La Reine morte, Le Maître de Santiago, Port-Royal*); Georges Simenon (1903-) became popular through his detective stories, many of which have been trans. into Eng. Jean Anouilh (1910-) enjoys a great popularity as a dramatist; Marcel Aymé (1902-) is known for his humorous novels and plays. Marcel Pagnol (1895-), whose trilogy *Marius, Fanny, Cécile* were successes before the Second World War, had turned to the cinema in the later 1930's.

Among poets, and former members of the surrealist movement, who achieved fame are Louis Aragon (1897-) and Paul Eluard (1895-1952), who passed from surrealism to an idealistic communism; Jean Cocteau (1889-), combined surrealism with his own brilliant fantasy; André Breton (1896-) may still be regarded as the leader of the movement, to which also belong Julien Gracq (1909-) and, more loosely perhaps, Henri Michaux (1899-). A school of 'Neo-Surrealism' was created in the late 1940's, attracting a number of younger writers, though no really outstanding poet since Valéry has yet emerged. Jacques Prévert (1900-) is known for his humorous fantasy and original free verse (*Paroles*, 1946, *Spectacle*, 1951); others that deserve mention for their individuality are Audiberti (1899-), René Char (1907-), Aimé Césaire (1913-), and Pierre Seghers (1906-); the last-named is also a publisher concentrating on 20th-cent. poetry (*Poètes d'aujourd'hui*). Poetic realism is found in Jean Follain and Guillevic. Catholic poets, each strongly individual, include Jean Cayrol, Luc Estang, Patrice de La Tour du Pin (all b. 1911), and Pierre Emmanuel (1916-). Among the Existentialists are Jean Wahl (1888-), Georges Bataille (1897-), Francis Ponge (1899-), André Frénaud (1907-), and Jean Grosjean (1912-).

Whilst Gabriel Marcel (1889-) represents the Christian side of Existentialism, the intellectual leader of atheistic Existentialism is Jean-Paul Sartre (1905-), who expounded his philosophy in his work *L'Être et le Néant*, 1943 (trans. under the title of *Being and Nothingness*, 1957), and popularised it in his novels (*Les Chemins de la liberté*), essays and lectures (*Existentialism and Humanism*), and plays. Similar ideas are to be found in the works of Maurice Merleau-Ponty (1908-). Another exponent of Existentialist writing is Simone de Beauvoir (1908-), whose novels *Le Sang des autres*, *Tous les hommes sont mortels*, and *Les mandarins* have become successes. To this group may be added the poet and playwright Jean Genet (*Les Bonnes, Le Balcon*) as well as Eugène Ionesco. Existentialism, however, already has its strong critics, from such diverse elements as rationalists, Catholics, and orthodox Marxists.

Albert Camus, dealing with the problem of the individual in *L'Étranger*, turned to man's fate as part of a collectivity (*La Peste, L'homme révolté*). In 1956 appeared *La Chute*, a novel on human distress.

A great number of Fr. writers turned to

politics during and after the Second World War, notably to Marxism, which left its mark in their works (Sartre, Aragon, Eluard, Lefebvre, Tristan Tzara, Aimé Césaire, and others). Sartre's *Les Mains sales*, 1948, is a political play about the responsibility for the assassination of a party leader; his *Nekrassov*, 1955, is a satire on the fear of Communism in the middle classes in France, and the distorted news in the influential press.

Although some intense nihilistic trends can be felt in recent Fr. literature, of which the controversial plays of the Irish-born Samuel Beckett (*En attendant Godot, Fin de partie*) are characteristic, there is also a tendency to go back to spiritual values, and to search for new approaches, trying to detach again philosophy and politics from literature.

Among the young generation, the novelist François Sagan (1935-) had a startling success with *Bonjour tristesse*, 1954, which was followed by the novels *Un certain sourire*, 1956, and *Dans un mois, dans un an*, 1957.

French Music. Although in France M. as a consciously cultivated art never held the pre-eminence of the Netherlands in the 15th cent., Elizabethan England, 16th and 17th cents., Italy or Germany and Austria between about 1700 and 1900, the Fr. school is by far the earliest to exert an influence and to command the attention of historians. Like other countries, but more conspicuously than any, France cultivated folksong and instrumental dances long before such things were fixed for posterity in musical notation; and musical art-forms arose before they could be ascribed to any individual composers, although they were clearly contrived by practising musicians according to definite principles. The 12th- and 13th-cent. troubadours in the S. of France and trouvères in the N. were certainly composers as well as poets and performers. They sang their songs probably, but not certainly, with instrumental accompaniment. The chief vocal forms of the period were the *lai*, set to a poem in pairs of stanzas, and the *rondeau*, *virelai*, and *ballade*, all of which had refrains, like round-dances; an actual dance played by instruments was the *estampie*, or *estampida* of Provence. The last of the trouvères, Adam de La Halle, used music of this type for a pastoral play, *Le Jeu de Robin et de Marion*, produced about 1275-86, which in a sense was an early anticipation of opera. Instrumental M. was also played by itinerant jugglers and, of course, by any musicians who gave their services to both folk and courtly dancers. The M. of the dances developed various forms, some of which still survive in instrumental M.

So far F. M. had been restricted to single melodic lines: the unaccompanied plain-song of the Church, the possibly accompanied songs of the minstrels, and the simple, symmetrical dance-tunes. But in the second half of the 12th cent. and the first of the 13th a rough kind of polyphony (q.v.) arose, known as *ars antiqua*, the chief Fr. centre of which was the school of Notre-Dame in Paris. This fl. for 2 generations, the former under the first great individual master of F. M., Léonin, the latter under his equally great successor, Pérotin. They began to combine different melodies where formerly plain-song tunes had been merely doubled at the intervals of an octave and a fourth, and by the time the school had reached its apex, it had discovered the use of canon. More and more elaborate settings of liturgical texts thus developed the motet (q.v.), as yet in a primitive form.

The outstanding master of the 14th cent., Philippe de Vitry, did much to undermine the medieval modes (q.v.) and work towards the modern major and minor scales. At this time new secular forms like the *rota* (round) and the *chace* (a song in canon, equivalent to the It. *caccia* and the Eng. *catch*) arose, and with

them and other secular forms the *ars antiqua* gave way to the *ars nova*. The great contemporary of Vitry was the slightly younger Guillaume de Machaut; both consolidated polyphonic Church M. in masses and motets and brought the popular vocal forms of the troubadour age to maturity, and in fact to the verge of decay, by over-elaboration in part-writing.

The 15th cent. is dominated by the Netherlands school which developed polyphonic Church M.; in France the important Burgundian school relied largely on Flem. composers, with Binchois and Dufay at their head. But early in the next century a secular polyphonic type that was peculiarly Fr. reached its full maturity—the *chanson* for sev. voices or 1 voice with instruments—which wove light melodic material into an airily elaborate texture and in the hands of its most characteristic master, Jannequin, introduced realistic imitations of various non-musical sounds, such as the noises of a battle. By 1570, when the poet Antoine de Balf founded an Académie de Poésie et Musique, words had become so important that the metres of verse imposed their patterns on the musical rhythm in a new type, the *chansonnette mesurée*, where long and short notes served not so much to form melodies as to follow the quantities of Fr. poetry. *Airs de cour* and *chansons à boire* became fashionable at this period. So also did lute M., of which Denis Gaultier was the greatest representative. The Reformation left little mark on Fr. church M., but the Huguenots Goudimel and Louis Bourgeois made important contributions to the Protestant psalter. Towards the end of the 16th cent. came Titelouze, the first master of organ M., which was to become a special feature of F. M.

In 1581 a stage entertainment, *Le Ballet comique de la reine*, distinctly pointed forward to a new 17th-cent. type, the *ballet de cour*. This developed out of earlier tourneys and masquerades and was soon to turn into the opera-ballet, a characteristically Fr. form, to which the influence of It. opera also contributed and which was to dominate the stage for a long time, cultivated by Lully and many others, and carried into the 18th cent. by Rameau. (See also under BALLET and OPERA.) But both these masters, as well as Cambert, Colasse, Campra, Desmarests, Montéclair, and Destouches, also wrote pure operas; in these, however, a spectacular element akin to that of the ballet was retained, and the M. was divided into short airs, choruses, and dances, linked with long stretches of recitative in which the dialogue was carried on with a good deal of care for the natural declamation of words rather than for musical interest. In the church a new type of motet, much less contrapuntal than that of earlier times and rather in the nature of operatic choruses, was cultivated by Marc-Antoine Charpentier, Lalouette, Lalande, and the great Couperin; this last is also the outstanding representative of the school of harpsichord composers

who are the most striking Fr. creative musicians of the 17th cent. The school included Chambonnières, who came so early as to be almost isolated and was followed by Le Bègue, d'Anglebert, Couperin, Clérambault, Dandrieu, Rameau, Dagincourt, Daquin, and Dauvergne. Marais, Forqueray and some others represented the end of the period of cultivation of the viol.

This gave place in the 18th cent. to an admirable school of violin playing and composition, the traditions of which were never forgotten. Senaillé, Leclair, Francœur, Baillet, and Rode were among the composers for this instrument. Opera continued successfully, but the mythological and heroic subjects of the preceding century now gave way to an increasing interest in real human beings, treated either humorously or sentimentally. Mondonville still adhered to the older type, but men only a little younger than he, like Philidor and Monsigny, favoured the newer comic opera, which before long shared the operatic stage with the *comédie larmoyante*, in which the characters were treated with an affectionate compassion, if often given rather thin M. by such composers as Grétry, Dezède, or Dalayrac. One composer of this group, Duni, was of It. origin; Grétry and Gossec were Belgians; and the Swiss Jean-Jacques Rousseau contributed to the Fr. stage pieces as slight as the Eng. ballad opera. It may be noted here that later on foreign composers (Gluck, Cherubini, Meyerbeer, Rossini) were to make notable contributions to Fr. opera, to the point of influencing its development. Later in the 18th cent. opera became more grandiose again in the hands of Cherubini, Lesueur, Méhul, and Catel, without however losing its concern with human beings, and by the time of the Revolution it had developed into the humanitarian 'rescue opera,' of which Cherubini's *Les Deux Journées* is the finest and Gaveaux's *Léonore* the most typical example, if only because its libretto became, trans. into German, that of Beethoven's *Fidelio*. That musically also Beethoven was influenced by Fr. opera of this kind is evident from Cherubini's and Méhul's works. Lesueur, Méhul, Catel, and especially Gossec did much to advance the art of orchestration, sometimes in an enterprisingly experimental way that points forward to Berlioz.

In the 19th cent. opera split up into 2 new types, *grand opéra* and *opéra-comique*. The latter was charmingly cultivated by Boieldieu, Isouard, Auber, Hérold, and others, and did not deteriorate artistically, though it became even lighter, in the operettas of Leococq, Audran, Planquette, and Messager. But the masters of Fr. operetta, of a peculiar satirical kind, as well as that of *grand opéra* at this time, were once again foreigners, the Ger. Jews Offenbach and Meyerbeer. A quite new development of *opéra-comique* came with one of the supreme masterpieces of all opera, Bizet's

Carmen, in 1875. Berlioz's *Les Troyens* was a new departure in the heroic type, but the lyrical grand operas of Ambroise Thomas, Gounod, Saint-Saëns, and Massenet had not enough grit or taste to exercise a wholesome influence. A valuable offshoot of comic opera, in a sense, were the ballets of Delibes. More remarkable than the developments of opera in the 19th cent., because less expected, were the advances made in instrumental M. and song. Another alien, the Belgian César Franck, had an influence on orchestral M. with his symphony, and he both carried on the Fr. organ school and gave new impetus to chamber M. by demonstrating its importance to his pupils, who included Castillon, Duparc, Chausson, and others. Duparc, however, was mainly a song-writer, the first of many who enriched the song repertory with sensitive and poetical work. The greatest of them is Fauré, who also did much, independently of Franck, to advance chamber and piano M. So, on a lower level of taste, if not of workmanship, did Lalo and Saint-Saëns. Guilmant, Gigout, and Widor represented the organ school. Before Debussy and Ravel the most important figure in what now took on the aspect of a renaissance of Fr. non-operatic M. was certainly Fauré, though it may perhaps be said to have begun with the slightly older Chabrier, a most original composer though less profoundly gifted. Meanwhile the Franck tradition was continued, but with a noble independence, by Vincent d'Indy, who showed an interest in folksong which had never touched Franck. This also influenced Hourgault-Ducoudray and Charles Bordes, as well as 'regional' composers like Guy-Ropartz, Séverac, and Ladmirault.

As we turn to the 20th cent., we find opera, sometimes verging on the sensational, continued by Reyer, Bruneau, Charpentier, and Leroux; the new instrumental tradition maintained by Maurice Emmanuel, Dukas, and Koechlin, with Roussel and Florent Schmitt coming in a little later; and the organ school upheld by Tournemire and Vierne. A new influence not unlike that of Chabrier came in the strange figure of Satie, but it was Debussy and Ravel who were the outstanding composers of this period, as eminent in their way as Berlioz had been in the first half of the 19th cent. Satie's influence was shown by some at least of the members of the group known as 'Les Six,' only 3 of whom, Honegger, Milhaud, and Poulenc, continued to make an impression. The 20th-cent. scene is not crowded with composers, and none has so far reached outstanding eminence; Messiaen has achieved some notoriety by excursions into strange territory, and a group of young 12-note composers shows that curiosity in new ways and means has remained a characteristic of Fr. creative musicians. See L. de La Laurencie, *Histoire du goût musical en France*, 1905; N. Dufourq, *La Musique française*, 1949; M. Cooper, *French Music*, 1951. See also

composers' names mentioned in this article.

French Oceania includes all the is. of the Pacific which lie E. of 155° W. long. except for a few small Brit. is. The official title is *Établissements Français de l'Océanie*, and they are administered from Papeete (q.v.) as a colony of France. The groups are as follows: Society Is. (q.v.), Rapa, Australs, Marquesas (q.v.), Tuamotu Archipelago, Gambier Is., and Clipperton Is. (q.v.). The colony is administered by a governor, appointed by France, assisted by a deputy to the Fr. Chamber of Deputies, a local Representative Assembly of 20 members, and a delegate to the Fr. National Union. There are 2 municipal councils, also 94 dist. councils composed of Tahitians which function in the different is. The basic laws are those of France.

The earliest truly scientific exploration of the Pacific was that of La Pérouse. Capt. Cook's discoveries having inspired the Fr. Gov. to sponsor the voyage. In 1788 La Pérouse reached Australia but thereafter was lost. The Constituent Assembly sent d'Entrecasteaux to look for him, but without results; after visiting New Caledonia and sev. strings of is. round it, d'Entrecasteaux d. in the course of his expedition. In 1825, during a cruise to Santa-Cruz, Dumont d'Urville learned that La Pérouse had perished there. Encouraged by the results obtained by Dumont d'Urville's voyage, Louis-Philippe decided to support Fr. missions in Oceania which the Bourbon Restoration had created. These bands of fathers were struggling against the London Missionary Society, which had spread over all the ter. Thenceforward Fr. incursions became frequent, their avowed object being the protection of the Catholic missions in the E. Pacific ocean. Thus the Fr. estab. themselves in Tahiti, which Wallis, a Brit. subject, had explored before Bougainville (q.v.), who had preceded La Pérouse. It only became known later that Bougainville had taken possession of Tahiti for France and buried the authenticated deed in the ground. He named the is. La Nouvelle Cythère. It was in Tahiti that the Fr. missionaries were threatened with expulsion by Queen Pomaré, who was encouraged by the energetic Brit. consul, Pritchard. Adm. Dupetit-Thouars obtained the first agreement guaranteeing the safety of the Frenchmen on the is.; in 1843 he had to organise a new expedition to lay the foundations of a new protectorate and, in the end, had to proclaim the deposition of Queen Pomaré.

The chief industries are the production of copra and phosphate. The fertile coast land grows coconuts, bananas, oranges, sugar, vanilla, and many other tropical products. The chief exports in 1954 were as follows: copra, 21,570 tons (value 270,507,000 francs); phosphate, 228,894 tons (value 186,587,000 francs); vanilla, 130 tons (value 120,710,000 francs); and pearl-shell, 872 tons (value 59,571,000 francs). The total value of imports in

1954 was 711,670,000 francs. The area of the whole colony is 1544 sq. m. Pop. of whole colony in 1951: natives, 53,868; Fr., 1424; Chinese, 6855; others, 881. See J. Stern (former Fr. minister of colonies), *The French Colonies Past and Future*, 1944, and the *Pacific Islands Year Book*.

French Revolution, see FRANCE, History.

French River, Ontario, Canada; it empties Lake Nipissing into Lake Huron and enters Georgian Bay after a rapid course of 60 m.

French Somaliland, see SOMALILAND; JIBUTI.

French Sudan, see SUDAN, FRENCH.

French West Africa, see FRENCH GUINEA; DAHOMEY; IVORY COAST; NIGER; SAHARA; SENEGAL; SENEGAMBIA; WADAI.

French West Indies comprise the is. of Martinique, Guadeloupe, Marie-Galante, Les Saintes, Désirade, St Barthélemy, and part of St Martin in the lesser Antilles. Total area 1105 sq. m.; pop. 469,130. See separate articles.

Freon, liquid known chemically as dichlorodifluoromethane (CCl_2F_2) used as a non-inflammable refrigerant. Also the extract of pyrethrum flowers is dissolved in F. and the solution used as a spray for killing insects.

Frequency (f) of alternating current (a.c.), the number of complete cycles per sec. The periodic time, T , is the time taken to complete 1 cycle or wave. If a coil is rotating at constant angular speed ω in the magnetic field between 2 poles, the e.m.f. induced in the coil completes 1 cycle during 1 revolution. Thus $\omega = \frac{2\pi}{T} = 2\pi f$. In power supply the F.

in Europe is usually 50 cycles per sec., in the U.S.A. 60 cycles/s. For traction, 16½ or 25 cycles is common. In radio communication a wide range is used, expressed in kc/s = 1000 c/s or Mc/s = 1000 kc/s = 10^6 c/s. Electromagnetic waves are propagated in space at a velocity of 3×10^{10} cm/s, thus wavelength and F. are related by $\lambda/T = f\lambda = 3 \times 10^{10}$ cm/s. The F.s are classed as:

very low	VLF	<30 kc/s, $\lambda > 10$ km
low	LF	30–300 kc/s, $\lambda = 10 - 1$ km.
medium	MF	300–3000 kc/s, $\lambda = 1000 - 100$ m.
high	HF	3–30 Mc/s, $\lambda = 100 - 10$ m.
very high	VHF	30–300 Mc/s, $\lambda = 10 - 1$ m.
ultra-high	UHF	300–3000 Mc/s, $\lambda = 100 - 10$ cm.
super-high	SHF	3000–30,000 Mc/s, $\lambda = 10 - 1$ cm.

Continental writers use the Hz (Hertz, q.v., after the Ger. physicist) and multiples kHz, MHz, as unit for F., 1 Hz = 1 c/s.

Frequency Modulation, see MODULATION.

Frere, Sir Henry Bartle Edward (1815–84), administrator, b. Clydach, Brecknockshire, and educ. at Bath and Haileybury. He entered the Bombay civil service in

1834, and remained in India for 33 years. During the mutiny he did invaluable work in connection with the relief of the Punjab, for which he was thanked by Parliament, and in 1859 appointed a member of the viceroy's council. Returning to England, 1867, he held various offices, and in 1877 was made governor of Cape Colony and high commissioner of South Africa. Under his rule occurred the first Boer war and the struggle with Cetewayo. In 1880 he was recalled for having exceeded his instructions. He defended himself in *Afghanistan and South Africa*, 1881, and other pubs. See life by Martineau, 1895.

Frere, John Hookham (1769–1846), Eng. diplomatist and author, son of John F., a distinguished antiquary, b. London and educ. at Eton and Calus College, Cambridge. He served in the Foreign Office, and, subsequently entering Parliament, was made under foreign secretary. In 1800 he was envoy to Portugal; ambas. to Spain 1802–4 and again 1808–9. He made some excellent trans. of the plays of Aristophanes, and was one of the founders of *The Quarterly Review*.

Fresco Painting, process of mural P. on plaster which is still *fresh* (lt. *fresco*) or wet. F. P. is executed on a brick or stone wall which must, first of all, be perfectly dry. The plaster to be applied is composed of lime and water prepared a year before it is wanted and then mixed with sand at the time of using. Sev. coatings of this preparation are applied, but the first ones only—the *arriccio*, half an in. thick—to the entire wall at once. The 2 finer coatings—the *intonaco*—are applied only to that portion of the wall which it is intended to paint in the day, so that it may not be dry before receiving the pigments. The reason for this is that in the process of drying, a crystal surface of carbonate of lime forms over the plaster, and it is essential that the pigments should be there ready to receive this coating, for it is protective to them and gives them clearness. When the plasterer has covered the portion of wall to be painted, the painter superimposes his cartoon and pricks off the outlines with an instrument of wood or bone, or makes an impression of it by pouncing. The cartoon is then removed and the colours are applied. The fresh plaster becomes thoroughly impregnated by them, and they are thus incorporated with the rock or stone of lime and sand which constitutes the plaster, and are therefore as enduring as the stone plaster if the process is properly carried out. The colours, which are principally earths or minerals, for these best resist the chemical action of lime, are ground up and mixed with pure water; they should be thin and transparent, and darker than required, for in drying they become paler. From its nature F. P. must be executed rapidly and its effects produced by single touches of the brush: therefore none but a master-hand can exercise the craft with complete success. F. P. has sometimes been confused with the *in tempera* and *encaustic*.

methods of P., which probably preceded it. The date at which it came into use cannot be fixed; it belongs to remote antiquity. Colossal figures painted *afresco* have been taken from ancient Egyptian palaces and temples, and fragments have been recovered in Herculaneum and Pompeii which had lain for centuries beneath masses of earth and ruins. These had preserved all their original brightness of colour. The best exponents of the craft were the It. masters, among them Giotto, Masaccio, Ghirlandajo and Michelangelo, Piero della Francesca and Luini. Ruskin says that F. P. seems to have been practised at Verona in absolute perfection in the 15th cent. In modern times F. P. has languished, though in their attempt to emulate early It. masters it was practised with fair technical success by Cornelius and other 19th-cent. Ger. painters. The attempt to introduce F. P. in London, notably in the ambitious enterprise of decorating the Houses of Parliament by this means, was not successful owing to the large quantities of sulphurous acid gas in the atmosphere. See J. Ward, *Fresco Painting*, 1909; H. Feibusch, *Mural Painting*, 1946; and E. W. Anthony, *Romantic Frescoes*, 1951.

Frescobaldi, Girolamo (1583-1643). It. organist and composer, b. Ferrara. He

GIROLAMO FRESCOBALDI

first gained a reputation as a singer. He was organist of St Peter's, Rome, 1608-28, and again from 1633 to his death. He was an excellent teacher, and numbered J. J. Froberger, the Ger. organist, among his pupils. His compositions included various forms of both instrumental and vocal music. A collection of madrigals was pub. at Antwerp in 1608, but it is his organ music (a large number of *ricercari*, *toccatas*, *cansoni*, etc.) that is especially noteworthy and of historical importance. See monographs by A.

Sostegni, 1929; L. Ronga, 1930; and F. Morel, 1945.

Fresh-water Herring, see COREGONUS.

Freshwater, largest par., and a seaside resort of the Isle of Wight, England, 10 m. W. of Newport. F. forms the W. extremity of the is., the greater part of the par. being enclosed by the R. Yar. F. is noted for its interesting caves, and as the residence of Tennyson during the latter years of his life. The par. church dates from the 11th cent. Pop. 4000.

Fresnel, Augustin Jean (1788-1827), Fr. physicist, b. Broglie (Eure). He was an engineer of the Ecole des Ponts et Chaussées, and served in the depts of Vendée, Drôme, and Ille-et-Vilaine, but owing to his espousal of the Bourbon cause, lost his post on Napoleon's escape from Elba. Although he was reinstated he had turned his attention to physics in the interval. In 1819 he was appointed a commissioner of lighthouses, and was the first to construct the compound lenses instead of mirrors. He studied effects which were due to the interference of light-waves, and in particular used a special prism (Fresnel's biprism) to produce interference patterns (Fresnel fringes). His discoveries helped to establish the undulatory theory of light, which had first been advanced by Huyghens. See D. F. G. Arago, H. de Senarmont, and others, (*Œuvres complètes de Fresnel*, 1866-70).

Fresnes-sur-Escaut, Fr. tn in the dept of Nord, 5 m. NE. of Valenciennes. It manufs. woollens, glass, and beet-sugar, and there are coal-mines nearby. Pop. 7400.

Fresnillo, tn in the state of Zacatecas, on the main line from El Paso to Mexico City, 7350 ft above sea level, at the foot of the Cerro del Proano, and 33 m. NW. of the city of Zacatecas; there are rich silver mines and some copper, and large amalgam works. Pop. 24,600.

Fresno, city and co. seat of the co. of F., California, U.S.A., in the San Joaquin Valley, and 160 m. SE. of San Francisco. It is a rich farming dist., producing grains and fruit, especially Smyrna figs, and grapes for raisins and wine-making. The chief industries are the preserving of fruits, lumbering, and mining; there are canneries, cotton-seed and olive-oil mills, foundries, and brick and pottery plants; farm equipment and clothing are also manufactured. The F. petroleum field is one of the richest in the state. F. is the seat of F. State College. Pop. 91,670.

Fretum Gallicum, see DOVER, STRAIT OF. **Fretum Herculeum**, see GIBRALTAR, STRAIT OF.

Fretwork, or **Fretsawing**, art of cutting exterior and interior patterns in thin material such as wood, sheet metal, composition boards, plastics, etc. Designs in the last century were for intricate ornamental articles. To-day designs and plans are pub. for F. which are useful for the making of models, toys, etc., and for architectural planning. The prin. tool is a long-armed metal frame with handle for control and guidance. A thin 5-in.

blade with about 20 teeth to the in. is held by a clamp between the arms. Rapid up-and-down motion causes the teeth to bite and cut and turn in a very small space. Holes are made for the tiny sawblade to be threaded through and refixed in the frame in order that interior frets can be undertaken: a special tool called the archimedian drill has a fine bit for the purpose of boring the hole necessary for the insertion of the saw. Fretsaw blades vary in number of teeth and thickness of blade from fine to coarse; metal-cutting blades have a much larger number of teeth. Full-size design patterns provided are pasted to the cutting material, or copied out on it. After cutting is completed the parts are cleaned with glass-paper (emery paper for sheet metal) and put together to make the complete article. F. in wood incorporates designs for pipe racks, wool winders, cigarette delivery boxes, wall plaques, etc. Treadle machines follow the same principle of cutting and leave both hands free to manipulate the work on the cutting table. Heavier and more ambitious work is thus possible. The most modern machine is a bench machine fitted with a fractional h.p. motor, driven from the electricity supply; this is suitable for the amateur, but heavier machines are provided for the commercial user. See W. F. Chambers, *All about Fretwork*, 1948.

Freud, Sigmund (1856-1939), prof. of neurology, Vienna Univ., famous as an exponent of psychoanalysis (q.v.). He was b. Freiburg, Moravia, and educ. in Vienna, and at the Salpêtrière, Paris. His first serious studies moved from law to natural science. Later he worked under Brücke in the univ., Vienna, and in 1884 became assistant physician at the General Hospital. In 1885 F. became associated with Charcot, the Parisian neurologist, who taught that hysteria is of psychical origin and that ideas can produce physical changes, and F. returned to Vienna with his first inspiration to psychoanalysis. In 1893 he pub. with Breuer, *Studien über Hysterie*, outlining the theory that hysterical cases can be successfully treated while under hypnosis by freeing the pathogenic idea from the unconscious mind. He discovered later that the cure was not lasting, and abandoned hypnosis for suggestion. From this point he progressed rapidly with his studies and consequent discoveries in psychoanalysis, and pub. successively *Die Traumdeutung*, 1900, *Psychopathologie des Alltagslebens*, 1904, and *Drei Abhandlungen zur Sexualtheorie*, 1905. *Die Traumdeutung*, the significance of dreams, embodies some of his outstanding discoveries, among them the claim that the interpretation of dreams is an important factor in psychoanalysis, that the recollected parts of dreams are symbols of the activities of the unconscious mind during sleep when the will is ineffective and conscious self-control is suspended. A new trans., *The Interpretation of Dreams*, by J. Strachey, was pub. in 1955. F.'s life work may be broadly summarised as the exploration of

the unconscious mind. He introduced the term 'id' to define the true unconscious—the self-preservative tendencies and the instincts as a whole. The revolutionary nature of his theories in *Psychopathologie des Alltagslebens* aroused great hostility, and on many occasions his statements during lectures to doctors were met with open ridicule. Moreover, public interest was increasing (the Eng. trans. of this work alone ran into ed. after ed.), and when he crystallised his theories in the assertion that nearly all cases of neurosis were due to the repression of sexual desires a storm of criticism burst upon him. He possessed, however, a personality of unusual strength, and proceeded unmoved. He claimed to have made a further discovery in 1898, when he stated that sexual desires begin at birth rather than puberty. Coming at a time when any frank exposition upon sexual problems shocked the public idea of morality, the claim aroused still fiercer attacks. Informed observers, however, found much to interest them in the consequent doctrine that a disturbance in a child's sexual growth explains all cases of mental subnormality, and that under proper direction sexual impulses may be 'sublimated' into forces which can inspire the noblest achievements. Though he took great liberties with philosophy, and was himself a philosopher *malgré lui*, F. always wrote and spoke as a man of science. He did not claim to have invented his remarkable view of mental processes, but averred that he had merely discovered it. His influence has permeated the world to such an extent that it may be discerned to-day in almost every branch of thought, and particularly in education. A *Times* reviewer writes that 'the famous theory of dreams and the various "complexes" resolve themselves, when viewed as Freud meant them to be viewed, into observations of the activities of the "natural man" imprisoned and ignored yet always alive within us. This original sin, if denied, possesses, he believed, the power to "attach" itself to or "associate" itself with other, apparently good and innocent thoughts, lending them, thereby, its own passionate energy. Hence the innumerable "anxieties" and fears ("phobias") of the mentally sick; hence their strange apings of physical disease, their perverted ideas, their unreasoning prejudices. To resurrect this natural man and yoke his powers to fresh and useful enterprises was the life-aim of the physician' (see also PSYCHOANALYSIS). His *Autobiographical Study*, trans. by J. Strachey, was pub. in 1936. In 1903 he founded the Vienna Psychoanalytical Circle, and by 1906 branches were estab. in other countries. In 1908 his influence spread rapidly, and the first International Psychoanalytical Congress was held at Salzburg, Switzerland. In 1909 the International Psychoanalytical Association was formed with the dual object of regulating propaganda and preventing its prostitution by insincere practitioners. Because of the

Nazi occupation of Vienna, F. sought refuge in London in 1938, and d. there the following year. See H. Sachs, *Freud, Master and Friend*, 1945; and E. Ludwig, *Der entzauerte Freud*, 1946. A trilogy of F.'s *Life and Works*, by E. Jones, appeared 1953-1957.

Freudenstadt, Ger. tn in the *Land* of Baden-Württemberg (q.v.), in the Black Forest (q.v.), 42 m. SW. by W. of Stuttgart. It was founded in 1601 by Duke Friedrich of Württemberg as a silver-mining tn. It was badly damaged in the Second World War, but has been rebuilt and is now one of the most up-to-date spas in Germany. It is also a winter sports centre. Pop. 13,000.

Freund, Wilhelm (1806-84), Ger. philologist. He took an important part in the movement for the emancipation of the Prussian Jews, and ed. a magazine, *Zur Judenfrage in Deutschland* (from 1843), which was largely instrumental in the *Judengesetz* of 1847. He pub. *Wanderungen auf plattischem Boden* and trans. of Gk and Lat. books, but his main work is *Wörterbuch der lateinischen Sprache*, 1834-45, which was fundamental to subsequent Lat. dictionaries.

Frevent, Fr. tn in the dept of Pas-de-Calais. It manufs. textiles, and has iron-works. Pop. 3800.

Frey, Norse god of peace and fruitfulness, son of Njord, god of wealth, brother of Freyja (q.v.), goddess of love. F. was one of the Vanir, the family of peace gods, as opposed to Odin, etc., the war gods of the Teutons. He was especially worshipped at Upsala.

Frey, Friedrich Hermann, see GREIF, MARTIN

Freyberg, Sir Bernard Cyril, 1st Baron, V.C., G.C.M.G., K.C.B., D.S.O. (1890-), soldier, b. London; emigrated with his parents to New Zealand in 1892. Educ. at Wellington College, New Zealand. Took part on Pancho Villa's side in the Mexican Revolution of 1914. Served with the Hood Battalion R.N.D. in the Dardanelles in 1915. Wounded 9 times in the First World War in France, Belgium, and the Near East. V.C., 1916. Became at 27 youngest brigadier in Brit. Army. Also awarded D.S.O. and 2 bars in that war, Major, 1927, lieutenant-colonel, 1929. Commanded 1st Battalion Manchester Regiment, 1929-31; colonel, 1931; assistant quartermaster-general, S. Command, 1931-3; G.S.O. (1) at War Office, 1933-4. Commanded Grenadier Guards and Queen's Royal W. Surrey Regiment. In Second World War he commanded the 2nd New Zealand Expeditionary Force, 1939. Appointed commander-in-chief of the Gk and imperial forces in Crete, May 1941 (see CRETE, BATTLE OF). Governor-general of New Zealand, 1946-52. Raised to the peerage, 1952. Constable of Windsor Castle, 1953.

Freyberg, see FREIBERG.

Freycinet, Charles Louis des Saulces de (1828-1923), Fr. statesman, b. Foix; he entered gov. service as a mining engineer. On the estab. of the Third Rep. in 1870 he

offered his services to Gambetta, and in Oct. became chief of the military Cabinet. It was mainly his power of organisation that enabled Gambetta to raise army after army to oppose the invading Germans. He entered the Senate in 1876 as a follower of Gambetta, but in Dec. 1877 became minister of public works in the Dufaure Cabinet. In 1879 he became president of the council and minister for foreign affairs; and in 1886 he became Premier. In 1888 he became minister of war in the Floquet Cabinet, the first civilian since 1848 to hold that office. In 1890 he was elected to the academy. In 1893 he resigned from the War Office, somewhat under the shadow of the Panama scandals.

Freycinet, Louis Claude des Saulces de (1779-1842), Fr. navigator, b. Montélimart (Drôme). In 1793 he entered the Fr.

High Commissioner for New Zealand

SIR BERNARD FREYBERG, V.C.

Navy; after taking part in sev. engagements against the Brit., he joined in 1800, with his brother, Louis Henri F. (1777-1840), who afterwards rose to the rank of adm., the expedition sent out under Capt. Baudin in the *Naturaliste et Géographe* to explore the S. and SW. coasts of Australia. Much of the ground covered by Flinders was revisited and new names composed by this expedition, which claimed credit for discoveries really made by the Eng. navigator. An inlet on the coast of W. Australia, in 26° S., is called F. Estuary; and a cape near the extreme SW. of the same coast bears the explorer's name. In 1806 he returned to Paris, and

was entrusted by the gov. with the work of preparing maps and plans of the expedition; he also completed the narrative, and the whole work appeared under the title of *Voyage de découvertes aux terres Australes, 1800-04, 1807-16*. He also wrote *Voyage autour du monde, 1817-20, 1824-44*.

Freyja, Norse goddess of love, one of the Vanir; daughter of Njordhr, god of wealth, and sister of Frey(r). Sometimes confused with Frigga, wife of Odin.

Freyr, see FREY.

Freyre, Gilberto de Mello (1900-), Brazilian writer and social anthropologist, b. Recife, Pernambuco, educ. privately and at the Gilreath Amer. College, Recife. Prof. of sociology, State Normal School of Pernambuco. He was prof. of sociology at the univ. of Rio de Janeiro, 1935-8, and has been visiting prof. at sev. univs. in the U.S.A. He served in the Brazilian Parliament, 1946-50, and was Brazilian delegate to the U.N. General Assembly, 1949. His best work, *Casa-Grande e Senzala*, 1933 (trans. by S. Putnam as *The Masters and the Slaves*, 1946), is a brilliant study of the development of Brazilian civilisation and an outstanding contribution to the sociology of Lat. America. It was continued in *Sobrados e Mucambos*, 1936. F. has also written *Nordeste* (Northeast), 1937, *Um Engenheiro Francês no Brasil* (A French Engineer in Brazil), 1940, *Região e Tradição* (Region and Tradition), 1941, *Brazil, an Interpretation*, 1945, and *Sociologia*, 2 vols., 1945.

Freyisingen, Otto von, see OTHO OF FREISING.

Freytag, Georg Wilhelm Friedrich (1788-1861), Ger. Arabist; studied under S. de Sacy in Paris. In 1819 he was appointed prof. of oriental languages at Bonn. He pub. *Selecta ex Historia Hebraea*, 1819, *Hamase carmina*, 2 vols., 1828-51, *Darstellung der arabischen Verskunst*, 1830, *Arabum proverbialia*, 3 vols. in 4 tomes, 1838-43, and *Einleitung in das Studium der arabischen Sprache*, 1861; but his fame rests chiefly upon his *Lexicon arabicum-latinum*, 4 vols., 1830-7.

Freytag, Gustav (1816-95), Ger. novelist and dramatist, b. Kreuzburg in Silesia. He studied philology at univs. of Breslau and Berlin. In 1839 he settled at Breslau as *Privatdozent* in Ger. language and literature, and devoted prin. attention to writing for the stage. He achieved success with his comedy, *Die Brautfahrt, oder Kunz von der Rosen*, in 1844, and in 1854 attained a prominent position by his comedy, *Die Journalisten*, one of the finest Ger. comedies of the 19th cent. In 1847 he migrated to Berlin, and the next year he took over, with Julian Schmidt, the editorship of *Die Grenzboten*, a weekly jour. which, founded in 1841, now became the leading organ of Ger. and Austrian Liberalism. His literary fame became universal in 1865 by the pub. of his novel *Soll und Haben*. This was trans. into almost every European language, and was undoubtedly the best Ger. novel of its day. The main purpose of the novel was to show that the Ger. middle class was the

soundest element of the nation. But it has a more directly patriotic intention, in the contrast which it draws between the reputed homely virtues of the Teuton, the shiftlessness of the Pole, and the rapacity of the Jew—views which the Germans still hold to this day. As a Silesian, F. has no love for his Slavonic neighbours, and being a native of a prov. which owed everything to Prussia, he was naturally an earnest champion of Prussian hegemony over Germany. In 1864 he pub. another novel, *Die verlorene Handschrift*, in which he endeavoured to do for Ger. univ. life what in *Soll und Haben* he had done for commercial life. The hero is a young Ger. prof., who is so wrapped up in his search for a MS. by Tacitus that he is oblivious of an impending tragedy in his domestic life. This book was, however, not so successful as its predecessor. Between 1859 and 1862 F. pub. in 5 vols. *Bilder aus der deutschen Vergangenheit*, a valuable work on popular lines, illustrating the hist. and manners of Germany. In 1872 he began a work with a similar patriotic purpose, *Die Ahnen*, a series of 6 historical romances, in which he unfolds the hist. of a Ger. family from the earliest times to the middle of the 19th cent. This series comprises the following novels, none of which, however, reaches the level of his earlier works: *Ingo und Ingriden*, 1872, *Das Nest der Zaunkönige*, 1874, *Die Brüder vom deutschen Hause*, 1875, *Marcus König*, 1876, *Die Geschwister*, 1878, and *Aus einer kleinen Stadt*, 1880. Among F.'s other works may be noticed *Die Technik des Dramas*, 1863; an excellent biography of the Baden statesman, Karl Mathy, 1869; an autobiography, *Erinnerungen aus meinem Leben*, 1887; and his *Gesammelte Aufsätze*, chiefly reprinted from *Die Grenzboten* 1877-8. See J. Hoffmann. **Freytag als Politiker, Journalist und Mensch**, 1922; H. Zuchold, *Gustav Freytag*, 1926.

Friar (from Lat. *frater*, brother), Eng. name given to the members of the various mendicant religious orders, the chief of which were the Franciscans or Minors (Grey F.s), the Dominicans or Preachers (Black F.s), the Carmelites (White F.s), and the Austin F.s or Hermits. Besides these there were the Trinity or Red F.s, and the Crutched or Crossed F.s.

Friar's Balsam, compound tincture of benzoin which is prepared by macerating benzoin with storax, tolu, and aloe in rectified spirit. It is used in the preparation of soaps and washes, as a medicine, and as a protective coating for wounds.

Friars Minor, see FRANCISCANS.

Friaul, see FRIULI.

Fribourg (Ger. *Freiburg*): 1. Canton of Switzerland, situated in the SW. of the country. The surface is hilly, the highest point being 7858 ft, and the chief rivs. are the Broye and the Sarine. The canton is on the Ger.-Fr. linguistic frontier; two-thirds of the inhab. speak Fr., and are almost entirely Rom. Catholic. It is essentially an agric. and pastoral canton, and is famous for its cheese (Gruyère) and cattle. Timber and

peat are also important products, and there are manufs. of straw hats, watches, and chocolate. Pop. 182,500.

2. (Fribourg en Nivonne) Tn on the R. Sarine, about 20 m. SW. of Bern, cap. of the canton of the same name. The riv. is crossed here by 2 great suspension bridges, constructed in 1832 and 1840. F. is the seat of the bishop of Lausanne, and manufs. sewing-machines, agric. instruments, and fertilisers. The prin. buildings are the collegiate church of St Nicholas, with a nave dating back to the

Jews. As last Nazi protector of Bohemia-Moravia (from 1943) he was guilty of further atrocities. He was among those major war criminals tried and executed at Nuremberg, 1946.

Fricke, Peter Racine (1920-), composer, b. London, partly of Fr. descent, with the poet Racine among his ancestors. He studied at the Royal College of Music in London, served in the Second World War, and completed his studies with Mátyás Seiber. His wind quintet gained the Clements prize in 1947 and his first

Swiss National Tourist Office

FRIBOURG, SWITZERLAND

13th cent., a 15th-cent. bell-tower, 250 ft high, and an organ with about 7900 pipes; the 16th-cent. tn hall; and the International Catholic Univ., founded in 1889. Pop. 31,400.

Frick, Wilhelm (1877-1946), Ger. politician, b. Aلسenz; educ. at Munich, Göttingen, and Berlin Univ. He took part in the National Socialist *putsch* in Munich, 1923. He was the first National Socialist to become a minister, being appointed minister of the interior in Thuringia, 1930; Reich minister of the interior in Hitler's Cabinet in 1933; and Prussian minister of the interior, 1934. F. was largely responsible for bringing the Ger. nation under the complete control of the National Socialist party; in large part he was responsible for legislation to suppress the trade unions, the press, and the

symphony the Kussevitsky award in 1949, when the *Prelude, Elegy, and Finale* was given at the Darmstadt Festival. In 1950 his string quartet was heard at the Brussels Festival of the International Society for Contemporary Music, and the viola concerto at the 1952 Edinburgh Festival. Other works of his are a second symphony, a violin concerto, some vocal chamber music, a sonata for violin and piano, and an organ sonata.

Friction, resistance to motion occasioned by the fact that 2 bodies are in contact, or, more correctly, the tangential force that opposes the motion of one body over another. If a book (say) rests on a horizontal table the weight of the book is balanced by an equal and opposite force which the table exerts on the book. Both these forces act along lines normal, i.e.

perpendicular, to the surface of the table, and the force on the book is called the normal reaction. The normal reaction can be increased by placing a load, such as another book, on top of the first. If the book is now pushed gently from one end no motion occurs, and some other force must therefore be acting on the book to prevent its moving. This force is called the force of F , and since it just balances the push applied to the book, and this is parallel to the surface of contact between book and table, the F also must act in a direction tangential to the same surface. If the push applied to the book is slightly increased no motion occurs, so the F must also increase, and to just the extent required to keep the book stationary. When the applied push is steadily increased, however, a value is reached sufficient to cause the book to move, so there is a maximum force that the F can assume. This is called the limiting force of static F , and its value depends upon the normal reaction, as well as upon such factors as the roughness of the surfaces of book and table, and the natures of the materials of which they are composed. The limiting force of static F depends little or not at all upon the areas of the surfaces in contact, but for dry surfaces and within certain limits of loading, varies directly as the normal reaction, so that the ratio limiting force of static F /normal reaction is a constant typical of the materials in contact and their roughnesses: this ratio is called the coefficient of static F . For most dry and fairly smooth surfaces its value lies in the range 0.15 to 0.6.

If the book is kept in steady motion along the table the F opposing motion is called the kinetic F , and its value is found to be somewhat lower than the limiting force of static F . The ratio of kinetic F to normal reaction is also approximately constant, and practically independent both of the area of the surfaces in contact and of the speed of motion, and is called the coefficient of kinetic F . The above facts may be better appreciated if the following simple experiment is performed. A long, uniform rod is balanced on the outstretched forefingers of the experimenter, a greater length of the rod being allowed to overhang at one end than at the other, and the 2 hands are brought closer together until the forefingers are in contact. The explanation of what happens is left to the reader.

More refined experiments than those described show that when one body slides slowly over the surface of another there is often a tendency for motion to occur in a series of short movements with intervals of rest between them, for example, by alternate slipping and sticking. The origin of the force of F is still a matter of debate. It has been suggested that the resistance to motion arises because tiny protuberances of one surface interlock with those of the other, so that slipping can only occur if these projecting parts become sheared off, or if one is lifted over

the other. There is much evidence, however, to show that during sliding the heat generated at small local areas may be sufficient to raise the temp. there to a value sufficient to melt one of the solids, so that the sliding may involve alternate welding of the surfaces together, and disruption of the welded junctions.

When it is necessary to reduce F to a minimum, as in the moving parts of machinery, it is usual to lubricate the surfaces which are to slide over one another. This means that a film of liquid is kept between the solid surfaces, and holds them apart except when they have been left stationary for some time. Since the film of liquid is maintained by the continual dragging of fresh liquid into the required position by the moving solids, the liquid must be one that adheres well to the bearing surfaces. It must also have a suitable viscosity; that is, it must not be so mobile that it is readily forced out from between the solids and yet should not be so highly viscous as to resist the motion more than is necessary. With lubricated surfaces the F is nearly independent of the normal reaction, but varies directly as the area of the sliding surfaces, and increases with increase of the speed of motion. Another way of reducing the effects of F is to replace sliding by rolling, as is done by using wheels on vehicles, or ball or roller bearings in machinery.

Friday *A.S. frige dag*, day of Freya or Freyja, the goddess-wife of Odin, being a trans. of the Rom. name of this day, *dies veneris*), 6th day of the week, and the Muslim Sabbath.

Frideswide, or **Frudeswitha**, *St (d. c. 735)*, patroness of Oxford, the daughter of the ealdorman Dida. She refused marriage with a Mercian noble, Algar, choosing rather a religious life. She founded, and ruled as abbess, the nunnery of St Mary's on the site of the present city of Oxford. She was canonised in 1481, and her feast is kept on 19th Oct.

Fridjónsson, Gudmundur (1869-1944), Icelandic poet, novelist, and publicist. His themes are predominantly the life and the struggles of the common people. His sympathy for the oppressed or down-trodden is unfailing, while he swings his lash equally over tyranny, hypocrisy, and conceit. The power and the purity of his language are exceptional, in prose and verse alike.

Fridolin, *St.*, sometimes called **Tridolin**, or **Trudelin** (*d. c. 650*), Irish monk and patron of Glarus in Switzerland. He estab. an abbey on Säkingen Is., in the Rhine, and is known as the apostle of the Upper Rhine.

Friedberg: 1. Ger. tn in the *Land of Hessen* (q.v.), 28 m. NE. of Wiesbaden (q.v.). It was once a free city of the empire. It has a 12th-cent. fortress, a medieval watch-tower, and a Renaissance castle. There are chemical, leather, and foodstuff manufs. Pop. 14,000.

2. Ger. tn in the *Land of Bavaria* (q.v.), 4 m. E. of Augsburg (q.v.). It has an old castle. Pop. 4500.

Friedeburg, Hans von (d. 1945), Ger. adm. or 'admiral-general,' was second in command of the U-boat fleet early in the Second World War. On the promotion of his chief, Adm. Dönitz, to commander-in-chief of the Ger. Navy in Jan. 1943, superseding Adm. Raeder, F. became commander-in-chief of the U-boat fleet. When Dönitz proclaimed the death of Hitler and his own succession as Führer, F. appears to have been again promoted into Dönitz's former position. He emerged as commander-in-chief of the navy in the closing days of the war, and signed at Rheims the instrument of Germany's unconditional surrender in that capacity. Subsequently imprisoned, he committed suicide.

Friedland: 1. See **FRYDLANT**.

2. (since 1946 **Pravdinsk**) Tn in E. Prussia, now Kaliningrad Oblast, 28 m. SE. of Kaliningrad. It was the scene of Napoleon's victory over the allied Russians and Prussians in 1807. Pop. (1939) 4500.

Friedrich, Caspar David (1774-1840), Ger. painter, b. Greifswald, Pomerania, studied art at Copenhagen and in Dresden, and became celebrated as a landscape painter. His mysterious and moonlit views represent supremely well the romantic mood of his time and country.

Friedrich Wilhelm Victor Albrecht, see **WILLIAM II**.

Friedrich Wilhelm Victor August Ernst (1882-1951), see **FREDERICK WILLIAM**.

Friedrichroda, Ger. tn in the dist. of Erfurt, in the Thuringian Forest, 22 m. WSW. of Erfurt (q.v.). The ducal hunting seat of Reinhardsbrunn incorporates remains of a Benedictine monastery founded in 1085. The tn is a health and sports resort. Pop. 7000.

Friedrichsdorf, Ger. tn in the *Land* of Hessen (q.v.), on the slopes of the Taunus hills, 22 m. NE. by E. of Wiesbaden (q.v.). It was founded by Huguenot (q.v.) refugees. Pop. 3000.

Friedrichshafen, Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the NE. shore of Lake Constance (q.v.), 78 m. S. by E. of Stuttgart. Before the Second World War it was famous as the home of the Zeppelins (q.v.) and the Dornier flying boats. The Zeppelin works were erected by public subscription in 1908. In 1924 the LZ126 flew from here to America, where she was transferred to Amer. ownership, in accordance with the treaty of Versailles (q.v.), and renamed the *Los Angeles*. The *Graf Zeppelin* was constructed here in 1928. During the Second World War F. was frequently and heavily bombed by the R.A.F.; one of these bombing attacks was on the largest radio-location factory in Germany. The tn is a bathing and sports resort, and has connections by ferryboat with Romanshorn in Switzerland. Pop. 30,000. See

which he eventually retired. He is buried in the mausoleum.

Friendly Islands, see **TONGA**.

Friendly Societies. Despite occasional periods of financial instability through which some of the smaller S. have passed, the social utility accruing from the almost universal institution of F. S. cannot be doubted. The participation in mutual advantages, on as sound an actuarial basis as small contributions will allow, combines the best principles of economy and collectivism, and the recognition of these facts may be said to have induced the State, almost from the earliest days of F. S., to render them assistance, especially by way of relief from taxation or other public burdens, and, ultimately, to recognise their elements of permanent value by adopting them as an integral part of the great scheme of insurance of 1911.

Voluntary associations for such purposes as the maintenance of members in sickness, old age, and poverty have existed even from early in the 17th cent., and it is generally assumed that the genesis of the F. society is to be sought in the burial club, an institution of a quasi-religious character. But the more complex organisations of to-day are by no means referable to any spontaneous creation, and are rather the outcome of a general social development.

Doubtless F. S. may be formed for almost any purpose of a philanthropic or charitable nature, but a more restricted classification of objects is to be gathered from the consolidating Act of 1896, which enumerates the kinds of S. which may be registered as F. S. under the Act. The purposes of such S. as the Act specifically designates F. S. include the relief or maintenance of the members, their husbands, wives, children, or other relatives in sickness or other infirmity and old age; payment of burial expenses; insurances on birth of children; and relief in case of unemployment, shipwreck, or other circumstances of distress; endowment insurance and insurance against fire of tools or implements to any amount not exceeding £15. Other classes of society regulated by the Act are 'benevolent societies' for any benevolent or charitable purpose; 'working-men's clubs' to promote social intercourse, mental and moral improvement, and recreation; and 'specially authorised societies,' or societies whose purposes justify the extension to them by the Treasury of the provisions of the Act. The report of the royal commission of 1870 divided registered F. S. into 13 classes, and gave them a nomenclature which has not found statutory expression. But the div., though only popular, brings out the distinctive characteristics of the various kinds of society. Affiliated S., like the great Manchester Unity of Oddfellows, the Order of Druids (see **DRUIDS**, **ANCIENT ORDER OF**), and the Order of Foresters (q.v.), are those consisting of one central body and a number of independent branches variously called lodges, tents, or

Friedrichshub, Ger. vil. in the *Land* of Schleswig-Holstein (q.v.), in the Sachsenwald, 15 m. E. of Hamburg (q.v.). Bismarck (q.v.) converted an inn in the middle of the forest into a residence, to

divs. Most of the lodges in existence before 1875 are now registered, but a society having a fund under the control of a central body, to which every branch must contribute, may be registered as a single society.

Two other important classes are the 'collecting' and 'dividing' societies. The former were so named from the fact that contributions were paid to collectors who went from house to house. These societies, as above indicated, are dealt with in the consolidating Act, the Collecting Societies and Industrial Assurance Companies Act, 1896. Under this Act members must be supplied with a copy of the rules and a printed policy for a sum not exceeding 1*l.* each. Default in payment of a contribution is not to cause forfeiture or a lapsed policy until continued default for 14 days after written notice to the member of the amount due. Collectors may not be members of the committee or hold any other office in the society or vote at meetings. Dividing S. are those which levy somewhat higher average contributions, and every Christmas-time divide or 'share out' the surplus remaining after payment of sick allowances during the year. The above Act, as amended in 1908, regulates all F.S. Most S. are, of course, approved S. for National Health Insurance purposes.

A F. society must consist of at least 7 members in order to be registered. The advantages of registry are (1) exemption from penalties under any of the provisions of the Unlawful Societies Act, 1744, and Seditious Meetings Act, 1817, so long as the business and meetings do not go outside the registered rules. The result is that a registered society may, but an unregistered society may not, require any unauthorised test or declaration from its members without incurring a penalty; (2) exemption from stamp duties; (3) power to obtain transfers of stock standing in the name of trustees by order of the chief registrar when the trustees are absent, dead, or otherwise incapable of making the transfer; (3) preferential rights over other creditors on the death or bankruptcy of officers of the society; (4) power to admit minors as members from the date of birth; (5) power to make loans to members or subscribe to the funds of any hospital, infirmary, or charitable or provident institution such sum as may be necessary to secure to members of the society or their families the benefits of such hospital or other institution; (6) power to invest in savings banks or with the National Debt Commissioners; (7) reduction of rates on death certificates; (8) officers of the society may be compelled to give security for the rendering of proper accounts and to account for and deliver up the property in their hands; and (9) power to proceed summarily against anyone misappropriating the society's property. Every registered society must have a registered office, appoint trustees, audit its accounts, send ann. returns to the registrar, make a quinquennial valuation of its assets and liabilities, and keep

copies of balance sheets and valuations hung up in a conspicuous place in its registered office. Under a registered society an individual member's rights are better safeguarded than in the case of an unregistered society. He is entitled to inspect the books, have copies of the ann. return, and a copy of the rules on payment of not more than 1*s.* In a registered society the limitation of an individual member's benefits, whether he belong to one or more S., is a gross sum of £300, not including bonuses, or an annuity of £52. Surplus contributions of members, after payment of any assurance money, may be accumulated at interest. A member of a registered F. society (other than a benevolent society or working-men's club) may dispose of any sum not exceeding £100 payable on his death by nominating any person he chooses to whom the money shall be paid at his decease. A registered society may invest its funds in any of the funds in which trustees generally are authorised to invest, or in a savings bank, or the public funds, or in the purchase of land, or in any other non-personal security where expressly authorised by its rules.

A F. society may be dissolved either voluntarily or compulsorily. In the former case, the consent of five-sixths *in value* of the members, including honorary members, and of all in receipt of any relief, annuity, or benefit, is necessary, unless their claims are provided for. In the case of an insolvent society, one-fifth *in number* of the members may apply to the registrar for a compulsory dissolution, and the registrar may make an award to that effect if on investigation that seems the best course.

F. S. were classified under 2 headings by the Industrial Assurance Act of 1923, as Life Assurance S. and Collecting S., and changes were made in the control of these bodies. The most important of these was the appointment of a commissioner of F. S., in whom are vested very great powers of control, and against whose decision it is only possible to appeal to the high court. The commissioner can demand to be satisfied on financial and other subjects, and may return or refuse to pass balance sheets and other accounts, and can dissolve a society that defaults or fails to carry out its legal obligations. He has also the power to exempt bodies from the requirements of the Acts and is the authority to settle disputes, thus taking the place previously held by the Board of Trade. The Acts of 1923 and 1924 slightly varied the existent law on the insurance of children by making the limit for which a child can be insured £5 up to 3 years of age, £10 up to 6 years of age, and £15 up to 10 years of age, but this alteration was in view of the slightly changed purchasing power of money. The old principle was maintained that no child should be insured for a larger sum than the cost of a funeral. In these and subsequent Acts powers were given for insurance in cases where the decease of the insured person might involve a liability on

the insurer. The Acts of 1923, 1924, and 1929 made it an offence to issue illegal life policies. Up till this change, premiums were frequently paid where there was no insurable interest, and thus money was lost to the insurer. In the new Acts it was provided that such a policy, issued in error, was to have a value bearing relation to the amount that had been paid, and this amount could be claimed in cash or as a paid-up policy.

War legislation affecting F. S. and their members' rights included the Industrial Assurance and Friendly Societies (Emergency Protection from Forfeiture) Act, 1940, which applies to any policy of life assurance (where there is a separate contribution) for a sum assured not over £50 (excluding bonuses), in force immediately before 1 Sept. 1939, subject to not less than 2 years' contributions having been paid. This Act prevents the lapsing of such assurances where failure to pay contributions was due to circumstances arising out of the war. The Societies (Miscellaneous Provisions) Act, 1940, enabled the chief registrar to give directions to authorise the suspension of meetings, appointment of officers, and the making or amendment of rules by the management committees of S. The Act also empowered S. to set up a fund for the purchase, on behalf of their members, of national savings certificates, defence bonds, and such other securities as might be presented. Furthermore, the Act gave protection to members serving in the forces whereby they should not be deprived of their membership by reason of their discontinuance of the payment of their contributions whilst serving, and whilst benefit might be suspended until such time as the member resumed his contributions within 3 months of determination of his service (or of the emergency period), upon resuming contributions the member was to be placed in the same position as to future benefits as he would have been had he not ceased to pay his contributions. But the Act did not preclude S. from granting to their serving members better terms than the minimum statutory protection.

There can be no doubt that members of F. S. benefited financially by the first National Insurance Act. It is probable that the new comprehensive National Insurance scheme when in full operation—with its increased contributions to provide the 'cradle to the grave' benefits on a scale beyond any 1912 conception—will have repercussions on the *voluntary* F. S., but only time will show the extent of its effect on the numerical strength and potential income of these S., with their various systems of sickness insurance and combined benefits tables based on a wide range of contributions scaled according to age and the extent and nature of the benefits provided. Since the insurance scheme of 1912 was introduced the voluntary S. have continued to grow in the face of keen competition, but their great expansion has naturally brought many S. to the point where they have already found

it difficult to maintain a sufficient influx of new young entrants to replace membership losses due to death and other causes. As to how far the general body of members comprising the F. S. movement can afford to continue their *voluntary* insurances along with their higher State scheme contributions in future, it must be borne in mind that present-day wage levels are much higher for all classes of workers than in 1912, and the gov. has declared that continued *voluntary* insurance to supplement State benefits, wherever one's means permit, should be encouraged. From 1938 to 1954, however, wages increased by 190 per cent, but the funds of F. S. by only 42 per cent. It is also apparent that until 1954 the deposit F. S. with their emphasis on personal savings were able to attract higher contributions and showed a better financial record, despite falling membership, than those F. S. which stressed the insurance function. In most S. the rules provide for (a) contributions at a uniform rate for all ages, together with an entrance fee varying according to the age of the entrant; or (b) periodical contribution at a rate varying with the age at entry. There are F. S. in many of the Brit. Dominions, notably in Australia, where there is a branch of the Ancient Order of Druids (q.v.). Fraternal S., as they are called, are also common in the U.S.A., but except in Germany and France the system does not prevail to a great extent abroad. *See also* BUILDING SOCIETY; FORESTERS, ANCIENT ORDER OF; NATIONAL INSURANCE ACT, 1946; ODDFELLOWS; RECREABLES, INDEPENDENT ORDER OF. *See* F. B. Fuller, *The Law Relating to Friendly Societies*, 1926; W. T. Pratt, *Friendly Societies*, 1931.

Friends, Society of, or Quakers, founded by George Fox (q.v.) (1624-91). Throughout his life Fox called on F. to bear themselves toward others in the way that was *most likely* to call forth the response of goodness to goodness; in other words, as he expressed it, they were 'answering that of God in every one,' even, in fact especially, in those who were doing evil. To a remarkable degree F. lived out the truth that they had seen, but their exposition of it often lacked clearness and consistency, inasmuch as they were entangled in the spirit of their time more than they realised. Nevertheless, it was from this central principle that their special 'testimonies' proceeded. The Quaker insistence on the unlawfulness of all war for the Christian is based not only on humanitarian grounds or even on passages of Scripture but on the conviction that more important than individual or national safety is the bringing of the evil mind to the 'inner light.'

Fox's first recorded success in gaining converts was at Manchester in 1647, but the beginning of a Quaker Church was in 1652, when some hundreds of 'Seekers' were 'convinced' by him at Preston Patrick, near Kendal. After 2 years' activity in the N. of England an organised campaign in 1654 carried the message all

over England and Wales. About this time F. meetings began to be held in Scotland and Ireland. The glowing ardour, sometimes injudiciously manifested, of the preachers, and certain mannerisms, drew on them the attacks of the mob, sometimes led by ministers of religion, to whom the Quaker testimony against a paid ministry and the payment of tithes was naturally unpleasing. In 1650 Fox, when imprisoned at Derby on a charge of blasphemy, called upon Justice Bennett to tremble at the word of the Lord. The justice retorted by calling him 'Quaker,' a word that had already been used of a certain fanatic sect, and the name stuck to the newly formed body because of its appropriateness, inasmuch as in some of their meetings a wave of spiritual emotion would cause a trembling to go through the company. After the restoration of the monarchy in 1660 the Conventicle Acts of 1664 and 1670 made illegal religious meetings of more than 4 persons (in addition to members of the family in whose house they met) held otherwise than in accord with the way of the Anglican Church. In many places other nonconformists gave way before the storm, but according to the testimony of their enemies F. held out to the end, often meeting in the street in all weathers when their meeting-house was closed against them, many hundreds of men and women being taken to prison. The refusal to take the oath of allegiance brought down on many F. long terms of imprisonment, their bare promise and their statement that it was against their principles to be concerned in plots not being accepted. About 450 F. *d.* in prison or directly in consequence of imprisonment. It was shortly before 1670, when, by reason of the death or imprisonment of leaders, the cause of Quakerism was at a low ebb, that Wm. Penn (q.v.) and Robert Barclay (q.v.) came to it, and by their worldly standing, their learning, and the depth of their spiritual life they powerfully reinforced it.

The Toleration Act of 1689 gave liberty for Nonconformist worship. For the next 150 years F. settled down into quietism, their 'testimonies' tending to become matters of ritual and tradition rather than of living conviction. Early in the 18th cent. F. opposed the trade in slaves and later, under the leadership of Woolman, Benezet (qq.v.), and others they gave freedom to all their slaves. This enabled F. in England to contribute leadership and united support to the movement under Clarkson and Wilberforce for the abolition first of slave trading by Britain (1807) and then of slavery itself in Brit. dominions (1833). They were marked off from the world by peculiarities of dress and speech, and they studiously secluded themselves from it except in so far as they were mixed with it in business and as they answered the calls of philanthropy. Deservedly they gained a reputation for rigid honesty and for right living in general, but also for being almost a monastic sect not desirous of increase.

The walking in the light led to a high standard of truthfulness, so that F. in courts of law and elsewhere refused to confirm their words by oath, inasmuch as an oath lowers the value of ordinary speech. Not only did they quote Matt. v. 33-7 and James v. 12, but they also insisted that for a follower of Christ, the *Truth*, it was a lowering to attempt to confirm his word by something supposed to be more binding. 'People swear to the end they may speak truth; Christ would have them speak truth to the end they might not swear' (Penn). They were confirmed in their stand by seeing all about them the small regard for oaths paid by many who had solemnly taken them. This same principle led Quaker shopkeepers to break away from the custom of bargaining by asking for their goods a higher price than they intended to take. This they held to be insincere, but though their practice led to temporary loss of custom, the convenience of the fixed price was so obvious that it became the usual way of trading.

In 1796 they opened the 'Retreat' at York, the first asylum in England, almost the first in the world, where the insane were treated with humanity and efforts made to cure them. Elizabeth Fry's (q.v.) work for prison reform, begun in the early 19th cent., is well known. The fact that many Quaker conscientious objectors themselves suffered imprisonment in the First and Second World Wars has helped to keep alive the concern of F. for penal reform, and they also work for the abolition of cap. punishment.

A heightened conception of the light of Christ in every man has always rendered F. keenly sensitive to outward conditions which put special difficulty in the way of obedience to it. From their beginning they have taken thought for the poor, having, even early on, some insight into the economic causes of poverty. Over a long period they have followed in the track of wars, organising (from their own people and from outside) measures of relief for civilian sufferers. This was done on a large scale after the Franco-Prussian war of 1870-1, and on a much larger scale during and after the First and Second World Wars. In 1947 the Nobel peace prize was awarded jointly to the Amer. Friends' Service Committee and the Friends' Service Council, in recognition of the S.'s work for international reconciliation.

Soon after the middle of the 19th cent. F. began to mix in the world undistinguished in appearance from others. One result of this emergence was an interest in foreign missions, and the S. of F. are now working in India, Kenya, Madagascar, Syria, and Pemba, and also maintain international centres in Geneva, Paris, London, etc., to promote international understanding. In their own country they have had a keen sense of civic responsibility, and very many of them, in proportion to their numbers, have taken part in the public life of their communities. John Bright and other

F. who entered politics in the 19th cent. were criticised for so doing by some of their fellow members, but that attitude has passed. There are now usually sev. members of Parliament who are Quakers. Excluding themselves for a large part of their hist. from art and music and various forms of literature, they have found recreation in natural hist. and science, and in these branches of knowledge and in medicine the Society has given to England a large number of eminent men. In philanthropic and commercial enterprise many of its members have been pioneers.

From its beginning the Quaker Church has needed an organisation; the present system is substantially the creation of

meeting. If on important matters there is considerable difference of opinion a time of quiet waiting or an adjournment almost always leads up to a conclusion which can be assented to by most, if not by all.

The Meetings for Suffering, estab. in 1675 to supply the needs of sufferers from persecution, is a representative assembly, meeting monthly in London. It is the executive body of the Yearly Meeting, and it also takes cognisance of the desire of F. for service in various parts of the world; it is sensitive to the cry of suffering wherever heard, and it watches legislative and other movements which have special bearing on national and international righteousness.

Elders are appointed to care for the ministry, giving advice in the way of restraint or encouragement as it is required. Overseers are appointed to have a special care for the congregation, to know who are in any way in need, who are making inquiries concerning F., and who are needing counsel; they also see to the education of children, etc.

The S. of F. consists (1956) of 21,454 members in Great Britain, and has 436 places of worship. There are, in addition, sev. thousand regular 'attenders' of meetings not in membership. The H.Q. of London Yearly Meeting is Friends House, Euston Road, London, N.W.1, opposite Euston station. The Irish H.Q. is in Eustace Street, Dublin. The total number of Quakers in the world is about 174,000.

The Society of Friends in America.—In 1656 Quakerism was taken to America by 2 women, and others followed, but the colonists, fearing them to be in league with witchcraft and the devil, subjected them to terrible persecution. Three men and a woman were hanged. Before long, however, Quakerism was a dominant influence in Pennsylvania and other colonies both in religious and political life. A period of quietism set in, as in England, and shortly before 1830 Elias Hicks of Long Is. so far pressed the doctrine of the inner light as to result in a self-sufficient individualism independent of the scriptures or other outward aid. He was opposed with unsympathetic rigidity and a secession ('Hicksite') resulted. Those who remained again divided, the extreme conservatives separating from the majority, who were moving toward an undenominational evangelical type of theology. Philadelphia stood apart, its position now being that of Eng. and Irish F. Those from whom the conservatives parted are organised (with the exception of certain Fundamentalist Yearly Meetings) into the 'Five Years Meeting,' H.Q., Richmond, Indiana. With few exceptions (Baltimore and others) they have given up the Quaker way of worship and meet under pastors. They retain the Quaker organisation and (for the most part) the position concerning war and the outward sacraments. The different sections are moving toward a sympathetic understanding of one another, and sev. of

GEORGE FOX

Fox shortly before 1670. In the Preparative Meeting a single congregation deals with its own affairs; sev. Preparative Meetings form a Monthly Meeting, the executive body; among other business it admits members and records withdrawals, it appoints elders and overseers, whose functions will be stated later, it carries through arrangements for marriage in the Quaker way, whether the parties are F. or not; sev. Monthly Meetings form a Quarterly Meeting, concerned with the affairs of F. in one or more cos., and a union of Quarterly Meetings forms a Yearly Meeting, the legislative body for its area. London Yearly Meeting comprises Great Britain; and there are others in Ireland, the U.S.A., India, Kenya, and on the Continent of Europe and elsewhere. Any Friend may attend any of these meetings, and may take part in any of which he or she is a member.

Each meeting is presided over by a man or woman (aided by an assistant) who acts as secretary, and is called the clerk. Decisions are not arrived at by vote, but after discussion (free from noise of applause or dissent) the clerk records what he considers to be the judgment of the

the divided Yearly Meetings have recently reunited. See R. M. Jones, *The Quakers in the American Colonies*, 1911, *The Later Periods of Quakerism*, 1921, and *The Faith and Practice of the Quakers*, 1949, ed.; W. C. Braithwaite, *The Second Period of Quakerism*, 1919, and *The Beginnings of Quakerism*, 1955 ed.; J. W. Graham, *The Faith of a Quaker*, 1920; E. Grubb, *What is Quakerism?* 1949 ed.; A. Raistrick, *Quakers in Science and Industry*, 1950; J. Woolman, *Journal*, reprinted 1952; H. H. Brinton, *Friends for 300 Years*, 1953; A. N. Brayshaw, *The Quakers: their Story and Message*, 1953 ed.; H. Loukes, *Friends Face Reality*, 1954.

Friends of the National Libraries, see LIBRARIES, FRIENDS OF THE NATIONAL.

Friern Barnet, urb. dist. of Middx, England, 8 m. N. of London, including Whetstone and Muswell Hill. Pop. 29,164.

Fries, Elias Magnus (1794-1878), Swedish botanist and taxonomist, b. Småland. Prof. of botany at the Univ. of Lund (1824), and later at Upsala (1851), and director of Upsala botanical museum and garden. His *Systema Mycologicum* and the *Flenchus*, 1821-32, became important for the nomenclature of fungi. Other works include *Novitiae florae Suevicæ*, 1822, *Epicrisis systematis mycologici*, 1836-8, *Summa vegetabilium Scandinaviæ*, 1846-9, *Hymenomyces Europæi* and *Icones*, 1874, and monographs on lichens and plants.

Fries, Jakob Friedrich (1773-1843), Ger. philosopher, b. Barby, Saxony. He was prof. of philosophy and elementary mathematics at Heidelberg in 1806, and in 1816 was invited to fill the chair of theoretical philosophy at Jena, but was deprived of his professorship for participation in the democratic disturbances of 1819. He was, however, recalled in 1824 as prof. of mathematics and physics, and while at Jena wrote *Handbuch der praktischen Philosophie*, 1817-32, *Handbuch der psychischen Anthropologie*, 1820-1, *Die mathematische Naturphilosophie*, 1822, *System der Metaphysik*, 1824, and *Die Geschichte der Philosophie*, 1837-40. Besides these he wrote the important treatise, *Die neue oder anthropologische Kritik der Vernunft*, 1807, in which he attempted to give a new foundation of psychological analysis to the critical theory of Kant. He is a link between Kant's system and the so-called historical school. See T. Elsenhans, *Fries und Kant*, 1906, and E. Gaede, *Die Religionsphilosophie von J. F. Fries und A. Görland*, 1935.

Friese-Greene, William Edward (1855-1921), inventor, b. Bristol; educ. at Queen Elizabeth's Hospital School, Bristol. His patronymic was Green; he took the name of Friese-Greene after his marriage in 1874 to Helena Friese. At the age of 15 he was apprenticed to a Bristol photographer, but after his marriage he set up a studio of his own in Bath. In 1880 he became associated with J. A. R. Rudge, the inventor of a form of magic lantern called the bio-phantoscope. With

Rudge he built a primitive projector for showing 12 photographs on glass plates in quick succession. With this F.-G. gave the first demonstration of cinematography in England. This was at a meeting of the Photographic Society in 1885. He realised the need for using some other substance than glass, and after a number of experiments with sensitised paper he was one of the first to appreciate the advantages of celluloid film. In 1889 he was granted a patent for a camera made 'to produce a series of instantaneous photographs of moving bodies which may afterwards be combined to produce animated pictures.' This camera had many resemblances to the modern ciné-camera, but was not put into practical use. F.-G. was compelled to sell the patent, and with the subsequent growth of the cinema industry his pioneer efforts were largely forgotten. He was also a pioneer with his experiments in colour photography, and was a profound believer in the possibilities of stereoscopic photography. A long list of patents stands to the credit of his inventive genius. He gained little financial recognition, however, and his costly experiments were paid for out of the proceeds of his work in studio photography in London, and later in Brighton. He was in very straitened circumstances at the time of his death, which occurred suddenly from heart failure during a meeting of film exhibitors. See R. Allister, *Friese-Greene: Close-up of an Inventor*, 1948.

Friesland, or Vriesland, prov. of the Netherlands, on the NE. side of the IJsselmeer (Zuider Zee). The surface is flat, and the coasts are protected by dikes, much of the prov. being below sea-level. There are sev. lakes, and the prov. has an extensive canal-system. The chief industries are cattle-rearing and the making of cheese and butter, but on the clay lands agriculture is also extensively practised. Woollens, fine linen fabrics, and sail-cloth are manufactured, and peat is dug in the higher fen dist. The prin. towns are Leeuwarden (cap.), Sneek, Harlingen, Bolsward, and Heerenveen. Area 1291 sq. m.; pop. (1954) 470,227. See also FRISIANS.

Friesland, East (Ger. *Ostfriesland*), name given to a region in NW. Germany, on the North Sea, between Jade Bay and the estuary of the Ems. It includes the E. Frisian Is. It was once part of Friesland (q.v.). It became a co. in the 15th cent., and later a duchy. In 1744 it passed to Prussia, and in 1815 to Hanover. Its cap. was Aurich (q.v.). Area about 1000 sq. m.

Frieze, in classical architecture, the member of the entablature above the architrave and below the cornice. It is decorated in various ways according to the Order used (see ORDERS OF ARCHITECTURE). In domestic architecture the name F. is given to the band of decoration which runs round the interior walls of a building immediately below the cornice, and above the picture-rail, if any.

Frigate, originally an oared sailing ship of the Mediterranean. Many such ships were built for the Brit. Navy in the 17th

cent.; but it was only during the Seven Years War that the first ship of the type technically known as a F. was built—a fast, full-rigged ship with upper deck, spar deck, and lower deck, carrying guns which by 1808 had increased in number to 50. The term is now used to describe certain types of anti-submarine vessels in the Royal Navy. One of them, H.M.S. *Maggie*, was formerly commanded by H.R.H. the Duke of Edinburgh. A large number of F.s have been built for the R.N. since the war and form a most important addition to the Fleet. Their armament includes the latest anti-submarine weapons, which represent a great advance on the depth-charge thrower. Some new F.s are equipped for anti-aircraft and aircraft direction duties. See *Sloop*.

Frigate Bird, or Man-of-War Bird (q.v.), marine bird belonging to the family *Fregatidae* of the order *Pelecaniformes*, and a native of the tropics. Its colour is black, strongly tinged with brown, while the pouch is scarlet. It is a large bird, having a long tail and wings, and a long hooked beak. It is essentially a sea-bird, and only comes to land during the breeding season. Its chief food is fish, and it has a habit of seizing the prey which it has forced another bird to disgorge. The 2 species of this family *Fregatidae* are *Fregatus aquila* and *F. minor*.

Frigga, or Frigg, Norse goddess, wife of Odin, and mother of Balder (q.v.). See also *ASFS*; *BRAGI*; *HEIMDALLE*.

Fried Lizard, see *CHLAMYDOSAUROS KINGI*.

Frimaire (frosty month), 3rd month of the year in the Fr. revolutionary calendar. See *CALENDAR*.

Frimley, tn in Surrey, England, 30 m. SW. of London. It now forms an urb. dist. with Camberley. It is mainly residential. Pop. (with Camberley), 24,220.

Fringillidae, see *FINCH*.

Frinton-on-Sea, seaside resort in Essex, England, 7 m. NE. of Clacton. A favourite centre for tennis tournaments. Pop. (with Walton-on-the-Naze) 9900.

Frisches Haff (Polish *Mierzeja Wiślana*; the *Vistula Lagoon*), lagoon of the Baltic Sea, SE. of the Gulf of Danzig. Its name means 'freshwater bay.' It was formerly in E. Prussia, and is now divided between Poland and the U.S.S.R. Once it was separated from the Baltic by a narrow spit of land, the *Frische Nehrung*, but in a storm in 1510 a passage was cut through this. It is about 50 m. long, 332 sq. m. in area, and 10-16 ft deep. In 1945, during the Russian invasion of E. Prussia, there was protracted fighting in the area of the F. H., Königsberg (Kaliningrad) being the objective. On 26 Jan. Soviet troops reached the Gulf of Danzig, and thereby cut off the E. Prussian garrison from central Germany. Elbing (Elbląg) was taken on 10 Feb., Braunsberg (Braniewo) fell after a severe struggle, but Pillau (Baltiysk) long held out, and Königsberg surrendered only on 9 April.

Frisi, Paolo (1728-84), It. mathematician, was a native of Milan. At the age of 16 he entered the Barnabite order,

and in 1756 was appointed prof. of mathematics at Padua. In 1764 he received a similar appointment in Milan, and just after this time visited sev. of the countries of Europe. Among his works are *Disquisitio mathematica*, 1751, *De Causa electricitatis dissertatio*, 1757, and *Cosmographia physica et mathematica*, 1774, 1775.

Frisian Islands, long chain of is. situated in the North Sea and extending along the coasts of the Netherlands, NW. Germany, and SW. Denmark. They are separated from the mainland by shallow flats (*wadden*), and are divided into the West F., East F., and North F. I. Originally part of the coastline, the is. were formed by penetration of the sea, and floods have diminished the area of most of them. Sheep and cattle are raised, and there are a number of small seaside resorts.

Frisians, seafaring people of Teutonic stock, who in the first cent. of the Christian era inhabited the coast lands between the mouths of the Scheldt and the Ems. They were partly conquered by the Rom. gen. Drusus, but revolted in AD 26. They were, however, again subdued by Corbulo in 47, but shortly afterwards all Rom. troops were withdrawn to the l. b. of the Rhine. In 58 they made an unsuccessful attempt to secure lands between the Rhine and the Yssel, and in 70 took part in the campaign of Clandius Civilis. It is uncertain whether they took part in the conquest of Britain, but they came into prominence again in the 7th cent. with the rise to power of the Franks. These people attempted to Christianise the F., but met with small success until Wilfred of York went there to convert them. The struggle between the Franks and the F. lasted for about 200 years, and although the F. made a stand for their freedom, they were compelled to cede the dist. from the Scheldt to the Zuider Zee to Pépin le Gros after an unsuccessful battle at Dorstadt in 689, and in 736 to acknowledge the supremacy of the Franks in the N., being finally subdued in 785 in the days of Charles the Great. Philip the Good of Burgundy laid claim to the whole of Friesland, but the people called on Frederick III in 1457 to protect their rights, and were acknowledged as dependents of the empire; but in 1498 Maximilian, Frederick's son, detached the prov. of Friesland from the empire and gave it as a fief to Albert of Saxony, and in 1523 it fell with the rest of the provs. of the Netherlands under the rule of the Emperor Charles. From 1579 to 1795 it was one of the constituent parts of the rep. of the United Provs., preserved its own dialect, and had a separate stadtholder; but in 1747 William IV was made hereditary stadtholder of all the provs., and his grandson, in 1815, took the title of King of the Netherlands.

Language.—W. Frisian is spoken by about 320,000 people in the Dutch prov. of Friesland, and on the is. of Terschelling and Schiermonnikoog; E. Frisian in Hanover prov. and the outlying is. of

Oldenburg is dying out; and N. Frisian, spoken by about 15,000 people on Föhr, Sylt, and the coast between Tondern and Husum. But the language is being supplanted more and more by Dutch. *Plattdeutsch* in Germany, and Dan. See J. Jung-Diefenbach, *Die Friesenbekehrung*, 1931.

Frith, or Fryth, John (1503-33), Protestant, b. Westerham, Kent, and educ. at Eton and Cambridge. Being invited by Wolsey he went to Oxford, but on account of his zealous support of reformation principles he was imprisoned. He was, however, released, and he then retired to Marburg, where he collaborated with Tyndale in his literary work. On his return to England in 1532 he was condemned to death for heresy, and burnt at Smithfield. He wrote, among other works, *Disputation of Purgatorie*, 1531.

Frith, William Powell (1819-1909), artist, b. Aldfield, Yorks, studied in the Academy schools and was elected R.A., 1852. His first attempts were costume pieces such as 'Othello and Desdemona' and 'Coming of Age in the Olden Time.' After 1853, however, he turned to realistic scenes of Eng. life. The grouping in these pictures shows great dexterity, and the types of people that he depicted testify to his observation and sense of humour. Among the best of these works are 'Derby Day' (National Gallery), 'Ramsgate Sands,' and 'The Railway Station.' His *Reminiscences* were pub. 1887-8.

Frith, see FIRTH.

Fritillaria, genus of bulbous plants of N. temperate regions, family Liliaceae, over 80 species; *F. imperialis*, the crown imperial, *F. meleagris*, the snake's head, and others are popular garden flowers.

Friuli (Ger. Friaul; anct Forum Julii), former Lombard duchy at the head of the Adriatic. Until 1919 it was divided between Italy (Udine, Portogruaro, qq.v.) and Austria (Gorizia, Gradisca, Idria, qq.v.). By the treaty of St Germain-en-Laye (q.v.) it became wholly Italian. After the Second World War a small portion was ceded to Yugoslavia. See **FRIULI-VENEZIA GIULIA**.

Friuli-Venezia Giulia, region (compartimento) of NE. Italy, comprising the provs. of Udine and Gorizia (qq.v.). It is bounded on the N. by Austria, on the W. and SW. by Veneto, S. by the Gulf of Venice, and E. by Yugoslavia (qq.v.). The region has a local autonomy, and was formed in 1947 from W. Friuli (q.v.) and the remaining portion of Venezia Giulia e Zara (q.v.). The chief tn is Udine. Area 2945 sq. m.; pop. 937,000.

Froben, or Frobenius, Johannes (c. 1460-1527), Ger. printer, b. Hammelburg in Bavaria. He was educ. at the univ. of Basel, and in 1491 founded a printing office in that city and issued about 300 works, among which may be mentioned his *Novus Testament* in Greek, 1516, which was used by Luther for his trans., and his eds. of St Jerome, St Cyprian, Tertullian, St Ambrose, and Erasmus. Some of his texts are illustrated by Hans

Holbein. It was largely owing to F. that Basel was the leading centre of the Ger. book trade in the 16th cent. After F.'s death his printing business was carried on by his sons and grandsons until 1603.

Frobenius, Leo (1873-1938), Ger. ethnologist, b. Berlin. Studied at Basel. Led 10 scientific expeditions to Africa and Asia Minor between 1904 and 1932. He founded the Institute of Culture Morphology at Frankfurt-on-Main in 1925. From this unique foundation, devoted exclusively to Africa and Oceania, Graebner and Wilhelm Schmidt were to found new schools of comparative anthropology in Vienna and elsewhere. The fact that W. African art and culture became at all known and admired in Europe was due largely to his enthusiasm.

Froberger, Johann Jacob (1616-67), Ger. organist and composer, b. Stuttgart, studied under his father, who became cantor at Halle c. 1620. F. became court organist in Vienna before 1637 until 1657, with a break in 1637-41, when he studied under Frescobaldi in Rome. In 1662 he visited London, but was so poor that he became organ-blower at Westminster Abbey, where he was ill-treated by Christopher Gibbons, but learnt how to play the organ from a foreign lady who presented him to the king, according to a not very well authenticated tradition. He went to Rome again but spent the end of his life at Héricourt, near Montbéliard, where the dowager duchess of Württemberg gave him asylum in her house. F. wrote exclusively for the organ and the harpsichord, so far as his preserved music shows.

Frobisher, Sir Martin (c. 1535-94), navigator, b. in Yorks. He made his first voyage to Guinea in 1554, and in the following 10 years went on yearly expeditions to the N. shores of Africa and the Levant. In 1576 he made his first voyage in search of a NW. passage under the auspices of Ambrose Dudley, earl of Warwick, reaching Frobisher Bay; and in the following year, as adm. of the company of Cathay, he sailed to the same region in search of gold, and explored S. of Meta Incognita and Jackman's Sound, bringing home 200 tons of gold from Kodlunarn. In 1578 he made his third voyage, and discovered a new strait and the upper part of Frobisher Bay, and in 1586 was vice-adm. in Drake's expedition to the West Indies. He was in command of the *Triumph* fighting against the Sp. Armada, and led one of the 4 newly formed squadrons, and the same year was knighted and put in command of a squadron of 6 ships to sweep the Narrow Seas. In 1590 he was vice-adm. to Sir John Hawkins, and in 1592 captured a large Biscayan ship with a valuable cargo of iron, etc. In 1594 he took part in the expedition for the relief of Brest and Crozon, and received a wound from which he afterwards d. at Plymouth. See F. Jones, *Life of Frobisher*, 1873, and P. F. Alexander (ed.), *The North-West and North-East Passages, 1576-1611*, 1915.

Fröding, Gustav (1860-1911), Swedish poet, b. Alster, Värmland. Although influenced by Byron and Heine, his poetry is intensely individual, combining a sombre *Weltschmerz* with burlesque humour and charming pictures of his native Värmland. Already his first vol. of verse, *Guitarr och dragharmonika*, 1891, had gained great popularity; his later publs., *Nya dikter*, 1894, *Stänk och flökar*, 1896, reveal the same rhythmic skill and technical virtuosity. F. is considered one of Sweden's greatest lyrical poets, and his influence on later writers has been immense. He ended his life in a mental home. See J. Landquist, *G. Fröding*, 1927; H. Olsson, *Fröding ett dikter-porträtt*, 1950.

Froebel, Friedrich Wilhelm August (1782-1852), Ger. educational reformer, b. Oberweissbach. The neglect he experienced in his youth led to his anxiety to promote the happiness of children. His mother d. in his infancy, and F. was apprenticed to a forester. In this position, in the Thuringian forest, he applied himself to the study of nature. No training could have been better suited to strengthen his inborn tendency to mysticism. Unity of nature was the conception in him which dominated all others. With difficulty he got to the univ. of Jena, but his allowance was too small to support him, and his univ. career ended in an imprisonment of 9 weeks for a debt of 30s. In 1802, when he was 20, his father d., and during the next few years he took up land-surveying, acted as accountant and private secretary, but all the time was conscious that he was meant to benefit humanity in some way, how he did not know. Whilst he was studying architecture in Frankfurt-on-Main the director of a model school, who had caught some of Pestalozzi's enthusiasm, persuaded him to take a post in his school. Later he retired from this post and educ. 3 lads in one family. He obtained the consent of the parents to his taking the boys to Yverdon, near Neuchâtel, and there formed with them a part of the celebrated institution of Pestalozzi. For 2 years he was qualifying to carry on the work begun by Pestalozzi. Taking the results at which he had arrived through the necessities of his position, F. developed the ideas involved in them, not by further experience but by deduction from the nature of man, and thus he attained to the conception of true human development and to the requirements of true education. F. now determined to continue the univ. course interrupted 11 years before, but again he was stopped, this time by the king of Prussia's celebrated call to 'my people,' so he enlisted in Lützow's corps and went through the 1813 campaign. Through his patriotism he met Langelthal and Middendorff. These 3 young men became attached to him on the field, and were ever after his faithful followers. Later he opened a school, starting with his own orphaned nieces and nephews as pupils. An educational institution was started by F. in

Switzerland, but it proved a failure. The Swiss Gov., wishing to turn his presence to advantage, sent young teachers to him for instruction. He felt that till the school age was reached, children were neglected, and he devised for small children a graduated course of exercises, modelled on the games in which he found them most interested. At Kellnau he opened the first kindergarten, in the nearby vil. of Blankenberg. This was in 1837. Self-activity was the keynote. The children were taught to do things; it was play, but as they played they learnt. F. wrote his *magnum opus*, *Die Menschen-erziehung* (The Education of Man), in 1826. He believed that 'all education not founded on religion is unproductive.' Pestalozzi taught the development of faculties through exercise, but F. postulated the function of education as the superintendence of inborn faculties by self- or voluntary activity. He held, with Comenius, that the knowledge of nature is the indispensable means of education; with Rousseau that each age has an organic and psychic completeness, but he added importance to the earlier stages. It was natural for him to devote himself, as did Pestalozzi, to the instruction of mothers. While Pestalozzi maintained that the child belonged to the family and Fichte declared categorically that he belonged to society, F. claimed that he belonged to both; he therefore instituted the kindergarten, in which educative play has a great part. See *Autobiography of Friedrich Froebel*, trans. by E. Michaelis and H. K. Moore, 1896; Emily Shirreff, *The Kindergarten*, 1876; *Friedrich Froebel and English Education*, 1952, various authors, ed. by Evelyn M. Lawrence.

Frog-hopper, Frog-spit, see CUCKOO-SPIT.

Frogbit, water-plant of the genus *Hydrocharis* (*H. morsus-ranae*), of the family Hydrocharitaceae. It is monocotyledonous and the leaves are ribbon-like. It is common in ponds locally in Britain.

Frogmore, royal residence in the Home Park, Windsor, about 1 m. SE. of the castle. The estate has long been the property of the Crown; the central block of the house dates from the early 18th cent., but there have been many later alterations and additions. F. has 2 mausoleums, that of the duchess of Kent, mother of Queen Victoria, who lived here for 21 years, and the Royal Mausoleum. The foundation stone of the latter was laid by Queen Victoria in 1832; the body of the Prince Consort was moved from the royal vault at St George's Chapel, Windsor, and placed in the mausoleum before its completion. Queen Victoria's body was brought here from Osborne House, Isle of Wight, where she d. Various members of the royal family are buried in the small cemetery adjoining the mausoleum.

Frogs, name applied to the family Ranidae of the order Anura, but in common speech the term is loosely used

to include other families of the order Anura. The family Ranidae includes some 200 species. The characteristics of the family are the presence of cylindrical

FLYING FROG

transverse processes on the sacral vertebrae, of teeth in the upper jaw, and the vomer, the fixation of the tongue in front instead of behind, more or less marked webbing between the toes, and a horizontal pupil in the eye. The best-known

varieties of F. are the common F. or *Rana temporaria*, the edible F., or *R. esculenta*, and the Amer. bull-F. or *R. catesbeiana*. There are also many very remarkable members of the family. For instance in West Africa there is found a hairy frog, the *Trichobatrachus robustus*, on whose sides and hind limbs long villous outgrowths are seen. Most of the tree-F. are now known to be more nearly allied to toads than to F., but the *Rhacophorus* of E. Asia, called by Wallace the flying frog, is a true member of the family Ranidae. It has markedly developed webs between the toes which it uses as parachutes in jumping from branch to branch. Some tree-F. make nests in the branches of trees which overhang water. The Common F. hibernate in holes in the ground. In the early spring they come above ground and mate. At this season a horny cushion appears on the first finger of the male frog. The eggs are laid in water, and are fertilised as they are laid. Nearly all F. desert their eggs, though there is one species in which the male places the eggs into hollows on the female's back, where they stay until they hatch out. The tadpoles hatch out from the eggs in about a fortnight. At first they are fish-like animals with external gills, and a long swimming tail, but no limbs. The first change to take place is the disappearance of the external gills, and the development of internal gills, which are still later supplanted by lungs. The hind legs appear before the front legs, and the last change to occur is the

After Sir J. Arthur Thomson's 'Outlines of Zoology' by permission of Professor James Ritchie, revising editor of the current edition, and the Oxford University Press

DIAGRAM OF LIFE HISTORY OF A FROG, AFTER BREHM

1-3, developing ova; 4, newly hatched forms clinging to water-weed; 5, 6, stages with external gills; 7-10, tadpoles during emergence of limbs; 11, tadpole with both pairs of limbs apparent; 12, metamorphosis to frog.

diminution and final disappearance of the tail. The tadpole stage lasts about 3 or 4 months. At the end of this time the animal leaves the water and lives in grass. Some species such as the edible frog are always aquatic. The grass frog lives mainly on insects, small worms, etc., which it catches very cleverly with its tongue. By autumn the frog grows big and sluggish. It stores fat in a special gland in the abdomen, and this fat is what it lives on during its winter sleep.

See G. A. Boulenger, *The tailless batrachians of Europe*, 1896; M. C. Dickerson, *The Frog book*, 1906; S. J. Holmes, *The biology of the frog*, 1906; A. H. Wright and A. A. Wright, *Handbook of frogs and toads (of the United States and Canada)*, 1949.

Frohschammer, Jakob (1821-93), Ger. theologian and philosopher. Ordained priest in 1847. In 1850 and 1854 respectively he pub. *Beiträge zur Kirchengeschichte und Über den Ursprung der menschlichen Seelen*, both of which were placed on the Index. In 1855 he became prof. of philosophy at Munich, and continued to pour forth a stream of false doctrine. This led to his excommunication in 1871, and between 1873 and 1876 he pub. a number of attacks on the Rom. primacy. F.'s later years were spent in philosophical speculation. Among his works in this field is *Die Phantasie als Grundprinzip des Weltprocesses*, 1877. His system is based on the unifying principle of imagination, which he extends to the objective creative force of nature, as well as to the subjective mental phenomena to which the term is usually confined. See A. Hinrichsen, *Deutsche Denker*, 1888; J. Friedrich, *J. Frohschammer*, 1896.

Frössart, Jean (c. 1338-c. 1406), Fr. chronicler, b. Valenciennes. His father was a heraldic painter. Philippa, wife of Edward III of England, made him her secretary in 1361. After her death he was patronised by the count of Namur, the duke of Brabant, and Guy de Blois, seigneur of Chimay, who gave him the living of Lestines. He travelled widely, visiting the courts of England, Scotland, and N. Italy, and that of Gaston de Foix.

F. wrote poetry of an indifferent character, but his fame rests on his 4-volumed *Chronicles*, probably started about 1360, which are a hist. of W. Europe from 1325 to 1400, and form one of the most important original sources of the period, in spite of errors of chronology and topography and certain personal prejudices. Their greatest value lies in their vivid descriptions of the customs and personalities that F. himself knew. See life by F. S. Shears, 1930, and the trans. of the *Chronicles* in Everyman's Library.

Frombork, see ERMELAND.

Frome, mkt tn in Somersetshire, England, 107 m. from London and 24½ m. from Bristol. It contains a 14th-cent. church, a market, and a school of art. There are breweries, foundries, wire-card manufactories and edge-tool works. The

woollen trade is one of the prin. industries. Pop. 11,140.

Fromentin, Eugène (1820-76), Fr. painter and writer, b. La Rochelle, son of a well-to-do physician. He early revealed a dual gift for writing and for painting, and produced (1841) a long poem *Sur la peinture moderne*. He studied under Louis Cabat, the landscape painter. He was much influenced in style by Eugène Delacroix and preferred exotic subjects, being known as the 'African' master (he travelled extensively in North Africa during the 1840's). He gradually turned from painting to literature and had success with 2 illustrated travel books—*Un Été dans le Sahara* 1857, and *Une Année dans le Sahel*, 1859, which won the praise and friendship of Sainte-Beuve and George Sand. His fame was enhanced later by his books *Matres d'autrefois*, 1876, an exposition of Dutch and Flem. painting, trans. as *Masters of Past Time*, 1913, and *Dominique*, 1863, and it is in them that his name has survived. See lives by L. Gonse, 1881; P. Dorbec, 1926; G. Assolant, 1931; M. Revon, 1937.

Fronde (1648-53), name given to a civil war in France. It is also sometimes applied to the Franco-Sp. war, 1653-9, which was the result of Sp. intervention in the second phase of the F. proper. The word means 'a sling,' and it was used to describe this contest because the windows of Mazarin's followers were pelted with stones by the mob in Paris. Originally the object was the redress of grievances, but there was a factional contest between certain nobles and Mazarin, the former attempting to reverse the results of Richelieu's work and to overthrow Mazarin, his successor. In May 1648 a tax levied on judicial officers of the Parlement de Paris was met by that body not merely with a refusal to pay but also with a condemnation of earlier financial edicts, and even with a demand for the acceptance of a scheme of constitutional reforms, framed by a committee of the Parlement. Helped by Condé, Mazarin was able to force the Parlement to sign the peace of Ruell, 1649. Subsequently Condé turned against Mazarin, enlisted Sp. help, and occupied Paris (1652). By 1653, however, the last strongholds of the F. had been crushed, and the result was, in the long run, a strengthening of the power of the Crown and a corresponding weakening of the power of the nobility and of the Parlement. See P. R. Doolin, *The Fronde*, 1935.

Frontenac, Louis de Buade, Comte de (1620-98), Fr. colonial officer, descendant of an anct Fr. family. He entered the army in 1635 and soon rose to be brigadier. After a brilliant army career he was appointed governor of the Fr. possessions in North America in 1672. His restless activity was a source of strength and vitality to the colony, but it led him into difficulties with the other colonial authorities and with the home gov. His first quarrel was with Perrot, governor of

Montreal, whom he caused to be put into prison. Then came a prolonged and acrimonious dispute with the Intendant Duchesneau, each accusing the other of making illegal gains out of the fur trade. The king, becoming impatient at such continual discord, at length recalled both. During this, his first term of office, F. built Fort F. (now Kingston, Ontario) to control the Iroquois, whom he treated with mingled kindness and firmness. After Denonville, the 11th governor-gen., had been recalled in 1689, the Fr. king turned to F., who, in spite of his 70 years, once again assumed the burden of office. He returned to find that Denonville had ordered Fort F. to be destroyed and that the Iroquois tribes were imperilling the countryside. F. then planned an attack upon the New Englanders. The Eng. colonists, knowing that the Iroquois, their allies, were attacking Canada from the W., replied by attacking the E. settlements of New France by sea. But the preparations which the New Englanders had made for an attack on Montreal, with the help of the Iroquois, proved as great a failure as their attack on Quebec. In his second term F. so broke the power of the Iroquois that they were never again a terror to the colony. F. was the strongest ruler Canada had seen since the death of Champlain. See life by F. Parkmann, 1918.

Frontier College, Canada, organisation by which young men of good education spend some part of the summer in the N. lands, doing manual work, and giving educational instruction. The scheme was begun in 1899 for E. Canada, and was extended to the W. provs. 9 years later. The instructors are univ. graduates, students, or teachers, and their pupils are lumberjacks, miners, and navvies, with occasional settlers. During the past 50 years about 500,000 have received elementary education and taken part in discussion on public affairs. Canadian hist., etc.; in addition, many foreign-born workers have been taught the Eng. language.

Frontinus, Sextus Julius (c. AD 40-c. 106), Rom. writer and soldier, was praetor in AD 70. He was governor of Britain from 74 to 78, and while holding that office distinguished himself by the conquest of the Silures. In 97 he was nominated *curator aquarum*, and d. about 106. He wrote *Strategematon libri iv*, a book on the art of war, and *De aquaeductibus urbis Romae libri ii*, which contains a hist. and description of the water-supply of Rome, and other matters of importance in the hist. of architecture. Both works have survived.

Fronto, Marcus Cornelius (c. AD 100-c. 166), Rom. historian, b. in Numidia. He came to Rome in the reign of Hadrian, made his name as an orator, and was appointed tutor to Marcus Aurelius and Lucius Verus. Few only of his works are extant, and these fall far short of the writer's great reputation. A number of his letters, addressed chiefly to Antoninus

Plus, Marcus Aurelius, and Lucius Verus, were pub. at Rome in 1823. There is also an ed. with trans. by C. R. Haines (Loeb Library, 2 vols., 1919-20). See M. D. Brock, *Studies in Fronto and his Age*, 1911.

Frosinone: 1. Prov. of Italy, in SE. Lazio (q.v.). It is generally mountainous and contains some high ridges of the Central Apennines (q.v.), but is crossed NW.-SE. by the broad valley of the Liri (see GARIGLIANO) and its trib. the Sacco. The prin. tns include F., Anagni, Sora, and Arpino (qq.v.). Area 1278 sq. m.; pop. 479,000.

2. (anc. **Frusino**) It. tn, cap. of the prov. of F., situated on a hill, 46 m. ESE. of Rome (q.v.). It has a trade in agric. produce and wood. Pop (tn) 2900; (com.) 29,300.

Frost, Robert Lee (1875-), Amer. poet, b. San Francisco. His father, a New Englander, d. when Robert was 10, and his Scottish mother, a teacher, moved to Lawrence, Massachusetts. After attending various schools and spending a year at Dartmouth, F. went to work in a Lawrence textile mill. From 1897 to 1899 he was at Harvard, but never got a regular degree, though he was later to have 16 honorary degrees. He was in turn teacher, cobbler, editor, and finally farmer for 11 years at Derry, New Hampshire. In 1912 he went to England and settled at Beaconsfield, where he met Rupert Brooke, Lascelles Abercrombie, Edward Thomas, and other poets. From this point his poetical career may be said to have begun. His first book of verse, *A Boy's Will*, 1913, was followed by *North of Boston*, 1914. In 1915 he returned to the U.S.A., where he was now famous, and became prof. of poetry at Harvard. He was 3 times awarded the Pulitzer Prize for poetry—in 1924, 1931, and 1937—and also received the medals of the Amer. Academy of Art and Letters in 1938 and of the Poetry Society of America in 1941. Though b. in California, his voice is the voice of New England, and he has been described as the purest classical poet of America. His works include *Mountain Interval*, 1916; *New Hampshire*, 1923; *West-Running Brook*, 1928; *A Further Range*, 1936; *A Witness Tree*, 1942; *A Masque of Reason*, 1945; *Sleepy Bush*, 1947; and *A Masque of Mercy*, 1947. His *Complete Poems* were pub. in 1949. See studies by G. B. Munson, 1927; and S. Cox, 1929; also C. Ford, *The Less Travelled Road*, 1935; L. Thompson, *Fire and Ice*, 1942.

Frost, that condition of climate when the temp. of the air is below the freezing-point of water; the term is also applied to manifestations in the form of small crystals of ice. Under ordinary conditions of pressure pure water solidifies at 0° C. or 32° F. Water containing substances in solution freezes at temps. somewhat below this point. Water contracts as it cools down to 4° C., but below that point it expands for a decrease in temp., and as it solidifies in a crystalline form it takes up more space as a solid than as a liquid. Therefore water-pipes are likely to burst

during a F., though the subsequent leakage is not discovered until the thaw, or period when the temp. has again risen above 0° C. The expansion of freezing water is also responsible for breaking off large pieces of rock when water has collected in cracks, and for the general disintegrating effects of F. upon soil and even vegetable structures. The general condition determining F. is diminution of temp. below 32° F., but in the Brit. Isles this does not obtain as an average condition, even through Jan., the coldest month of the year. There are therefore usually special circumstances connected with F.s, and it is necessary to distinguish between air F.s and ground F.s. Ground F.s can occur when the air temp. is above 32° F. and are caused by loss of heat by the ground because of radiation to space. Radiation loss is hampered by an abundance of water-vapour in the atmosphere, therefore ground F.s occur on clear nights when there is neither cloud nor wind. These conditions are characteristic of anticyclonic periods, that is, when there is a high barometric pressure and the air gently flows outwards from the anticyclonic area. As the likelihood of ground F. depends upon the freedom of the atmosphere from water-vapour, some indication of the probable night temp. may be gained from an examination of a wet- and dry-bulb thermometer; a good estimate is obtained by multiplying the difference between the wet- and dry-bulb readings by 24, and subtracting the result from the actual air temp. (dry bulb). Sometimes the frequency of F.s is affected by the nature of the land with regard to slope. On a calm night the heavier cold air tends to flow down the sides of hills to the valleys below; therefore plantations on the slopes of hills are not so liable to F. as those in the valleys. The effects of F. on agric. enterprise may be advantageous or the reverse, according to the seasonableness of the low temp. Thus a F. in winter helps to break up the ground and checks the growth of plants at a time when too early development might be dangerous. On the other hand, spring F.s often do great damage by destroying blossoms and fruit buds. The destructive action of F. on vegetation is due to the formation of ice on the outside of the cells, from which the water has been squeezed by the contraction due to low temp.: if the ice thaws rapidly the water cannot be reabsorbed by the cells in time, and either runs off and causes the plant to dry up, or collects in intercellular spaces and causes decay. As F.s do not often occur in the Brit. Is. when the air is humid, attempts are sometimes made to prevent a threatened F. by flooding the soil. This causes a bank of mist to rise up and serve as a blanket for the prevention of overmuch radiation. Protection from F. damage during the critical period of growth of fruit is usually obtained by the use of orchard heaters, small pots burning oil. This method is very popular in the citrus orchard areas of California. Small areas may be sufficiently protected from a light F. by

coverings of straw, paper, etc. See R. Bush, *Frost and the Fruit Grower*, 1945.

Frost Figures, or Ice-flowers, curved aggregations of ice-crystals, produced when hoar-frost is formed on a cold surface. The atmosphere contains a varying amount of water-vapour diffused in it. The exact amount is dependent on the physical configuration of a country, the prevailing winds, nearness to the sea, etc., and the amount that can be present in the atmosphere increases with its temp. When no more evaporation is possible the atmosphere is said to be saturated, and any decrease in temp. when this condition is estab. causes the deposition of the excess of water on any available surface. When this occurs at the surface of the earth, the water is deposited on the ground in the form of dew. Should the temp. drop to below 32° F. the water-vapour may be deposited as ice without passing through the intermediate liquid stage. In these circumstances small crystals of ice are formed, belonging to the hexagonal system of crystals. They have the habit of twinning; that is, 2 crystals may have a common face, but their axes may not be parallel. This phenomenon, when continued with crystal after crystal, produces a pattern of gradual curves, whose interpenetration and divagation produce a remarkable similarity to beautiful foliage. See ICE.

Frostbite, consequence of the continued action of great cold on parts of the body. Limited areas of the body may be frozen for a short period without risk, as in surgical operations. But when larger portions are frozen for considerable periods, especially when the circulation returns too soon, more outlying parts—say, the fingers in the case of a frozen hand—may perhaps die (see GANGRENE) and fall off. It is stated to be specially apt to occur in persons given to the use of alcoholic drinks, in whose blood-vessels loss of vitality is prone to cause sluggish circulation. If circulation does not return the part affected may simply shrivel up and turn black and gangrenous. But if the injury to the tissues is less severe circulation returns as the part thaws, and the vessels become swollen, red, and painful, sometimes with inflammation and subsequent gangrene. The condition is preventable by adequate covering of hands and feet, etc., when there is extreme cold; also by maintaining the circulation with movement. But when F. has occurred the patient should be put in a cold room, and the parts affected should, in traditional practice, be rubbed with snow or covered with somewhat cold water. Sometimes the pain can be relieved by lifting the limb. Later there can be gentle rubbing with oil, but the longer the part has been exposed to the cold the more gradual must be the course of treatment. When the circulation has returned the part may be lightly wrapped in cotton-wool.

Symptoms.—Here are some of the symptoms described by the vivid pen of the Amer. Rear-Adm. R. E. Byrd, in

Alone, 1939. Byrd experienced F. in its most virulent form, near the S. Pole in 1934. 'Times when the temperature was in the minus fifties or sixties, a wind would come rustling out of the cold, edged with a breath so sharp that it fairly sliced the skin from the face. (He had chemical heat pads in his sleeping clothes, and under his furs in the daytime.) Maybe my toes would first turn cold, and then dead. While I was dancing up and down to flex them and restore the circulation my nose would freeze, and by the time I had attended to that my hand would be frozen. The wrists, the throat where the helmet chafed, the back of the neck, and the ankles, pulsed and crawled with alternating fire and ice. Freezing to death must be a queer business. Sometimes you feel simply great. The numbness gives way to an utter absence of feeling. You are as lost to pain as a man under opium. But at other times, in the enfolding cold, your anguish is the anguish of a man drowning slowly in fiery chemicals.'

Treatment.—It must be pointed out that there is difference between orthodox medical tradition and the treatment advocated by the explorer, V. Stefannson, who, in *My Life with the Eskimo*, 1913, says: 'One of these superstitions is that, when your face or any other part of your body begins to freeze, you must thaw it out with an application of snow. Few things could be more absurd. Any high-school pupil could tell us offhand what would happen if liquid air were applied to a man's cheek or nose; of course the part would freeze instantly. The same would be true of the snow of carbon dioxide, and the same is true of snow or water, except, of course, that the freezing would not be so nearly instantaneous.' Stefannson's treatment was brief application of a warmed hand to the part affected.

Frottola, form of light part-song for 4 voices cultivated in Italy between about 1490 and 1530, with sophisticated and often elegantly indecent words set to music with a melodious top part and little elaboration of texture beneath. It led at the end of its period to the more polyphonic madrigal on the one hand and to a more diversified continuation of its own manner in the canzonet, villanella, and similar forms.

Froude, James Anthony (1818-94), historian, b. in Devon, and educ. at Westminster and Oriel College, Oxford. F. was originally associated with the Tractarians, but later lost his faith in organised religion. His *History of England from the Fall of Wolsey to the Defeat of the Spanish Armada*, 1856-70, is his greatest work, and brought him great fame, but, though most admirably written, as a hist. it is not entirely reliable, F. being inclined rather to endeavour to support his own theories than to follow the facts elucidated by the documents from which he worked. Among his other books were *The English in Ireland in the Eighteenth Century*, 1872-4, *Oceana*, 1886, *The English in the*

West Indies, 1888, *The Life and Letters of Erasmus*, 1893, and *English Seamen in the Sixteenth Century*, 1895. His friend Carlyle (whose influence on F.'s views was enormous) appointed him his sole literary executor, and in that capacity he pub. Carlyle's *Reminiscences*, 1881, *History of the First Forty Years of Carlyle's Life*, 1882, *Letters and Memorials of Jane Welsh Carlyle*, 1883, and *Carlyle's Life in London*, 1884. His biography of Carlyle was vigorously attacked, and gave rise to a bitter controversy. F. was editor of *Fraser's Magazine* from 1860 for 14 years. He was rector of St Andrews from 1868, and regius prof. of modern hist. at Oxford, 1892-4. See A. Cooper, *James Anthony Froude* (a lecture), 1907; G. P. Gooch, *History and Historians in the Nineteenth Century*, 1913; and W. H. Dunn, *Froude and Carlyle: a Study of the Froude-Carlyle Controversy*, 1930.

Fruetidior (fruit-month), 12th month in the Fr. revolutionary calendar. See CALENDAR.

Fructose, or *Laevulose* (fruit-sugar), discovered by Dubrimant in 1847. A ketose (see SUGAR), $\text{CH}_2\text{OH}(\text{CHOH})_3\text{CO}\cdot\text{CH}_2\text{OH}$, contained in most sweet fruits, honey, and starches together with dextrose. Obtained pure by boiling inulin—a starch contained in dahlia tubers—with water, and together with glucose by the inversion of cane sugar. It is also obtained by hydrolysing sucrose with sulphuric acid. F. crystallises from alcohol, and has a melting point of 95° C. It is less easily fermented than glucose, is a powerful reducing agent, and is laevorotatory (see STEREOCHEMISTRY). It is sweeter than cane sugar and is more easily assimilated. It can be obtained as a syrup or as a granular crystalline. It is used instead of cane sugar by sufferers from diabetes. It was synthesised chemically in 1887.

Frugoni, Carlo Innocenzo Maria (1692-1768), It. poet, b. Genoa. At the age of 15 he was sent to a monastery, and forced to take monastic vows. In 1716 he was prof. of rhetoric at Brescia, and afterwards taught at Rome, Genoa, Bologna, and Modena. He became poet laureate to the duke of Parma, and was released from his monastic vows by the pope. His lyrics and pastorals are remarkable for their facility and elegance, and he was also a very successful writer of Lat. poetical epistles and operatic libretti.

Fruit, popularly the product of a shrub, tree, or plant, usually containing the seed, which may be eaten. Botanically a F. is the fertilised gynaecium of a flower, together with the adherent parts of the inflorescence that enlarge after fertilisation. When only the gynaecial structures are affected, the result is a true F.; when other parts, such as perianth, receptacle, etc., are involved the result is a false F., or pseudocarp. The rind or shell of a F. is derived from the wall of the ovary and is known as the pericarp, and is made up of 3 more or less distinguishable layers: the epicarp or outer epidermis, the endocarp or inner layer, and the mesocarp or

SOME TYPICAL FRUITS

1. Cypselia—Head of *Olearia haastii* in seed. 2. Cypselia—Single parachute seed of same. 3. Glans or Nut—Sweet Chestnut, cupule open, showing the three nuts. 4. Glans—Longitudinal section of nut of same. 5. Glans—A single nut of same. 6. Glans—Section of young fruit. 7. Capsule of *Euonymus europaeus*. 8. Capsule of same, open and empty. 9. Capsule of same, open, with seeds in position. 10. Samara—Single samara of Elm. 11. Samara—Single samara of Ash. 12. Samara—Double

mesophyll, a spongy middle layer. In pseudocarps the other parts combining with the ripened ovary are chiefly derived from the floral receptacle, as in the apple in which the true F. is the core, and the strawberry in which the carpels, forming the apocarpous gynaeceum, cover an enlarged fleshy receptacle. The terms pericarp, epicarp, endocarp, and mesocarp are not very applicable to pseudocarpic F.s. The classification of F.s is complex, but may be simplified as follows:

Dry Dehiscent Fruit.—Usually many-seeded, such F.s open or split on maturity to liberate the seed. Most capsules dehisce valvularly, the side walls (pericarp) splitting longitudinally, and breaking away in segments or valves. Splitting down the dorsal sutures is called loculicidal dehiscence; down the ventral suture, septicidal dehiscence; while, if in either method the septa is broken across to leave the seeds as a free central column on the placenta, it is septifragal dehiscence. Some F.s, on dehiscent, throw their seed (e.g. balsam, geranium), others dehisce by pores (e.g. papaver), others by teeth (e.g. *Primula veris*), and others by the release of a lid (e.g. anagallis). Dehiscent F.s may be capsules, follicles, legumes, siliques, or pyxidiums which dehisce transversely.

Dry Indehiscent Fruit.—Includes most fleshy F.s. If with dry walls and 1 seed, the F. may be an achene, as in black medick; a caryopsis, as in grasses; a cypsela, as in the Compositae, or a nut, as in hazel or beech. Many-seeded, indehiscent F.s are known as schizocarps, usually break into 1-seeded parts, mericarps, and may be known as carcerules; if winged they constitute samaras.

Succulent Fruit.—Such F.s may be the berry, with a wholly succulent pericarp (e.g. gooseberry, grape, currant, etc.) or a drupe or stone F.

False Fruits are of many types, and include pome F.s (e.g. apple, pear, hawthorn, etc.), fig, pineapple, mulberry, and strawberry. When bracts enlarge, they may form a cover for F.s, or cupule, or wings (e.g. tilia). A knowledge of the flower and process of fertilisation are necessary for the understanding of any F. See FLOWERS; FERTILISATION; BOTANY; GARDENING. See also S. B. Whitehead, *Fruit from Trained Trees*, 1954.

Fruit, Drying of, see PRESERVING.

Fruit, Preservation of, see PRESERVING.

Fruit-bat, name given to all members of the Pteropodidae, a frugivorous family found only in the tropical regions of the E. and in Australia; they are variously called flying-foxes, flying-bats, and fox-bats. The heads of many of them are curiously fox-like, and their hair is a reddish brown. *Pteropus caulin*, the great kalong, is the largest of all bats, measuring nearly 5 ft across the wings. *Cynopterus marginatus* is the destructive and voracious Indian F.

Fruit Drinks, see COCKTAILS; COOKERY.

Fruit-farming, as distinct from market-gardening, comprises the cultivation of tree and bush fruit, including strawberries and raspberries. The agric. conditions, etc., are treated under the headings of the different fruits; a short account of the extent of F. in this country, and of the importation of fruit, will here be given. The growing popularity of the fruit industry may be gathered from the fact that the Ministry of Agriculture returns concerning the fruit areas of Great Britain show a continuous increase. The total area in 1888 was 199,178 ac., in 1901 234,660, and in 1953 about 314,000. The following are the areas devoted to F. by certain Eng. cos.: Kent, 60,000 ac.; Devonshire, 22,000; Worcestershire, 22,000; Herefordshire, 20,000; Somersetshire, 19,000; Gloucestershire, 14,000; Cambs and Isle of Ely, 11,000; Norfolk, 9,000; Sussex, 5,000; Essex, 5,000; Lincs, 4,000; Cornwall, 4,000; Suffolk, 3,500; Middx, 3,500; Shropshire, 3,500.

The acreage under small fruit cultivation (approximately 51,300 ac. in 1953), is about one-sixth of the total devoted to F. The prin. small fruits grown are strawberries, currants, gooseberries, and raspberries, while loganberries have increased in importance. Among the prin. strawberry-growing cos. are Cambs, Hants, Norfolk, and Worcestershire. The following is the proportion occupied by the various small fruits: strawberries, 18,000 ac.; raspberries, 10,100; currants and gooseberries, 21,300; other kinds, 1900.

The following is the average crop per ac. of some of the fruits: strawberries, 32.7 cwt.; raspberries, 32.0; red currants, 38.7; black currants, 30.8; gooseberries, 41.9. Orchard trees represent a large proportion (274,000 ac.) of the fruit acreage, but much of this is devoted to unspecialised production. In 1953 the

samara of Sycamore. 13. Samara—Section of half of same, showing enclosed cotyledonous leaves. 14. Legume—Pod of Broom, closed. 15. Legume—Pod of Broom, open. 16. Berry—Wild Gooseberry. 17. Berry—Section of same (transverse). 18. Carcerulus—Fruit of *Phlomis fruticosa*, with part of calyx-tube. 19. Carcerulus—Fruit of *Phlomis fruticosa*, splitting into four nuts or achenes. 20. Drupe—Cherry. 21. Drupe—Section of same, showing stone. 22. Drupe—Complete section of same, showing kernel within stone. 23. Pome—Crab-apple. 24. Pome—Transverse section of same. 25. Pome—Longitudinal section of same. 26. Aetaerio of Follicles—*Magnolia conspicua*. 27. Aetaerio of Follicles—Vertical section of same. 28. Aetaerio of Drupes—Blackberry. 29. Aetaerio of Drupes—Vertical section of same. 30. Cynarrhodium—Dog-rose. 31. Cynarrhodium—Vertical section of same. 32. Strobilus—Spruce Fir, closed cone. 33. Strobilus—Spruce Fir, winged seeds of same, within scale. 34. Strobilus—Weymouth Pine, open cone.

acreage of various orchard fruits and production per ac. were: apples (dessert and eating), 129,300 ac. and 76.8 cwt.; cider apples, 3800 and 37.0; pears (dessert and eating), 16,700 and 42.4; plums, 41,000 and 39.0.

F. is an uncertain industry, and a moderate crop in a bad year will probably yield more profit than a good crop in a very good year, when the market will consequently be glutted. A large amount of labour is required, but in some cases the profits have compensated for this. It is, however, in the cultivation of fruit, principally grapes and tomatoes, under glass that the largest fortunes have been made. About 12 tons of grapes and 33 tons of tomatoes may be grown to the ac. by this method. Owing to the perishable nature of the produce, few industries are more precarious in this respect, and great developments are possible in the direction of systematic marketing in the interest of the producer. Experiments have been tried with considerable success along co-operative lines, the growers in a dist. (as in the Pershore dist. of Worcestershire) combining to form a market of their own from which supplies can be forwarded with the minimum of delay and expense to places where the demand is good. Another development which considerably enhances the profitable character of F. and diminishes its risks is the provision of factories and other facilities for preserving the surplus produce by canning or one or other of the various methods outlined in PRESERVING.

The great proportion of fruit grown in the Brit. Isles is produced as a side line on farms and in market gardens, and falling a highly elaborated system of marketing, within easy distance of a fruit farm, and falling also a specially well suited climate and soil, this is undoubtedly the best method of undertaking fruit culture. The grower is then not seriously dependent on the vagaries of the season, and can usually make good use of a considerable part of the land occupied by the fruit crops, as by pasturing sheep in the orchard, or by enclosing it in a series of poultry runs.

Importation of Fruit.—F. is carried on extensively in all the dominions and in many colonies, and in foreign countries. By the process of canning, and by the use of refrigerating chambers on board ships, fruit can now be transported to any part of the world.

The estimated consumption of fresh and processed fruit in Britain in 1954 was about 123 lb. per head of the pop., which is only slightly less than pre-war. Although Brit. imports of fruit since the war have been much smaller than in 1934-8, total supplies have not been greatly reduced because the home supply of fruit has been doubled. Imports into Britain in 1954 totalled 1,033,800 tons, of which nearly half came from Commonwealth countries. The classes of fruit imported were (in thousands of tons): citrus, 459.8; bananas, 290.7; deciduous and other fruit, 233.3.

See the articles on the various fruits, and GARDENING; and N. B. Bagenal, *The Fruit Growers Handbook*, 1949; N. P. Seabrook, *Modern Fruit Growing*, 1951; Royal Hortic. Society, *The Fruit Garden Displayed*, 1951; R. Bush, *Penguin Handbooks on Fruit-Growing*, 1951.

Fruit Sugar, see FRUCTOSE.

Fruit Wines, see WINES, HOME-MADE.

Frumentius, St (c. AD 300-80), apostle of Ethiopia, b. at Tyre. He was captured by the Abyssinians, whom he converted to Christianity, and he was consecrated bishop of Aksum about 336. His feast is on 27 Oct.

Frundsberg, Georg von (1473-1528), leader of the Ger. Landsknechte (free-lances) during the it. wars of Maximilian and Charles V, was b. at Mindelheim in Swabia. He fought for Maximilian against the Swiss in 1499, and in 1504 took part in the war in the Netherlands. In 1509 he won fame in the war against Venice, and in 1513 and 1514 was again occupied with the Fr. and Venetians. He gained a victory at Bicocca in Italy in 1522, was partly responsible for the defeat of the Fr. at Pavia, 1525, and suppressed a peasant revolt in Germany the same year.

Frunze, Mikhail Vassilievich (1885-1925), Russian revolutionary gen., b. Pishpek (renamed F. in 1926), son of a peasant, settled in Turkestan and became a surgeon. Sent to Siberia, 1914, but escaped, and again heard of at Minsk, 1917. Defeated Kolchak, 1919; fought Wrangel successfully, 1920. In 1924 president of the Revolutionary Military Council. In Jan. 1925 became people's commissary for military and naval affairs.

Frunze, tn (formerly Pishpek), cap. and region of the Kirgiz S.S.R., Soviet Central Asia, 150 m. S. of SW. extremity of Lake Balkhash. Grain is cultivated and there are cotton mills and tobacco factories. Pop. 155,000.

Frusino, see FROSINONE.

Frustum, portion cut off from any solid figure. The term is most frequently applied in the case of the cone, and conoidal surfaces of revolution. By 'frustum of a cone' is meant any part cut off from a cone which does not contain the vertex. This distinction is drawn because any part of a cone which contains the vertex is still a cone.

Fry, Charles Burgess (1872-1956), Eng. athlete and journalist. Educ. at Repton and Wadham College, Oxford. Captained Oxford at cricket, association football, and athletics; as an undergraduate he set up the world record for long jump. He was a football international, and captained England at cricket against Australia and South Africa in the Triangular Tests, 1912. A pioneer of scientific back-play, F. was a magnificent driver, pre-eminent in his generation of batsmen. In 1901 he made 6 hundreds in succession—a feat equalled only by Sir D. Bradman. His *Cricket*, 1912, is a fine treatise on batting; he founded and ed. *Fry's Magazine*. From 1908-50 he commanded

the training ship *Mercury*. See his autobiography, *Life Worth Living*, 1939, 1948.

Fry, Christopher (1907-), playwright, b. Bristol. Educ. at Bedford Grammar School, he was a schoolmaster for a few years, then turned to the stage and was in turn actor, script writer, and producer. From 1934 to 1936 he was director for the Tunbridge Wells Repertory Players, and in 1939 and 1940 his pageant plays *Thursday's Child* and *The Tower* were performed. In 1940 he became director of the Oxford Playhouse, but was called up and served in the Second World War from 1940 to 1944. In 1946 his play *A Phoenix Too Frequent* appeared, to be followed by *The Lady's Not for Burning*, 1949, *Venus Observed*, 1950, *A Sleep of Prisoners*, 1951, and *The Dark is Light Enough*, 1954. *The Firstborn*, 1946, shows his tragic power. Written in flexible verse, his plays form a landmark in the revival of poetic drama in England. See study by D. Stanford, 1951.

Fry, Sir Edward (1827-1918), judge, b. Bristol. He was educ. at Univ. College, London, and London Univ. and was called to the Bar in 1854. From 1877 to 1883 he was judge of the high court chancery div., and in 1883 was made lord justice of appeal, but resigned in 1892. He presided over the royal commission on the Irish Land Acts, 1897-8, and was conciliator in the S. Wales colliery dispute, 1898. He was chairman of the court of arbitration under the Metropolitan Water Act, 1902; and ambas.-extraordinary and first Brit. plenipotentiary to The Hague Peace Conference in 1907. He wrote *Essays on the Accordance of Christianity with Nature of Man*, *The Doctrine of Election*, 1864, *James Hack Tuke*, 1899, *Studies by the Way*, 1900, and *The Liverworts*, 1911. See Agnes Fry, *Sir Edward Fry*, 1921.

Fry, Edwin Maxwell (1899-), architect and town-planner; b. Wallasey; educ. Liverpool Univ.; worked as partner with Messrs. Adams and Thompson after 1927; then with W. Gropius (q.v.), designing with him Impington Village College, 1937. Was town-planning adviser in West Africa, 1943-5, in partnership with his wife, née Jane Drew. In 1951 he was appointed senior architect for the new cap. of the Punjab at Chandigarh (see 'LE CORBUSIER'). Other buildings include Sun House, Hampstead, 1935; Kensal House flats, London, 1937; educational buildings, Gold Coast (Ghana), 1946-53; Univ. College, Ibadan, Nigeria, 1954.

Fry, Elizabeth (1780-1845), prison reformer, was a daughter of John Gurney, Quaker banker of Norwich, and was b. there. In 1800 she married Joseph F., Quaker banker and tea merchant, related to the Frys of Bristol. She worked, life-long, to alleviate the conditions of women prisoners which were then indeed terrible. The usual punishments were transportation or death. In 1813 she began to visit and to teach and occupy the women in Newgate prison with their children. In 1817 she formed

an association for the improvement of conditions, and her work extended to other prisons. For 25 years she visited every ship bound with women convicts for Australia, arranging instruction and occupation. Her unflagging devotion, magnetic personality, reports to authority, and pub. pamphlets enlisted public sympathy, led to enquiry, and then to reforms. Later she carried her work to continental prisons. In addition she brought up 10 of her 11 children and was active in promoting schools and in the improvement of sick-nursing. There are lives by her daughter, Mrs Cresswell, 1845; Susanna Corder, 1853; G. King Lewis, 1910; and Janet Whitney, 1937, and sev. reprints.

Fry, Joseph (1728-87), Quaker chocolate manufacturer and type founder. He settled in Bristol as a doctor, but later turned his attention to commercial projects. He helped Richard Champion in his Bristol china works, was partner in a firm of soap-bollers, and owned some chemical works at Battersea. He was the founder of the Bristol firm of chocolate manufacturers, having purchased the patent right from Wm Churchman. In 1764 he became interested in type-founding, and entered into partnership with the first printer of the *Bristol Gazette*, Wm Pine. The business soon moved to London, where he assumed complete control of it in 1776. After his death the chocolate firm, which was the first of its kind, was carried on by his widow, Anna, and his son, Joseph Storrs. The factory expanded rapidly, and a Watt's steam engine was purchased in 1798 so that the cocoa beans could be ground by steam. In 1896 the business was converted into a private limited company, under the directorship of members of the F. family. Building began at a site in the country outside Bristol in 1921, and the whole factory was transferred there in the course of 13 years. See also COCOA and CHOCOLATE.

Fry, Mrs J. P., see KAYE-SMITH, SHEILA.

Fry, Roger Eliot (1866-1934), painter and critic; son of Sir Edward F. (q.v.). Educ. at Clifton College and King's College, Cambridge Univ. Was a pupil of Francis Bate and also studied in Paris. He first attracted attention by the exhibitions of 'Post-Impressionist' paintings which he organised in 1911 and 1913. The ensuing controversy strengthened his views, and it was to him that the belated recognition of Cézanne in Britain was due. He ed. the *Discourses* of Sir Joshua Reynolds, 1905, and wrote monographs on Giovanni Bellini, Matisse, and Paul Veronese; but his merits as an artistic philosopher will be estimated rather on such pubs. as *Vision and Design*, 1920, *Transformations*, 1927, and *Reflections on British Painting*, 1934—works which showed great aesthetic sensibility and had much influence. His last work, *Last Lectures*, was pub. posthumously, 1939. For a time F. was curator at the Metropolitan Museum, New York, and in 1933

he was appointed Slade prof. of fine art at Cambridge.

Fryatt, Charles Algernon (1872-1916), master-mariner, b. Parkeston, Essex. When the submarine policy of the Ger. Gov. came into force on 18 Feb. 1915, it became F.'s constant business to cross a war zone where his ship was liable to be sunk without warning. On 28 Mar. 1915, when navigating the S.S. *Brussels* from Parkeston to Rotterdam, he was met by a submarine U33 near the Maas lightship. He disregarded the signal to stop, and steered straight for the submarine, which escaped by diving. On the night of 23-24 June 1916, steaming home from the Hook of Holland, the *Brussels* was captured by a torpedo-boat flotilla and taken to Zeebrugge. F. was tried (for his alleged offence of 28 Mar. 1915) at Bruges, 27 July 1916, and shot the same day.

Frydant (Ger. Friedland), Czechoslovakia in the region of Liberec (q.v.). The anct castle belonged to Wallenstein (q.v.), who was duke of F. Textiles are manufactured. Pop. 4500.

Frying, see COOKERY.

Fryth, John, see FRITH, JOHN.

Fryxell, Anders (1795-1881), Swedish historian, educ. at Uppsala. His chief work is *Berättelser ur Svenska Historien* (trans. 1844), a hist. of Sweden from the earliest times to the death of Gustavus III, which took 46 years to complete.

Fuad I (Ahmed Fuad) (1868-1936), king of Egypt, youngest son of Khedive Ismail Pasha. In 1917, on the death of his elder brother, Sultan Hussein Kemal (q.v.), F. became sultan, and, the Brit. protectorate coming to an end, he was proclaimed king on 16 Mar. 1922. In 1928 the constitution was suspended, but was restored in 1929. On his death he was succeeded by his only son, Farouk (deposed on 26 July 1952).

Fuchow: 1. City of China, in the prov. of Kiangsi, an important seat of trade in native paper, and linen.

2. (Fukien prov.) See FOOCOW.

Fuchs, Leonhard (1501-86), Ger. botanist, b. Memmingen, Bavaria. He studied classics at Ingolstadt under Reuchlin, and became prof. of medicine at Tübingen in 1535. Soon he took up the pursuit of botany, of which he must be looked upon as one of the fathers. His most important work on the subject is *De Historia Stirpium Commentarii Insignes*, 1542. This work is beautifully illustrated by woodcuts, and gives a clever description of domestic plants alphabetically arranged. In it F. laid the foundation of a permanent botanical nomenclature. The fuchsia was named after him.

Fuchs, Sir Vivian Ernest (1908-), scientist and explorer. He led and took part in expeditions to Africa and to Greenland before the Second World War, and from 1947 to 1950 he organised the Falkland Is. Dependencies Survey in the Antarctic. He was director of the Falkland Is. Dependencies Scientific Bureau from 1950 to 1955, and in 1955 became leader of the Brit. Trans-Antarctic Expedition. He left Shackleton Base on the Weddell

Sea on 24 Nov. 1957 with a party of 12 in 3 Snocats, 2 Weasels, and 1 Muskeg, and reached the S. Pole on 19 Jan. 1958. Depot 700, which had previously been estab. by Sir Edmund Hillary (q.v.), was gained on 7 Feb.; thenceforward the party was guided by Hillary to Scott Base on McMurdo Sound, arriving there on 2 Mar. 1958. F. thus became the first explorer to traverse the Antarctic, completing 2200 m. in 99 days.

Central Press Photos Ltd.

SIR VIVIAN FUCHS

Portrait taken at the South Pole, just after his arrival.

Fuchsia (Neo-Lat., named after Leonhard Fuchs (q.v.), a genus of plants of the family Onagraceae, containing more than 50 known species, mostly natives of tropical America. The majority are shrubs, but some are arborescent or climbing. The flowers are generally pendulous, 4-petalled, and of a brilliant and delicate colouring, red, purple, and white. The leaves are opposite and verticillate. F.s are much cultivated as greenhouse plants, and for bedding-out. *F. magellanica* is fairly hardy, and its variety *riccartonii* is often used for hedges in Cornwall and in Ireland.

Fuchsin, aniline dyestuff of a magenta or red colour, consisting of a mixture of the hydrochlorides or acetates of pararosaniline and rosaniline. In commerce F. is known by various names, such as magenta, rubine, roseine, etc., and was at one time widely used for dyeing purposes. Occasionally it is also employed for the colouring of confectionery and wines. See ANILINE; DYE.

Fucino, or **Celano, Lake of** (anct *Lacus Fucinus*), lake bed in Italy, in Abruzzi e Molise (q.v.), 20 m. SSE. of L'Aquila (q.v.). The level of the lake was subject to great variations, owing to lack of an outlet, and disastrous consequences frequently resulted from this. Claudius I (q.v.) constructed a tunnel in AD 37 by which the surplus waters were carried to the Liris (see GARIGLIANO); it is uncertain when this went out of use, but various attempts were made to re-open it from

1240 onwards. In 1854-75 the lake was finally drained, and the bed is now cultivated.

Fuegians, nomadic aborigines of Tierra del Fuego. They are divided into 3 distinct groups, the Onas, the Yahgans, and the Alacalufs, in the E., centre, and W. of Tierra del Fuego respectively. The Yahgans are the true aborigines. Very little is known of the Alacalufs, but they are probably of Araucanian descent. The Onas are similar to the Tehuelche Patagonians in their tall stature and the nomadic life they lead. The F. have dark brown, copper-coloured skins, and plentiful coarse black hair. They hunt and fish to supply themselves with food, and live in huts formed of tree-trunks and branches. They obey no chief, and do not appear to believe in a future life, though they are afraid of invisible beings and spirits. They have been largely exterminated by white sheep farmers, who regarded them as vermin to be hunted and shot. See J. H. Steward, *Handbook of South American Indians*, vol. i., 1946; E. Lucas Bridges, *Uttermost Part of the Earth*, 1948.

Fuego, see TIERRA DEL FUEGO.

Fuel, invariably carbonaceous materials which give out heat (q.v.) in combining with oxygen. The amount of heat which a F. gives out during combustion naturally has a great influence on its value for commercial purposes, and this will be considered in detail. F.s may be divided into 3 classes: natural, prepared, and liquid and gaseous F.s. To the first class belong wood, peat, lignite, and all kinds of coal; to the second belong compressed F., such as briquettes, etc., prepared peat and wood, charcoal, and coke; in the third class are found petroleum and its extracts, alcohol and certain hydrocarbons, such as benzole and naphthalene, coal gas, natural gas, water gas, and producer gas.

The heating or calorific power of a F. is the quantity of heat generated by the combustion of a unit weight. The heat is measured in units; the standard unit now adopted in Britain is called the Brit. Thermal Unit (B.t.u.) (q.v.), and is the quantity of heat required to raise 1 lb. of water by 1° F. when at its maximum density, i.e. from 39.1° to 40.1° F. The scientific unit of thermal value is the calorie (q.v.), which is the amount of heat required to raise a unit weight of water (at 39.1°) 1° C. Heat may be stated in calories or B.t.u. for comparative and calculating purposes, but to engineers the evaporative duty of the coal is of the most importance, and this is usually stated as so many pounds of water at 100° C. (212° F.) converted into steam at the same temp. In the case of tn gas, to facilitate calculation, the 'therm' was introduced by the Gas Regulation Act. One therm is equivalent to 100,000 B.t.u.s.

An important point with F.s is the quantity of inorganic matter they contain, as this constitutes the ash, the amount of which is an important factor in the suitability and economy of the F. In addition to the F.s enumerated above,

various kinds of vegetable refuse, such as brushwood, straw, cotton, stalks, etc., are used for heating purposes where better fuel is lacking. In various parts of France and Germany tan cakes made of the spent bark used by tanners are employed as F. A common F. in India and Egypt is the dung of camels and oxen, which is moulded into thin cakes and dried in the sun; these have very little calorific power, and are characterised by an acrid ammoniacal vapour during combustion. The salient characteristics of the various F.s are briefly as follows:

Wood.—The value of wood (q.v.) as F. varies with the amount of moisture therein and the ash which remains after combustion. Even after prolonged drying wood will contain from 17 to 20 per cent of moisture. The percentage of moisture in a few varieties of fresh-cut wood is as follows: hornbeam, 18.6; sycamore, 27; oak, 34.7; pine, 39.7; elm, 44.3; larch, 48.6; poplar, 51.8. The percentage of ash in wood is on the average between 2 and 3. The calorific value of wood is low, as much heat is required to consume the moisture, and the percentage of hydrogen is very low. The charcoal which is made from wood has about a quarter of the weight of the wood used, and double the calorific value of an equal weight of wood.

Peat (q.v.) is formed of vegetable matter, such as mosses and aquatic plants, which, by the agency of pressure, have in time become converted to the spongy brownish-black substance which is found in peat bogs. When cut out in square blocks and air-dried in the usual manner, its calorific power is roughly equal to that of wood. When the peat is excavated and compressed into briquettes by machinery, however, a really valuable F. is produced which will bear comparison with the best coal. Peat represents an intermediate formation between wood and coal. Peat, or 'turf', is an important factor in the economy of the Rep. of Ireland, where it is processed by the most modern methods.

Coal (q.v.) may be classified into 3 main varieties: lignite, bituminous, and anthracite. Lignite or brown coal is the least carbonised of any coal, showing indications of organised structure, and containing a considerable proportion of hydrogen and oxygen. Most of the coals found in the Brit. Isles are bituminous in character; there is a larger variety in this class of coal, which includes steam coals, coke and furnace coals, gas coals, and household coals. The coals which are most used for the house and general use are non-caking long-flame coals. From 70 to 80 per cent of carbon is contained in them, but little available hydrogen; their sp. gr. is about 1.25. The coals which are most used for the manuf. of gas contain from 80 to 85 per cent of carbon, with a sp. gr. of about 1.3. Coking and furnace coals burn with a smoky flame of varying luminosity, and contain in some cases nearly one-third of volatile hydrocarbons. The best steam coals are

anthracite in character, being difficult to ignite and without much tendency to smoke. The sp. gr. varies from 1.34 to 1.44, and the percentage of carbon from 90 to 98. Anthracite coals are hard and dense in character, with a metallic lustre. Intense heat without flame or smoke is generated by anthracite, but as a powerful draught is required and ignition is difficult it is chiefly used in furnaces and engineering works. The sp. gr. of anthracite varies from 1.4 to 1.6 and the percentage of carbon is as high as 98.

Coke (q.v.) has been prepared from coal for many years, but it was not until 1800 that the preparation of coke was carried out on scientific principles, great improvements being effected. For many metallurgical processes coke is specially prepared in coke ovens from well-washed small coal. The chief requisites of a good coke are strength, infusibility, a low percentage of sulphur, and a high calorific power. The constituents of a first-class coke should be 92-98 per cent carbon, 5-22 per cent ash, 1.3 per cent oxygen, 0-27 per cent sulphur, and 0-23 per cent nitrogen. According to theoretical calculations coke should be slightly more efficient from a heating point of view than coal, but in actual practice the results are about equal. There are certain varieties of coal which can be used most economically, for firing boilers, furnaces, and kilns, when in a powdered form. As a result pulverised F. has developed considerably of late.

Liquid Fuel.—The use of liquid F.s may be said to date from the middle of the 19th cent. Of late years their use has greatly extended for steam raising and small furnaces, as well as for various types of engine. Petroleum distillates, residues, and cracked products represent the chief source of liquid F.; alcohol is used to a very small extent; benzole is recovered from coal and is used as a motor F. The lighter fractions of petroleum, such as gasoline and kerosene, are well suited for internal combustion engines such as those in motor cars, while the heavier fractions and residues are used in other types of engine and for heating purposes. At the present time the U.S.A., the U.S.S.R., the Middle East, and Venezuela supply most of the petroleum of the world, but oil has been found in many other places. Most F. oils have about 85 per cent of carbon, from 10 to 13 per cent of hydrogen, and remainder of oxygen, etc. Weight for weight the heating power of oil F. is about 40 per cent greater than that of good coal.

The chief advantages of liquid F. are (1) greater calorific power and less weight; (2) occupies less space; (3) convenience of storing and loading; (4) greater speed in getting up steam; (5) complete control over combustion. Against these must be set the danger of explosion of stored oil, loss by evaporation, and in some localities increased cost. In oil engines the oil vapour is exploded with air in the cylinder, the heat thus generated providing the motive power. When used for producing heat the oil is injected into the

furnace in the form of a spray. The most generally used method now consists of the direct atomisation of the oil so as to drive it direct into the furnace chamber in spray which is so finely divided as to act almost as a gas, thus ensuring complete combustion. This atomising action is carried out either by forcing the oil out from a jet at a considerable pressure, or by injecting it with steam or air, or a combination of the two. The former method is applied in burners for boilers in ships and in power stations. The F., after being heated to a temp. of 200-300° F., is introduced at high pressure through tangential channels into the base of a conical swirl chamber. Rotating rapidly as it passes through the swirl chamber, it emerges from the orifice at the apex of the cone and disintegrates into a network of fine droplets. The second method, which is applied in many different kinds of burners, is based essentially on the principle of the scent spray; a stream of air or steam impinges on an issuing stream of oil in such a way as to disperse it in the form of a fine spray. Blast burners, as these are called, are used in crucible furnaces, heaters for metal forging, furnaces for grain driers and bakeries, etc. The air used for atomisation is usually insufficient for complete combustion of the F. For each pound of oil F., 15-20 lb. of air are consumed in combustion, and in consequence special air control systems must be installed in oil-burning furnaces to ensure adequate air supplies. Oil F.s are often extremely viscous and have to be raised to temps. of 100-250° F. for pumping. Although there is great variation in F. oil specifications, a legal minimum flashpoint of 150° F. is given in many countries as a safety precaution. Oil F. is used for firing pottery, brick and lime kilns, metallurgical furnaces of all kinds, glass-making furnaces, and pot furnaces in the manuf. of paints and varnishes. Lighter grades of oil F. are also used in domestic central heating systems and for cooking on an institutional scale.

Gaseous Fuels are now used in many metallurgical processes, as in the Siemens-Martin steel process. Re-heating and other furnaces also use gaseous F.; and in the various types of gas engine gas is extensively used as a prime motor. Large quantities of combustible gases are obtained from the earth in the U.S.A., Russia, China, and other places; these are known as 'natural' gases. Natural gas found in parts of the U.S.A. and U.S.S.R. contains from 80 to 90 per cent of methane, and is the most valuable of gaseous F.s from a calorific point of view.

Manufactured gases are of 4 main varieties: (1) coal gas, produced by the distillation of coal in closed retorts; (2) water gas, made by the action of steam on incandescent carbon; (3) generator or producer gas made by the passage of air through incandescent carbon; (4) mixed producer and water gas, called semi-water gas, made by the passage of both air and steam over highly heated F. Coal gas is used for lighting, heating, and

cooking purposes and for gas engines; it is much in favour for both power and F. When coal gas is used for the latter purpose it is burnt at a very high temp., mixed with air in atmospheric burners; important features are the absence of mess, dirt, and smoke, and the ease and exactitude with which it can be regulated.

Water gas depends for its formation upon the fact that at a high temp. carbon has a greater affinity for oxygen than has hydrogen, and that when steam and carbon in any of its amorphous forms are heated to such temps., the steam is decomposed, with liberation of either carbon monoxide or carbon dioxide, according to the temp. and the quantities of steam and carbon interacting. The value of water gas thus produced depends on the closeness of the approximation to ideal conditions. Water gas is largely used for welding and other engineering works, and, when mixed with the gases formed by the decomposition of various grades of oil, forms the basis of carburetted water gas. Water gas is also used as the starting material in the manufacture of many important chemicals. Producer gas, which possesses the least thermal value of the 4 varieties, is a mixture of carbon monoxide and nitrogen. Air is passed through a column of heated coke, when the carbon at the lower surface thereof combines with the oxygen of the air to form carbon dioxide; this is turned into carbon monoxide by contact with the heated carbon over which it has to pass, and, in combination with the residual nitrogen from the air, forms producer gas. Siemens's producer gas differs from ordinary producer gas in that small coal or slack is used instead of coke. The gas thus produced has a higher thermal value. Mond's gas is an extremely cheap form of producer gas, made from a cheap bituminous coal slack. Arrangements exist in the process for the recovery of ammonia, which in other producers is wasted, and a sufficient quantity is recovered to pay for the F. used, thus compensating for the low calorific power of the gas. The large amount of carbon dioxide and nitrogen present accounts for the low thermal value of producer gas. Gas generators which work on the suction system find considerable use for the working of gas engines. The charge of gas is drawn into the engine directly from the producer, in which a mixture of air and steam is drawn over red-hot anthracite. The cylinder is in direct communication with the producer, and the back stroke of the piston causes a fresh mixture to be drawn over the anthracite. A cheap form of gaseous F. is thus obtained, when required, by a self-contained plant.

Instruments for finding the heating value of a F. are known as calorimeters. In all calorimeters the method adopted is to burn a weighed quantity of the F. in oxygen so as to impart the heat produced to a known quantity of water. The many varieties in use differ in the method of carrying out the combustion of the F. and of imparting the heat to the water, but may all be referred to one or other of 3

types: (1) where the combustion of the F. is effected with the admixture of a solid oxidising agent, as is done in the Lewis Thompson calorimeter; (2) where the combustion is carried out in oxygen at constant pressure (a) when the temp. of the escaping gas is undetermined, as in the Wm Thomson calorimeter; (b) when the temp. of the escaping gas is under control, as in the Fischer calorimeter; (3) where the combustion is carried out with oxygen at constant vol., as in the Berthelot, Mahler, Mahler-Donkin, or Mahler-Krocker calorimeters. The bomb calorimeter, belonging to the third class, is the most accurate, but that of Lewis Thompson is the most widely used, although the least accurate, as it is very easy to manipulate. All the above calorimeters are primarily designed for solid F., and if liquid F.s are to be tested, the platinum crucible or holder should contain kieselguhr, on to which the oil should be dropped. For testing the heating power of a gaseous F. a Simmance-Abady calorimeter is one of the best; this is a modification of the original Junker calorimeter.

With the introduction of the Gas Registration Act, recording calorimeters, which give a continuous record of the heating value of the gas, have come into use. These ingenious instruments correct automatically for changes in barometric pressure, temp., humidity, and sp. gr. of the gas. The most important types are the Fairweather and the Thomas. The Simmance-Abady calorimeter is easily modified for use with light oils, alcohol, etc.; a small lamp on a sensitive balance is used instead of a gas burner and meter. For further details see the articles on FISCHER-TROPSCH PROCESS; GAS; HEAT; COAL; and CARBONISATION, and the various gases herein mentioned. See also E. J. Mills and F. J. Rowan, *Fuel and its Application*; P. Bateson, *Fuel Purification*, 1891; Sir E. Lowthian Bell, *Gaseous Fuel* (J.I.S.I., vol. ii), 1889; R. Galloway, *Fuel*, 1904; H. L. Payne, *Fuel Value of Gases*; V. B. Lewes, *Oil Fuel*, 1913; J. H. Nicolls and C. B. Mohr, *Fuel Analysis*, 1934-36, 1937; Ministry of Fuel and Power, *The Efficient Use of Fuel*, 1944; H. M. Spiers (ed.), *Technical Data on Fuel*, 5th ed. 1950; J. S. S. Brame and J. G. King, *Fuel: Solid, Liquid and Gaseous*, 5th ed. 1955; The Shell Petroleum Co., *Oil Fuel*, 2nd ed. 1956.

Fuel Research Station, section of the Dept. of Scientific and Industrial Research, estab. at Greenwich in 1918. It is primarily concerned with the more efficient use of fuels and its research programmes include work on the improvement of combustion in boilers with consequent reduction of smoke, improvement in the efficiency of domestic heating equipment, production of freely burning coke for domestic use, gasification, production of synthetic oils and chemicals from coal, flow properties of residual fuel oils, and recovery of sulphur compounds from flue gas. The station also organises the nation-wide survey of atmospheric

pollution carried out by local authorities and others. Results of research are pub. as ann. reports by H.M.S.O.

Fuelling Stations, see BUNKERING STATIONS.

Fuente Podrida, see REQUENA.

Fuenteovejuna, Sp. tn in the prov. of Córdoba. It was once a stronghold of the Order of Calatrava. It has a meat-curing industry, and is a centre for coal, mica, and argentiferous galena mines. Pop. 20,000.

Fuenterrabia (Basque Ondarrabia; Fr. Fontarabie; Eng. Fontarabia), Sp. fishing tn in the prov. of Guipúzcoa, on the bay of Biscay and on the Fr. frontier. Long an important fortress, its successful defence against Condé (q.v.) in 1638 is still celebrated. It has many fine buildings and the remains of an anct. castle. Milton confuses F. with Roncesvalles (*Paradise Lost*, l. 587). It is a fashionable holiday resort. Pop. 5800.

Fuero (Lat. *forum*), in Sp. law a term of wide import, but generally used to denote (1) general codes of law, or bodies of customs, such as the F. Viejo of AD 980 and the F. Juzgo; and (2) special tribunals having jurisdiction in cases relating to certain depts, such as the army and navy or the post office. F. Juzgo was the code of laws estab. by the Visigoths as the *forum judicum*, which later, after the reconquest of Spain in the middle of the 13th cent. by the Christians, continued to be administered by separate courts and judges for the Mozárabes, i.e. Christians who had lived under Muslim rule and assimilated themselves to the Arabs. This F. applied to Mozárabes wherever no provision was made by royal privilege, or by special charters, or F.s as they are also called, such charters or F.s being, as in medieval England, privileges granted to cities or tns in consideration of the payment of dues to the owner of the land. No common tribunal administered the F. Juzgo, and it was subject to a great number of local jurisdictions. Many of its provisions are still in force, but a number of unchartered tns in 1260 adopted the F. Real, a code promulgated by Alonzo el Sabio in 1255, as a preliminary to a larger digest or code called *Las Siete Partidas*. But the latter, even when formally promulgated a century later, was expressly made subject to all existing F.s. The F. de Salamanca was a code of civil law promulgated at the beginning of the 12th cent. for Salamanca, and there were a number of other such municipal F.s for the government of different tns and the administration of justice in them. Spain was early the home of a highly specialised local gov., acknowledging scarcely any relation to a central administration. In the provs. these written or unwritten codes of laws relating to legislative, judicial, and administrative functions were called F.s or *foros*; those of the tns, *carlas-pueblos* (tn or vill. charters). Like the common law of England, or rather the special customs (see COMMON LAW; CONSUETUDINARY; CUSTOMS), these F.s owed their strength to

their immemorial antiquity, although unlike Eng. customary law they owed their formal recognition to some royal grant or grant by a lord paramount. As in England, some Sp. monarchs, e.g. the Castilian, were bound on their accession to swear to observe the F.s, but when Spain became united under an absolute monarchy most of the F.s were openly violated, one marked exception, however, being the F.s of the Basques. See F. M. Marina, *Ensayo historico-critico sobre la antigua legislacion y principales cuerpos legales de los reynos de León y Castilla*, and M. de Colmeiro, *Curso de derecho politico segun la historia de León y de Castilla*, 1873.

Fuerteventura, or **Forteventura**, one of the Canary Is., in the prov. of Las Palmas (q.v.). It is in the E. of the archipelago, separated from Lanzarote by the channel of Bocaina. Its cap. is Puerto de Cabras, on the E. coast. Area 666 sq. m.; pop. 15,000.

Fuessli, Johann Heinrich, see FUSELI, HENRY.

Fugger, Swabian trading family, who lived at Augsburg, and who became so wealthy that they frequently financed the military expeditions of Ger. monarchs. The founder of the family was Johann (or Hans) F., a master weaver of Graben, near Augsburg. His son, Johann, became a citizen of Augsburg by marriage and an assessor of the dreaded *Vehmgericht* (see FEHMIC COURTS). His eldest son, Andrew, known as 'the rich Fugger,' became the founder of a noble line, F. von Reh, which became extinct towards the end of the 16th cent. Jacob, the second son of Johann, and the first of the family who owned a house in Augsburg, became head of the guild of weavers. His sons, Ulrich, George, and Jacob, all men of great energy and resource, enormously increased their patrimony—Ulrich as a trader of varied operations, and Jacob by exploiting the Tyrolean mines to such purpose that he lent the Archduke Charles of Austria 150,000 florins and built the castle of Fuggerau. All 3 brothers married women of rank, and were themselves ennobled by Maximilian. For a large loan this monarch mortgaged to the brothers the properties of Kirchberg and Weissenhorn. Jacob (d. 1525) founded in the outskirts of Augsburg the Fuggerei, a settlement of about 50 double dwelling-houses for needy people. Jacob and the sons of Ulrich d. without issue, so that the family property passed to the sons of George. In consideration of the help rendered to him in the early 16th cent. by the 2 brothers, Raimund and Antonius, sons of George F., Charles V gave them the mortgaged properties mentioned above, and created them counts, with princely privileges.

Later, after they had financed his expedition against the Algerian pirates, the king gave them the right to issue their own gold and silver coinage. Notwithstanding their exalted rank they continued their mercantile activities and Antonius (d. 1560) left a fortune of 6,000,000 gold crowns, in addition to other estate in various continents. Raimund (d. 1535)

and Antonius were founders of 2 great lines which were continued to modern times. The fortunes of the F. family are some indication of the prosperity of Germany before the country was devastated by the Thirty Years War. See R. Ehrenburg, *Capital and Finance in the Age of the Renaissance: a Study of the Fuggers and their Connexions*, trans. 1928. See also Eng. trans. of 2 selections from the *Fugger Newsletter*, 1923 and 1928.

Fugitive Offenders Act, 1881. A person who has committed a crime in the Brit. Isles, and who, to avoid arrest, has taken

alleged to have committed the offence (*locus delicti commissi*). When at the *locus delicti* the accused is entitled to a trial within 6 months, and if not tried within that period, or if acquitted, he is entitled to be paid his passage money back either to the place of arrest or his intended destination at the time of arrest. In any case, if not sent back for trial within 1 month of committal he is entitled to be discharged. The magisterial hearing of a case under this Act must be at Bow Street police court, and in Scotland before the sheriff of Edinburgh. By an

German State Railways, Tourist Dept.

THE FUGGEREI, AUGSBURG

refuge in some other part of the Brit. Empire, may be arrested and brought back under the F. O. A., 1881, either (a) upon a warrant duly endorsed by the colonial governor, or by a judge of the supreme court in the colony to which the offender has fled; or (b) upon a provisional warrant issued by a colonial magistrate upon such evidence and in such circumstances as would justify such a warrant if the offence had been committed within such magistrate's jurisdiction. These provisions extend also to countries to which the Foreign Jurisdiction Acts (q.v.) apply, but where the offender has escaped to any other foreign country he can only be got back under the terms of an extradition treaty. If the magistrate before whom the fugitive is brought thinks there is *prima facie* evidence of guilt, he may commit or send the accused back for trial to the country or place where he is

Act of 1915 persons wanted in the Brit. Isles for treason and other crimes may be arrested in any of the colonies and protectorates, and vice versa. See Earl of Birkenhead, *International Law*, 6th ed., 1927.

Fugitive Slave Laws. In the U.S.A., before the constitution, there were no F. S. L., it being left to the comity (q.v.) of the states or colonies to surrender slaves who had escaped from service. In 1787 the slave-holding states inserted provisions in their constitutions regulating the surrender of fugitive slaves, and these provisions later found expression in the federal constitution. In 1850 Congress strengthened the provisions by regulating the mode of arrest, trial, and surrender of fugitive slaves. This Act was repealed in 1864. The amended constitution prohibited the slave trade altogether. In England, when serfdom existed, a serf

who evaded recapture for a year and a day obtained his freedom, and an Eng. serf could purchase his freedom. No analogous provisions are to be found in the old Amer. F. S. L.

Fugue, highest form of contrapuntal art, and the aesthetic and technical climax of the possibilities of polyphonic music. A F. commences with the statement of a subject by one part followed by the restatement, or answer, by a second part in another position in the scale, usually the dominant, during which the first proceeds with a counter-subject, the third and succeeding parts (if any) being introduced in the same manner. When all the parts have been brought in the

Shantung, China. Pongee, straw platt, and beans are produced. Pop. 215,689.

Fuhshien, tn of Manchuria in the prov. of Liaoning on the E. shore of the Gulf of Liaotung, S. by W. of Newchwang (Yingkow). Pop. 180,000 (1948).

Fujisan, Fujiyama, or Fuji, highest mt in Japan, situated between Shizuokaken and Yamanashiken, in the middle of Jap. archipelago, on the Pacific coast. It is a conic volcano, 11,200 ft high, but extinct since 1709. F. has 7 routes leading to the summit, where stands a Shinto shrine, and is worshipped by tens of thousands of people yearly from all over the country. It has long been regarded as the symbol of Japan. The top third is almost always

THE CREST OF FUJISAN

A photograph from H. G. Ponting's *In Lotus Land*

subject is developed at length, its contrapuntal possibilities being fully exploited by means of canon, augmentation, diminution, inversion, etc., and the introduction of episodes. The F. then works up to a climax over a pedal-point, usually the dominant, and the material may be further elaborated by various polyphonic devices, the whole work being brought to a conclusion by way of a *stretto*, where the subject is made to overlap closely in all the parts. Although many 16th-cent. experiments were designated by the title of *fuga*, they were nothing more than canons; it was not until the latter part of the 17th cent. that the true F. was accomplished. The greatest master of F. was J. S. Bach, who not only wrote many fine organ F.'s, which have not been surpassed, but also originated the pianoforte F. in *Das wohltemperirte Clavier*, 1722-44; whilst the early 18th-cent. oratorios of Bach and Handel contain some excellent examples of the choral F. See G. Oldroyd, *The Technique and Spirit of Fugue*, 1948.

Fuh-Shan, tn in Fuh-Shan co., E.

covered with snow. Buses now travel to a height of 8000 ft, so that it is possible to climb up and down within 24 hrs from Tokyo. The 5 lakes on the N. skirt are also noted for their scenic beauty.

Fujiwara, see JAPAN, *History*.

Fujiyama, Mount, see FUJISAN.

Fukien, maritime prov. in China, bounded on the SE. by the China Sea, and on the other sides by the provs. of Chekiang, Kiangsi, and Kwangtung. Its area is 48,737 sq. m. The surface is very mountainous, and the prov. is noted for its beauty, the mts. clad with timber and shrubs, forming a picturesque background. The prin. riv. is the Minkiang, which enters the sea below Foochow, the cap., which is celebrated for its fruits, and produces a considerable quantity of ginger. The prov. produces tea, camphor, tobacco, sugar (cultivated in the irrigable country), indigo, and alum, which form its chief exports. The occupation of Taiwan (Formosa) and the F. coastal is. Quaimoy and Matsu by Chiang Kai-Shek's refugee gov. since 1949 has greatly restricted the prov.'s foreign trade; but

the Chinese Gov. has spared no effort in developing it. Two railways (Yint'an-Amoy and Nanping-Foochow; see CHINA) were built in 1956. There is a good timber industry, the chief woods being fir, rosewood, and pine; and paper is manufactured from bamboo pulp. The mineral resources include coal and iron and the precious metals. Clay for the porcelain manufs. of Min ware is also important (see CHINESE ART). The coast people are engaged in trading and fisheries. Pop. 13,142,721 (1954).

Fukui, city noted for its silk industry, and the seat of prefectural gov. of Fukuiken, Japan. An earthquake in June 1948 caused 12,000 casualties, including 1500 dead, in the prefecture. The city, however, was quickly rebuilt, and now has thriving paper and plastic industries, as well as the traditional silk products. Since 1956 a new development-scheme on mechanical industry has been fostered. Pop. 126,000.

Fukuoka, industrial city on the N. coast of Kyushu, Japan, 90 m. NNE. of Nagasaki. The seat of prefectural gov. of Fukuokaken, it is a centre of coal industry, fishery, and forestry. Also famous for its silk, textiles, glassware, and Hakata dolls. Pop. 544,000.

Fukushima, the seat of prefectural gov. of Fukushimaken, Japan, 168 m. N. of Tokyo. Important centre for trade in raw silk and cocoons, as well as textiles of various kinds, pulp and paper, vegetables and fruits. Pop. 127,000.

Fukuyama, city of Hiroshimaken, Japan, 55 m. E. of Hiroshima (q.v.). Noted for production of rush goods and hat-making. Pop. 76,000.

Fulahe, or **Fulani**, important ruling Hamitic-Negro people in Nigeria and Fr. Sudan, founders of the sultanates of Sokoto (q.v.), Gando (q.v.), and others. They are of a light brown or copper colour, of good stature, with Caucasoid features, black hair, and negroid speech. They seem to have migrated westward at an early period, and gradually extended their influence to the E. They number from about 6 to 8 million, and towards the close of last century their sultans were a source of much trouble to Brit. trading interests. The estab. by the National African Company, between 1886 and 1896, of trading stations on the Niger and Benue brought the Brit. into contact with these vigorous Muslim emirates of the N. interior. The Fulani rulers of Kano and Sokoto and the neighbouring ters. represented a century-old wave of Muslim conquest from the Sudan superimposed upon a much older Muslim element dating from the Middle Ages. These Fulani states were strongly administered, warlike, and ruthless in slave-raiding among the pagans and in maintaining the ascendancy of the ruling class by bloodthirsty methods. Although the company had made treaties with them a warlike period began in 1897. Later, in a period of difficult relations here with the Fr. at a time when the Muslim states still remained to be settled with, it was

evident that a trading company was unequal to the responsibilities that would fall upon it, and in 1899 the company's (now Royal Niger Company) charter and governing powers were withdrawn and Col. F. D. Lugard (q.v.) became high commissioner for the newly constituted protectorate of N. Nigeria. His first task was to subdue the N. emirates, whose sultans would not give up slave-trading without a struggle. Already the company had had some fighting with the sultan of Sokoto, but the result was inconclusive. In 1902-3 Lugard overcame the Fulani rulers, and brought their ter. within the area to be ruled by their Brit. suzerain. See S. J. Hogben, *The Emirates of Northern Nigeria*, 1930; F. W. de St Croix, *The Fulani of Northern Nigeria*, 1944; and M. Perham, *Lugard*, 1956.

Fulcrum, see **LEVER**.

Fulda, Ludwig (1862-1939), Ger. poet and dramatist, b. Frankfurt. His one-act verse comedy, *Die Aufrichtigen*, gained him a prize in a competition in 1882, and his dramatic career may be said to have begun with his tragedy, *Christian Günther*, the same year. This was followed by a series of comedies, including *Ein Meteor* and *Die wilde Jagd*, and some dramas, amongst which are *Das verlorene Paradies* and *Die Zwillingsschwester*, 1901. In 1893 he won the Schiller prize with his dramatic fairy tale, *Der Tulieman*, 1893. His trans. of Molière, under the title of *Meisterwerke*, are masterly. He also trans. Rostand, Ibsen, and Sp. comedies. His later works included *Herr und Diener*, 1910, *Die Rückkehr zur Natur*, 1914, and *Des Esels Schatten*, 1920. See monograph by A. Klaar, 1922.

Fulda, Ger. tn in the *Land of Hessen* (q.v.), on the F. R., 72 m. NE. by E. of Wiesbaden (q.v.). It grew up around a Benedictine abbey founded by St Boniface (q.v.) in the 8th cent. In the 9th and 10th cents. the abbey school, estab. by Rabanus Magnentius (q.v.), was famous. In 1020 the tn was the scene of a meeting between the Emperor Henry II (q.v.) and Pope Benedict VIII and in 1157 it was made a city. The abbots of F. were made prince-bishops in 1752. The baroque cathedral contains the tomb of St Boniface; and there are sev. other notable churches, including 2 which date from the 9th cent. The Abbots' Palace (now the tn hall) and the Orangery are both 18th-cent. baroque buildings. There are textile, chemical, and tanning industries. Pop. 47,000.

Fulgentius, St (468-533), one of the fathers of the Church (q.v.), was made bishop of Ruspe in N. Africa, 507 or 508, evidently against his will. For his *Disputation* with Thrasimund, king of the Vandals (496-523), he was banished 510-23, but was restored 523-32. He then retired to a monastery on the is. of Circe. His Lat. treatises against the Arians and Pelagians were ed. by Hunter, Innsbruck, 1884. See also Migne, *Patrologia Latina*, vol. lxx; H. Leclercq, *L'Afrique Chrétienne*, 1904; O. Bardenhewer, *Les Pères de l'Eglise*, 1905.

Fulgentius, the monk, *see* GOTTSCHALK.
Fulgentius, Fabius Planciades (c. 480–550), Lat. writer and grammarian of N. Africa, probably related to St F. (q.v.), with whom he must not be confounded. The inflated style of his writing affords strong indications of African origin. Four works, which bear evident marks of the same hand, are ascribed to him, and all represent the late African style. The *Liber Physiologus* and others are lost. The 4 extant works are *Mythologiarum Libri III ad Catum Presbyterium* (the identity of Catus is unknown)—a collection of 75 myths connected with the hist. and exploits of gods and heroes, but marred by extravagance and unsound Gk etymology; *Expositio sermonum antiquorum cum testimoniis ad Chalcidicum*—a glossary of obsolete words and phrases, but unreliable, it is often printed with or appended to the *De compendiosa doctrina* of Nonius Marcellus; *Liber de expositioe Virgilianae continentiae ad Chalcidicum grammaticum*—a title which means an explanation of the *Aenid* as a picture of human life or of the esoteric truths allegorically conveyed in Virgil's poems; and *De actibus mundi et hominis*. *See* R. Helen (ed.), *Fulgentii Opera*, 1898; H. Liebeschütz, *Fulgentius Metaphorals* (on his influence upon medieval mythology), 1926.

Fulgina, *see* FOLIGNO.

Fulgurites (Lat. *fulgur*, lightning), in petrology, the name given to rocks whose surface has been fused by lightning, and to the characteristic holes thus formed. Examples of the kind have been found on Ararat, in the Alps, Pyrenees, and elsewhere, the surface showing in parts a thin, glassy crust or film, like a coat of varnish. Another kind of F. (vertical sand-tubes, sometimes half an in. in diameter) is found in dry sands, as on the sand-hills of S. America and N. Africa. They often run downwards in the sand for sev. ft, branching off and gradually lessening in their course. The glassy material is seen under the microscope to contain grains of sand and many small cavities. Minerals like mica and feldspar are fused more easily than quartz, but sometimes silica abounds in F. glasses.

Fulham, metropolitan bor. of London, on the N. bank of the Thames, and W. of Chelsea. Four old vils. and hamlets are comprised in the bor. The manor of F. belonged to the bishops of London from c. 691 until 1868, and they have been in continuous residence in F. Palace since 1141. The oldest portion of the present palace, however, is the fine courtyard built by Bishop FitzJames, c. 1510–20; the rest of the buildings are mainly early 19th cent. From the mid 17th to the mid 18th cents. F. supplied London with vegetables. Pottery has been carried on since c. 1670. F. and the adjoining bor. of Hammersmith return 3 members to Parliament, 1 each for the constituencies of F. and Hammersmith, and 1 for the newly created bor. constituency of Baron's Court, which is comprised of 3 wards of F. and 4 of Hammersmith. Area 1706

ac.; pop. 120,700. *See also* HURLINGHAM PARK.

Fuliang, *see* CHINGTEHCHEN.

Fullia, *see* COOT.

Fulgino, *see* FOLIGNO.

Fuller, George (1822–84), Amer. artist, noted as a portrait painter. He studied under H. K. Brown, the sculptor, in Albany (1842–3), exhibiting a portrait of him in 1857, and becoming associate of New York National Academy. He was dreamy and poetic in style, characteristic works being 'Turkey Pasture in Kentucky,' 1878, 'The Romany Girl,' 1879, 'And she was a Witch,' 1879, and 'Winifred Dysart,' 1881. *See* van Rensselaer, *Six Portraits*, 1889.

Fuller, John Frederick Charles (1878–), Brit. soldier who achieved fame in connection with the development of tanks. Major-general, 1930. Campaigns: South African war, 1899–1902, and First World War. It was mainly through his energetic advocacy and the part he played in the use of tanks in the First World War that the weapon became a success not long after it was first used at the battle of Cambrai (q.v.). His work, *Tanks in the Great War, 1914–18*, 1920, reveals the grip he had on the potentialities of this war machine. He held staff appointments continuously from 1907 until he retired in 1933. When it was decided to introduce mechanised brigades he was appointed military assistant to the chief of the imperial general staff in 1926. He has written numerous works of military science, including *British Light Infantry in the Eighteenth Century*, 1925, *Sir John Moore's System of Training*, 1925, *Foundations of the Science of War*, 1926, *The Generalship of Ulysses Grant*, 1929, *War and Western Civilisation, 1832–1932*, 1932, *Empire Unity and Defence*, 1934, *The Army in my Time*, 1935, *Towards Armageddon*, 1937, *Armaments and History*, 1946, *The Second World War, 1939–45*, 1948, *Decisive Battles of the Western World, 1954–6*.

Fuller, Sarah Margaret (1810–50), Amer. critic and essayist, b. Cambridgeport, Massachusetts. She was educ. by her father, a stern and unbending taskmaster. In 1839 she issued a trans. of the *Conversations of Goethe with Eckermann*. She became a member of the Transcendental Club, and on the foundation of the *Dial* (q.v.), the literary organ of the club, she accepted the editorship, with George Ripley as assistant editor. This was in July 1840, and for 2 years S. F. struggled to keep the paper alive in the face of financial stress. In 1844 she pub. her first book, *Summer on the Lakes*, and in 1845 *Woman in the Nineteenth Century*. In the same year she joined the staff of the New York *Tribune* as literary critic, under Horace Greeley, and in 1846 her contributions to the paper were reprinted as *Papers on Literature and Art*. In the next year she went to reside in Italy, and in Rome she met her husband, Giovanni Angelo, Marquis Ossoli, an adherent of Mazzini. During the siege of Rome in 1849 by the Fr. she took

charge of a hospital. After the capitulation of the city and the total loss of her husband's property she decided to return to America, but perished on the way in a shipwreck. Her *Autobiography*, with memoirs by Emerson, Channing, and Clark, was pub. posthumously in 1852, and sev. lives have been written, notably those of Julia Ward Howe, 1883; T. W. Higginson, 1884; K. Anthony, 1922; M. Wade, 1940; and M. B. Stern, 1942.

Fuller, Thomas (1608-61), Eng. author and clergyman, *b.* Aldwinkle in Northants, his father being rector of the par. He went to Queens' College, Cambridge, where he graduated in 1628, and 2 years later was appointed to the curacy of St Benet's. He became rector of Broadwindsor, Dorsetshire, in 1634, but gave

THOMAS FULLER

up his living in 1641, and settled in London, taking a curacy at the Savoy church in the Strand. His *History of the Holy War* had appeared in 1639, and on coming to London he pub. the *Holy and Profane State*, 1642, his most characteristic work. He was a chaplain in the royal army during the Civil war, and a strong adherent of the royal cause; and during this time wrote, for the encouragement of his men, *Good Thoughts in Bad Times*, 1645, and a sequel, *Good Thoughts in Worse Times*, 1647. At the Restoration he was appointed chaplain extraordinary to the king. One of F.'s characteristics is his quaint humour, though his wit is never forced, and, like Hood, he plays upon words instinctively. His writings are remarkable for wisdom and imagination, as well as pathos, when occasion demands. Amongst his numerous works, besides those already referred to, may be mentioned: *A Pisgah-sight of Palestine and the Confinies Thereof*, 1650, with maps and views, a geographical account of the Holy Land; *The Church History of Britain from the Birth of Christ until the Year 1643, 1655*; *Misc'd Contemplations in Better Times*, 1660; and

The Worthies of England (pub. posthumously, 1662), his best-known work, which is full of interesting biographical and antiquarian matter. See E. K. Broadus (ed.), *Thomas Fuller: Selections with Essays by Charles Lamb, Leslie Stephen*, etc., 1929; and lives by A. T. Russell, 1844; J. E. Bailey, 1874; M. Fuller, 1884; and D. B. Lyman, 1935.

Fuller's Earth (A.-S. *fullere*, from Lat. *fullo*, fuller), pulverulent material resembling clay in appearance, fine-grained and of a variable colour, without plasticity, formerly much used for fulling cloth and wool, that is, cleansing these materials of oil and grease, from whence it derives its name. Nowadays it is more generally employed for clarifying cottonseed and lubricating oil, as a filtering material, absorbing their impurities. F. E. was at one time only mined in England, chiefly at Nutfield, near Reigate, Surrey, and also at Woburn and near Bath, and was considered of great value, its exportation being prohibited. Deposits are now being mined in various localities in the U.S.A., chiefly in Florida. See *Mineral Resources of the United States*, issued by the U.S.A. Geological Survey (Washington, annually). Cimolite is a variety of F. E.

Fullerton, Lady Georgiana Charlotte (1812-85), novelist, *b.* Tixall Hall, Staffordshire, daughter of Lord Granville Leveson-Gower. She spent much of her early life in Paris, where in 1833 she married Alexander George F. Her earlier works include *Ellen Middleton*, 1844, and *Grantley Manor*, 1847. In 1846 she entered the Rom. Catholic Church and later wrote controversial novels on Catholic subjects, including *Lady Bird*, 1852, and *Constance Sherwood*, 1855. See lives by A. Craven (trans. from the Fr. by H. J. Coleridge), 1888; C. M. Yonge, 1897; and F. M. Taylor, *The Inner Life of Lady Georgiana Fullerton, with Notes of Retreat and Diary*, 1899.

Fulleylove, John (1847-1908), landscape painter, *b.* Leicester. He early showed a taste for architectural drawing, and exhibited from 1871, mainly water-colours resulting from his travels in Britain, Italy, Greece, and Palestine. He produced 2 series of drawings of the Oxford and Cambridge colleges and churches. F. became a member of the Royal Watercolour Society, 1879.

Fulmar, see PETREL.

Fulminates, class of salts derived from fulminic acid, C:N·OH; they are isomeric with cyanates, but explode violently when struck or heated. The 2 chief are fulminating mercury and silver. The first is obtained by heating mercury with alcohol and nitric acid. The white, silky crystals are used in manufacturing percussion caps. Brugnatelli's fulminating silver was first obtained in 1798, a year before Howard's mercury, which merely substituted mercury for silver in the heating process. The white needles are bitter and poisonous. F. of sev. other metals are known.

Fulminic Acid (C:N·OH), an organic acid isomeric with cyanic acid. Its salts

or 'fulminates' are very explosive and used as detonators. The free acid is also very explosive, and the vapour poisonous like that of prussic acid. It and its salts are interesting inasmuch as they contain a bivalent C. atom, the normal valency of C. being 4.

Fulton, Robert (1765-1815), Amer. mechanician and engineer of Irish parentage. From 1786 he studied under West in England, taking out patents for sev. inventions. F. was in Paris, 1797-1804, and devoted considerable attention to steam navigation. By 1803 he had constructed a small steamboat which navigated the Seine. His inventions included flax-spinning and dredging machines, and a submarine or torpedo (Nautilus, 1801). Disappointed by his reception in France and England, F. returned to America, and was employed by the gov. in making canals. In 1807, with Livingston, he perfected the discovery of steam navigation, and launched the *Clermont*, which went from New York to Albany (150 m.) in 32 hrs. Speed was soon considerably increased. F. pub. *Treatise on the Improvement of Canal Navigation*, 1796, and *Torpedo War*, 1810. See also SHIPS and SHIPBUILDING. See lives by C. D. Colden, 1817, and C. Montgomery, 1825; and R. H. Thurston, *History of the Growth of the Steam-engine*, 1878; T. W. Knox, *Fulton and Steam Navigation*, 1893; Mrs A. C. Sutcliffe, *R. Fulton and the 'Clermont'*, 1909; and H. W. Dickinson, *R. Fulton: Engineer and Artist*, 1913.

Fulton, city, cap. of Callaway co., Missouri, U.S.A., in agric. and coal-mining area 25 m. N.E. of Jefferson City. It manufs. flour and fire-clay products and is the seat of the Missouri School for the Deaf and of Westminster College. Here Prime Minister Churchill delivered in 1946 a famous speech advocating an Anglo-Amer. 'fraternal association.' Pop. 10,100.

Fulvia (d. 40 bc), Rom. lady noted for her ambitious intrigues. Her first husband was Clodius; her third, Mark Antony (44 bc). She had considerable power in Rome during the civil war that followed Caesar's murder, and showed a vindictive spirit in the proscriptions. She instigated an unsuccessful revolt against Octavian during his absence in the E. Besieged in Perugia, she managed to escape to Athens, but was coldly received by Antony, and d. soon afterwards at Sicyon. See Cicero, *Philippics*, ii. **Fulvio**, see HUMUS.

Fum, Funs-hwang, or Fung-hwang, a fabulous Chinese bird of good omen, one of the 4 symbolical creatures guarding the celestial empire, whose appearance heralded an age of universal virtue and prosperity. Sometimes called the Chinese phoenix, it is a grotesque mixture of many birds and beasts, with a fish's tail. It perches only on the woo-tung tree, and figures on porcelains or the embroidered robes of mandarins.

Fumaric Acid, acid geometrically isomeric with maleic acid, and possessing

the formula $\text{HOOC}\cdot\text{CH}:\text{CH}\cdot\text{COOH}$. It occurs in various fungi, in the fumitory (*Fumaria officinalis*), and in Iceland moss. It may be prepared by heating maleic acid alone to 150°C ., or by heating it with hydrochloric acid or hydrobromic acid, and by boiling monobromosuccinic acid with water ($\text{HOOC}\cdot\text{CHBr}\cdot\text{CH}_2\cdot\text{COOH} = \text{HOOC}\cdot\text{CH}:\text{CH}\cdot\text{COOH} + \text{HBr}$). F. A. is a white crystalline solid, which when heated yields maleic anhydride and water. See also MALEIC ACID.

Fumarole, small volcanic vent from which steam and other volcanic gases emerge. F.s occur in areas where vulcanicity is quiescent or declining and may provide exploitable sources of substances such as sulphur and borax.

Fumay, Fr. tn in the dept of Ardennes, in the valley of the Meuse amid wooded heights. It has slate quarries and engineering works. Pop. 4000.

Fume Precipitation, Electrostatic (Lodge-Cottrell). The first successful installation was in connection with the removal of sulphuric acid from smelter gases. The gas to be treated passes through an intense electric field between a central electrode at high potential and the walls of earthed plates or tubes. The distance between the electrodes varies from 2 to 6 in., while the voltage may be between 30 and 100 kV., and is regulated to give as strong a glow discharge as possible without disruptive discharge. On passing through the field, the particles of dust or fume become charged, and are deposited on the larger electrode surfaces. If liquid, the particles coalesce and flow away; if solid, a tapping device dislodges the dust which collects at the base of the apparatus. The h.v. direct current for charging the central electrode is obtained from a rectifier (q.v.) supplied from a step-up transformer. The method removes sulphur trioxide from gases by the formation of sulphuric acid mist, so that moisture content and temp. are important considerations. According to Howard (*Trans. A.I.M.E.*, 49, p. 540), for the removal of sulphur trioxide and dust from copper furnace fumes a gas velocity of less than 15 ft/s., a temp. of 90°C ., and a water content of 4 per cent by weight of the dust collected give the best results. The process has also been applied successfully to metallic and acid fumes, to the dust from cement kilns, and to smoke and dust from power plants and the removal of tar from carbonisation gases. The efficiency is generally over 99 per cent.

Fumigation (from Lat. *fumigare*, to smoke), operation of burning, or volatilising, substances in order to produce vapours calculated to destroy disease germs, vermin, etc. The use of F. as a disinfecting process is now practically restricted to steam and hot-air disinfection. Other measures, such as the burning of resins, camphor, etc., have little or no effect on micro-organisms, and preserve their popularity by virtue of the powerful odours which effectually disguise any smell of putrefaction. F. for the destruction of vermin is effectively carried

out in the case of house vermin by burning sulphur. The paper should be stripped from the walls, the room made as air-tight as possible before the sulphur is lighted, and the fumes should then be left for some time to penetrate into every corner and crevice. A favourite manner of ridding the garden of insect pests was to fumigate with tobacco smoke. This was done by enclosing some strong tobacco mixed with organic refuse in a wire cage, getting it well alight by swinging the cage in the air, and then leaving it to smoulder in close proximity to the plants to be treated.

Fumitory, popular name given to species of *Fumaria*, a genus of about 20 species, chiefly ann. herbs.

FUMITORY

Funchal: 1. Dist. of Portugal, co extensive with the Madeira Is. (see MADEIRA). Area 302 sq. m.; pop. 267,000.

2. Portuguese city, cap. of F. dist., on the S.E. coast of Madeira Is. It was founded in 1421 by João Gonçalves Zarco. It was sacked by the Fr. in 1566, was in Sp. hands 1580-1640, and was occupied by the Eng. during the Napoleonic wars. The city is beautifully situated on hill slopes, and has a 15th-cent. cathedral and an old fort. The harbour takes ocean-going vessels. There are sugar, tobacco, and distilling industries; and wine, embroidery, and wickerwork are exported. Pop. 37,215.

Function: 1. In mathematics a number whose value is dependent on the value of another number or other numbers. Any symbol which may take on one of a class of values, and is not restricted to a single value, is called a variable. A casual labourer's yearly income, which may fluctuate within certain fairly definite limits, is, therefore, a variable quantity. If it fluctuates simply because he cannot work on wet days, its value depends on the number of wet days in the year; the labourer's income may then be said to be a F. of the number of wet days

in the year. If it depends on other causes also, such as the general prosperity of the dist., his personal health, etc., it may be stated as a F. of many variables. In algebraical language, the variable y is called a F. of the variable x if to every value of x there corresponds one or more values of y . Such quantities as ax , $ax+b$, x^2 , $\sin x$, $\log x$, etc., are all F.s of x . When a quantity involves the first power of x only, as in $ax+b$, it is said to be a linear F., or F. of the first degree; when it involves the second power of x and no higher power, as in ax^2+bx+c , it is said to be a quadratic F., or F. of the second degree; when it involves the third power of x and no higher power, as in ax^3+bx^2+cx+d , it is said to be a cubic F., or F. of the third degree; in general, a F. of the form $a_nx^n+a_{n-1}x^{n-1}+a_{n-2}x^{n-2}+\dots+a_{n-1}x+a_n$ is said to be a F. of the n th degree. F.s are indicated by various signs, such as $f(x)$, ϕ , ψ , etc. Thus if y , etc., is a F. of x , the relation is shown by the equation $y=f(x)$. Where there are two or more variables, the relation is indicated as in $y=f(x, r)$ and $y=f(x, r, s)$. The variable on which the value depends is called the independent variable, that whose value depends on the independent variable is called the dependent variable; thus in the relation $y=f(x)$, x is the independent, and y the dependent, variable. A F. is said to be homogeneous when all its terms are of the same degree. A rational and integral F. is one where the indices of the variable are positive integers and the coefficients do not involve the variable, as in the form $a_nx^n+a_{n-1}x^{n-1}+a_{n-2}x^{n-2}+\dots+a_{n-1}x+a_n$.

A symmetrical function is one in which any two variables may be interchanged without altering the value of the F. Thus $x^3+y^3+z^3-xyz$ is a symmetrical F. An alternating or skew symmetrical function is one where, if two variables are interchanged, the F. is altered in sign but not in value. Thus $a^2(b-c)+b^2(c-a)+c^2(a-b)$ is an alternating F.

Derived functions may be obtained in this way. Let $f(x)=a_0x^n+a_1x^{n-1}+a_2x^{n-2}+\dots+a_{n-1}x+a_n$. Then $f(x+h)=a_0(x+h)^n+a_1(x+h)^{n-1}+\dots+a_{n-1}(x+h)+a_n$. Expanding, we get $a_0x^n+a_1x^{n-1}+\dots+a_{n-1}x+a_n+h[na_0x^{n-1}+(n-1)a_1x^{n-2}+\dots+(n-1)a_{n-1}] + \frac{h^2}{2}[n(n-1)a_0x^{n-2}+\dots+2a_{n-2}] + \dots + \frac{h^n}{n!}[n(n-1)(n-2)\dots 2.1a_0]$. This result is written more concisely as $f(x+h)=f(x)+hf'(x)+\frac{h^2}{2}f''(x)+\dots+\frac{h^n}{n!}f^{(n)}(x)$ and the terms $f'(x)$, $f''(x)$, ..., $f^{(n)}(x)$ are known as the first, second, ..., and n th derived F.s of $f(x)$. This expansion is called Taylor's Theorem, having been first pub. in 1715 by Dr Brook Taylor.

Limiting values.—In the equation $y=f(x)$, if, as the independent variable approaches a value a , the F. $f(x)$ can be made to differ by as little as we please from a fixed quantity b , then b is called the limit of y , when $x=a$. Consider the

series $1 + \frac{1}{2^n} + \frac{1}{3^n} + \dots$. The sum $= \frac{1 - (\frac{1}{2})^n}{1 - \frac{1}{2}}$
 $= 2 - \frac{1}{2^{n-1}}$ and is therefore a F. of n ; that

is, $S = f(n)$. But $\frac{1}{2^{n-1}}$ can be made as small as we please by increasing the value of n ; that is, the value of S can be made to differ from 2 by as little as we please. This is expressed by saying that the limit of S is 2 when n is infinite.

F.s may be either *algebraical* or *transcendental*. An algebraical F. is one which may be expressed in a finite number of terms, and involves no other processes than those of addition, subtraction, multiplication, division and root-extraction. All other F.s are called transcendental, and include such F.s as $\log x$, $\sin x$, $\cos x$, etc.

A F. is said to be *continuous* when an infinitely small change in the independent variable is accompanied by a correspondingly small change in the dependent variable. A F. is said to be *discontinuous* when an infinitely small change in the independent variable is accompanied by a great change in the dependent variable.

Periodic functions are those whose values recur regularly to certain limits, passing through all the values between those limits, while the independent variable increases or decreases in value by a certain definite amount called the period. To quote an example from trigonometry, $\sin A$ is a F. of A ; as A increases from 0° to 90° , $\sin A$ increases from 0 to 1; as A increases from 90° to 180° , $\sin A$ decreases from 1 to 0; as A increases from 180° to 270° , $\sin A$ decreases from 0 to -1; as A increases from 270° to 360° , $\sin A$ increases from -1 to 0; as A increases from 360° to 450° , $\sin A$ increases from 0 to 1, and so on. It is now seen that the limits of the values of the F. $\sin A$ are -1 and 1, and that the values fluctuate between these limits as the angle increases. The value of $\sin A$ is 1 when $A = 90^\circ$ or 450° or $810^\circ \dots$. The period in this case is therefore 360° , and any values of the independent variable which have a difference of 360° give the same value for the dependent variable. This is expressed by stating that $f(x + \frac{1}{2}a) = f(x - \frac{1}{2}a)$ for all values of x , a being the period. The importance of periodic F.s is best demonstrated by their use in connection with the theory of sound vibrations. Any periodic disturbance in air may be resolved into a series of sine curves (see SINE, CURVE OF). Fourier's theorem states that a single-valued periodic F. may be expressed as a convergent series, thus:

$$\frac{1}{2}A_0 + \sum A_n \cos 2n\pi x \\ + \sum B_n$$

where a is the period and n has values from 1 to infinity.

Elliptic functions are usually defined with reference to elliptic integrals, so-called because certain types are expressed

by the arc of an ellipse. The development of these F.s is owing in a great degree to the labours of A. M. Legendre (1752-1823), who pub. his *Traité des fonctions elliptiques* in 1827. His work was supplemented and to an extent revolutionised by N. H. Abel and C. G. Jacobi. A good introductory treatise is provided by A. C. Dixon in his *The Elementary Properties of the Elliptic Functions*, 1894, and by A. T. Baker in *Elliptic Functions*, 1915. See also J. Wright, *Theory of the Functions of Complex Variables*, 1918; E. Hobson, *Theory of Spherical and Ellipsoidal Harmonics*, 1931; and E. C. Titchmarsh, *Theory of Functions*, 1932.

2. In physiology, the special activity of a cell, tissue, or organ. In organisms which comprise but a single acellular unit, all the various types of activity necessary for the maintenance of the living state are undertaken by the cell as a whole; the amoeba, for example, performs the processes of engulfing its food, digesting it, excreting waste material, and building up the nutrient matter into its own substance by chemical and physical actions in which all parts of the cell seem to join. Multicellular organisms, on the other hand, possess cells which are differentiated for special activities, and their form is determined by the work they are called upon to do. Again, certain cells take on a measure of continuity with each other to form tissues which are again differentiated according to the work they have to perform. Thus we have connective tissues, including the varieties: osseous tissue, cartilaginous tissue, fibrous tissue, adipose tissue, nervous tissue, epithelial tissue, etc. These tissues enter into the structure of organs with special activities; thus we say the F. of the stomach is to digest, that of the kidney to excrete waste liquid products, and so on.

Functionalism, see ARCHITECTURE, 9.
Fundamental Education, system of education designed to raise the standards of living of the pop. generally. It is particularly applicable to agric. and rural areas where mechanisation is virtually unknown. Through it an attack on illiteracy (q.v.) is made. But as many speakers argued at the immediate post-war meetings of UNESCO, literacy is no guarantee of effective participation in economic and political affairs. The feeling was strongly held that education could and should do more than promote literacy—it should help to promote democratic ways of living, and form the basis of permanent peace, security, and social justice for people all over the world. In pursuance of these aims UNESCO and other agencies have initiated pilot projects, designed in the first instance as experiments from which information about the theoretical and practical problems associated with this kind of education could be acquired. UNESCO has estab. 2 international training centres for teachers and workers in F. E. They are at Patzcuaro, Mexico, and Sirs-al-Layyan, Egypt. According to UNESCO, F. E. is the minimum of general education

which helps children and adults to understand the problems of their immediate environment, their rights and duties as individuals, and to participate more effectively in the economic and social progress of their community. It is 'general' in the sense that the knowledge is not imparted for its own sake but as a means of raising standards of living, and developing social and individual living. It is concerned with children and adults who have received no primary school education.

Education, therefore, is centred round social and economic activities rather than books. The principles behind it are not new. John Dewey at the start of the century gave great impetus to the idea of 'learning through doing.' Gandhi, in his Wardha scheme, suggested that education should be based on craft work, that is on the cottage industries that abound in India. The theory is that through this craft work not only could the children become productive, selling their products to help maintain the school, but the creative and intellectual sides of personal growth would be encouraged. In modified form this scheme has been accepted by the Indian Gov. as suitable for their primary schools. The plan is called Basic Education (see MASS EDUCATION). It does, however, require for its implementation a corps of well and specially trained teachers, adequate buildings, and well equipped workshops. Furthermore it has to meet the challenge created by the fact that India is moving slowly but inevitably away from agriculture to industry. A new base might have to be found to provide education through the fundamental occupational skills. These and many community development schemes are operating throughout the world. See UNESCO, *Fundamental and Adult Education* (quarterly); *Studies in Compulsory Education* for various countries; *Fundamental Education*, 1947; monographs on Fundamental Education (various titles).

Fundamentalism is in its essence the opposition of orthodox churchmen to the teaching of modern science where the latter comes into conflict with the Bible story. F. came into nation-wide notice in the U.S.A. in 1925 when a young schoolmaster, John T. Scopes, a teacher in the high school at Dayton, Tennessee, was arraigned in court for violating the state law, which forbade the teaching of evolution in state schools. The immediate issue was a violation of a state law. But its wider implications involved the question whether a state, through its legislature, could restrict scientific teaching when it conflicted with religious beliefs. Bryan, one of the prosecutors, argued for the literal truth of every word and every sentence of the Bible. He objected to the theory of evolution because it ran counter to the Bible story of creation. Scopes was fined 100 dollars. Later the Supreme Court reversed the decision, on a technical point of law. Mississippi afterwards passed a similar law, and the

Fundamentalists attempted to bring this about in some 7 or 8 other states, but their measures were killed by ridicule. See H. E. Fosdick, *The Modern Use of the Bible* (against F.), 1924; J. C. Machen, *What is Faith?* (for F.), 1925; M. Shipley, *The War on Modern Science*, 1927; S. G. Cole, *History of Fundamentalism*, 1931.

Fundanus, Laous, see FONDI.

Funded Debt was the term originally used for a D. the service (administration and payment of interest) of which was secured upon some specified fund. But the term is now used without special application to any fund in respect of any large public loan raised for permanent purposes, bearing a certain rate of interest. When the loan is raised a date of repayment may or may not be quoted. The F. D. of the U.K. belongs to the latter category, but the gov. reserves to itself the right to redeem after a fixed period. Goschen's consols, a case in point, were made redeemable after 1923. The practice in general use in the U.K. for the reduction of D. is that of a sinking fund from which contributions should be made annually by the chancellor of the exchequer. This practice is open to the objection that in the hands of a chancellor who is not too squeamish the sinking fund is open to inroads which may help him to tide over his difficulties for the time, but unfortunately do not help in the reduction of the national D. Another practice adopted is that of conversion, by which means loans issued at certain rates of interest are converted into issues bearing a lower rate. To reduce their F. D.s other nations sometimes make yearly purchases by drawings, the money being supplied by a sinking fund. See also PUBLIC DEBT.

Fundi, see FONDI.

Funds, see PUBLIC DEBT.

Fundy, Bay of (Fr. *fond de la baie*, head of the bay), arm of the Atlantic Ocean separating Nova Scotia from New Brunswick and the state of Maine, extending 180 m. in length. It is exceedingly difficult to navigate, owing to the tides, which at certain seasons have a rise and fall of 53 ft, producing dangerous bores in the upper reaches. At low tide the shores have the appearance of long stretches of mud-flats.

Fünen, Denmark, see FYN.

Funeral Expenses, in law, are a privileged debt allowed before all other charges, both in England and in Scotland, if limited to the estate left by deceased.

Funeral Rites, observances connected with death and burial. The care of the dead is a marked feature of religion among all nations. Among the Hindus the corpse is perfumed and adorned with flowers and then burned. The Muslims bury their dead; and, as is well known, the Egyptians always embalmed dead bodies (see MUMMIES). The mourning customs of the Jews may be collected from the Scriptures. In the creed of the Greeks and Romans, sepulture of the dead was an act of piety to prevent the wanderings of the spirit on the shores

of Styx. They burned their dead on funeral pyres and deposited the ashes in an urn. F. R. in ancient times often included games or scenic and gladiatorial shows.

Funeral Societies, see FRIENDLY SOCIETIES.

Funkirchen, see PÉCS.

Fungi, one of the 2 groups of plants of the Thallophyta, the div. of the vegetable kingdom which includes the most lowly organised plants. F. differ from the algae, the other group, in having no chlorophyll; hence they cannot assimilate carbon dioxide, but depend upon living or dead organic matter for food. Many F. are saprophytes, living on dead organic matter, others are parasites, living on live plants or animals; some behave as both.

FUNGI (BASIDIOMYCETES)

A, Ink cap or Shaggy cap (*Coprinus comatus*). Left to right: puff-ball (*Lycoperdon saccharum*); edible mushroom (*Pleurotus arvensis*); morel (*Morchella esculenta*); *Agaricus (Pleurotus) ostreatus*.

Most plant diseases are caused by F., or their near relations, bacteria. F. vary in form from single-cell, microscopic structures to specialised forms with conspicuous fructifications. In the widest sense, F. are sometimes held to include the Myxothallophyta (alime F.), Myxomycetes (the Mycetozoa of the zoologist), Schizomycetes (bacteria), and Lichenes; but are more closely applied to the Eumycetes, a subdiv. of heterotrophic organisms, comprised of about 37,000 species in over 3500 genera. As such, F. are usually multi-cellular organic units, with a vegetative body composed of fine tubes or threads termed hyphae, which collectively are called the mycelium (commonly known in mushrooms as 'spawn'). The hyphae are woven and intertwined, and when the fructification is formed, they are closely packed to produce a solid mass which becomes the mushroom, toadstool, bracket fungus, or fruit body, of soft, leathery or even woody texture, but always consisting of interwoven hyphae.

F. reproduce by means of spores, simple structures of one or more cells, without embryos, varied in colour, form, and size, and produced in gills or tubes of fruit-bodies. All F. produce asexual spores, and in some there is also a sexual process. F. are divided into 4 classes: (1) Phycomycetes, in which the mycelium is not partitioned or non-septate. This class contains the F. responsible for moulds, such as potato blight, damping-off, tomato leaf-mould, etc. (2) Ascomycetes, with mycelium septate, and producing sexual spores in asci. The class includes mildews, blue-green moulds, *Penicillium*; and higher forms having cup-shaped fructifications which are brightly coloured (e.g. *Peziza*). (3) Basidiomycetes, with mycelium septate, and sexual spores on basidia; a large class which includes the parasitic F. responsible for Smuts and Rusts; mushrooms, toadstools, and puff-balls. (4) F. Imperfecti, with mycelium septate, and asexual spores. Most F. Imperfecti are imperfect states of Ascomycetes, but may include imperfect states of some Basidiomycetes. Briefly, many F. produce spores by abstricating (cutting-off) tips of hyphae. The spores are known as conidia, and the stage of a fungus producing conidia is the 'imperfect stage.' When the fungus forms a complex fructification which produces other special types of spores, it has reached the 'perfect stage.' F. with 2 such reproductive stages often receive 2 names, but the name for the perfect stage is the correct one. F. are identified by the form and structure of their perfect fructification, and the colour, size, and shape of the spores it produces. See G. Massee, *British Fungi*, 1911; E. W. Swanton, *Fungi and How to know Them*, 1923; M. Grievé, *Fungi as Food and in Medicine*, 1925; H. Gwynne-Vaughan and B. Barnes, *Structure and Development of Fungi*, 1927; J. Ramsbottom, *Handbook of the Larger British Fungi*, 1951; J. Ramsbottom, *Mushrooms and Toadstools*, 1954.

Fungibles. In the classification of property Scots law, following Rom. law, distinguishes between F. and non-F. F. are such things as are estimated by weight, number, or measure and can be replaced by others of equal quality and quantity, e.g. money or grain. The distinction is of importance in the case of a loan when there may be a question of whether the actual subject lent must be returned or merely its equivalent.

Fungicide, a chemical compound chiefly used to prevent or inhibit fungus diseases in plants. A F. may act by killing the fungus parasite, or by preventing the germination of its spores, or both. F.s may be applied in liquid or powder form, and their effectiveness usually depends upon proper coverage of the plant and application at the right time. Older F.s are based chiefly on copper salts or sulphur, but more recently mercury compounds and complex organic chemicals have come to the fore. The more important F.s are:

Bordeaux mixture, a mixture of copper sulphate and lime solutions; *Burgundy mixture*, a mixture of copper sulphate and washing soda solutions; *colloidal copper*; *copper-lime dusts*; *ammoniacal copper carbonate*; *copper oxychloride*; *copper sulphate* (used on dormant plants only); *cuprous oxide*; *Cheshunt compound*; powdered sulphur; *lime-sulphur*; *liver of sulphur*; *ammonium polysulphide*; *mercury compounds*. Organic F.s such as *Captan*, *Zineb*, *Ziram*, *Thiram*, *Manam*, and *Karathane* are tending to supplant the older F.s in many programmes for disease control. See FUNGI; PARASITES.

Fungus, in medicine. Some members of the F. group of plants are parasitic to man, causing diseased conditions; such are *Achorion schleinii*, causing *favus* (q.v.), *Microsporum audouinii* and *Trichophyton tonsurans*, causing ringworm (q.v.), and *Actinomyces bovis*, or ray F., which causes the swelling of the jaw known as actinomycosis (q.v.).

Fungus Melitensis, see CYNOMORIUM.

Funicular Railway, see RAILWAYS, Mountain Railways.

Funk, Isaac Kaufman (1839-1912), Amer. author and publisher, b. Clifton, Ohio, and educ. at Wittenberg College and Wittenberg Theological Seminary. He was ordained a minister of the Lutheran Church, 1861, and after holding various pastorates he started a publishing business, 1876, in which he was joined by A. W. Wagnalls, 1878. The firm operates successfully to-day as Funk and Wagnalls. F. ed. the *Standard Dictionary*, founded the *Metropolitan Pulpit*, now the *Homiletic Review*, 1876, and various other papers, and wrote, among other works, *The Next Step in Evolution*, 1902, and *The Psychic Riddle*, 1907.

Funk, Walther (1890-), Ger. journalist and economist, b. in E. Prussia and educ. at Berlin and Leipzig Univs. He was appointed head of the Reich press bureau in 1933; and in the same year was made Reich minister of propaganda. He became minister of economics, 1938, and in 1939 he took over the Reichsbank when Schacht (q.v.) was dismissed. He was president of the Reichsbank until 1945. F. was tried at Nuremberg (1946) as a war criminal, and sentenced to life imprisonment.

Funkia, see HOSTA.

Funny-bone, popular name for that part of the elbow where the ulnar nerve passes down the inner condyle of the humerus. The nerve being comparatively unprotected, a blow on this point will cause a tingling, pricking sensation down the whole length of the nerve to the ulnar side of the hand, followed by numbness. It has also been termed the crazy-bone.

Fur, term used generally to cover the skins of animals complete with the outer covering of wool and hair; used for the manuf. of coats, ties, and trimmings. F.-bearing animals are found widely distributed throughout the world, but with some exceptions the finest are obtained from the colder regions of the N. hemisphere. The animals should be taken

when the weather is coldest, as then their F. is most fully developed; that is in winter, or early spring in the case of water animals. F.s present a considerable variety of colour, texture, and pattern; after dressing, some are used in a more or less natural state, whilst others are dyed and submitted to various processes before being manufactured into coats.

Fox.—The silver fox occurs in the wild state as a mutant of the red fox, and exhibits colour phases varying from pure black to a complete covering of silver guard hair. Wild silvers are comparatively rare, but the animal has been raised in captivity since 1908, and silver fox ranching is now an extensive industry, particularly in N. America, the

Reproduced by permission of the Governor and Committee of Hudson's Bay Company

PLATINA FOX, RAISED IN CAPTIVITY

Scandinavian countries, and Russia. Cross fox occurs in red fox litters, and its distinctive feature is a dark cross on the shoulders. White fox is found mainly in the Arctic circle and Siberia, is pure white in colour with deep, dense F., and is used for making capes, trimmings, etc. Most is dyed, particularly with the light pastel shades. Red fox is found in practically every country N. of the equator. It varies in colour from yellow to dark red, and is often dyed and used extensively for trimmings. Blue fox is found in the Arctic regions of Canada, Alaska, and Greenland, is bluish in colour, and used to make capes and stoles. It is farmed extensively in Scandinavia.

Weasels.—Fisher is the largest species of the weasel family, and has very fine, silky hair, which is a dark brown in colour. This is a highly prized and very valuable F., found only in N. America. Badger is found in the N. Amer. continent, Europe, and Asia. The hair is silvery grey in colour, and those from N. America

are used for trimming, etc., and the European and Asiatic skins for brushes. Ermine is found mainly in Canada and Siberia, and is creamy white in colour, with a black tip to the tail. Marten is a fine and valuable soft, silky F. used for capes, stoles, etc., found mainly in Canada, and varying in colour from yellow to dark brown. It is the Canadian counterpart of Russian sable. Sable is the most costly and prized member of the weasel family, and is found in most parts of Russia. It has the same characteristics as the Canadian marten, but is smaller, with better colour and quality of F. Skunk is found in N. and S. America, and is black in colour. Many have white stripes, which are cut out or dyed before the F. is used.

Rodents.—Beaver is found mainly in Canada and N. U.S.A. The best types come from E. Canada; they are brown in colour, and are not used in their natural state. The top hair is plucked, and the under F. is sheared to make coats, etc. There are 3 main types of muskrat recognised by the F. trade: (a) Canadian and Amer., which varies from golden to dark brown in colour, and has thick underwool with short top hair, and is used naturally and dyed for coats, etc; (b) black, which is found mainly in E. America; apart from being black in colour its characteristics are as (a); (c) S., which is found in Louisiana and Texas, and is farmed extensively in Russia, has brown underwool and black top hair, otherwise with the same characteristics as (a) and (b). Marmot is found mainly in Mongolia, Russia, and Russian Siberia, and is generally used as a cheap imitation of mink. Nutria is native to S. America, and is an inferior species of the beaver. It is also raised in captivity; the top hair is plucked or sheared, leaving soft brown underwool. Squirrel is found in all parts of the N. hemisphere, but the largest quantities come from Russia and Canada. The finest come from Russia, and are grey-blue, and very well furred. The Canadian type are weaker and of a red-brown hue. They are dyed and manufactured into coats.

Cat.—Leopard is found principally in India and Africa, the best types coming from Somaliland. The hair is short and the best bear a well-defined pattern of black rosettes on a clear yellow background. House cat is found in almost all countries; it is of many different colours, and is used for cheap coats, trimming, etc., after processing. Lynx is found mainly in Canada and Siberia. It is the most beautiful of the cat family, having long, silky F. of a silvery grey colour, and is used for trimming.

Fitch.—This is a species of ferret found in Europe and Asia. The colour varies from dark brown to yellow (found in Europe) and white to pale brown (found in Asia). It is used to make cheap coats, etc.

Mole.—This is a small insect-eating animal with soft, velvety, blue-black F., which is found throughout the N. hemi-

sphere. It wears badly and is not in great demand.

Opossum.—Each country produces a different type, but in the main they have creamy white underwool with darker, somewhat silvery, guard hair. Skins from N. and S. America have sharp guard hair. Australia and New Zealand produce a woolly textured F.

Pony.—The ponies used by the F. trade come mainly from S. America and Russia. They have short, coarse brown hair, the short-haired variety with a moiré pattern being recognised as the finest.

Raccoon.—These are found in America and Canada, are bluish-black tipped and reddish-brown in colour, and have thick, woolly F., used for trimming, coats, etc.

Mink.—The most desirable types of wild mink are found in Canada and N. America. The F. varies in colour from light to dark brown, and is of a dense, even, silky texture. Its prin. use is for manuf. into coats. Mink are also raised in captivity, and the best of the ranch types compare very favourably with the wild types. In recent years a number of varieties have been developed. They are known collectively as mutation mink, of which the most valuable are silver blue, pastel, and white.

Seal.—There are 2 types, which are found in most oceanic regions: (a) F. seal, which is taken mostly in Alaska, Pribilof Is., Lobos, and Cape of Good Hope, S. Africa, where the animal goes to breed. It has coarse, silvery top hair and very soft underwool which, when the top hair has been removed, is dyed and used for coats, etc; (b) hair seal, which is found mainly in the N. hemisphere, and is characterised by its absence of underwool.

Lamb.—There are very many varieties of lamb which are used by the F. trade. The types most commonly used are the Persian and Indian lambs. Persian are indigenous to Bokhara, Afghanistan, and Samarkand, but are now extensively found in S. Africa, whence come most of the skins used commercially. The wool is curled, and the value of a skin depends on the size, lustre, and pattern of the curls. The majority are black, but grey, white, brown, and mottled varieties also occur. Indian lambs are not so fine as Persian, and are mainly white in colour, though some are brown, black, or mottled, the curl being flat and open, and the skins are used for coats, etc.

See H. A. Innis, *Fur Trade in Canada*, 1930; F. Merk, *The Fur Trade*, 1931; F. Moloney, *Fur Trade in New England*, 1931; C. T. Williams, *Modern Fur Farming*, 1934; and B. A. de Voté, *Across the Wide Missouri*, 1948; and *The British Fur Trade Year Book*.

Fur Seal, or Sea Bear, belongs to the Otariidae, or sea-lions, as opposed to the Phocidae or true seals. F. S.s are divided into N. and S. herds, the latter of which are much reduced. But *Otaria ursina* of the N. Pacific, especially of the Commander and Pribilof (or Pribilof) Is. in the Behring Sea, is still comparatively plentiful. These is. were leased by the

U.S.A. to the Alaska Commercial Company (1870-90), and afterwards to the N. Amer. Commercial Company, whose monopoly, however, expired in 1910. The adult bull is 6 ft long, with a girth of 4 ft. In its seventh year it weighs about 450 lb. Its fur is dark brown, but that of the female, which is much smaller and weighs only 80 lb., is often fairly light. Seals feed in deep water chiefly on a small fish rather like smelt, and on Alaska pollack and squid. Their breeding grounds are the rock-strewn is. shores. The bulls arrive in May and the cows in June, the pup is b. soon after the cow's arrival, and by the winter-time (Nov.) is ready to swim away with its mother, the bulls having already (in Aug.) gone to sea to feed. In their winter migrations the Commander seals penetrate to the lat. of S. Japan, and the Pribylov as far as S. California. It is the custom of the young bachelor seals to sleep away from the 'rookeries.' Those who hunt them for their fur surround them in gangs by night, and drive them inland to the killing ground, where they knock them down with clubs. This method of trapping has been superseded by 'pelagic sealing,' that is, pursuit in open waters with spear or shot gun. Pelagic hunters, however, have killed male and female indiscriminately, with the result that the species is fast dying out. Various commissions have tried to remedy this abuse. Land sealing on the Pribilof and Commander Is. from 1868 to 1897 resulted in a catch of 3,382,949 and pelagic sealing of 963,529. The gov.-owned fur-seal herd of the Pribylov Is., administered by the dept of commerce, comprises about 85 per cent of the F. S.s of the world. This herd contained about 2,338,000 animals in 1941.

Fur Tribe, see DAR-FUR.

Furetière, Antoine (1619-88), Fr. lawyer and lexicographer, b. Paris. His announcement that he had compiled a dictionary of the Fr. language brought about his expulsion from the Fr. academy for alleged plagiarism, that body fearing that his dictionary was intended to supersede their own. F.'s *Dictionnaire universel* was pub. 2 years after his death, and it is a valuable work. An improved ed. was pub. by Baenage de Bauval in 1701, and the last reprint was at Amsterdam in 1725. It has survived as the basis of what is called the *Dictionnaire de Trévoux*. His other works were *Cinq Satires* (verse); *Gospel Parables* (verse); *Le Roman bourgeois*; and especially *Fureteriana* (pub. posthumously), being a collection of *bons mots* or anecdotes, which have often been parodied.

Furfuran, or **Furan** (C_4H_4O), organic substance obtained by heating the barium salt of pyromucic acid with soda-lime. It is a colourless liquid boiling at 32° C., is insoluble in water, and has the characteristic smell of pine-wood tar, in which it occurs. A molecule of furan may be looked upon as possessing closed chains of 5 atoms; if the oxygen atom is replaced by sulphur, thiophene is produced; if it be replaced by NH, pyrrole is produced.

Furfural, **furfurol**, or **furfuraldehyde** ($C_4H_4O \cdot CHO$) is the aldehyde of pyromucic acid, and may be prepared by distilling bran with dilute sulphuric acid. It is a colourless liquid boiling at 162° C., and is soluble to some extent in water. It has a pleasant smell, and turns brown on exposure to the air. When mixed with caustic potash, furfur-alcohol and pyromucic acid are formed, and it shows general properties analogous to those of benzaldehyde. With phenol (q.v.) furfural forms resins which are widely used in the manuf. of moulded articles similar to those made from cellulose, galolith, etc. Furfural and various of its derivatives are employed as solvents, germicides, etc. See Chicago Mines Laboratories Bulletin, No. 2, 1925, *Furfural and its Derivatives*.

Furfuraturum, see CRUSCA.

Furies, or **Furias**, see EUMENIDES.

Furka Pass, one of the highest Alpine passes in Switzerland (7992 ft.). It leads from Andermatt, in the canton of Uri, to the Rhône glacier, passing through the Reuss valley and ending at the Hôtel Gletsch in Valais.

Furlo Pass, tunnel, some 40 yds long, excavated in the Apennines, Italy. It is part of the Via Flaminia (q.v.), the main Rom. road from Rome to Fano on the Adriatic. An inscription at the N. end records that the tunnel was made by the Emperor Vespasian, AD 77.

Furlong, see METROLOGY.

Furlough, military term once used for leave of absence (and still so used in U.S.A.). On home service it applied to non-commissioned officers and men, but on foreign service it also applied to officers.

Furnaces (Lat. *fornax*, a vault), contrivances for application of heat generated by the combustion of fuel or by electrical means. The substance to be heated is usually called the charge. In fuel-burning F. a correct admixture of air is essential for efficient combustion, and air supply is sometimes regulated by a fan (forced draught) and by dampers. The F. may be classified under 3 headings: (1) where the fuel and the charge are in contact with each other; to this class belong shaft, blast, and hearth F., used for the smelting of iron, copper, and lead ores; (2) where the charge is heated directly by the products of combustion; these are reverberatory F. When the charge is not melted the furnace is known as a 'wasting' or 'calcining' furnace; when it is, as a 'melting furnace'; (3) where the charge is not in contact with the fuel or the products of combustion. When the heating chamber is fixed and forms part of the furnace, the latter is known as a muffle furnace. Other varieties are crucible F. and retort F.

Blast F. are of great antiquity, and forms differing little from ordinary smiths' F. are now used in India. The Catalan and Walloon forges, formerly used in the production of malleable iron, mark stages in the development of blast F. The Bessemer converter (see BESSEMER PROCESS) is a blast furnace hinged so that it can turn around a horizontal axis for

tipping out the molten steel charge. Hearth F. are sometimes employed in the air reduction process of smelting iron, but they are wasteful.

Where the charge must not come into contact with the fuel itself, but is directly heated by combustion products, the fuel is burnt in a special combustion chamber placed at the side of the hearth. The body of flame and the heated gas are drawn over the working-bed and beaten down by reverberation from the low vaulted roof. The term 'cupola' was originally used for the reverberatory

Mirrorpic

TAPPING A FURNACE

Photograph taken from under the furnace, showing the molten steel running down launder from the furnace into the steel ladle

furnace, but is now used to designate a small blast furnace, such as that used by iron-founders. The 'melting' reverberatory furnace is used in the concentration of poor metallic compounds into a regulus by fusion, in the reduction of lead and tin ores, in the refining of copper and silver, and in the puddling processes of making malleable iron. The 'calcining' type of reverberatory furnace has a less extended use.

Sometimes the solid fuel is converted into gas. The success of this method is due to the easy regulation of combustion, which can be made perfect without excess of air and the possibility of a long flame and large F., even with fuel of inferior quality.

Electric furnaces are expensive to run, but the absence of smoke and ashes, freedom from contamination with noxious gases, and the ease of regulation and tele-control are important advantages. Arc F. produce the highest temps. obtainable

—4000° C. as against 2000° C., the maximum temp. in a combustion furnace. The arc may be burning in the material to be heated (gas reaction F.), or the charge may be in the path of the arc, or the arc may be outside the charge, heat being transferred by radiation. A famous gas-reaction furnace is the Birkeland-Eyde plant at Rjukan, Norway, for obtaining nitrogen from the atmosphere. Air is drawn into a 6-ft.-diameter steel cylinder lined with refractory material. In the centre burns a powerful arc between 2 hollow, water-cooled copper tube electrodes $\frac{1}{2}$ in. apart. To prevent short circuit the arc is blown out into a fan shape by electromagnetic action. The arc is virtually nitrogen burning in oxygen. The NO formed is discharged through holes in the cylinder and passes up cooling-towers. The final product is calcium nitrate. Each of a series of 10MW, 3-phase generators serves 3 separate single-phase F. In other types of arc F. carbon electrodes are inserted through the walls; if the arc is to pass through the charge, the positive electrode is usually inserted through the roof of the furnace chamber, the negative in the floor, and the charge is placed between. Arc F. are used for the manuf. of calcium carbide and its derivatives, of ammonia, and other nitrogenous products, for reduction of iron ore and heat treatment of alloys. Resistance F. utilise the heat I^2R generated by a current I amps in a conductor of resistance R ohms. With indirect heating, coils or grids of nickel-chromium wire are inserted in walls, roof, and floor of the furnace chamber containing the charge. These F. are used for lacquering and japanning, for melting and refining special metals such as high-grade steel and certain alloys. The coils are controlled from outside and the furnace is suitable for processes in inert or other specified atmospheres. In direct resistance heating, the current passes through the charge. This is used for heating rivets, for granular or powdery substances, and for liquids. The electrode boiler is a direct-heating resistance furnace, the current passing through the water between 2 electrodes. In low-frequency Induction F. the charge is placed in a ring-formed trough round an induction coil. When this is supplied with a.c. the charge becomes the short-circuited secondary of a transformer and is heated by the induced current. In h.f. induction F. the charge is heated by the eddy currents generated by a h.f. (500–2000 c/s) current in a surrounding coil. In induction F. the heat is generated in the charge itself and there is no loss in radiation or convection. In h.f. heating, the depth of penetration of the heat depends partly on the frequency and is thus subject to control.

Furneaux Islands, also called **Flinders**, group of is. between Australia and Tasmania in the Bass Strait and included within the state of Tasmania. Flinders, or Great Is., is the most important, others being Cape Barren, Clarke, Hummock, and Badger. They were discovered in 1773 by Cook's lieutenant, Furneaux, from whom they take their name. They are for the most part barren and unproductive. Pop. 1027.

Furnes (Flem. *Veurne*), tn in the prov. of W. Flanders, Belgium. It is situated at the junction of sev. canals, 16 m. N.E.

Belgian Embassy

**FURNES: THE PROCESSION OF
PENITENTS**

of Dunkirk and 27 m. SW. of Bruges. The prin. industries are the manuf. of linen and tiles; there is a trade in hops, corn, and dairy produce. A remarkable religious festival, the procession of penitents, is held at F. annually in July, when hooded and black-robed citizens carry heavy crosses through the tn. Pop. 7300.

Furness, Sir Christopher Furness, 1st Baron (1852-1912), shipowner and ship-

builder, head of shipping firm of F., Withy & Co. He was b. at West Hartlepool, Durham, and started a shipbroking business when he was 24 years of age. He next estab. the line of steamers. In 1885 he joined Edward Withy and founded the present firm. He was Liberal member for the Hartlepool div., 1891-1910, when he was raised to the peerage as a baron, and took the title of Lord F. of Grantley.

Furness, peninsula of N. Lancs, England, situated between the Irish Sea and Morecambe Bay. The ruins of F. Abbey stand in a deep valley S. of Dalton and adjacent to the F. railway. It is interesting to artists and antiquaries, being a fine example of the transition Norman and early Eng. architecture. It was founded in 1127 and was, until the Reformation, a great and wealthy Cistercian abbey. The prin. tn of F. is Barrow (q.v.), noted for its docks and iron works.

Furniss, Harry (1854-1925), caricaturist, b. in Wexford, son of a Yorks engineer; at the age of 19 he settled in London, and soon after became a regular contributor of humorous drawings to the prin. illustrated papers. He joined the staff of *Punch* in 1880, and for many years was one of its most popular illustrators. He leapt into fame with his invention of the Gladstone collar, and became known all over the world for his picture (used since by Pears' Soap as an advertisement), 'Two years ago I used your soap, since then I have used no other.' An admirable humorist, he illustrated, with success, the work of the 2 great humorists, Thackeray and Dickens. Author of many books, including *Confessions of a Caricaturist*, 1901; and *Harry Furniss at Home*, 1903.

Furniture (from Fr. *fournier*, to furnish) includes all movable goods, such as fittings, vessels, etc., provided to increase the usefulness and comfort of buildings. Until the Renaissance most household appliances were rare luxuries. The peoples of antiquity (except for kings and nobles) were satisfied with some form of table and seat, for they slept on the floor and the best hrs of their lives were spent out of doors. Up to Rom. times the woods most commonly employed for domestic furnishings were cedar, rosewood, ebony, teak, pine, and walnut, whilst bronze and electrum, silver and gold and ivory were freely used also. Under the empire, wealthy Romans had golden cooking utensils. Still, wood has always been the basis of F. and for this reason few examples of early work have lasted until to-day. The chief sources of information about Assyrian and Egyptian household fittings and likewise about those of Greece and Rome are sculptures and mural decorations. The cabinet-makers of Nineveh, as also of Thebes and Memphis, knew how to embellish their couches and tables with inlays of ivory, and often supported their chairs and thrones on legs shaped like those of wild animals; bulls, lions, and rams were favourite devices for carving. Slaves were

sometimes used as 'human furniture' being made to support the regal throne. The Greeks derived their furnishing fashions from the E., and the plutocrats of Rome patronised Ok rather than native workmen. Folding chairs, chairs with sloping and upright backs, elaborate footstools, bronze tripods, arm-chairs with sphinxes for elbow rests, splendid marble tables and candelabra, oriental couches, and all manner of bronze work damascened in gold and silver were common appendages in the palaces and sumptuous homes of the kings and aristocrats of classical antiquity. Rom. fashions were copied by Byzantine craftsmen, and under

vestments. They were the ancestors of our modern 'dual purpose' F., for when the family moved, they served as trunks for all forms of apparel. From these the modern *dressoir* or sideboard has developed. Beds were square and roofed, with panelled testers supported on carved posts. Oak and pine predominated. A word must be said of Saracenic work, for the Saracens deserve praise for the beauty and delicacy of their lattice work and inlaying, whether with silver filigree, brass, ivory, or mother-of-pearl, seen in their tall, hexagonal tables and cross-legged reading desks. After the Renaissance artisans no longer carved

Charlemagne there fl. the Rheno-Byzantine school of art, whose best work appears in their magnificent enamelled shrines and reliquaries. In the Middle Ages beds and chairs were still largely restricted to the upper classes, but in the castles and manor houses of the Norman barons household appliances were rapidly developing both in number and artistic worth. The F. of these times was sombre, heavy, dignified—strictly masculine in feeling. The 'linen-fold,' a design taken from the folds of the purificator used at mass, was often employed as decoration on the big chests and portable presses so typical of the times. These chests were made at home and had wrought-iron clasps and hinges and iron strap-work ornamentation or sometimes panels of tempera painting on gilt backgrounds. They were used as repositories for money and valuables; in churches and monasteries they were also used for eccles.

episodes from the lives of the saints or the cycles of romance, for these were superseded as decorative material by the fashion for classical mythology. During the Quattrocento period in Italy (1400-1500) sumptuous F. of every description was executed at the bidding of the Medici and other patron princes. The fashion for gilt grounds, *pietra dura* work, that is, the inlaying of slabs of coloured and richly veined marbles, and *tarsia*, or *certosina* work, or inlaying of wood in geometrical patterns or floral designs, came quickly into vogue and spread rapidly across the Alps to other countries. During the reign of Henry VIII, Jean de Mabuse and Holbein introduced It. fashions into England, and in France, as the result of the infiltration of It. craftsmen, a mass of heavy and rich F. was made, but the frequent use of strap-work and the cartouche, which characterises the Henri Deux style, is peculiarly Fr.

The Jacobean and Restoration styles, though overshadowed by the great *floraison* in F., which marks the 18th cent. throughout Europe, evolved directly from the Elizabethan solidity (e.g. the famous 'great bed of Ware'), and were marked by increased use of upholstery, the evolution of present types of chair from the old, box-like structures, the appearance of simple sofas and gate-legged tables. Carving, though still abundant, became lighter and walnut began to come into its own. Under William and Mary, the Dutch influence brought a notable increase in comfort. The upholstered wing-chair (which has lasted till to-day),

for which they were designed. His designs incorporated Wedgwood plaques, low relief carving, gilding, and marble console tops. Sheraton's genius contributed much, including the kidney-shaped desk and table, sectional book-cases, and 'pouch' sewing tables. His book, *Cabinet Makers' and Upholsterers' Drawing Book*, 1791, 1793, 1802, greatly influenced cabinet-makers on both sides of the Atlantic. The inspiration of these men was clearly drawn from the Fr. artist Boulle, who owed his excellence in marquetry work to Florentine and Venetian craftsmen. Boulle belongs to the Louis Quatorze period—the *armoire* in

SHERATON

Satinwood side-table (one of a pair) with serpentine sides and slightly cabriole legs

CHIPPENDALE

Walnut desk chair with seat covered in leather

the slant-top desk, corner cabinets for display of china, all now made their appearance. Queen Anne F. included *secrétaires*, grandfather clocks, tallboys and lowboys. Carved mahogany began to replace walnut and Chinese influence was evident. The heyday of cabinet-making in Britain is associated with the names of Chippendale, Sheraton, Hepplewhite, and Adam. Chippendale's famous designs formed a transition from Queen Anne to late Georgian styles. His *The Gentleman and Cabinet Maker's Director*, 1754, became a classic. Hepplewhite's aim 'to unite elegance with utility' made his F. less magnificent than Chippendale's but distinguished by lightness and grace. He used the urn shape, the 'Prince of Wales's Plumes,' wheat blossoms, garlands and swags in decoration. Robert Adam introduced the important idea of harmonizing all the furnishings and the decorative detail with the architecture

the Jones' collection at the Victoria and Albert Museum, South Kensington, London, is a beautiful example of his work—but though this period and the succeeding ones, the regency and the Louis Quinze or rococo, afford much that is both sumptuous and elegant, the cabinet-maker's art reaches its high-water mark just before the Fr. revolution, that is, in the reign of Louis XVI. In the South Kensington Museum may be seen some splendid specimens of the work of Röntgen, Riesner, and Gouthière, who enjoyed the patronage of Marie Antoinette. Gouthière was the first founder and chaser of his day, and used to mount in ormolu or bronze-gilt the elegant commodes and cabinets which the other two had made. These men turned their backs on the frivolous, rampant vagaries of Meisssonier and other apostles of the rococo school and developed a beautiful restraint and delicacy accentuated by their preference

for classic forms. Thus the 'riotous curves' of the du Barry period gave place to medallions and straight-lined patterns, which heralded a purer style. The transitional work between the restrained classicism of Louis XVI and the heavier Empire style is known as Directoire F., and shows a gradual loss of delicacy and increasing use of Rom. motifs. The Regency styles were much affected by the Directoire interpretation of classicism, but they were more severe, stiff and formal. Pedestal base tables were popular, chairs with Gk circular backs, sofas with rolled ends, bookcases with copper wire screening in front. Mahogany and rosewood, black lacquer, gold banding, and marble tops were fashionable. Rooms were dignified and simple, but this period merged into the 'English Empire' and so to the Victorian hotch-potch of over-elaboration. F. became clumsy and awkward, rooms overfilled with love-seats, what-nots, and hanging cupboards. Marble, ebony, black walnut, and mahogany were used profusely. Bygone styles were copied by poor methods of machine manu. Characteristic of the period is artificiality and imitation with touches, however, of real sentimental charm and often a homely picturesqueness. Wm Morris and the Arts and Crafts centre led a revolt against such fashions and encouraged a group of enthusiasts to design and make F. of a simple and high standard. The best known of the group were Ernest Gimson, Ambrose Heal, and the Barnsleys. This F., small in amount and known only to a limited public at the time, did much to establish Britain in the lead for design and hand craftsmanship, the high standard was maintained in every detail. In the period between the 2 world wars, however, when wood-working industries had become fully mechanised, there was little designing for the special needs of machine-made F. Quantities of imitation 'period' F. of poor quality flooded the market. A limited number of firms continued to produce good pieces in the Gimson tradition but these were mostly hand made and therefore too expensive for popular use. Shortage of timber during the Second World War led to rationing of F. An advisory committee of leading designers, appointed by the President of the Board of Trade, produced specifications for 'utility' F. Limited in range and varying in quality, this was, however, of good proportions and pleasing appearance. Since then, the use of plywood and laminated woods, new strong glues and heat- and stain-resisting finishes, are stimulating the production of new designs for use with the machine. Modern methods make it possible for F. to be strong while appearing very light and 'airy.' This effect has been used with great success in Scandinavian countries, but in all modern developments furnishing effects now depend largely on colour schemes and overall impressions.

The manu. of Amer. F. has developed

along much the same lines as Eng., but the influence of the early settlers' countries of origin, combined with pioneer and local conditions and materials available, have produced many interesting and purely Amer. designs and styles. Early Amer. F. included the 'Connecticut Chest' and the 'Hadley Chest' (which later developed into the Governor Winthrop sloping lidded desk), and the Boston Rocker. The Amer. Federal styles included 'Martha Washington' chairs, and 'Bull's Eye' mirrors with carved frames topped by an eagle. The Amer. Post-Federal period was marked by the influence of the great cabinet-maker Duncan Phyfe and also of Samuel McIntire. Local styles of furnishing, such as 'Pennsylvania Dutch', 'French Provincial', etc., mark contemporary decoration schemes with distinctive and individual beauty. Many of the modern furnishing trends to-day originate in America, notably the great new emphasis on kitchen F. and decor, where modern 'functional' designs and materials have combined at their very best to give an entirely new dress to the Cinderella of the furnishing family.

See T. Chippendale, *The Gentleman and Cabinet Maker's Director*, 1754; L. V. Lockwood, *Colonial Furniture of the Pilgrim Century*, 1921; R. Edwards, *Sheraton Furniture Design*, 1946, and *Hepplewhite Furniture Designs*, 1947; R. W. Symonds, *Chippendale Furniture Designs*, 1948; H. Gordon, *Old English Furniture*, 1948; J. and R. Hooper, *Modern Furniture and Fittings*, 1949; J. Gloag, *English Furniture*, 4th ed. 1952, and *Short Dictionary of Furniture*, 1952; P. Macquoid and R. Edwards, *Dictionary of English Furniture* (Middle Ages-late Georgian), 2nd ed. 1954.

Furniture Cream, mixture used for polishing chairs and sideboards, etc. Beeswax and resin are dissolved in heated turpentine and then mixed with a solution of powdered soap and carbonate of potash. When applied to wooden surfaces, the oil dissolves the former polish and the other constituents make a new one.

Furnival, Frederick James (1826-1910), philologist and editor, b. Egham, Surrey. Educ. at London Univ. and Cambridge, he founded 7 societies for the promotion of literary appreciation and for the pub. of texts. These were the Early Eng. Text Society, 1864, the Chaucer, 1868, Ballad, 1868, New Shakespeare, 1874, Browning, 1881, Wyolf, 1882, and Shelley, 1886. By means of these associations he collected as much as £30,000, which was expended in issuing cheap eds. of a number of early texts and rare works of literary merit, which thus became accessible to a large circle of interested students. Many of the texts were ed. by F. himself, but his great work as editor was his issue of *A Six-text Print of Chaucer's Canterbury Tales in Parallel Columns*, 1868-75, which was an exact replica of 6 original MSS. F. further supervised the pub. of a series of facsimiles of the quartos of Shakespeare's plays, and for some years was editor of the

Oxford *New English Dictionary*. F. was in his day a splendid oarsman, and in 1885 introduced races for sculling fours and eights. See *Frederick James Furnival: a Volume of Personal Record* (reminiscences) by 49 contributors, with a biography by J. Munro, 1911.

Furnival's Inn, see INNS OF COURT.

Furse, see FUR.

Furse, Charles Wellington (1868-1904), painter, b. Staines. He studied in Paris, and, returning to London, made a name by pictures exhibited at the Royal Academy and New Eng. Art Club. His most famous work is 'Diana of the Uplands,' open-air in feeling. A fine decorative sense also appears in his mural decorations for the tn hall at Liverpool. Among his other pictures are 'The Return from the Ride,' 'The Lilac Gown,' and 'Cubbing with the York and Ainsty.' His early death was a serious loss to Brit. art.

Furse, Roger (1903-), designer and painter, b. Ightham, Kent. Educ. St George's Choir School, Windsor and Eton. He began as stage designer in 1934 and speedily became one of the most successful. He has designed settings and costumes for stage productions of all kinds and has been responsible for many of the Shakespearean productions at the Old Vic and Stratford-on-Avon, as well as for productions such as *The Mousetrap* and *The Sleeping Prince*. During the Second World War he was temporarily released from the R.N. to design the costumes and armour for the film of *Henry V*, and he was responsible for the décor in *Richard III*. He has been equally successful in New York.

Fürst, Julius (Heb. name, Al-sari) (1805-73), Jewish historian, Heb. bibliographer and lexicographer. 1864 onwards, prof. at the univ. of Leipzig. Editor of *Orient*, 1840-52. Main works: *Lehrgebäude der aramäischen Idiome*, 1835, *Aramäische Chrestomathie*, 1836, *Bibel-Konkordanz*, 1837-40, *Bibliotheca Judaica*, 3 vols., 1840-63, *Hebräisches und chaldäisches Handwörterbuch*, 2 vols., 1857-61, *Geschichte des Kaddertums*, 3 parts, 1862-7, and *Geschichte des jüdischen Literatur*, 2 vols., 1867-70.

Fürstenberg, Ger. tn in the dist. of Frankfurt an der Oder, on the Oder (q.v.), 15 m. SSE. of Frankfurt (q.v.). It is at the end of the Oder-Spree canal, and has metal industries. Pop. 6000.

Fürstendfeldbruck, Ger. tn in the Land of Bavaria (q.v.), on the Amper, 15 m. W. of Munich (q.v.). It is a spa, and has anct houses and a fine 18th-cent. baroque church. Pop. 11,000.

Fürstenwalde, Ger. tn in the dist. of Frankfurt an der Oder, on the Spree and the Oder-Spree canal, 20 m. W. of Frankfurt (q.v.). It was a bishopric, 14th-16th cents. There are textile and engineering industries. Pop. 25,000.

Fürth, Ger. tn in the Land of Bavaria (q.v.), at the confluence of the Regnitz (q.v.) and the Pegnitz, 5 m. NW. of Nuremberg (q.v.). It dates from the 7th cent., and has a fine 12th-cent. Gothic church and numerous buildings of the

17th and 18th cents. The F.-Nuremberg railway was the first in Germany, 1836. There are engineering, metal-goods, and brewing industries, and there is an airport. Pop. 101,050.

Fürth im Wald, Ger. tn in the Land of Bavaria (q.v.), on the Czechoslovak frontier, 98 m. NE. by N. of Munich (q.v.). Pop. 9500.

Further Education, see ADULT EDUCATION.

Furtwängler, Adolf (1853-1907), Ger. archaeologist, b. Freiburg-im-Breisgau. He took part, 1878-9, in excavations at Olympia. Assistant in Berlin museums, 1880; prof. and keeper of antique records, in Munich, 1894. In 1901-7 he undertook excavations in Aegina, Amyklæ, and Orchomenos. Wrote *Meisterwerke der griechische Plastik*, 1893, *Die antiken Gemmen*, 1900, *Griechische Vasenmalerei*, 1900, *Agina*, 1906, and *Klassische Schriften*, 1912-13.

Furtwängler, Wilhelm (1836-1954), Ger. conductor, b. Berlin, son of Adolf F. (q.v.). Studied in Munich; was in the court theatre under Mottl, 1911-15. Conducted opera in Munich, and (1915-19) in Mannheim. Conducted (1920-2) symphony concerts of Berlin state orchestra, and Frankfurt museum concerts; and, 1922-7 (as successor to Nikisch), Leipzig Gewandhaus concerts. Conductor of concerts of Gesellschaft der Musikfreunde, Vienna, 1921-30. Conducted at Philharmonic concerts, New York, 1926-7; Vienna Philharmonic concerts, 1927-30; director of the Berlin Philharmonic concerts, 1922-34, and from 1935 to his death; of the Berlin state opera, 1933-4; permanent guest conductor, Vienna Philharmonic orchestra and Vienna state opera; conductor, Bayreuth festival, 1931, 1936-7, 1943-4. In Dec. 1946 a Ger. denazification tribunal accepted F.'s application to have his name and record cleared, on the ground that his return to musical life in Germany after Hitler came to power was due to misunderstanding of the conditions in Nazi Germany. See monographs by O. Schrenk, 1940, and F. Herzfeld, 1941.

Furuncle, see BOIL.

Furze, see ULEX.

Fusan, or Fusan, important seaport on the SE. shore of Korea, is the terminus of the railway from Seoul. This treaty port was opened to Jap. trade in 1876 and later on to foreign trade generally. The tn consists of 2 parts, the native part and the Jap. settlement, which is the new part. The chief exports are rice, beans, hides, and silks, while cotton goods and Jap. goods are imported. The fisheries are also of some importance. It has a good harbour. Pop. about 180,300.

Fusaro, Lake of (anct Acherusia Palus), small lt. lake, in Campania (q.v.), on the NW. promontory of the Bay of Naples (see MISENO, CAPO). The ruins of Cumæ (q.v.) are near by. Oysters and fish are bred in the lake.

Fuse, or Fuze, contrivance for igniting the explosive element in a blasting cart-ridge or shell at the required moment. A F.

may be required to be instantaneous or it may be designed to delay the explosion.

F.s for blasting (q.v.) are either slow-burning or electrical. In the former case a cylindrical packing with a core of gunpowder (q.v.) is used. As ordinarily prepared this burns at the rate of about 2 ft per min., and takes effect on the detonating cap which then explodes the main charges. An electrical F. is constituted by inserting the ends of 2 insulated copper wires in the detonating cap. The wires are then attached to long wires leading to a battery deposited some distance from the scene of the explosion.

F.s for shells and bombs are either percussion or time F.s. Percussion F.s are actuated either by pressure or by rotation induced by the rifling, whereby a needle is set free or unlocked, in order to cause the explosion or impact. If the F. is operated by direct impact only it must necessarily be of sufficient strength to obviate explosion at the discharge of the gun. Time F.s usually depend on 2 channels of slow burning F. composition which is ignited by the discharge of the gun: these channels are movable with respect to each other, so that the distances from the point of first ignition may be adjusted to determine the time to elapse before explosion. Time F.s may also be operated by clockwork. F.s for bombs, rockets (q.v.), and guided missiles are operated by electronic devices. *See also* AMMUNITION; EXPLOSIVES; FIREARMS.

Fuses, safety devices inserted in a circuit to prevent the current rising to values causing overheating, damage to insulation, and eventually fire. A fuse is a wire of tin, copper, or silver of such dimensions that it melts ('blows') and so interrupts the circuit as soon as the current exceeds the maximum the circuit can safely carry. In the simple wire fuse the wire, bare or in an asbestos tube, is fixed between 2 terminals in a porcelain handle, which fits into spring contacts on the fuseboard. When the fuse is inserted, the wire closes the gap between the contacts. House installations are usually divided into groups, each with its own fuse, all F. being assembled on the fuseboard. The usual ratings are 5 A. for lighting and 10-15 A. for power. A 5 A. fuse on 240 V. would carry $5 \times 240 = 1200$ W. or 20 lamps of 60 W. each. In power stations and distribution networks high-rupturing-capacity (hrc) F. are used together with circuit-breakers, as they act more rapidly on severe overload or short circuit, while circuit-breakers allow more accurate rating. In hrc F. the silver wire is enclosed in powdered quartz in a ceramic container.

Fuses, or **Fuzes**, *see* WATON.

Fusel, or **Fousel**, **Oil**, also called **Potato Spirit**, consist chiefly of amyl alcohol ($C_5H_{11}OH$), but with it are also mixed butyl and propyl alcohol. It is a colourless fluid with an oppressive smell and a burning taste. Commercially it is used for making peardrops and other forms of amyl acetate for flavouring purposes, patent varnishes, and essential oils.

When potatoes, rye, and barley are fermented and the liquor distilled, it will usually be found to contain F. O., which becomes gaseous at a higher temp. than either alcohol or water. It is a constituent of most inferior spirits, but is not poisonous, though it produces undesirable physiological effects.

Fuseli, or **Fusoli**, **Henry**, or **Fusseli**, **Johann Heinrich** (1741-1825), Swiss artist and writer, b. Zürich. He studied art in Italy, and then took up his residence in London, where he was known by the name of Henry Fuseli. He was elected R.A. in 1790, and about 1798 became a prof. of painting at the academy. His pictures, which testify to his wonderful imagination, are somewhat lacking in their method of execution. He painted 'The Nightmare', 1782, and illustrations for both Shakespeare's and Milton's poetry. He wrote *Lectures on Painting*, 1801-20. His collected works, with a life by J. Knowles, were pub. in 1831. *See* F. Ganz, *The Drawings of Henry Fuseli*, 1949.

Fushiki, or **Fushigi**, old seaport in Toyamaken, Japan, on the mouth of R. Koyabe, facing the Japan Sea. Although historically significant as one of the earliest open ports of the country, it is now only of local importance.

Fushimi, a ward of Kyoto city, Japan. It was formerly a separate tn, where a battle was fought between the imperialists and the followers of Shogun in 1668. Pop. 31,000.

Fusible Metal, general term applied to certain bismuth alloys which have a particularly low melting point. The chief varieties are (1) Newton's metal, containing 50 per cent bismuth, 31 per cent lead, 19 per cent tin; melting point 95° C.; (2) Darcel's metal, containing 50 per cent bismuth, 25 per cent lead, 25 per cent tin; melting point 93° C.; (3) Rose's metal, containing 50 per cent bismuth, 28 per cent lead, 22 per cent tin; melting point 94° C.; (4) Wood's metal, containing 50 per cent bismuth, 24 per cent lead, 14 per cent tin, 12 per cent cadmium; melting point 73° C.; A useful property of these alloys is that they expand on solidification, and therefore give a sharp definition when cast into an intricate shape. Such metals are also used as safety plugs in steam-boilers, when, if the water level falls too low, they are melted and act as a safety valve.

Fusiliers, originally soldiers armed with a 'fusil' or lighter musket than the rest of the infantry. The term F. now has only an historic significance. *See also* the names of the various regiments: LANCASHIRE FUSILIERS; ROYAL FUSILIERS; SCOTS FUSILIERS; ROYAL; WELCH FUSILIERS, ROYAL, etc.

Fusion Welding, *see* WELDING.

Fust, **Johann** (d. 1466), wealthy burgher of Mainz, Germany, who financed Gutenberg (q.v.). These two, with Schoeffer, F.'s son-in-law, developed the practice of printing. When F. foreclosed the business passed to Schoeffer, whose masterpiece was a Lat. psalter, 1457, the initial letters in which were printed in red and

blue. F. is sometimes supposed to have been the original of the Faust (q.v.) legend.

Fustel de Coulanges, Numa Denis (1830-89), Fr. historian, b. Paris. He was prof. at Amiens, Paris, and Strasburg; in 1870 he was appointed to the École Normale, Paris, and afterwards became a prof. at the Sorbonne. His most famous work is *La Cité antique*, 1864 (trans. into Eng., 1874). Other works include *Histoire des institutions politiques de l'ancienne France*, 1875-92, and *La Gaule romaine et le royaume des Francs*, 1888-91. F.'s importance lies in his assertion that the early institutions of France were less indebted to Teutonic than to Rom. origin. See P. Giraud, *Fustel de Coulanges*, 1896, and P. E. Champion, *Les Idées politiques et religieuses de Fustel de Coulanges*, 1903.

Fustian, cotton fabric. The name is an old one, said to be derived from El-Fustat in Cairo. During the Middle Ages women's apparel and priests' vestments were made of F., but to-day the material is commonly used for labourers' clothes. It is the cotton equivalent of silken velvet, and is variously known as velveteen, corduroy, and moleskin. Jean, which is a thick, twilled cotton cloth, is one kind of F., and corresponds to satin in silk stuffs. F. is dyed many colours, mostly dark.

Fustic, name of 2 dyestuffs. Old F. is the wood of the *Machura tinctoria*, a tree indigenous to the West Indies and Brazil. The dye from it is yellow, and was widely used before the introduction of aniline dyes for animal fibres, especially wool. Young F. is the wood of the smoke plant, *Rhus cotinus*; as a dye the yellow colour derived from it is very fugitive to light, but it is much employed in tanning operations. See DYK.

Futa-Djalon (Fouta Djallon), dist. of Fr. Guinea, West Africa, having an area of about 42,500 sq. m. The cap. is Labé. It stands at an elevation of about 4000 ft. with beautiful scenery and a pleasant climate. It is mainly inhabited by Fulani. The chief products are cattle, gold and other metals, rice, and cotton. Its chief rivs. are the Senegal and Gambia, both of which rise here, while Tuba is the largest city. Pop. about 700,000. See also FRENCH GUINEA.

Futa-Toro, ter. of West Africa in the N. portion of Fr. Senegal. It produces pigeon and tamarinds. Pop. about 120,000.

Futhark, see RUNES.

Futures, commercial term applied to the purchase of a commodity (merchandise, stocks and shares) with a view to delivery at a future date. The practice lends itself to speculation since a person may sell in the hope that by the time of delivery the price will have fallen and he can repurchase at a cheaper rate. Such speculation helps to even out price fluctuations over a time.

Futurism. This movement was founded in 1909 by the It. poet, Filippo Tommaso Marinetti, and spread to art and music, as well as to letters. It represented in an extreme form the reaction against the past and approval of the speed and

mechanical powers of the 20th cent. In 1911 Marinetti pub. his work *Le Futurisme*, and in Feb. of that year he arranged an exhibition of the work of 5 It. painters in the Bernheim Jeune gallery in Paris. These artists, Umberto Boccioni, Carlo D. Carra, Luigi Rossolo, Giacomo Balla, and Gino Severini, issued a 'profession of faith,' in which they stated that they were young and their art was of violently revolutionary nature; they expressed their strong hatred of the academic in art, and showed that their aim was to portray movement. Painting and sensation, they declared, were inseparable words, and 'what must be rendered is *dynamic sensation*—that is to say, the particular rhythm of each object, its inclination, its movement, its interior force . . . we thus arrive at what we call painting of states of mind (*la peinture des états d'âme*). In the summer of 1913 (20 June to 16 July) Boccioni organised an exhibition of his own works, his paintings and sculptures; but in later years he developed a different and more intelligible style, which showed him as a sculptor of note. As a movement F. was short-lived. See also SURREALISM. In 1920 Marinetti issued *Il Manifesto del futurismo* in 4 vols. in Milan. See G. Coquilott, *Cubistes, Futuristes, Passéistes*, 1914, also *Cahiers d'Art (un demi-siècle d'art italien)* (various writers), 1950.

Fux, Johann Joseph (1660-1741), Austrian composer, see GERMAN AND AUSTRIAN MUSIC.

Fuze, see FUSE.

Fuzuli (d. 1562), Turkish poet, see TURKEY, Literature.

Fyleman, Rose, see CHILDREN'S BOOKS.

Fyllot, see SWASTIKA.

Fyn (Ger. *Fünen*), second largest is. of Denmark, situated between the Cattegat, the Little Belt, and the Great Belt. It is 50 m. long by 40 m. wide, and is fertile and well wooded. Flax, fruit, grain, and hemp are cultivated. Bee-keeping, and cattle and horse rearing are carried on and provide the prin. exports. The fisheries are also important. Chief tns: Odense (cap.), Svendborg, and Nyborg; area 1150 sq. m.; pop. (1957) 366,330.

Fyne, Loch, inlet of the sea in Argyll, Scotland, extending in a northerly and north-easterly direction from the Sound of Bute for c. 40 m., having the dists. of Kintyre, Knapdale, and Mid Argyll on the W., and Cowal on the E. Inverary (q.v.) stands on the W. shore some 8 m. from the head of the loch. Tarbert is the centre of the famous herring industry. Maximum depth, 624 ft.

Fyzabad (Faizabad), city of Uttar Pradesh state, India. Ajodhya (q.v.), once a city of great native splendour, is now a suburb. The Mausoleum of the Bahu Begum is the finest in the state. It is 140 ft. high. Bahu Begum was one of the 2 Begums of Oude whose alleged ill-treatment was a subject of the indictment of Warren Hastings. F., once the cap. of Oude, has diminished in importance since the death in 1816 of Bahu Begum, who resided here for many years.

G

G: 1. Seventh letter of the Eng. alphabet. The Semitic *gimel* (= Gk *gamma*) passed through the Etruscan alphabet to Lat. and became **C**, originally employed for both *k* and *g* (see **C**). At a later stage a change (attributed to Appian Claudius Censor in 312 BC) was adopted to denote the voiced guttural stop *g*. This consisted in the addition of a bar to the lower end of **C**, thus converting it into **G**. This letter was placed in the position of the *zeta* in the Gk alphabet, which was dropped (see **Z**). At a later period the Lat. *g* was palatalised before front vowels. O.E. **G** may be considered under 3 headings: (1) As an *explosive* or *stop*. It was a voice-guttural stop in the forms *ng*, *gg*, developing into hard *g* (cf. O.E. *singan*, *frogge*; Mod. E. *sing*, *frog*). When *ng*, *gg* was followed by *i* or *j*, it was a voiced palatal stop, developing into the sound *dje* (cf. O.E. *sengcan*, *cege*; Mod. E. *singe*, *edge*). (2) As a *spirant* **G** was a voiced guttural spirant initially when followed by an original guttural vowel (*a*, *o*, *u*) or by a consonant, and medially when following an original guttural vowel or a consonant. Initially it developed into Mod. E. hard *g*, except before *n*, when it became silent (cf. O.E. *gōs*, *gripan*, *gnagan*; Mod. E. *goose*, to *grip*, to *gnaw*). Medially it became palatalised (cf. O.E. *burga*; M.E. *burwe*; Mod. E. *borough*). Finally **G** was a voiceless guttural spirant when following a guttural vowel or consonant, and often was vocalised to *h*. It is present in Mod. E., but is silent or pronounced as an *f* (cf. O.E. *hēah*, Mod. E. *high*; and O.E. *genþ*, *genþh*, Mod. E. *enough*). Initially before, and medially and finally after, an original palatal vowel **G** was a voiced palatal spirant. Initially it developed into Mod. E. *y*, otherwise becoming vocalised to *i* (cf. O.E. *szeldan*, *daeg*; Mod. E. *yield*, *day*). (3) O.E. **G** also represented the Germanic *j*, and as such was always a palatal spirant, represented in Mod. E. as *y* (cf. O.E. *geong*, *gēa*; Mod. E. *young*, *yea*). The M.E. symbol *ȝ*, used through Fr. influence, was used much later in Scotland than in England, and may still be noted in such words as *capercailzie*, *Menzies*. To the forms of Mod. E. **G** already noted may be added the hard *g* before *e*, *i* in words of Teutonic origin, e.g. *give*, *get*, and in Heb. proper names, *Gideon*, *Gehenna*. As an initial preceding *n* **G** has become silent, and *gn* is sounded in many words of Fr. origin as *sign*, *feign*. It may or may not be pronounced hard medially, e.g. *singer*, *younger*. See **ALPHABET**.

2. In music, is the 5th note of the ascending diatonic scale of **C**, major or minor, the dominant of the key of **C**. The scale of **G** major has a key signature of 1 sharp, that of **G** minor of 2 flats.

Ga, important people of Ghana (q.v.), living in the coastal region S. of Ashanti (q.v.). They live mainly in the large towns along the coast of Ghana. See M. J. Field, *Social Organisation of the Ga People*, 1940.

Gaba Tepe, headland on the E. end of the Gallipoli peninsula in Turkey, between Suvla and Krithia. During the First World War the Australian and New Zealand Army Corps, under the command of Gen. Birdwood, landed just N. of the headland on 25 April 1915. The Turks attacked heavily in this locality, but failed to move the Brit., who, however, made little progress, and finally withdrew in the following Dec. See **GALLIPOLI CAMPAIGN**.

Gabbard, Battle of, the naval battle fought during the first Dutch war (1652-4) between an Eng. fleet of 105 vessels, with 16,000 men, under Adm. Blake, and a smaller Dutch fleet under Tromp. See D. Mathew, *The Naval Heritage*, 1945.

Gabbatha, 'an eminence', place of Pontius Pilate's judgment seat which John (xix. 13) calls Lithostratos, the paved place, part of the Herodian fortress, the Antonia. It has been excavated and shown to be a paved space more than 50 yds square on the highest spot of the city to the E.

Gabbro, group of basic igneous (plutonic) rocks. They have a completely crystalline granitoid texture, and usually occur as large sheets or bosses. The chief mineral constituents are plagioclase, generally a soda-lime or lime feldspar—labradorite being the commonest, though anorthite is often present in abundance—together with augite, magnetite, and sometimes hornblende or olivine. Apatite is almost invariably present. Generally the felspar is embedded in great crystals of augite which have evidently developed last of all. The composition of these rocks shows from 45 per cent to 55 per cent of silica and a large proportion of lime and magnesia. The proportion of alkalis is small. There are **G. areas** in Cornwall, in Ayrshire, in Mull, and in Skye. The composition of **G.** bears a very close resemblance to that of dolerite. Nickel, chromium, or platinum ores are sometimes associated with **G. intrusions**.

Gabelenz, Hans Conon von der (1807-1874), Ger. linguist and politician. He pub. numerous works on the Gothic, Finno-Ugric, Mongolian, Malayo-Polynesian, and the native Amer. languages.

Gabelle (Low Lat. *gabulum*, a tax), term applied in France to a tax on various articles, but more particularly to the tax on salt. It was apparently first levied by Philip IV in 1286, and was made permanent by Charles V. In general it compelled all above the age of 8 to

purchase, every week, a fixed quantity of salt at a set price, though details of the G. varied from prov. to prov., some being exempt altogether. It was most unpopular, and was finally abolished in 1790.

Gabelsberger, Franz Xavier (1789-1849), b. Munich, inventor of a Ger. system of shorthand. The formation of his signs in shorthand corresponded as far as possible with the written characters of the Ger. alphabet, and his method is still used in Ger.-speaking countries.

Gaberlunzie, old Scottish name for a beggar or tinker, who was so called from his wallet. Scott's *Eddie Ochiltree in The Antiquary* is a good example of the professional beggar. Tradition has it that the author of the song or ballad entitled *The Gaberlunzie Man* (see *Percy Reliques*) was King James V of Scotland, who was noted for strolling about his dominions in the disguise of a tinker or beggar.

Gabes, see **CABES**.

Gabil, ant. tn of Latium, situated on the Via Praenestina, about 12 m. from Rome. It was famous for its baths, and the Emperor Hadrian built a senate house (Curia) and an aqueduct there.

Gabinus, Aulus, Rom. gen. and prov. governor. As tribune in 67 BC he proposed the *Lex Gabinia*, which conferred on Pompey his extra-ordinary command against the Mediterranean pirates. As consul in 58 G. supported Clodius in banishing Cicero. From 57 to 54 he was governor of Syria, and in 55 restored Ptolemy Auletes to the Egyptian throne. Impeached for mis-government on retiring from office, G. went into exile; but he returned to support Caesar in the Civil war, and d. on active service in Dalmatia (48 or 47 BC).

Gabirol, see **IBN-GABIROL**.

Gable, Clark (1901-), Amer. actor, b. Cadiz, Ohio; his third wife was Carole Lombard, the actress. He started as a call boy, toured with the Jewell players, and appeared on Broadway. He entered films in 1931 in *The Painted Desert*. His better-known films include *China Seas*, *Forsaking All Others*, *Mutiny on the Bounty*, *San Francisco*, *Idiot's Delight*, and *Gone With The Wind*, in which he was ideally cast as Rhett Butler. He won the Academy Award for the best male performance of the year in *It Happened One Night*, 1934.

Gable, the triangular piece of walling at the end of a double-pitched roof. In timber-framed houses, the G.s. are of timber, and often overhang the lower storey (see illustration).

Gablonz, see **JABLONEC NAD NISOU**.

Gabon, or **Gabun**, dist. on the W. coast of Africa, which forms part of Fr. Equatorial Africa. It was discovered by Portuguese in 1485 and received its name from its fancied resemblance to a cabin; the Fr. first settled there in 1839. G. has an area of about 93,218 sq. m., and its chief rvs. are the Ogowe and the G. The surface is flat near the coast, but behind this rises to a plateau at a height of 3000 ft. The climate of the coast is unhealthy; that of the plateau is better. The

natives grow manioc, bananas, nuts, and tobacco, while the Europeans cultivate coffee, cocoa, and vanilla. The chief exports are palm kernels, palm-oil, and timber. In the Second World War, in 1940, after the collapse of France, the dist. espoused the cause of the Free Fr. under Gen. de Gaulle. Pop. 408,516 (1936). Cap. Libreville. See also **FRENCH EQUATORIAL AFRICA**.

Gaboriau, Emile (1835-73), Fr. writer of detective novels, b. Saujon. He began by writing for the Parisian papers and became famous at once when his story

A farmhouse at Forthampton, near Tewkesbury, Gloucestershire

L'Affaire Lerouge was pub. in 1866 in *Le Pays*. He quickly wrote others: *Le Crime d'Orléans*, 1868, *Monsieur Lecoq*, 1869, *Les Esclaves de Paris*, 1869, *La Vie infernale*, 1870, and *L'Argent des autres*, 1874, which have become classics of detective fiction. See **DETECTIVE STORY**.

Gabriel (Heb. 'man of God'), archangel who explained to Daniel the vision of the ram and the he-goat, and appeared to Zacharias to announce the birth of John the Baptist, and to the Blessed Virgin to announce the birth of Christ. He is called archangel by both Jewish and Christian writers and is mentioned in the book of Enoch as the one who is set over 'all the powers.' The Targum ascribes to him the destruction of the host of Sennacherib. He is venerated also by the Muslims, who give him the titles of Holy Spirit and Spirit of Truth.

He appears in the Koran, where his special work is divine revelation.

Gabriel, Ange Jacques (1698-1782), Fr. architect, b. Paris, son of Jacques Jules G. (q.v.); succeeded his father as *premier architecte du Roi*, 1742, retiring 1775. In that capacity he made alterations to the palaces of Versailles, Fontainebleau, Marly, Choisy, and Compiègne; laid out the Place de la Concorde, Paris, 1749-53; and designed the École Royale Militaire, 1751; the Petit Trianon, Versailles, 1762-6; the Royal Opera House, Versailles, 1748-70; and the Ministry of Marine, Paris, 1767-70.

Gabriel, Jacques (Jules) (1667-1742), Fr. architect, b. Paris, son of the architect Jacques G., and father of Ange Jacques G. (q.v.). Became *architecte du Roi*, 1687, and *premier architecte*, 1735. Besides numerous bridges, he designed the facade of the cathedral at La Rochelle, c. 1740; the Hôtel de Ville at Rennes, 1734-43; the Archbishop's Palace at Blois, 1725; the Hôtels Biron and de Varangeville, etc.

Gabrieli, Andrea (c. 1520-86), It. organist and composer, b. and d. Venice, one of the 2 chief figures of a special Venetian school which cultivated an antiphonal style suited to the 2 choir-galleries and 2 organs of St Mark's Church. He was a pupil of Willaert and seems to have visited the Rhineland, Bohemia, Munich, Graz, and Augsburg. He was appointed second organist at St Mark's in 1566 and first in 1584. He wrote madrigals, instrumental sonatas, organ works, and especially church music with instrumental parts.

Gabrieli, Giovanni (1557-1612), It. organist and composer, nephew and pupil of the preceding, and the second great representative of the antiphonal Venetian school. He assisted Lassus at Munich in 1575-9 and became second organist at St Mark's, Venice, in 1585, retaining that post, which was concurrent with, rather than subordinate to, the first, until his death. He had many foreign pupils, including Hassler and Schütz, and composed madrigals, organ music, and eccles. works for voices and instruments which imitated and surpassed his uncle's in elaborate lay-out.

Gabrosentum, see GATESHEAD.

Gabun, see GABON.

Gad, 7th son of Jacob by Zilpah, handmaid of Leah, and founder of the tribe. They settled E. of Jordan close to the tribe of Reuben, their ter. including Gilead. They were noted for their bravery; 11 of the tribe of G. came to help David when he most needed it. G. is also the name of a seer of King David, as well as of the god of luck or fortune. Isaiah lrv. 11 (R.V.).

Gad-flies, dipterous insects of the family Tabanidae. The females have mouth-parts adapted for piercing.

Gadag, tn of Bombay State, India, some 450 m. S. of Bombay. G. is an old tn. and has fine temples of both Vishnu and Shiva. It is also a great cotton centre.

Gadames, or Ghadames, tn and oasis in

Libya, North Africa, situated on the N. border of the Sahara, about 300 m. from Tripoli at the intersection of the frontiers of Libya, Algeria, and Tunisia. G. had its origin from the hot spring which probably made the Romans visit it about 20 bc, when it was captured by Balbus and called Cydamus. It is important for its caravan trade, and its gardens produce apricots, dates, and figs. The inhab. are chiefly Arabs and Berbers. Captured by Gen. Le Clerc's expeditionary force on 26 Jan. 1943 (see FREZZAN). G. is the mysterious city, the citadel of Islam, into which no white man had succeeded in penetrating before the beginning of this century, and for the first 4 decades few ventured to go there. The marquis de Morès, a coeval of Pétain (q.v.) at St Cyr, was murdered there by fanatical Muslims. The white fathers who had tried to catechise the natives of G. had been assassinated one after the other. Pop. 7000.

Gadara, anct tn of Syria, situated to the SE. of the sea of Galilee, and a member of the Decapolis (q.v.). Originally a Gk city, it is said to have been captured by Antiochus of Syria in 218 bc. Some years later it was besieged and partly destroyed by Jannaeus, but it was restored by Pompey about 63 bc. It is now in ruins. Its coins bear Gk legends and inscriptions, from which fact it is probable that the wealthy classes were Greeks. G. was famous for its hot sulphur springs which still exist.

Gaddi, It. family of artists:

Gaddo Gaddi (c. 1260-1332), painter, b. Florence. He was a friend of Cimabue, whose influence is seen in the 'Coronation of the Virgin with Saints and Angels,' a mosaic in the cathedral at Florence said to have been executed by him. Other works assigned to him are the mosaics in Santa Maria Maggiore, and those in the choir of old St Peter's at Rome.

Taddeo Gaddi (c. 1300-66), son of the former and a student of Giotto, also b. Florence. He painted in fresco the 'Virgin and Child between Four Prophets' in the Baroncelli Chapel in Santa Croce at Florence, as well as 'Scenes from the Life of the Virgin,' besides other frescoes at Pisa, Naples, and Berlin. He is considered one of Giotto's most important followers.

Agnolo Gaddi (active 1369, d. 1396), son of Taddeo and also a follower of Giotto, b. Florence and studied under Giovanni da Milano and Jacopo del Casentino. In 1369 he worked in the Vatican, probably with his brother Giovanni. He painted a series of frescoes in Prato Cathedral, representing the 2 legends of the Virgin and the Sacred Girdle (these are still to be seen, though much damaged), and the legend of the Cross, a work in the choir of Santa Croce, Florence, consisting of 8 frescoes.

See Vasari's *Lives of the Painters*.

Gaddir, see CADIZ.

Gade, Niels Vilhelm (1817-90), Dan. composer, was b. Copenhagen. His vture, *Echoes of Ossian*, 1840, first brought

him before the public; the composition was well received, and the king gave him a stipend which enabled him to go to Leipzig. There he became acquainted with Mendelssohn, and on his death in 1847 took over the Gewandhaus concerts. In 1848 he returned to Copenhagen, in 1850 became conductor of the Musical Society, and in 1866, with the composer J. P. E. Hartmann, he founded the musical conservatorium. His compositions include orchestral music, e.g. 8 symphonies, cantatas, e.g. *The Elf-King's Daughter*, *Psyche*, *Spring Message*, *Spring Fantasy*, pieces for the piano, and chamber music. See lives by W. Neumann, 1857, and W. Behrend (*Minder om Gade*), 1930.

Gadidae, family of teleost fishes allied to the hakes and placed in the order Anacanthini. The codfish, or *Gadus*, is a member of this family. Others are the haddock and the whiting, both of which form valuable foods.

Gadolinium, metallic element of atomic number 64 and atomic weight 157.3. It belongs to the group of rare-earth metals, from which it may be isolated by the fractional crystallisation of their nitrates and bromates. Its salts are colourless and it forms a white oxide. Its symbol is Gd.

Gads Hill, short distance outside the city of Rochester. It forms the scene of the adventures of Falstaff and Prince Henry, as depicted in Shakespeare's *Henry IV*. It is of more recent interest as the residence of Charles Dickens. He had always coveted the house known as G. H. Place, and purchased it in 1856. He lived here between 1860 and his death in 1870.

Gadsden, James (1788-1858), Amer. diplomat, b. Charleston, South Carolina. He fought in the war of 1812, also with Stonewall Jackson against the Seminole Indians. He afterwards became Amer. minister in Mexico and purchased by treaty in that capacity part of the states of Arizona and New Mexico, a tract known as the G. Purchase.

Gadsden: 1. Co. in the N. of Florida, U.S.A., in an agric. area (corn, peanuts, tobacco, vegetables, dairy products, poultry, hogs). It manufs. food products, cigars, naval stores, lumber, and bricks. Pop. 36,460.

2. Tn in Alabama, U.S.A., cap. of Etowah co. It is 60 m. NE. of the tn of Birmingham, and has cotton manufs., blast furnaces, and pipe works. Pop. 55,700.

Gadwall, species of duck (*Anas strepera*). It is practically unknown in Britain, although it has been known to exist in the marshes of Norfolk. It is, however, found practically all over the world, existing in North Africa, Asia, America, and in all parts of Europe. It is much esteemed as a table luxury, and is for that purpose imported in large quantities into Britain. In size it is not quite so large as the mallard, and it is a fresh-water bird. It breeds principally in marshy districts.

Gaea, or **Gē** (Rom. *Tellus*), the earth-goddess, daughter of Chaos, and mother of

Uranus and Pontus (Earth and Sea), mother also of the Titans and the Cyclopes. She was one of the deities presiding over death, Hades, and marriage. Her cult was extensive in the E., and she was worshipped originally at Delphi and Olympia.

Gaskwar, title of a powerful Mahratta prince, ruler of the former state of Baroda in W. India. In 1948-9 the G. agreed to the merging of Baroda in Bombay.

Gaelic Football, see FOOTBALL.
Gaelic Language and Literature, see CELTIC LANGUAGES; IRISH LANGUAGE AND LITERATURE; SCOTTISH GAELIC LANGUAGE AND LITERATURE.

Gaertnera, genus of Rubiaceae. It is common to the tropical dists. of Africa and Asia; some of the species are cultivated for their fragrant blossoms. Of these *G. racemosa* is one of the best known.

Gaeta (anc. *Caleta*), It. fortified seaport, in Lazio (q.v.), 40 m. SE. of Latina (q.v.). It stands on a high promontory in the Gulf of G., an inlet of the Tyrrhenian Sea (q.v.). In 1861 it was the scene of the last stand of the reigning prince of Naples against united Italy (see ITALY, History). The archiepiscopal cathedral and other ancient buildings were damaged during the Second World War. G. has one of the best harbours in Italy, and has a glass industry and a trade in fish. Pop. (com.) 20,000.

Gastula, name given in classical times to the region immediately S. of Numidia and Mauretania in North Africa. The country was inhab. by a Libyan race who are probably the ancestors of the modern Berbers. They were conquered and made part of the empire by the Romans at the beginning of the Christian era.

Gage, Thomas (1721-87), gen., son of the 1st Viscount G. Served in the Seven Years War, and, in 1755, in Braddock's ill-fated Amer. expedition. In 1760 he was appointed military governor in Montreal, and in 1763 commander-in-chief of the Brit. forces in America. As governor of Massachusetts he precipitated the revolution by his ill-timed severity, and, after the battle of Bunker's Hill, he was recalled to England. See C. E. Carter (ed.), *The Correspondence of Gen. Thomas Gage*, 1931-3; J. R. Alden, *General Gage in America*, 1948.

Gage, see GAUGE.
Gagetown, Camp, see OROMOCTO.
Gahanbars, the 6 ann. Parsee festivals each of which lasts for 5 days.

Gahnite, ore of zinc belonging to the class known as spinels. It varies in composition, and may contain sev. elements other than zinc. Part of the zinc may be replaced by iron or magnesium. The general formula may be given as (ZnFeMg)(AlFe)O₄.

Gaiety Theatre, London, opened in Dec. 1868 by John Hollingshead. The first productions were *On the Cards* by F. C. Burnand and *Robert the Devil* by Gilbert. Its famous stars included Nellie Farren and Fred Leslie. Musical comedy was first seen there in 1894 with the production of *The Shop Girl*. The first G. T. had

to be pulled down to allow for the making of Aldwych, and the new building, designed by the famous Eng. architect Norman Shaw, was opened in 1903 with George Edwardes's *Orchid*. Among other productions which appeared at this theatre were *The Spring Chicken*, *The New Aladdin*, *The Girls of Gottenburg*, and *Our Miss Gibbs*. The G. T. was in the Strand, at the W. end of Aldwych; it was closed down in 1939 because of suggested road improvements which never materialised because of the outbreak of war. It did not reopen, and was demolished in 1957.

Gaillac, Fr. tn in the dept of Tarn, on the Tarn. It grew up around a 10th-cent. Benedictine abbey, and has many old buildings. There is a large trade in white wines. Pop. 8500.

Gaillard, Félix (1910-), Fr. politician. An economist, he entered politics as a Radical after the Second World War. He became Fr. Premier on 5 Nov. 1957, succeeding Bourges-Maunoury (q.v.). He was the youngest man ever to hold the Fr. premiership, and succeeded to a situation of acute financial crisis.

Gaillardia, genus of ann. or perennial herbs, sometimes called blanket flowers, family Compositae, about 12 species, native to America. *G. pulchella* is the chief parent of ann. G.s, *G. aristata* of perennial G.s, grown in gardens.

Gainesville: 1. City of Florida, U.S.A., and co. seat of Alachua co. It is a rail junction and a processing and shipping centre for lumber, boxes, naval stores, concrete blocks, tung oil, and vegetables. It is a well-known winter resort, and is the seat of the univ. of Florida. Pop. 28,860.

2. City of Texas, U.S.A., situated in Cooke co. It is a great industrial centre and manufs. cotton-seed oil, flour, and iron-ware. Pop. 11,250.

3. Tn of Georgia, U.S.A., in Hall co. It is a textile-manufacturing and poultry-processing centre; surgical gauze, tobacco, chairs, harness, and lumber are also produced. G. is a popular summer health resort, with mineral springs. It is the seat of the Brenau College. Pop. 11,940.

Gainsborough, Thomas (1727-88), portrait and landscape painter, b. Sudbury, Suffolk, where he received small schooling, but where, by the age of 10, he had 'sketched every fine tree and picturesque cottage.' At 14 he went to London, studied etching under Gravelot and painting under Hayman. At 19 he married a young lady with £200 a year, and started housekeeping in Ipswich, where he remained till he moved to Bath in 1769. His studio soon became a resort of wealth and fashion, and among his sitters at this period were Richardson and Sterne, the novelists, and Garrick, whom G. regarded as 'the greatest creature living.' Moreover, he patronised musicians of every nationality, himself tried to play the harp, hautboy, and viol-da-gamba, and was a welcome *habitué* at the green-room of Palmer's Theatre. In 1768 G. was chosen one of the 36 foundation members of the Royal Academy, and was

a regular contributor at its exhibitions until 1784, when he virtually retired because in his opinion 'The King's Daughters' had been unfavourably hung. In 1774, at the height of his fame, he removed to London, where he paid £300 for his share of Schomberg House, Pall Mall. Here he painted a number of the great people of the day, among them Dr Johnson, Clive, Franklin, Sheridan, Canning, Burke, Lady Mary Montagu, and Mrs Siddons, whose portrait is still one of the treasures of the National Gallery. His death was due to a cancer which rapidly developed after a chill caught whilst attending the trial of Warren

E.N.A.

THOMAS GAINSBOROUGH
Self-portrait

Hastings. At the last he was reconciled with Reynolds, his rival and former friend, who came to him on his deathbed and who was dismissed with the words: 'We are all going to heaven, and van Dyck is of the company.'

It was Reynolds who generously and truly prophesied that, with the growth of an Eng. school, 'the name of Gainsborough will be transmitted to posterity as one of the very first of that rising name.' As a portrait painter he vied with Reynolds, and in landscape, realistic or imagined, he was original and a pioneer of later development. In his earlier works he faithfully reproduced the local character of the Suffolk landscape, but in his London years his landscapes became, as Ruskin remarked, 'rather motives of feeling and colour than earnest studies.' Whilst Richard Wilson looked back to Claude for much of his inspiration, G. sought always, as in his 'Waggon and Horses Passing a Brook,' 'The Cottage Door,' and 'The Market Cart,' to give an individual and

personal rendering of what he saw, though he was influenced by Dutch and Flem. painters. His portraits, such as 'Orpin, the Parish Clerk' and 'Master Buttail' (the Blue Boy), invariably graceful and often expressive to a high degree of a passing phase or gesture, have all the merits of instinctive genius without any of the laborious finish conventional in this branch of art. His lightning speed helped to secure a good likeness, and his free touch did not merit Reynolds's censure. Such is the exquisite blend of shining draperies with backgrounds of soft cloud-girt skies and feathery trees of spraying, lightly touched foliage; such is the solemn grandeur produced by the glow and richness of his colours and the transparency of his shadows, that even his least scholarly portraits are justly deemed masterpieces. His free compositions, like the late 'Diana and Actaeon' have risen in modern esteem. See A. Cunningham, *Lives of the Painters*, 1829-33; *Lives* by Lord R. Gower, 1903; J. Greig, 1909; W. T. Whitley, 1915; E. R. Dibdin, 1923; and Mary Woodall, 1949.

Gainsborough, mkt tn of Lincs, England, situated on the R. Trent, about 15 m. NW. of Lincoln. Its chief industries are shipbuilding, engineering, and the manuf. of agric. implements, also oil, linseed cake, and malt, joinery, and flour milling. The tn has a very fine bridge and a manor house built by Sir Thomas Burgh, c. 1480. Pop. 17,509.

Gairdner, James (1828-1912), historian, b. Edinburgh. He entered the Public Record Office when a boy, and afterwards became assistant keeper. He ed. a considerable number of historical works, and contributed much to modern historical literature. His publs. on the early Tudor period are still considered standard authorities. Among the works which G. ed. are *Memorials of King Henry the Seventh*, 1858, *Letters and Papers of the Reigns of Richard III and Henry VII*, 1861, *The Paston Letters*, 1872-5, and *Letters and Papers of the Reign of Henry VIII*, 1880-1910. His other works include *Richard III*, 1878, *Studies in English History* (with James Spedding), 1881, *A History of the English Church*, 1902, and *Lollardy and the Reformation in England*, 1908.

Gairloch, coastal vil. in Ross and Cromarty, Scotland, 59 m. W. of Dingwall, a herring and ood fishing centre, with salmon and trout fishing also. G. is a stronghold of Gaelic culture. Pop. 2000.

Gaitskell, Hugh Todd Naylor (1906-), Brit. politician, educ. at Winchester and New College, Oxford. He had a distinguished academic career and subsequently lectured on political economics at London Univ. In 1945 he became Labour M.P. for South Leeds. From 1947 to 1950 he was minister of fuel and power; minister of state, 1950; and chancellor of the exchequer, 1950-1. His rise within his party since 1951 has been extremely rapid, and in 1954 he was elected its treasurer. He became leader

of the parl. Labour party in 1955, in succession to Attlee (q.v.), and, therefore, leader of the Opposition in the House of Commons. G. has done much to reconcile the varying factors within his party and to prepare it for the next general election.

Gaius, or **Calus**, Rom. jurist and one of the 5 great luminaries of Rom. jurisprudence, the others being Papinian, Paul, Ulpian, and Modestinus. Probably b. in the time of Hadrian, and fl. during the 2nd Christian cent., writing under the Antonines. Nothing is known of his personal hist., although he himself tells us that he was an adherent of the Sabinian school (see CAPITO). G. composed, besides other works he is known or believed to have written, a treatise on the *edictum provinciale*—i.e. the edict of the proconsul in the provs.—and a commentary on the Twelve Tables (q.v.). But the work by which he is known to all law students is his *Institutiones*, and the discovery of the MS. of this work by Niebuhr in 1816 has very greatly contributed to our knowledge of Rom. law. The MS. had been written over with the letters of St Jerome, and its very existence was all but unsuspected until Niebuhr found it while examining the contents of the library of the chapter at Verona. The work formed the basis of the *Institutes* of Justinian (q.v.), who has followed the order in which G. treats his subject, and adopted his exposition of law, so far as it was applicable to the times in which Justinian's *Institutes* were composed. The work of G. affords a valuable comparative study, showing where the law changed between the 2 periods, and so enables us to understand what the law really was at the time when its system was most perfect. See the eds. by G. Poste (with Eng. trans., 1875); and G. Studemund and P. Krüger, 1923.

Galactose (formula $C_6H_{12}O_6$), one of the hexose sugars, isomeric with glucose (grape sugar) and fructose (laevulose or fruit sugar). G. exists in 3 forms, viz. inactive, dextro-, and laevo-rotatory. The dextro-modification is obtained, together with glucose, by the hydrolysis of milk-sugar. On reduction it yields the alcohol dulcitol, and on oxidation first galactonic acid and finally mucic acid. Melting point 166°.

Galago, name of a member of a sub-family of African and Asiatic lemurs (family Galagidae). The galagos or 'bush-babies' have long feet, long, bushy tails, and large ears. They are active tree climbers and are nocturnal, feeding on fruit, insects, eggs, and small birds.

Galahad, in the Arthurian romances the son of Lancelot and Elaine. In the cycle of legend he is the model of ideal knight-hood and purity. He sets out on the quest of the Holy Grail, and on his journey redresses all grievances that cross his path.

Galanga, or **Galangal** (Chinese *Kao*, name of a prov., *liang*, mild, and *kaang*, ginger), old name given to *Alpinia*, a genus of plants belonging to the Zingiberaceae, the most important species

being *Alpinia officinarum*, a native of S. China. The roots and stems of this plant possess aromatic, stimulating properties similar to those of ginger, and are widely used in E. pharmacy.

Galanthus, see SNOWDROP.

Galapagos Islands, of volcanic formation, lie on the equator, 600 m. W. of the coast of the South Amer. state of Ecuador, of which the group is a prov. It takes its name from the enormous land tortoises originally found there in great numbers. The land area is 2966 sq. m. There is 1 large is., 4 fairly large, and 10 smaller ones, with innumerable islets and rocks. Darwin (in *Volcanic Islands*) estimated the number of extinct volcanoes at 2000. Discovered in 1535 by Fray Tomas de Balanga, 3rd bishop of Panama, the is. soon became a favourite resort of Brit. buccaneers who made forays on the Sp. Main, which accounts for the fact that the individual is. all have Eng. as well as Sp. names. The cap. of the group is Progreso, on Chatham Is., where live the military governor and more than 400 inhab. The climate is dry, and tempered by the cool Peruvian current. Owing to their position and isolation, the G. I. have a fauna and flora peculiar to themselves, and are of special interest to scientists. Sugar-cane, cotton, grain, and fruits are the main crops. Exports are hides, sugar, rum, and orchilla moss. Pop. in 1954 was 1350.

Galashiels, burgh of Selkirkshire, Scotland, 32 m. S. of Edinburgh. The chief industry is the manuf. of Scotch tweeds. The Scottish Woollen Technical College, within the tn, is the H.Q. of the country's tweed manuf. The residence of Sir Walter Scott, Abbotsford, is just outside the tn. Pop. 12,500.

Galata, suburb of Istanbul, situated at the S. end of the Bosphorus. Here are found banking houses and shipping agencies. There is also a lighthouse.

Galatea: 1. Sea-nymph, daughter of Nereus and Doris, see AOLS.

2. An ivory statue endowed with life by Aphrodite at the prayer of the sculptor Pygmalion (q.v.).

Galați, or **Galatz**, tn in Rumania, important as a port and as the seat of a bishop. It is situated on the l. b. of the Danube. It is the seat of the Rumanian 3rd Army Corps and the naval school, the International Danubian Commission and the chief Danube shipping companies, and 3 chambers of commerce. It is an important industrial tn and among its chief industries are the manuf. of candles, soap, wire, nails, buttons, chemical products, iron, and copper. It possesses saw-mills, paste-mills, flour-mills, roperies, and petroleum refineries. It is the chief port of entry for the overseas trade of the Danube and the chief port for the export of timber. Other exports are maize, wheat, barley, rye, and flour. The rapid growth of the tn is due to the opening up of the Danube carrying trade. It has been the scene of 2 engagements between Turks and Russians. In the Second World War it was captured by the

Russians on 27 Aug. 1944 (see further under EASTERN FRONT, or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR). Pop. (1948) 80,000.

Galatia, an ant. dist. of Asia Minor. The name is derived from the Gauls who invaded and settled in that part of the peninsular about the 3rd cent. BC. It was included in the Rom. Empire and under Augustus became a Rom. prov. St Paul's Epistle to the Galatians was addressed to Jewish converts of this area.

Galatians, St Paul's Epistle to the, undoubtedly written by St Paul, probably composed at Ephesus either about AD 49 while Paul was on his way to the Council of Jerusalem (if Gal. ii. 1-10 refers to his second visit to Jerusalem recorded in Acts xi. 29-30), or after that Council (when it is difficult to account for the silence about the decisions taken at it). Ramsay, in his *Historical Commentary*, 1900, showed that in the time of Paul, Galatia stretched right across Asia Minor, and so the Epistle may well be addressed to the converts of the first missionary journey (c. 45-9). The Epistle, which 'reads like a dithyramb from beginning to end,' was a passionate outburst, containing, strangely enough, no word of praise or greetings. The letter is divided into a vindication of his mission and apostolic independence, an inspired exposition of how Christianity had superseded the Mosaic law, a panegyric of faith as the mark of the true 'son of Abraham,' and finally a fervid plea for the superiority of Christianity to legalism as the 'free and final religion.' The whole style of the epistle, which has been described as 'a veritable torrent of genuine and inimitable Paulinism,' is in very strong contrast to the calm and measured exposition of the later Epistle to the Romans, which deals with the same issue; but it is inferred from the Epistle to the Romans, as well as from 1 Cor. (also written after G.), that the Christians in Galatia had then been won back to St Paul and his gospel. G. is something more than a writing dealing with a controversy of bygone days; it is for all time the charter of Christian freedom. See commentaries by J. B. Lightfoot, 1884; W. M. Ramsay, 1900; J. Lagrange, 1918.

Galatz, see GALATI.

Galaxy, or **Milky Way** (from Gk *gala*, milk), name of a splendid luminous belt of many thousands of millions of stars, which may be seen, on a clear night, stretching in a great arc from horizon to horizon. It surrounds the whole earth in what is almost a great circle, and is inclined to the celestial (or terrestrial) equator at an angle of about 65 degrees. For some 150 degrees the zone spreads out into 2 branches—one shining, the other dull and disconnected—which eventually reunite. To the naked eye the stars are merged together in one broad stream of light.

Galba, **Servius Sulpicius** (5 BC to AD 69), Rom. emperor, became consul in AD 35, and under Nero showed courage, force

and equity in the administration of Aquitania, Africa, and Hispania Tarraconensis. With the help of Vindex, Otho, and the praetorian guard, he became emperor on Nero's death in AD 68. But no sooner was he fully instated than he lost all his popularity and became an object of hatred because of his extreme avarice, the extortions of his favourites, to whom he surrendered the reins of power, and his refusal to pay the soldiers the promised rewards. In AD 69 Otho led a successful mutiny, ordered the assassination of G., and succeeded him on the imperial throne.

Galbanum, gum-resin obtained from *Ferula galbaniflua* and *F. rubricaulis*, 2 species of Umbelliferae. It has been used medicinally as an antispasmodic expectorant, and external rubefacient.

Galdós, Benito Pérez (1842-1920), Sp. novelist, b. Las Palmas, Canary Is. He was educ. at Madrid, where he worked for 7 years as a journalist, afterwards devoting himself to writing novels until a few years before his death, when he became blind. G. was a most prolific writer, and his great collection of works comprises 2 series of Sp. national historical episodes, contemporary Sp. novels, dramas, and miscellaneous works. He first made a name with his historical novel *La Fontana de Oro*, 1870, and many of his books have been trans. into Eng. amongst these being *The Perfect Lady*, *Trafalgar*, *Leon Roch*, and *Martana*. Since the time of Cervantes, G. was the writer who most influenced the Sp. mind. He was a member of the Royal Academy of the Sp. Tongue, and sat in Parliament on sev. occasions as a Republican member. The honour in which he was held was shown at his funeral, there being an attendance of members of all the academies, members of the gov., the whole of the Madrid tn council and prov. deputies; while the official *Gazette* announced a decree of the gov. offering to pay all the expenses of the funeral of 'Spain's greatest writer since Cervantes.' Many of his theatrical works have been played both in Spain and in other countries, the best known being *Electra*, 1900, and *Casandra*, 1905. See L. B. Walton, *Pérez Galdós and the Spanish Novel of the Nineteenth Century*, 1927.

Gale, Norman Rowland (1862-1942), poet, b. Kew, Surrey. His vols. of verse include *A Country Muse*, 1892, *Orchard Songs*, 1894, *A Book of Quatrains*, 1909, *The Candid Cuckoo*, 1918, *Verses in Bloom*, 1925, and *Love-in-a-Mist*, 1939. He also pub. some books of verse about cricket.

Gale, Thomas (c. 1636-1702), antiquary and an eminent scholar. Became prof. of Greek at Cambridge in 1666 and fellow in 1669. Dean of York, 1697. He is noted for his eds. of a large series of Eng. chronicles, 1684-91, and of Gildas and Nennius.

Gale, Zona (1874-1938), Amer. novelist, b. Portage, Wisconsin. Educ. at the univ. of Wisconsin, she became a journalist. Her novels include *Romance Island*, 1906, *Heart's Kindred*, 1915, *A Daughter*

of To-morrow, 1917, *Birth*, 1918, *Miss Lulu Bett*, 1920, which was dramatised and awarded the Pulitzer prize, *Faint Perfume*, 1923, *Preface to a Life*, 1926, *Borgia*, 1929, *Papa is Fleur*, 1933, and *Light Woman*, 1937. *When I Was a Little Girl*, 1913, and *Portage, Wisconsin*, 1928, are autobiographical. In 1928 she married W. L. Breece. See A. Derleth, *Still Small Voice*, 1940.

Gale, see STORM.

Gale, Sweet, see BOG MYRTLE.

Galen, or **Galenus** (c. AD 130-201), Gk physician, b. Pergamos in Mysia, Asia Minor. For centuries he was in error called Claudius Galen, due to misinterpretation of the prefix Cl. (clarissimus) often used with his name. He studied medicine at Pergamos, Corinth, and Alexandria. He then went to Rome where he later became physician to the emperor M. Aurelius. He also attended the emperors Commodus and Severus. He is supposed to have d. in Sicily. Next to Hippocrates, Galen is the greatest physician of all time. No one before or since has exercised so great an influence on medical hist. He was the most prolific of the anc. writers on medicine; he wrote about 130 books, of which 83 survive (about 2½ million words); he was also the author of 125 books on philosophy, law, mathematics, and grammar. His dogmatism and dialectic skill impressed those who came after him and for 15 centuries his works, which formed the foundations of anatomy and physiology, were authoritative. No great anatomist followed him until Vesalius (1514-64) and no great physiologist until W. Harvey (1578-1657). G.'s humoral theory of disease was until the Renaissance the very foundation of all medical thought. His works were first printed (in Greek) at Venice, 1525; the most important ed. is that ed. by J. L. Kühn, with Gk and Lat. text, 20 vols., Leipzig, 1821-33. J. Walsh has pub. sev. papers on G. and his writings in the *Annals of Medical History*, 1927-39.

Galen, Clemens August, Count von (1878-1946), Ger. prelate, b. Dinklage of a noble family. In 1933 he became bishop of Munster, and as a leader of the Rom. Catholic Church was an outspoken critic of National Socialism, especially during the Second World War. He was made cardinal in Mar. 1946, but d. of exhaustion soon after his return from Rome in the same month.

Galena, city, cap. of Jo Daviess co., Illinois, U.S.A., on G. R., near the Mississippi in the NW. of the state. It is the centre of a dairying and lead and zinc mining area. G. was the home of President Grant. Pop. 4600.

Galena, or **Lead-glance**, the naturally occurring sulphide of lead (PbS) which constitutes the chief source of the metal. G. is found widely distributed in the form of cubic crystals of a lead-grey colour (sp. gr. 7.5; hardness, 2.5), occurring chiefly in veins in the carboniferous deposits, and often accompanying other metallic ores. G. is easily oxidised, and the metal

is readily obtained by reduction. Some specimens contain so much silver that the separation of that metal is profitably carried on. See LEAD.

Galeopithecus, name given to a genus of the mammalian order Dermoptera, a group which is sometimes included among the Insectivora. They inhabit the forests of the Philippine Is., flying from tree to tree by means of the patagium, or parachute-like membrane; when at rest they hang by their posterior limbs, head downwards, after the manner of bats. They are about the size of cats and are nocturnal animals. There is one species, *G. volans*. *Galeopterus temminckii*, the other species of 'flying lemurs,' is found in Malaysia.

Galerius (*Galerius Valerius Maximianus*, sometimes referred to as *Maximianus II*), Rom. emperor (AD 305-11), b. of humble parentage in Thrace. He served in the wars of Aurelian and Probus, and eventually married Diocletian's daughter. In 293 Diocletian conferred upon him the title of Caesar with jurisdiction over Illyricum and the Danubian region. On the abdication of Diocletian and Maximianus I in 305, G. attained the rank of Augustus. He was defeated by Maxentius (q.v.) in 307, losing Italy and Africa. G.'s name is associated with the persecution of Christians under Diocletian.

Galesburg, city, cap. of Knox co., Illinois, U.S.A., a railway centre and livestock market, near coal mines and clay and gravel pits. G. manufactures iron and steel products, farm implements, clothing, etc. It was an Underground Railroad (q.v.) 'station'; one of the Lincoln-Douglas debates was held here. G. is the seat of Knox College. Pop. 31,400.

Galgacus, Caledonian chieftain who organised the bitter resistance offered about AD 85 to the Rom. invaders under Gnaeus Julius Agricola. He was finally defeated at the battle of Mons Graupius.

Galani, Ferdinando (1728-87), It. political economist, pub. in 1750 his *Della Moneta*, a revolutionary description of coin or currency. He maintained that money, being merchandise, must not be restricted, either as regards interest or value, a doctrine at once adopted into the practice of his native city, Naples. In the later ed. of 1780 he enlarged on the intrinsic value of the precious metals, and on their suitability as media of exchange. See A. Margheri, *L'Abbate Galani*, 1878.

Galish (Ukrainian *Halych*, Polish *Halicz*), small tn in the Stanislaw Oblast of Galicia (q.v.), 70 m. SE. of L'vov. It has the ruins of a castle and sev. medieval churches. In the 11th-13th cents. it was cap. of G. principality and the kingdom of Galicia and Volhynia (q.v.). In 1340 it became Polish, in 1772 Austrian. It was the scene of bitter fighting in 1914. From 1919 to 1939 it was Polish.

Galicia: 1. Region in NW. Spain, comprising the provs. of La Coruña, Lugo, Orense, and Pontevedra (qq.v.). Occupied at one time by Phoenicians and Gauls, it became a Gothic kingdom in the 6th cent. Later it was one of the chief

centres of Sp. resistance to the Moors. It is a high plateau, containing ridges of the Cantabrian Mts, and is traversed NE.-SW. by the Miño (q.v.). The deep fiords along the indented coast afford splendid anchorages, the chief harbours being La Coruña, El Ferrol, and Vigo (qq.v.). Livestock, vegetables, fish, tin, and tungsten are the prin. products. The Gallegos are a hardy race, and their language, allied to Portuguese, is distinct from Castilian Spanish. The climate is very wet. Area 11,260 sq. m.; pop. 2,632,500.

2. Area in W. Ukraine comprising L'vov, Droghobych, Stanislaw, and Ternopol' Oblasts; it embraces the N. slopes of the Carpathian Mts in the S., and the Volhynia-Podolia upland in the N. It belonged to the Kievan state (see KIEVAN RUSSIA), was independent after 1152, fused with Volhynia (q.v.), 1199-1340 (see GALICIA and VOLHYNIA, KINGDOM OF), and became Polish in 1349; it was an Austrian crownland, 1772-1918, then again Polish, was annexed by the U.S.S.R. in 1939, and in 1941-4 was occupied by the Germans and included in the Gov. General (see POLAND, History). As an Austrian crownland G. included a part of Little Poland around Cracow.

Galicia, Campaign in (First World War). In the early months of the First World War the Russians attempted to break through to Germany via Bohemia, which necessitated an advance through G. In Sept. 1914 they swept over Tarnopol, Lemberg, and Przemyśl, but were arrested at the Carpathian Mts, which were strongly held by an Austro-Hungarian force which offered the stoutest resistance. In the spring of 1915 the Germans, under von Mackensen, broke through the important Gorlice pass and soon hurled the Russians back. Mackensen relieved Przemyśl at the commencement of June and Lemberg towards the end of the month. Brusilov (q.v.) commanded the Russians on this front, and as soon as he reorganised his force dealt the Austrians a severe blow SE. of Lemberg in Sept. 1915. He made another attack in the autumn of 1916, but the Russian Revolution brought all operations to a standstill. See also WORLD WAR, FIRST.

Galicia and Volhynia, Kingdom of, medieval state in E. Europe, consisting of the principalities of Galicia and Volhynia (q.v.), which in 1199 were fused into 1 principality whose prince received from the Pope the title of king in 1254. Volhynia became Lithuanian in 1340, Galicia Polish in 1349. K. of G. and V. (Lodomeria) was also the official name of Galicia as an Austrian crownland, 1772-1918.

Galigani, Giovanni Antonio (1796-1873), and Guglielmo (1798-1882), were 2 publishers in Paris, whose father, Giovanni Antonio G. (1752-1821), had immigrated from Italy. They continued to bring out the daily newspaper (written in Eng.) entitled *Galigani's Messenger*, which their father had founded in 1814.

In its columns they did what they could to establish cordial relations between England and France. Their connection with the paper was severed in 1884. A monument to their honour stands in Corbell, where they built and endowed a hospital.

Galilaeans, fanatical sect led by a certain Judas of Galilee, who rebelled against the taxation census of AD 67 (Acts vi. 37; cf. Josephus, *Jewish War*, ii, 8:1).

Galilee: 1. (From Heb. *Gallil*, a border or ring), is rarely mentioned in the O.T., but some time after the return of the Jews from exile it was occupied by the Israelites, and rapidly developed a vigorous nationalism, so that G. became a tetrarchy under the Herods within the Rom.

E.N.A.

TIBERIAS ON THE SEA OF GALILEE

Empire. In the time of Christ, the prov. spread from the Mediterranean to the Jordan, embracing all N. Palestine. Upper G. is mountainous and well wooded, Lower G. fertile and flat. The chief cities were Sepphoris and Tiberias, though Capernaum, Nazareth, and Nain are more important in the gospel story. The inhab. were chiefly Syrians, Phoenicians, Arabs, Greeks, and Jews; to-day they are Muslims, Jews, Greeks, Christians, Arabs, Druses, and Maronites—but many Arabs, upon the Jewish invasion of 1948, fled to neighbouring Arab countries. The sea of G., called also the lake of Gennesaret, the sea of Tiberias, and the sea of Cinneroth, is an expansion of the Jordan, 680 ft below sea level, 13 m. long, and 8 m. broad. When Christ preached it was surrounded by prosperous villages, densely populated, but since those times and until very recent years it became almost a wilderness, and fertility seemed to have deserted its shores. The people of G., though in Judaea regarded as boorish provincials, whose Judaism was overlaid with despicable laxity and corruption,

were attractive for their very simplicity and happy, gentle dispositions.

The vegetation of Lake G. is sub-tropical. Lower G. has a less intensive agriculture than the plain of Esdraelon but resembles it in having 60 per cent of its ordinary crops, in the non-irrigated land, under cereals, and has proportionately less tubers, hay, and fruit, but more legumes. Its distinctive feature is its large area of olives and of fallow land. Upper G., on the other hand, has more of the intensiveness of the plains and more irrigated land, producing more deciduous fruit, especially grapes and apples, and more vegetables and green fodder. There are facilities for the repair of agric. machinery at the Ilon settlement in G. Kersenneh, beans and lentils are grown in Nazareth; chick-peas in Tiberias. In 1925 a new 102-kW. hydro-electric station was built at Tiberias. During the Second World War Tiberias had a lake airport for flying boats. There are hot springs at Tiberias, and parks, part of the development of the tourist trade by Jewish immigration. Nazareth, a purely Arab town until recently, is distinctive in Palestine in having stone buildings. It retains something of the period of the crusaders, with its Franciscan monks and their old gardens, and women clad in costumes embroidered in the style of the 12th cent. with earthenware jars on their heads. Amidst the hills of G. are hotels and sanatoria in the Jewish settlements, which offer hospitality to the visitor.

2. Architectural term for a porch or chapel attached to a church. Examples may still be seen at the W. end of the naves in Ely and Durham cathedrals, and on the W. side of the S. transept in Lincoln Cathedral. They were used sometimes as the part reserved for penitents, sometimes for corpses previous to interment, and at other times as the meeting ground for monks and their women relatives, who might not penetrate further into a monastic church.

Galileo Galilei (1564–1642), It. experimental philosopher and astronomer, b. Pisa. In 1581 he entered the univ. there. At first he studied medicine, but early renounced this science in favour of experimental philosophy, finding a good friend in Guido Ubaldi, through whose good offices, G. eventually obtained, in 1589, a mathematical professorship in Pisa under the Grand Duke Ferdinand I de' Medici. It is stated (though the story may be apocryphal, like some others about him) that, having watched the swing of a bronze lamp in the Pisan cathedral, G. soon discovered the isochronism of pendulum oscillations; for he found that the range of the swing or oscillation had no effect on its duration. He tested his discovery by counting the beats of his pulse and comparing the number of pulsations with the time of the pendulum vibration, and at once saw the possibility of utilising his invention for chronometers. In his youth he also wrote a treatise on the sp. gr. of solid bodies and constructed a hydrostatic balance. His next vital

discovery was the equality of the velocities of all falling bodies great and small. Up to his time people had imagined that a body 6 times as heavy as another would fall through the same space in one-sixth the time. The story is often told about G. dropping the weights from the Leaning Tower of Pisa to disprove the current belief about falling bodies, but this story is now known to be apocryphal.

In 1592 G. accepted the chair of mathematics in Padua, as his revolutionary discoveries and still more his biting satire had made him many active enemies in Pisa. Here he worked till 1610, and among his numerous inventions were an imperfect species of thermometer and a proportional compass. He was the first to use the telescope for astronomical purposes. With his new appliance he revealed a series of startling and brilliant scientific facts. Never before his time had anyone declared that the Milky Way was, as Milton, who had visited G., stated, 'powdered with stars,' or that the moon, far from being a smooth and self-luminous sphere, was diversified with great mts and valleys, and lightened only by reflections of the sun's rays from the earth, or that the planet Jupiter had 4 satellites, or that Saturn had a triple aspect (due to its rings), or, finally, that the sun which the schoolmen had regarded as a symbol of perfection was, in reality, besmirched with spots. It is not generally appreciated by modern scientific thinkers what little prominence time had in pre-Galilean systems of philosophy. It was taken for granted as being practically identical with consciousness itself, thus calling for no special thought on its own account. The great achievement of G. was to create conceptions in terms of which motion could be treated mathematically, and to this end he represented time as a space-like dimension which could be measured—divided up into equal parts as a length is. But this dimension, or 'spacified' extension, of time was so conceived for the one purpose of making motion amenable to mathematical treatment. The world describable in terms of it was specifically limited by G. to the world of mechanical phenomena. All else—even physical experiences like heat, sounds, smells, colours, and the rest—he excluded from this world, and located in the perceiving being. It is difficult to overestimate the value of this achievement, for it has made possible the whole of modern physical science; and it is difficult also to overestimate the illusions it has created, for, having seen the value of the concept of 'spacified' time in mechanics, subsequent thinkers, less perspicacious than G., have taken it to be a universal receptacle for the whole of human experience, and therefore as representing in a more precise form everything that human consciousness has ever meant by time. Consequently the whole of experience has been distorted to fit a concept to which most of it is non-conformable (Herbert Dingle).

After 1610 he worked freely in Florence

under his new patron, Ferdinand II, to whom he dedicated, in 1632, his famous *Dialogue on the Ptolemaic and Copernican Systems*. Not content with showing that the latter adequately explained celestial movements, G. threw himself into theological controversy by trying to explain the congruity or incongruity of certain biblical texts read in the light of his theory. His interpretations ran counter to the accepted opinion, and already in 1616, though not condemned by name, he had been compelled by the Rom. Inquisition not to assert 'what seemed to contradict Scripture.' His 1634 pub. therefore was taken by the Rom. authori-

GALILEO GALILEI

Engraving from a picture by Allan Ramsay in Trinity College, Cambridge

ties under his former patron Urban VIII as a direct challenge. He was summoned to Rome, where he was obliged solemnly to abjure his 'heresies,' above all that of the diurnal and yearly motion of the earth and of the stability of the sun. He was further to recite the 7 Penitential Psalms once a week for 3 years, and was technically imprisoned, i.e. under observation, for the rest of his life. This sentence, however, though signed by 3 cardinals, did not receive papal ratification. The remark said to have been made to a friend—*Eppur si muove!* ('It moves for all that')—is apocryphal. Irascible, but forgiving by nature, G. loved the amenities of social life and was qualified by taste and knowledge to pass judgments in poetry, music, and painting. Torricelli, who was passionately attached to his master, is the most famous of his pupils. See F. R. Wegg-Prosser, *Galileo and his Judges*, 1889; and J. Fahle, *Scientific Works of Galileo*, 1921; F. S. Taylor, *Galileo and the Freedom of Thought*, 1938; Z.

Harsanyi, *Et Pourtant elle tourne: vie de Galileo*, 1947.

Galileo's Telescope, see OPERA GLASS.

Gallia, see KALISZ.

Gallium, see BEDSTRAWS.

Gall, St (d. c. 640), Irish monk of Bangor; disciple of St Columbanus (q.v.) whom he followed to the Continent. After St Columbanus's exile from France G. settled in Switzerland, of which he is considered one of the apostles and where his name was commemorated in the great abbey of St G. A Swiss canton and tn are also named after him. His feast is on 16 Oct.

Gall, Franz Joseph (c. 1757-1828), founder of the system of phrenology, was b. Tiefenbrunn, in Baden, Germany. He became physician in Vienna in 1785. Having studied exhaustively from boyhood the external manifestations on the cranium of the different powers of human mind and character, he eventually concluded that the talents and mental characteristics depended on the functions of the brain, and that these characteristics caused variations in the development of certain areas on the surface of the brain, which could be determined by careful study of the external surface of the skull. He began to lecture on this subject (phrenology) in 1796. Phrenology was exploited by quacks and charlatans and soon became a subject of derision among the medical profession, although many philosophers ranged themselves on G.'s side. His work stimulated others to study cerebral physiology and led to the localisation of certain activities in definite areas of the brain. Chief works (in collaboration with his pupil J. C. Spurzheim) were *Introduction au cours de physiologie du cerveau*, 1808, *Recherches sur le système nerveux*, 1809, and *Anatomie et physiologie du système nerveux* (4 vols.), 1810-19. See life by Jessie Fowler, 1896; and Dr B. Hollander, *In Search of the Soul*, 1920.

Gall, excrescence or tissue-body produced in plants by the presence of parasitic insects or fungi; G.s vary greatly in form, some of them being complicated structures resembling fruits and flowers. The so-called oak 'apples' and 'witches' brooms' are well-known examples. See GALL-FLY; OAK-GALL.

Gall, see BILE; GALL BLADDER.

Gall Bladder, pear-shaped membranous sac, 3 or 4 in. long and about 1½ in. across its widest part, and capable of containing 8 to 12 fluid drachms. It is lodged obliquely in a cleft in the concave lower surface of the right lobe of the liver (q.v.). Its large end or *fundus* projects beyond the anterior border of the liver and is directed forwards, downwards, and to the right. Its upper surface is attached to the liver by areolar tissue, its under surface and *fundus* are covered by the peritoneum, which is reflected over them from the surface of the liver. The neck gradually narrowing is curved S-shape, and then becomes much constricted and, changing its general direction, it bends downwards and terminates in the cystic duct. This

duct joins, at an acute angle, the single duct formed by the junction of the right and left hepatic ducts, and the common channel to all 3 is termed the *common bile duct* which runs down to the second part of the duodenum, into which it opens through the sphincter of Oddi. The chief function of the G. B. is to act as a reservoir for the secreted bile. The secretion of bile from the liver is continuous, unlike the other digestive secretions, which take place only during digestion and cease, more or less, during abstinence. But while the secretion of bile is continuous, its excretion or output into the duodenum is periodic, and coincides exactly with the period of digestion in which the acid chyme is spurted by rhythmical jets from the stomach to the intestine. It is therefore evident that the bile secreted during abstinence must all collect in the G. B., which, in short, is a lateral diverticulum of the excretory bile ducts, where the bile becomes condensed by absorption of water.

Experiments made by Oddi in 1887 resulted in the discovery of a special sphincter of plain muscle situated at the duodenal end of the common bile duct. The mechanism by which the flow of bile into the intestine is brought about consists in a reflex diminution in tone of this sphincter caused by the distension of the intestine and the entrance of the chyme from the stomach. It is therefore an inhibitory reflex discharged from a higher centre. Concretions of the solid matter of bile are liable to form calculi (q.v.) in the gall bladder or cystic duct. These are known as *gall stones*. If causing symptoms such as colic, and when they obstruct the passage of bile and give rise to jaundice, they must be removed surgically. *Cholecystitis*, inflammation of the G. B., may be acute, and may lead to suppuration (empyema, or abscess, of the G. B.), or may be chronic, in which case the walls of the G. B. become fibrous and thickened. Chronic *cholecystitis* is a predisposing cause of gall stones. Upper abdominal pain, flatulence, and dyspepsia are symptoms of *cholecystitis*.

Gall-midges, minute dipterous insects belonging to the family Cecidomyiidae, which live in the different parts of plants or under the bark of trees. Certain species of *Miastor* and *Oligarces* possess the remarkable power of reproduction whilst in the larval state. *Cecidomyia destructor*, the Hessian fly, is injurious to cereals, and is a great pest in some parts.

Gall-stones, Cholelithiasis, or Biliary Calculi. G. are found in the gall bladder and biliary ducts of man and most vertebrate animals, being especially common in oxen. Their size varies from that of small gravel to large stones quite 5 in. in length. When large the stones are usually found singly and of a rounded or oval shape. The smaller, wedge-shaped ones are generally more numerous. Their colour ranges from white to black, but is generally brown. Chemically they are a compound of lime and bile pigment,

with traces of mucous and phosphatic earths; the larger and lighter coloured stones are covered with cholesterol. G. are rare before puberty, and most common after 30 years of age. They are more common in women than men and tend to occur in fat rather than thin people. They are often associated with cholecystitis (see GALL BLADDER).

When the stones enter the bile passages, they give rise to biliary colic, that is to say, intense pain on the right side of the abdomen, below the ribs. This attack is followed by jaundice within 12 to 48 hrs. The pain usually lasts until the stone is passed out of the duct or falls back again into the gall bladder, which may take place in a few hrs or only after sev. days. The attacks may recur from time to time as new stones leave the bladder. There is no means of removing or 'dissolving' G. by medicinal treatment. A low fat diet helps to minimise the liability to attacks of biliary colic and jaundice, but if these recur frequently the gall bladder and the stones in it must be removed by operation. This operation is known as cholecystectomy.

Gall-wasps are small hymenopterous insects belonging to the family Cynipidae and related to the ants and bees; they are black and wasp-like in shape, with straight antennae. The presence of the larvae results in plant excrescences, or galls (q.v.), from which the insect emerges on reaching maturity. *Rhodites rosae* causes the bedeguar gall which is commonly found on wild rose-trees and also on the cultivated plant. The true gall-makers are called Psenides, and, in addition to the typical genus *Cynips*, include *Aphilotrix*, *Andricus*, *Neuroterus*. *C. gallatinctoriae* produces the gall-nuts of commerce, and *C. insana* produces those known as Dead Sea Apples or Apples of Sodom.

Gallait, Louis (1810-87), Belgian painter, was b. Tournai, where he studied art. He was of note in his own time as one of those who revived historical painting in Belgium, his huge 'Abdication of Charles V' being the best known.

Galland, Antoine (1646-1715), Fr. orientalist. In 1709 he became prof. of Arabic in the Collège de France. His chief work is his trans. of the *Arabian Nights* (3rd ed., 12 vols.), 1704-8, being the first trans. into a European language. He wrote also historical monographs and other works, and pub. translations of the Koran and of *Kalilah and Dimnah*.

Gallarate, It. tn., in Lombardy (q.v.), 11 m. S. of Varese (q.v.). It has cotton-spinning industry. Pop. (tn) 14,700; (com.) 29,700.

Gallarus Oratory, on the Dingle peninsula, Rep. of Ireland, a perfectly preserved 7th cent. church. It is built throughout of un-mortared stone and is completely watertight after over a thousand years' exposure to Atlantic gales.

Gallas, Matthias von, Count of Campo, Duke of Lucera (1584-1647), Austrian gen., distinguished in the Thirty Years War. He first served with the Spaniards in Savoy (1617), then with the army of the

Catholic League, and was major-general of the forces which captured Mantua (1629). He commanded under Wallenstein in Bohemia, fighting against the Swedes at Nuremberg and Lützen (1632). G. then intrigued against Wallenstein, and after the latter's assassination succeeded to his command, 1634, winning a notable victory at Nördlingen. Archduke Leopold superseded him (1638). G. was in command again in 1642, but was defeated by Torstenson at Magdeburg c. 1644. His army earned a reputation for cruelty, and the word marauder is derived from his *Marode Brüder*.

Gallas, African Hamitic tribe, racially closely allied to the Somalis. Their original home is uncertain, but was probably somewhere in the highland mass lying between the Ethiopian plateau proper and the Somali plain. Some believe that they came across the Red Sea from S. Arabia. From the 16th cent. onwards they have migrated in waves into the main plateau of Ethiopia, and occupied great parts of the S. highlands. It is largely owing to the Galla invasions that the aboriginals of the S. of Ethiopia have not been assimilated like those of the central highlands. The G. were pagans when they invaded the country, and for the most part remain so. Some Galla tribes, like the Wollo, have become fanatical Muslims. Others have received a faint tinge of Christianity. Much information on them has been gathered from the writings of Balthazar Telles, a Portuguese Jesuit, who incidentally disillusioned the world on the myth of Prester John. The G. number over 4,000,000. They have proved themselves quite as capable of being administrators as the Amharas, and many of the highest offices in the Imperial Gov. service are held by G. The emperor's confidence in their unequivocal loyalty is also evinced by the fact that many G. are commissioned in the Imperial Guard, the army, and the air force. These posts are in no way restricted to Christians, and many Muslim G. are so employed.

Gallatin, Albert (1761-1849), Swiss-Amer. financier and statesman, b. Geneva. He emigrated to the U.S.A., 1780, and, unsuccessful in trade, supported himself for some time by teaching Fr. at Harvard College. Elected to the U.S. Senate (1793), he was deprived of his seat on the ground of ineligibility. He then entered the House of Representatives (1796). It was as secretary of the treasury (1801-13) that he first proved himself a great financier. He was mainly responsible for the favourable conclusion of peace negotiations with England in 1814, and himself signed the treaty of Ghent. After filling important diplomatic positions in Paris and London he returned to New York, and retired from public life (1827).

Gallatin, riv. rising in Wyoming, U.S.A., and flowing 120 m. N., forming deep canyons between Madison and G. ranges in SW. Montana, to a point NE. of Three Forks, where it joins Madison and Jefferson

G.s to form the Missouri. It is used for irrigation.

Gallaudet, Thomas Hopkins (1787-1851), Amer. teacher of the deaf and dumb. He was b. at Philadelphia, and took his degree at Yale. He afterwards became a student of theology at Andover, Massachusetts, and after having obtained, in 1814, a licence to preach visited Europe with a view to teaching the deaf and dumb. He studied in Paris under the Abbé Sicard, and in 1816, on his return to America, founded a school for deaf mutes at Hartford, being the head of it until 1830. He wrote sev. works, among them *The Child's Book on the Soul*, 1832,

since the great development of Colombo harbour.

Galleon (Sp. *galeon*), large ship used by Sp. merchants in the 15th-18th cents. to convey gold and silver from Mexico and Peru to Spain. The ships, which were armed, possessed 3 or 4 decks.

Gallery means a long and narrow passage raised above the ordinary floor of a room. These G.s are often to be seen in churches, as in the case of the rood-loft, which is a G. forming a means of support and elevation for the rood or cross; in Norman castles the great hall often had a G. surrounding it. The great halls of old mansions were provided with a minstrels'

MODEL OF GENOESSE GALLEY IN CEREMONIAL RIG (16TH CENTURY)

Civil Naval Museum, Genoa

and *The Youth's Book on Natural Theology*, 1832.

Galle, Johann Gottfried (1812-1910), Ger. astronomer, b. Pabsthaus, near Wittenberg. He was the first to observe the planet Neptune (25 Sept. 1846), the existence of which had previously been proved by the calculations of the Fr. astronomer, U. J. J. Leverrier (q.v.), and the Eng. astronomer, J. C. Adams. The theory ascribing the formation of halos to the refraction of light by floating ice crystals was completely demonstrated by G. (and A. Bravais). The third ring round the planet Saturn, commonly known as the 'Crape' ring, was first recorded by G. at Berlin in 1838. In 1875 he pub. the results of the observations of the minor planet Flora in connection with the value determined for the solar parallax.

Galle, called also **Point de Galle**, seaport on Ceylon, situated in the SW. of the is. in the S. prov. It has a good harbour, but is not so important now as a port of call for steamers to the E. and Australia,

G., but as a domestic feature the G. only attained importance with the introduction of the Elizabethan long G.; whence the application of the word to a museum of art treasures. For G. in military mining, see MINES, *Military*.

Galley, low, flat-built sea-going vessel with one deck, propelled by sails and oars, formerly in common use in the Mediterranean, e.g. by Genoans and Venetians. The rowers were usually slaves or condemned criminals. The term is also applied to warships of ancient Greece and Rome, as well as to the Viking ships (see NORSEMEN) and to a large open rowing boat used by press-gangs.

Galley Slaves (Fr. *galériens*; It. *galeotti*), term applied in olden times to convicted criminals who had to work out their hard labour as rowers on board a galley. In later days such convicts were principally employed on the docks and military harbours of France, Spain, and Italy.

Gallia, in ancient geography 'the country of the Gauls' (Galli), in 2 great divs., Cisalpina or Citerior (on 'this,' i.e. the

Rom. or S. side of the Alps) and Transalpinia or Uterior (across the Alps from Rome). G. Cisalpina extended S. and E. from the Alps, and was bounded in Caesar's time by Liguria, Umbria, and the Rubicon, comprising N. Italy between the Alps and the Apennines. Gallic invaders came here perhaps as early as the 6th cent. BC. A Rom. colony was estab. at Sena Gallica (282), the country was reduced after the second Punic war (203), and its conquest finally completed on the defeat of the Boii (191). G. Transalpina extended N. and NW. of the Alps, comprising all modern France (often loosely called 'Gallia'), Belgium, and parts of Holland, Germany, and Switzerland. The Rom. prov. of G. Narbonensis, originally called Provincia (later Provence) was formed in the SE. (121 BC). Julius Caesar thoroughly subdued the whole ter. (58-50 BC), then divided into 3 parts, Aquitania (SW., inhabited by Iberians represented by the modern Basques), Celtic Gaul (in the centre, the cradle of the modern F. nation), and Belgic Gaul (NE., inhabited by Belgae, closely allied to the Celts of central Gaul). Augustus made 4 provs. (27 BC), Narbonensis, Aquitania, Lugdunensis, Belgica. In the 2nd cent. AD Christianity was introduced, and in the 4th cent. there were 2 dioceses, Galliarum and Viennensis.

After invasions by Vandals, Goths, and Franks in the 5th cent., a fresh empire rose on the ruins of the old. See E. Desjardins, *Géographie historique et administrative de la Gaule romaine*, 1877; C. Julian, *Histoire de la Gaule* (8 vols.), 1907-28; A. Grenier, *La Gaule celtique*, 1945; and O. Brogan, *Roman Gaul*, 1953.

Galliard (Fr. *galliarde*; It. *gagliarda*), old lively dance in triple time, much in vogue in the 16th and 17th cents. The G. often appeared in music as a kind of afterpiece paired with the pavan (q.v.), sometimes with the same tune transformed into triple time from the duple rhythm of the pavan.

Gallie Acid ($C_6H_4(OH)_2COOH$), one of the 6 possible trihydroxybenzoic acids, occurs together with tannin (tannic or gallotannic acid) in gall-nuts, divi-divi, sumach, etc. It forms colourless silky crystals, having an astringent and slightly acid taste, readily dissolves in hot water and melts at $220^\circ C.$, at the same time decomposing into pyrogallol and carbon dioxide. G. A. is a powerful reducing agent, readily absorbing oxygen in alkaline solution. With iron (ferric) salts a blue-black solution is produced, from which a black precipitate is finally deposited; use is made of this in the production of ink.

Gallikanism, word used in theology to describe certain theories which, while recognising the primacy by divine right of the see of Peter, yet limit the power of the pope in temporal matters and in certain eccles. matters. This attitude of resistance to the papal claims was particularly strong in France, and hence the name G. was given to it, while the church in France is known, in this connection, as the

Gallican Church. G. can only be understood in connection with the rival theory, known as Ultramontanism, which now holds almost complete sway in the Rom. Church. The first clear enunciation of Gallican principles was made in the Pragmatic Sanction (1269) in the reign of St Louis, which declared that the gov. of the Church should be carried out in conformity with the common law, the canons of the councils, and the statutes of the anc. fathers. It was still further developed by Philippe le Bel in his conflict with Pope Boniface VIII. The most celebrated expression of G. is found, however, in the Four Propositions of 1682, drawn up by Bossuet and signed by 35 bishops and 35 other clergy. The propositions are: (1) that the pope's jurisdiction is in things spiritual and not in things temporal, and therefore that kings are not subject to eccles. authority in such matters; (2) that the authority of a general council is at all times superior to that of a pope; (3) that the authority of the pope is to be limited by the canons of the universal church, and that the rules, customs, and institutions of the Gallican Church and kingdom remain intact; (4) that the judgment of the pope is not infallible unless it be afterwards confirmed by the whole Church. These declarations, especially the last 3, were frequently condemned by the papal authority, and Ultramontanism, if not in its extreme manifestations, is now substantially triumphant. G. throws much stress on the authority of the civil power, and has therefore been generally condemned as Erastian.

Galliéni, Joseph Simon (1849-1916), Fr. soldier and colonial administrator whose fame rests on the great share he had in winning the first battle of the Marne (1914); b. Saint-Béat, Haute-Garonne, and received his military education at St Cyr. He fought bravely in the Franco-Ger. war of 1870, and increased Fr. power in Senegambia, whither he was sent as captain in 1878. He served with distinction in the Sudan and crushed brigandage in Tonking. He was made governor-general of Madagascar in 1896 and general of div. on his return to France in 1899. In 1904 he was military governor of Lyons, and when the First World War broke out he had virtually retired. At that time he was military governor of Paris, and when the Ger. right wing under Gen. von Kluck changed its direction from SW. to S., thereby leaving Paris on its right, G. at once began to organise his command, and the troops sent by Marshal Joffre to augment it, for a blow at the exposed Ger. right wing when the right moment arrived. The threat was noticed by von Kluck, who halted and faced W. to meet it. It was this movement that arrested the victorious Ger. progress towards Paris. G. became war minister in 1915, but resigned in 1916, and d. in May of the same year. He wrote *Trois colonnes au Tonkin*, 1894-5, *La Pacification de Madagascar*, 1900, and *Neuf Ans à Madagascar*, 1908. See P. Ellis, *Le*

Général Gallieni, 1900, and P. Gheusi, *Le Maréchal Gallieni*, 1921.

Gallienne, Richard Le, see LE GALLIENNE.

Gallienus, Publius Licinius Egnatius, Rom. emperor (AD 260-8), and co-regent with Valerian, his father, from 253 until the latter's capture by the Persians in 260. G.'s reign is known as 'the period of the Thirty Tyrants,' for usurpers arose throughout the provs. The most prominent, Aureolus, was proclaimed emperor in Illyricum, invaded Italy, and captured Milan. While besieging him in that city, G. was murdered by his own troops. He was succeeded by Claudius II.

Gallifet, Gaston Alexandre Auguste, Marquis de, Prince de Martignes (1830-1909), Fr. gen., b. Paris, who distinguished himself in the Crimea, the It. campaign (1859), Mexico (1863), and at Sedan in 1870. He commanded the 3rd Chasseurs d'Afrique in the Franco-Ger. war (1870-1), winning fame by his heroic cavalry charge at Sedan. He earned a character for severity by his rigorous measures against the Communists. See his *Mes Souvenirs*.

Gallinae, or Galliformes (Lat. *gallus*, a cock), constitute an order under which are included such birds as the Phasianidae, or pheasants, the Tetraonidae, or grouse, Perdidae, partridges and quails, the Megapodidae, or mound-makers; the Cracidae, curassows, and guans; and the Opisthocomidae, the curious hoatzins, or 'stinking pheasants' of South America. They are a widespread group, being found in almost every part of the globe, and they include almost every variety of plumage and shape from that of the common domestic fowl to the beautiful silver pheasant of S. China, which was embroidered as an emblem on mandarins' dresses.

Gallio, Junius Annaeus, Rom. consul of Achaia under Claudius, while St Paul was at Corinth, AD 51-2. He was a brother of Seneca and uncle of Lucan. Ill health induced him to resign, and he was either put to death by Nero's order or committed suicide in 65. G. was an easy-going man, known for his amiability, *dulcem Gallionem*.

Gallipoli: 1. It. seaport, in Apulia (q.v.). It is built on a steep rock on the N.E. shore of the gulf of Taranto (q.v.), 22 m. SSW. of Lecce (q.v.), and has a baroque cathedral and a 13th-cent. castle. There are tunny fisheries, and a trade in olive oil, wine, and fruit. Pop. 15,500.

2. (Turkish *Gelibolu*), Turkish seaport on a peninsula at the N.E. extremity of the European side of the Dardanelles. It has been Turkish property since 1357. The Venetians defeated the Turks here in 1416. G. trades in corn, wine, and oil. The magazine and cellars built by Justinian and other ant. remains are in the vicinity. The tn has 2 harbours and is the prin. station for the Turkish Fleet. It was fortified by the Brit. and Fr. in 1854 and these fortifications were renewed and enlarged in 1878. The guns of G. command the Dardanelles just before the

strait joins the sea of Marmora. Pop. 17,000.

Gallipoli, Strait of, see DARDANELLES. Gallipoli Campaign (1915-16). The naval operations of the early part of 1915-16 in which the allied Anglo-Fr. fleets endeavoured to force the passage of the Dardanelles are described under DARDANELLES. This article deals with the military or land operations in the peninsula.

The immediate purpose of the attack on the Dardanelles was to force the straits in order to deal so effective a blow against the Turks that the pressure on Russia might be relieved and Bulgaria deterred from active adherence to the cause of the central powers. It is most likely that had the attack been crowned with success Turkey would have been out of the war, whilst the check to Ger. aspirations in the SE. (see also BAGDAD RAILWAY) would have been so serious that the war might well have been curtailed by as much as 2 years.

Experience having taught the necessity of a combined land and water expedition, the Brit. Cabinet resolved to send out a force to Gallipoli to co-operate with the fleet. It was hoped by effecting a landing of soldiers on the European side of the peninsula to storm Gaba Tepe (q.v.), Achi Baba (q.v.), and other formidable forts and thereby to facilitate the task of the ships in running the 40-m. gauntlet of the straits.

Cape Helles and Anzac Cove Operations.—In the last week of April 1915 2 divs. of the Australian Imperial Force and troops of the 29th Div. effected a landing at Helles at the S. tip of the peninsula and also at Anzac Cove (as it was subsequently called), which lies some 15 m. to the N. of Cape Helles. The men scrambled through the water in the face of a murderous hail of bullets, seeking in every conceivable way to shelter themselves on an exposed beach offering nowhere any hope of throwing up defensive works speedily enough to avoid grave casualties. The Australian and New Zealand troops brilliantly scaled a series of steep cliffs and with the most dogged resolution gradually dug themselves in. Of particular interest is the ruse by which the *Clyde*, an old troopship which, like the wooden horse of Troy, concealed numbers of armed men, was brought close up to the shore and the men rapidly disembarked through an improvised gangway.

The Battles for Krithia and Achi Baba.—It was decided, after the landing was effected, to make a combined advance by forces from both the S. and the W. This attack resulted in the sanguinary battle of Cape Helles and the battles for Krithia, the objective being the commanding height of Achi Baba. The attack, however, failed, the enemy being fully prepared, the terrain being ill adapted for offensive operations and the foe being constantly reinforced, as the attack dragged on, by ever more overwhelming numbers. A little ground, however, even against heavy Turkish counter-attacks,

GALLIPOLI AND THE DARDANELLES

The map on the right shows the three main theatres of operations, Suvla Bay, Anzac Cove, and Cape Helles, while on the left is a more detailed map of the Cape Helles area with the well-known names of the places where landings were effected. The black lines show the final positions of the Allies' troops before the evacuation.

was gained during these battles and, in the course of other engagements, during May. In May, June, and July the Turkish armies received a great accession of strength through Russia being forced to abandon her initial plan of co-operating with the Fr. and Brit. from the Black Sea. During these months heavy engagements were fought on 6-8 May (second battle for Krithia) and 4 June (third battle for Krithia). But, in view of the Turkish reinforcements, it was decided to send out, in addition to the 52nd Brit. Div., 3 more regular divs., and 2 territorial divs. of infantry.

The Suvla Bay Plan.—The new plan

was to land troops at Suvla Bay and by a combined advance from there, and from Anzac Cove on the heights of Sari Bair, to cut the Turkish communications on the Gallipoli peninsula. The prin. battles of this ill-starred plan, which began on 6 Aug., were the battles of Sari Bair and Suvla (6-15 Aug.); but, although the allied forces were foiled in their plan, they undoubtedly made such a drain on the Turkish forces that the repercussion was felt both in Syria and in Mesopotamia.

Sari Bair and Suvla.—The operations involved an advance from Anzac to the Sari Bair hills, a landing at Suvla Bay, and an advance thence to join up with

Topical Press

THE GALLIPOLI CAMPAIGN: TROOPS LANDING AT ANZAC COVE

the colonial troops. The advance on the Sari Bair heights had to be carried out over numerous ravines, and though the heights were reached, the Turkish troops, by heavy counter-attacks, drove the allied forces out again. Added to this check was the failure of the Suvla Bay operations. Troops were landed under cover of night, but grave difficulties of transport and water supply nullified any advantage that might have been gained by this surprise. Far more casualties indeed occurred through dysentery, from lack of water, and general disorganisation of auxiliary services, than through actual fighting, there being in fact but little resistance to the landing parties. The result of these failures was that the attempt to clear the European side of the straits was abandoned; but it was made clear to the world through official pronouncements that the Allies would certainly remain on the peninsula. This they did until the end of the year, the troops digging themselves in and carrying on months of trying trench warfare which at least had the effect of greatly impairing the Turkish forces. The endurance of the allied troops during this terrible campaign is a veritable epic in Brit. military hist.

Results of the Campaign.—The prin. object of the Gallipoli operations was not effected and the evacuation, brilliantly carried out in Dec. 1915 and Jan. 1916, brought the operations to a close. The conception was sound, but the means at the disposal of the Allies, and the inevitable disorganisation resulting from local circumstances, rendered its execution all but impossible. Indirectly, however, the campaign achieved limited results in the wastage of the Turkish armies, which, apart from the victory over Gen. Townshend's small force at Kut, never seriously hampered the steady pressure of the Brit. and Fr. in Palestine and the Brit. in Mesopotamia and the Russians in Armenia.

Casualties (approx.): 30,000 killed and d. of wounds; 8000 missing and prisoners; 74,000 wounded. See Sir Ian Hamilton, *Gallipoli Diary*, 1920; C. F. Aspinall-Oglander, *Gallipoli*, 1928-31; Sir W. S. Churchill, *The World Crisis*, 1923-9; Alan Moorehead, *Gallipoli*, 1956.

Gallium, metallic element first discovered by Lecoq de Boisbaudran in 1875 by spectroscopic analysis of a zinc blende from Pierrefitte in the Pyrenees.

It occurs in blendes from different localities and also, but in minute amounts, in other minerals. G. is obtained by dissolving the ore in acids, treating with zinc to precipitate the foreign metals, redissolving the precipitate in hydrochloric acid, and throwing out the G. in the cold with zinc. Subsequent fractionation yields G. in the pure state. In properties G. is allied to aluminium. It has a characteristic spectrum—2 lines in the blue and violet. Atomic weight, 70; atomic number, 31; symbol, Ga; melting-point, 30.1°. It is identical with Mendeleev's hypothetical eka-aluminium. G. is very widely distributed, but usually in

very minute quantities. It seems likely to find industrial application in electric lamps and in optical apparatus.

Gallivara, or **Gellivara**, tn of Sweden, situated about 130 m. NW. of Lulea, with which port it is connected by rail. There is also a railway line connecting G. with the Ofoten Fjord, Norway. The iron-mines near this tn are exceedingly productive, the output being considerably over 1,000,000 tons per year. Pop. 12,500.

Gallon, and **Ale Gallon**, **Wine Gallon**, see METROLOGY.

Galloway, **Joseph** (c. 1731-1803), Amer. lawyer and anti-nationalist, b. in Kent co., Maryland; early removed to Philadelphia. Member of the Pennsylvania Assembly during most of the period 1757-1774. He was against proprietary gov. and advocated the erection of Pennsylvania into a royal prov. He married a daughter of Lawrence Growden, Speaker of the Assembly, and was himself Speaker, 1766-74. Opposing the ideas of the revolution, he proposed, as a member of the Congress of 1774, a scheme of gov. consisting of a president-general, appointed by the king, and a grand council elected for 3 years by the various assemblies of the colonies. This was rejected by a narrow majority. In Dec. 1776 G. joined the Brit. Army under Sir Wm Howe, and he became civil administrator of Philadelphia on its capture. He accompanied the army to New York. In 1778 he went to England, and his estate of £40,000 was confiscated by Congress. He wrote many pamphlets on Amer. and biblical subjects.

Galloway, fertile and extensive dist. in the SW. of Scotland, comprising Wigtownshire and the Stewartry of Kirkcudbright. It is bounded by Ayrshire, the sea, the Solway Firth, and the R. Nith, and is divided into Upper and Lower G. Famed for its breed of hornless black cattle, with dairy-farming as its prin. industry. The climate is mild, and there is much diversity of scenery. G. is associated with the story of the Covenanters (q.v.). G. contains a predominantly Celtic element and, indeed, it is not very long ago that the Gaelic of G. d. out. The first waves of the Celts who arrived in Britain are traced to G. and the region between the Solway and the Clyde, and they retained their identity and language longer than was the case anywhere else in the S. of Scotland where they settled.

Galloway, **Mull** of, rugged and mountainous promontory, situated at the SW. extremity of the G. peninsula, Wigtownshire, and the most S. point of Scotland. On its E. side it rises to a height of 210 ft, crowned by a lighthouse 60 ft high.

Galloway Breed, see CATTLE.

Gallowgano, see ELLAGIC ACID.

Gallowglass (Irish *galla*, a manservant), heavy-armed foot soldier or chieftain's retainer who fought in the old Irish wars. Armour-bearers in the Scottish Highlands were once so called and are mentioned in Shakespeare's *Macbeth* as coming, with Kernes, from the W. isles of Scotland.

Gallus, Cornelius (c. 70–26 bc), Rom. poet, b. Forum Julii (Fréjus) in Gaul, and the friend of Virgil and Ovid. None of his works survive, but some believe him to have been the author of the *Ciris* attributed by Suetonius to Virgil.

Gallus, Gaius Aquilius, Rom. equestrian, praetor in 66 bc. He was a pupil of Q. Mucius Scaevola the pontifex, and became celebrated as a jurist. G.'s writings were ed. by his pupil Servius Sulpicius, himself a famous jurist. Cicero eulogised G. for having promulgated an edictal rule on fraud in matters of buying and selling.

Gallus, Gaius Vibius Trebonianus, Rom. emperor (AD 251–4), is said (though no upon cogent evidence) to have been treacherously concerned in the defeat and death of Decius, whom he succeeded. After his accession G. concluded a dishonourable peace with the Goths, conceding them a fixed ann. tribute and allowing them to retain their captives and plunder. He was killed by his own soldiers when on the march to suppress another Gothic invasion.

Galluzzo, It. vil., in Tuscany (q.v.), 2 m. SW. of Florence (q.v.). On a hill near the vil. is a famous fortress-like Carthusian monastery, the *Certosa di Montecassino*, which dates back to 1342 and contains numerous art treasures. It has been restored after damage during the Second World War.

Gally, Merritt (1838–1904), Amer. inventor, b. near Rochester, New York. He was ordained Presbyterian minister in 1866, but resigned owing to voice trouble, and interested himself thenceforward in mechanics. He took out more than 400 patents, many connected with printing machinery. His inventions included the Univ. printing press, a machine for the manuf. of printers' types from cold metal by swaging, and the composite swage-locked type-bar or linotype. He was also the inventor of the 'orchestrone,' and made many productive experiments with automatic musical instruments.

Galston, burgh of Ayrshire, Scotland, on the Irvine, E. of Kilmarnock, and is engaged in the manuf. of lace and hosiery goods. Pop. 4560.

Galsworthy, John (1867–1933), novelist and dramatist, b. Kingston Hill, Surrey. He was educ. at Harrow and New College, Oxford, where in 1889 he took an honours degree in law. He was called to the Bar by Lincoln's Inn, but instead of practising he went on a trip to the Far East, making the voyage in merchant ships, and on the sailing ship *Torrens* met Joseph Conrad. In 1897 he pub. a book of stories, *From the Four Winds*, under the name John Sinjohn; in 1898 the novel *Jocelyn*, in 1900 another novel, *Villa Rubicun*, and in 1901 *A Man of Devon* and other tales. *The Island Pharisees*, a novel pub. in 1904, was the first book to appear under his own name. In 1906 *The Man of Property* was pub. This, the first of that great series of novels 'The Forsyte Saga' and 'The Modern Comedy,' is the most dramatic of his novels, and the

complete saga probably his greatest work. He himself says of the Saga that it 'cannot be absolved from the charge of embalming the upper middle-class life,' and in the complete success of this undertaking consists its greatness.

In 1906 G. first became known as a dramatist with the play *The Silver Box*. In 1907 came the comedy *Joy* and the novel *The Country House*. A vol. of sketches, *A Commentary*, was pub. in 1908, and in 1909 the important novel *Fraternity*; also during that year the play *Strife* was first performed, to be followed in

E.N.A.

JOHN GALSWORTHY

1910 by *Justice*, and another vol. of sketches, *Motley*, and in 1911 by the novel *The Patrician*, *The Inn of Tranquility* (further sketches), and the play *The Little Dream*. In 1912 he pub. a book of verse, *Moods, Songs and Doggerels*, and in the same year the original tragi-comedy *The Pigeon* and the play *The Eldest Son* were first performed. The novel *The Dark Flower* and *The Fugitive*, a drama, came in 1913; the novel *The Freelanders* and the play *A Bit o' Love* in 1915; in 1917 *Beyond*, a novel, and the play *The Foundations*, in 1918 *Indian Summer of a Forsyte*, a delicate short story, later included in 'The Forsyte Saga'; *The Five Tales*, *Another Sheaf*, *The Burning Spear*, and *The Saint's Progress* in 1919. In 1920, *In Chancery*, the second vol. of 'The Forsyte Saga,' was pub., and in 1921 the last vol. of the trilogy, *To Let*. *The Skin Game* was first

performed in 1920, and in that year *Tatterdemalion*, a collection of war stories, was pub.; the comedy *A Family Man* was produced in 1921, and in 1922 *Loyalties* and *Windows*. More tales, *Captures*, appeared in 1923, and in 1924 *Old English*, an earlier story dramatised, was first performed, and later in that year the play *The Forest*. At this time also *The White Monkey*, the first book of the second trilogy, 'The Modern Comedy,' was pub., to be followed by the second book, *The Silver Spoon* in 1926, in 1927 by 2 interludes, later to be included in the second trilogy, and in 1928 by the last book of the cycle, *Swan Song*. Another play, *The Show*, was produced in 1925, and in 1928 the drama *Escape*. A selection of earlier and unpublished poems, *Verees New and Old*, was pub. in 1921, in 1927 a book of essays, *Castles in Spain and other Screeds*, and *The Way to Prepare Peace*; *The Roof*, a play, in 1929, and in 1930 a book of short stories, *On Forsythe 'Change*. In 1929 G. was awarded the Order of Merit and, in 1932, the Nobel prize for literature. His last novel, *Flowering Wilderness*, appeared in 1932. *Over the River* was pub. posthumously in 1933.

G. is sometimes considered to use too much propaganda in his works, particularly in his plays, but he uses it rather as a framework than as the purpose of his plays. He is ironical but humanitarian, reserved—and this reveals itself in reticence and sparseness of words in dialogue—and although seemingly oppressed by the sadness of life, he has a sense of humour and a great appreciation of beauty. His work was influenced by Turgenyev and Maupassant, whom he read a great deal in his youth, but it is essentially Eng. *The Silver Box* is a play typical of his dramatic methods, and *The Man of Property* contains the essence of his greatness as a novelist. It has been well said that if no biographical facts were available about G. it would be possible to deduce from his works and from their style that he was an aristocrat and that he had had a legal training. His books are not especially rich in incident, but they convey an almost unique effect of abstract beauty suspended in an ethereal atmosphere. His purpose as a novelist, which will be found stated allegorically in his *Inn of Tranquillity*, is that of a light-bearer in dark places—to show in a detached manner what is there, whether good or bad; but readers are very divided on the question of his reputed impartiality. The conviction is irresistible, however, that the dominant motif of his work is the cult of the underdog. Like a judge he weighs the evidence, but his emotions are apt to colour the impartiality of his presentation. His plays show a remarkable economy of construction, and in the later work the economy of style and characterisation is so extreme as to produce the effect of meagreness and a want of human warmth. See lives by Sheila Kaye-Smith, 1916; L. Schallit, 1928; and H. Ould, 1934; H. V.

Marriot, *The Life and Letters of John Galsworthy*, 1935; and R. H. Mottram, *For Some We Loved*, 1956.

Galt, Sir Alexander Tilloch (1817-93), Canadian politician, b. Chelsea. In 1835 he went to Canada, and 14 years later sat in the Canadian Parliament. In 1858 he drew up his memorandum on Confederation; and in 1859, as minister of finance, introduced Canada's first protective tariff. He was closely connected with the Grand Trunk Railroad. G. became first minister of finance of the Dominion of Canada, 1867. In England in 1880-3 he adopted the title of Canadian 'High Commissioner.' He wrote *Civil Liberty in Lower Canada*, 1876, and *The Future of the Dominion of Canada*, 1881.

Galt, John (1779-1839), novelist and dramatist, b. Irvine, Ayrshire, son of a sea captain. He first worked unsuccessfully in London, then travelled extensively on the Continent, where he made friends with Byron (of whom he wrote a life). Returning to England, he pub. 'Letters from the Levant' in *Blackwood's Magazine*; *The Ayrshire Legatees*, 1820, and his masterpiece, *Annals of the Parish*, in the following year. In 1826 he went to Canada as secretary of a land company, and founded the tn of Guelph, but the venture was unsuccessful and he returned to Scotland broken in health and fortune. His works include an *Autobiography*, 1833, *Literary Life and Miscellanies*, 1834, and a number of novels, including *The Provost*, 1822, *Sir Andrew Wylie*, 1822, and *Laurie Todd*, 1830. He married the daughter of Dr Tilloch, the proprietor of the *Star* newspaper, for which he worked. G. was a prolific but unequal writer, unrivalled in his delineation of life in small Scottish tns. An ed. of his works, with introduction by S. R. Crockett, was pub. in 1896. See lives by W. Maginn, 1830; Sir G. Douglas, 1897; and J. W. Aberdein, 1936.

Galt, city of Ontario, Canada, 54 m. W. of Toronto and 24 m. NW. of Hamilton. On main line of Canadian Pacific railway, and branch lines of Canadian National railways, with electric railways to Kitchener and Brantford. Market centre for tns of Preston and Hespler and vils. of Ayr, Blair, Dumfries, etc. It lies in a rich agric. dist., and has 13 churches, 3 parks, 2 hospitals, a co-educational school, and a fine public library. Industries include boilers, boots, brass goods, edge tools, engines, farm implements, leather, belts, lime, lumber, safes, soap and oils, nails, etc. The neighbourhood supplies limestone, sand, lime, and natural gas. It is named after John G. (q.v.). Pop. 22,185.

Galtie Mountains, Ireland's finest inland range, in the SW. of co. Tipperary. The highest summit is Galtymore (3018 ft), on the S. of which are the huge Mitchelstown caves. N. of the mts is the Glen of Aherlow with an extensive State forest. The R. Aherlow abounds in fish.

Galton, Sir Francis (1822-1911), anthropologist, cousin of Charles Darwin, was b. Duddleston, Warwickshire. Educ. at

King Edward VI Grammar School, Birmingham, he became medical student at Birmingham Hospital and King's College, London, and took his degree at Trinity College, Cambridge, 1844. He devoted himself to the study of heredity, and endowed a research fellowship for the study of eugenics in the univ. of London, 1904. He systematised finger-print methods of crime detection. G. received a knighthood in 1909. His prin. works are *Meteorographica*, 1863, *Hereditary Genius*, 1869, *English Men of Science, their Nature and Nurture*, 1874, *Human Faculty and its Development*, 1883, *Natural Inheritance*, 1889, and *Memories of My Life*, 1908. See life by K. Pearson, 1914-24.

Galuppi, Baldassare (1706-85), It. composer, particularly noted for his comic operas, b. Burano, near Venice. He also wrote sacred music and sonatas for the harpsichord. He often set librettos written for him by Goldoni (q.v.). See A. Della Corte, *Baldassare Galuppi: profilo critico*, 1948.

Galvani, Luigi (1737-98), It. physiologist, b. Bologna, and in spite of his wish to enter the Church was educ. for the medical profession. He graduated at Bologna in 1759, and became professor of anatomy there in 1766. His greatest discovery was pub. in the treatise called *De Viribus Electricitatis in motu Musculari Commentarius*, 1791. The word galvanism is derived from his name, as also galvanometer. His whole research was directed towards ascertaining the relation of animal muscle to electricity, and he initiated the study of electrophysiology. He refused in 1797 to take the oaths of the gov. of the new Cisalpine rep., and was deprived of his chair at the univ. Before he could be reinstated he d.

Galvanising, name applied to the process of coating iron or steel with zinc to preserve it from rusting. The iron, thoroughly cleaned by scouring with dilute sulphuric or hydrochloric acid and sand, is dipped into a bath of molten zinc covered with ammonium chloride to act as a flux, whereby a protecting layer of zinc-iron alloy is formed on the outside. The temp. of the bath varies from 450° to 480° C. G. was first practised about 1837; iron so treated withstands the action of air and moisture better than tinplate (q.v.), hence it is extensively used for single wire, wire-netting, corrugated roofing, cooking vessels, chains, water tanks, etc. *Galvannealing* is employed to improve the adhesion of the galvanised coating, and is usually applied to give flexibility to galvanised wire. The wire is passed, immediately after G., through a furnace maintained at 650-700° C. for about 15 min.

Galvanism, term applied to the method of alleviation of pain and cure of disease by means of current of electricity. The current may be obtained from a battery of cells, or by means of a switchboard where electrical power is available. An alternating current may be used instead of a direct current, and is often of much

value for therapeutic purposes. The terminals of the source of the current are connected to metallic electrodes which are covered with some absorbent material. To make the resistance of the skin of the patient as low as possible the electrodes and the skin are well wetted with a solution of sodium bicarbonate. The electrodes are applied to the body and the current passes from the one to the other through the body. Great care must be taken to prevent the metal touching the skin, and to avoid too strong a current.

Galvanometer, instrument for detection and measurement of small electric currents.

Moving-magnet Galvanometers.—A small bar magnet is suspended by a fine quartz

MOVING-COIL GALVANOMETER

wire at the centre of a flat vertical coil of many turns of fine wire. If the plane of the coil is placed in the magnetic meridian and a current flows in the coil, the magnet is deflected by an angle whose tangent is the ratio of the magnetising force of the current, proportional to the ampere turns, and the intensity of the earth's magnetic field. A small mirror is fixed on the magnet, a beam of light is focussed on the mirror by a lamp and lens with a vertical wire next to the lens, and the reflected image is viewed on a translucent scale fixed above the lamp. When the magnet is deflected through an angle α , the reflected beam is deflected through 2α . The instrument is screened against outside magnetic effects by enclosure in a Mumetal case. An astatic needle practically eliminates the effect of terrestrial magnetism. It consists of 2 equal magnets rigidly connected one above the other, parallel but in opposite N.-S. sense. The coil is wound in figure-8 round the 2 magnets, so that the current deflects them both in the same direction. The swinging of the needle may be damped by mica vanes fixed on the magnet system.

Moving-coil Galvanometers.—A coil of fine wire is suspended by a phosphor-bronze strip in the gap between the poles of a magnet and a soft-iron cylinder (see figure). The current passes from the terminal H to the suspension D, thence to the coil and out at F. When a current passes through the coil, this is deflected until the magnetic force balances the restoring couple due to the torsion of the suspension. The reading of the deflection by the light-beam reflected from the mirror is as for the moving-magnet G. The swinging of the coil may be damped by winding it on a metal frame.

String Galvanometers.—A fine silvered quartz fibre is stretched taut in a strong magnetic field and at right angles to its lines of force. The current passes along the fibre by way of its metallic coating, and the deflection is viewed in microscope.

Ballistic Galvanometers are used for measuring current-impulses. The motion of the swinging system is not damped, but the time of swing should be so long that the impulse to be measured has passed before the first deflection is completed. The ballistic G. is used for measuring the discharge of a capacitor, and for magnetic testing. The magnetising-current circuit is connected through a reversing switch and a few turns of fine wire (search coil) are wound round the magnet and connected to the ballistic G. On reversing the current, the change in the magnetic field induces a momentary e.m.f. in the 'search coil,' and the ballistic G. deflection is a measure of the e.m.f.

Alternating-current Galvanometers.—The moving system in the vibration G. is so adjusted that the frequency of vibration equals the frequency of the a.c. to be tested. A small current passed through the G. sets the system vibrating by resonance and a mirror fixed on the vibrator shows a wide luminous band.

See A. Gray, *Absolute Measurements in Electricity and Magnetism*, 1921; D. J. Bolton, *Electrical Measuring Instruments and Supply Meters*, 1923; and E. W. Golding, *Electrical Measurements and Measuring Instruments*, 1940.

Galveston, port of entry and cap. of G. co., Texas, U.S.A., on G. Is. (N.E.), at the mouth of G. Bay. Next to New Orleans it is the most important port on the Gulf of Mexico, and trades with Great Britain, France, Cuba, Mexico, and Brazil. Its harbour, which is the best in the state, has over 12 ft. of water on the bar at low tide. The chief export is cotton; others are grain, timber, cattle, hides, oil-cake, and petroleum. There are iron foundries, machine-shops, cigar factories, grain elevators, and manufs. of flour, ice, rope, bagging, cotton-seed oil, cotton-cake, etc. There are regular steamship sailings to all parts of the globe. It is a Catholic bishop's see, and has sev. academies. Settled in 1837, it was captured by the Federals (1862) and retaken by the Confederates (1863). A fire in 1885 caused much destruction, and worse havoc was wrought by a storm and influx

of the sea (1900). Precautions against a similar disaster include a 4½ m. sea-wall and raising of the city's level. Pop. 66,600.

Galvin, George, see LENO, DAN.

Galway: 1. Maritime co. of Connaught, Rep. of Ireland, bounded W. by the Atlantic (coast much indented); S. by Clare co.; SE. by Tipperary, Lough Derg, and the Shannon; E. by Offaly and Roscommon; N. by Roscommon and Mayo. Among the is. off the coast are Inishbofin, Inishark, Gorumna (N.W.), and the Aran Is., which form a natural breakwater at the entrance to G. Bay (about 20 m. broad) between G. and Clare cos. (SW.). The surface is mountainous in the W., with the Twelve Pins group and the Mamturk Mts (over 2300 ft). The Slieve Baughta (Aughty) Mts come further S. G. contains Lough Corrib and part of Lough Mask. The chief rivs. are the Shannon and its tribs. the Suck, the Black, and the Clare. There are wild moorland tracts in the W., such as Joyce's Country, Connemara (noted for marble), and Iar-Connaught. A branch of the Grand Canal connects the Shannon harbour with Ballinasloe. Agric. produce, wool, and marble are the chief exports. Limestone is plentiful, and copper ore is found at Roundstone (SW.). Area 2293 sq. m.; pop. 160,124.

2. Cap. of above, parl. bor. and seaport on G. Bay, 115 m. W. of Dublin, at the mouth of the Corrib. Claddagh vil., formerly the fishermen's quarter, is close by. Salthill, a leading tourist resort, is a suburb of G. city. Hats, woollen goods, chemicals, artificial manures, and ammunition are the chief manufs., and kelp on the coast. G. is the seat of a Rom. Catholic bishop. Queen's College (founded about 1845) was renamed Univ. College (1908). Pop. 21,271. See J. Hardiman, *History of the Town and County of Galway*, 1820.

Gama, Vasco da (1469-1524), Portuguese navigator, b. Sines, in the prov. of Alemtejo. He early estab. a reputation as a fearless sailor, and followed closely in the footsteps of Prince Henry of Portugal. In 1497 he was dispatched with 3 vessels to attempt to round the Cape. With incredible difficulties to face he at last succeeded in doing so, and continued his journey across the Indian Ocean to Calicut. Here he estab. a settlement, but owing to the hostility of the natives had great difficulty in forcing his way out of the harbour. He returned to Portugal in 1499, and was raised to the nobility. At the same time an expedition was dispatched to plant a Portuguese colony at Calicut, but the atrocities of the natives caused G. to be sent out there again. He estab. a number of stations on his way there, and finally returned with rich booty to Portugal in 1503. It was not until 1524 that his services were next required. The atrocities at Calicut had again become excessive, and G. was again dispatched. He succeeded in restoring Portuguese prestige, but on the way back he d. at Cochlin. See G. Correa, *The Three*

Voyages of Vasco da Gama and his Vice-royalty (Hakluyt Society), 1869; R. W. Major, *Discoveries of Prince Henry of Portugal*, 1868-77; *The Lusitana of Camoens*; and Castan Leda, *Historia do Descobrimento da India*, 1551, largely based on MSS. of Alvaro Vilho, a trans. of which MSS. by Ferdinand Denis is to be found in E. Charton's *Voyageurs Anciens et Modernes* (vol. iii), 1855. See also E. G. Ravenstein (trans. and ed.), *Journal of the First Voyage of Vasco da Gama*, 1898; K. G. Jayne, *Vasco da Gama and his Successors*, 1910; and J. P. Alaux, *Vasco da Gama, ou l'épopée des portugais aux Indes*, 1931.

Gamaliel (d. AD 52), famous Pharisee and Rabbi, and a well-known and influential member of the Sanhedrin. He was the grandson of Hillel. As a doctor of the law he was more tolerant, peaceful, and broad-minded than others. He had a great liking for Greek, and studied that language and the manners and customs of the people. G. does not seem, on any reliable authority, ever to have been inclined towards Christianity, in spite of his defence of Sts Peter and John (Acts v. 34). Recent studies suggest that he belonged to a generation earlier than that of G. the Elder, who is often referred to in the Mishna.

Gamba, Viola da, see VIOL.

Gambeson, see ARMOUR.

Gambetta, Léon Michel (1838-82), Fr. statesman, b. Cahors, of Jewish-It. extraction. He became a member of the Paris Bar and soon became well known for his radical republican views. He became a deputy in 1869 and was primarily responsible for the proclamation of the 3rd rep. after the disaster of Sedan. The provisional gov. which was formed to conduct affairs after this defeat was largely under his influence, and he held the portfolio of the Ministry of the Interior. He conducted the defence of Paris, but after the beginning of the siege he escaped from Paris by means of a balloon, and conducted the war from outside. He struggled on bravely to the end, and was bitterly opposed to any surrender, and he was finally repudiated by the Fr. provisional gov. and fled to Spain. He was soon, however, re-elected as a deputy, and from 1872 onwards he took his place as the leader of the Republican party, putting forward an advanced radical programme. He was instrumental in preventing the attempted royalist restoration under the duc de Broglie in 1877, and quarrelled violently with MacMahon. For making statements about MacMahon which were held to be libellous he was arrested and imprisoned, but his popularity was so great that he gained a virtual victory over the president, who subsequently resigned. In 1879 he became president of the Chamber of Deputies, and 2 years later premier. His revision of the constitution was, however, rejected, and he retired. He d. 2 years later as the result of a pistol accident. His *Discours et plaidoyers* were pub. 1881-5, and *Dépêches, décrets*, 1886-91. See J.

Reinach, *Histoire du ministre Gambetta*, 1884; and H. Stannard, *Gambetta and the Foundations of the Third Republic*, 1921; and lives by P. Deschanel, 1919, P. Matter, 1923, and J. P. T. Bury, 1936.

Gambia: 1. Riv. of West Africa, flowing for about 700 m. through Fr. Guinea, Senegal, and G. It discharges into the Atlantic at Bathurst through a deep estuary. Light craft can ascend as far as the Barraconda Rapida, 350 m. from the estuary, and about 150 m. further when the riv. is in flood.

2. Brit. crown colony and protectorate on W. coast of Africa. It extends for about 250 m. along each bank of the R. G., and its area, including that of the parts of the colony administered as a protectorate, is 4003 sq. m. The Fr. have been given access to the navigable parts of the riv. The chief tn is Bathurst, on the is. of St Mary. The tn is built on piles, and considerable improvements have been effected in recent years. Together with Georgetown and some adjoining land and is. it forms the colony proper, which has an area of 89 sq. m.

The remainder of the ter. constitutes the protectorate. The country consists largely of creeks and swamps. The protectorate contains 4 provs., each under a commissioner who is responsible to a senior commissioner for the protectorate, who is, in turn, responsible to the governor. By an ordinance of 1946 the Kombo St Mary Div. was subtracted from South Bank Prov. and added to the colony.

There are sev. elementary and secondary schools run by the gov. and the Church. School-children enrolled (1956) totalled 2813. Internal communication is maintained by steamers or launches; there are no local railways. Bathurst is connected with St Vincent and Sierra Leone by cable and with tns in the protectorate by wireless. The prin. exports are groundnuts, hides and skins, palm kernels, and beeswax. The prin. imports are cement, edible oils, tobacco, cotton yarn and piece goods, wheat flour, rice, motor vehicles, sugar, wearing apparel, petroleum, and kola-nuts.

G. was discovered by the early Portuguese navigators, but no settlement was made. The Brit. colony was founded purely for trading purposes, the original patent being granted in 1588 by Queen Elizabeth. Later various merchant companies obtained charters and settled along the riv. banks. From 1807 G. was controlled from Sierra Leone, but in 1843 it was made an independent crown colony. It was recognised as Brit. by the treaty of Paris, 1814. In 1866 it was included in the West African Settlements, but was again a separate crown colony in 1888. In 1953, following recommendations, the secretary of state approved a new constitution. It was introduced in 1954, and its provisions apply both to the colony and to the protectorate. The Executive Council consists of 4 *ex officio* members and 1 official member, and not less than 6 appointed members. Thus for the first time there is an unofficial majority in the

Executive Council. The Legislative Council, which met for the first time in Dec. 1854, consists of a speaker, 4 *ex officio* members, 1 nominated official member, 3 nominated unofficial members, and 14 elected members. Meetings of the Council are usually presided over by the speaker, but the governor has the right to attend any meeting and to preside. The governor attends and presides at meetings of the Executive Council, and he has reserve powers to legislate by declaration if he considers it expedient. Pop. (colony) 27,297; (protectorate) 280,929.

Gambier, James, Baron (1756-1833), adm., b. in the Bahamas. He entered the navy and rose rapidly in its service. He served under Lord Howe in 1794, and commanded the fleet which bombarded Copenhagen in 1807. He was present with Cochrane at the battle of Aix Roads in 1809, but refusing to act on that sailor's advice was tried by court-martial and honourably acquitted. He was made an adm. of the fleet in 1830, and d. 3 years later. His memoirs were pub. in 1861 by Lady Chatterton.

Gambit, see **CHESS**.

Gambling may be broadly defined as the playing at games of chance or wagering on some fortuitous event for money or money's worth. At the common law all games were allowed provided they were played fairly. When the legislature first intervened is not quite certain, but once having done so it classed together as illegal all sorts of games and pastimes such as cards, dice, cock-fighting, and races, without regard to the absence of any inherent common element. Perhaps the earliest instance of state interference was the proclamation issued by Edward III, who is recorded to have looked with disfavour on games of stones, bars, handball, football, cock-fighting *et alios vanos ludos*, not because of anything vicious in the games *per se*, but apparently because he found that his subjects preferred such peaceful games to the 'noble sports of war'. The proclamation was therefore made, according to some historians, not out of regard for the moral welfare of the people, but in the interests of recruiting for the army. Statutory restrictions on games and gaming are to be found as early as the reign of Richard II. The object of these and subsequent statutes has generally been to punish as public nuisances all manner of games of chance by referring the persons who play at them to the category of rogues and vagabonds. Old writers assign the quaintest reasons for this legislative interference. In regard to the later statutes against gaming and wagering, including the prohibition of lotteries, it is to be noted that the principle varies according as the statute is creating a criminal offence or merely declaring that certain contracts shall not be civilly enforceable. (As to this see also **GAMING**.) G. or wagering contracts are unenforceable simply because there is no legal consideration (see **CONSIDERATION**; **CONTRACT**). The principle underlying the Acts which punish certain

forms of G. as indictable offences is by no means clear. As the criminal law now stands a number of games are expressly forbidden, avowedly on the principle that they are games of chance. The Gaming Act, 1845, the Betting Act, 1853, the Gaming House Act, 1854, the Vagrancy Act, 1873, and the Street Betting Act, 1906, without expressly defining gaming, strengthen the common law against the keeping of common gaming houses or betting in the streets or other public places, presumably on the common law principle that such practices are public nuisances in that they promote cheating and other corrupt practices. But the element of chance as the deciding factor is apparent in most of them. Members of a bona fide club may bet with each other at their club, and apparently betting in the streets could only be punished if any person were found frequenting or loitering in the streets or other public places for an appreciable time for that purpose (see **BETTING**).

Certain games are expressly made unlawful by a series of statutes: they are ace of hearts, pharaoh (faro), basset, hazard, roulette, passage, and every other game played with dice or any instrument, engine, or device in the nature of dice, having figures or numbers on it, but not backgammon or games played on backgammon tables. The prohibition is wide enough to include any card game of mere chance, and that form of baccarat called *chemin de fer* (q.v.) has been vetoed since 1895. In the celebrated case of *Jenks v. Turpin* (1884), where a divisional court upheld a magisterial decision which punished the playing of *baccarat banque* in a gaming-house, the only substantial argument urged against the inclusion of this game was that the element of skill consisted in the player determining whether he would stand on the card dealt to him or take another. Considerable public comment was evoked by a later decision of the courts against progressive whist drives. The principle of the decision was that the element of chance altogether predominated over that of skill, especially as after the first hands were played no player knew who his partners were going to be for the rest of the drive, and further that weak or unskilful players might be indiscriminately pitted against strong players. The craze for limericks in certain pubs, was also suppressed by decisions which declared that such competitions were mere lotteries. The Lotteries Act, 1823, punishes as rogues and vagabonds persons who sell tickets or chances in lotteries authorised by foreign potentates or states, and an Act of 1836 provides penalties for advertising lotteries. The Small Lotteries and Gaming Act, 1854, permits the holding of small private gaming parties not promoted for private profit provided that the prize money does not exceed £20 and the stake of each participant is only 5s. See also **LOTTERY**.

There can be no doubt about the popular love of G. at all times and in

all countries. The periodical raiding of West End clubs and the organisation, especially since the First World War, of sweepstakes offering immense prizes are evidence of this fact (see CALCUTTA SWEEPSTAKE). It was by analogy with the principle of betting in a club that the football pools continued to function after it was decided by the courts that the publication of forms in the press was illegal. It seems evident that pools partake of the nature of both lotteries and sweepstakes; but the position regarding both is as obscure as it is on the licensing of bookmakers and the estab. of totalisators on race-courses, and it may be said that the law on G. is publicly flouted every day. The G. instinct is more prevalent among the hot-blooded and oriental races. If that were not so it would be difficult to explain the absence of restrictions on such games as roulette and *trente-et-quarante* in France, Monaco, and, formerly, in Portuguese colonies, and other countries inhabited mostly by Lat. races, and in China. For a time, it is true, Ostend was a serious rival to Monte Carlo; but in 1902 the Belgian Parliament suppressed public gaming, and awarded compensation to the gaming-house proprietors of Ostend. Baccarat is still prevalent in France, although strictly regulated by the clubs who play the game. The Chinese are a race of notorious gamblers, and there is curiously intermingled a strong vein of superstition.

At the present day, however, it must be conceded that even among Lat. races G. is less and less favoured by the various states, and that this disfavour has resulted in the isolation of Monaco as the one spot in Europe where the roulette whirls, not only by the sanction of the state, but for the express purpose of providing the revenue to support it, and such epithets as 'a hot-bed of vice,' 'the plague spot of Europe,' 'the pickpockets' paradise,' 'the wastrels' Eldorado,' and so forth have been showered on this place. See MONTE CARLO; ROULETTE. See also GAMING and under the various games, CHEMIN DE FER; TRENTE-ET-QUARANTE, etc.

Gamboge, resinous gum which is procured from certain trees in Siam, Ceylon, and other tropical places. It may be used medicinally as a purgative, but cannot be used alone. It is also used as a source of a yellow pigment.

Gambrel Roof, in architecture, an Amer. term for a roof of double slope (see also MANSARD ROOF), a type introduced into New England during the 17th cent.

Gambrius, mythical Flem. king who is supposed to have commenced the brewing of beer. His name may be derived from Gan Primus, who was the president of the Guild of Brewers.

Game Laws. Laws relating to the preservation of game and the punishment of persons unlawfully killing game have sunk to a position of insignificance as compared with a century ago. Blackstone in his time could truly write of the offence of destroying game, that the sportsmen of England seemed to think it

of the highest importance, and the only one of general and national concern. The statutes anent the subject were many and various, and, as the classical commentator said, not even grammatical. Moreover, they exhibited the worst features of class legislation, for they drew broad distinctions between offenders of such rank as was called a 'qualification' (i.e. being the son and heir apparent of an esquire) and indigent offenders. Traditions, however, die hard, and the G. L. were a legacy of the repressive forest laws of the Conqueror. For centuries the one passion of the Eng. landed gentry seems to have been the pursuit of game, and no punishment was too terrible for the poverty-stricken wretch who poached to supply his needs. Even as late as 1827 an Act was passed punishing the felony of killing or wounding deer in any enclosed land with transportation for 7 years. But the protecting of game by oppressive laws was probably more injurious to the morals of the rural pop. than any other single cause. The game swarmed before the labourer returning home from a day of unremunerative toil. Repression only led to night poaching with violent resistance to escape detection. The jails were not large enough to contain the hundreds of prisoners annually convicted. The total public expenditure which the preservation of game occasioned was probably more onerous than that which was required for the support of pauperism. The G. L. were also the greatest hindrances to the improvement of agriculture; and it has often been stated that from 3 to 5 hares eat and destroy as much as would keep 1 sheep. The destruction by game to crops was enormous.

But public opinion has effected a great change, notwithstanding the curious anomaly that the Game Act of 1831 and most of the other repressive G. L. still remain on the statute book. Poaching is now looked upon as not much more than an escapade, and, comparatively speaking, is but lightly punished. In a word, it may be said that the milder manners of the present age, the growing humaneness towards dumb animals, and the tendency to excuse offenders where no great moral iniquity characterises the offence have conspired to reduce the G. L. to a purely secondary place in the criminal system. The prin. Acts now in force are the Game Act, 1831; the Night Poaching Act of 1829 as amended by 7 and 8 Vict. c. 29; the Hares Killing Act, 1848; the Game Licences Act, 1860; and the Ground Game Act, 1880; besides certain Acts for the protection of wild birds. Broadly speaking, these Acts have for their object the restriction of the right either to kill or sell game, and, as incidental thereto, the punishment of those who infringe that exclusive right; the provision of close seasons for birds; and the regulation of game certificates and licences. It may be noted here that these Acts, by punishing trespass as a criminal offence, and inflicting penalties on those who infringe exclusive right of killing game, have

overcome the difficulty presented by the common law principle that there can be no private ownership in animals *ferae naturae* (i.e. in a state of nature) unless reclaimed or confined, or killed on one's land.

Game is declared by the Game Act of 1831 to include hares, pheasants, partridges, grouse, heath or moor game, black game, and bustards. Snipe, quail, land-rail, woodcock, and conies are not game, but they may only be taken or killed by certificated persons. Woodcock and snipe may be taken with nets or snares, and also rabbits, by the proprietor in an enclosed ground or by a tenant and his servant. The right to the game is vested in the tenant in all cases where it is not reserved to the landlord in his agreement with the tenant. Where the game is reserved the occupier can neither kill game nor give permission to another to do so.

Poaching or trespassing on the lands of another in search of game is, if committed in the daytime, an offence punishable summarily under section 30 of the Game Act, 1831, by a fine not exceeding £2. Trespassers may be required to quit the land, and give their names and places of abode, and in case of refusal may be arrested. Firing at game from a highway is a trespass in pursuit of game. The leave of the occupier of the land is no defence where the game belongs to the landlord or some other person, unless given prior to the trespass. These provisions do not apply to persons hunting, or coursing, or exercising a right of free warren, or to gamekeepers. An information for trespass may be laid by a common informer. Trespassers to the number of 5 or more acting together are liable to a penalty not exceeding £5. The law is more severe against poaching by night. Under the Night Poaching Act, 1829, as extended by an Act passed in 1844, any person unlawfully (i.e. having no certificate or licence) taking or destroying any game or rabbits by night, in any land open or enclosed, or on public roads or highways, gates, paths, outlets, or openings between such lands and roads or paths, or leading to enclosed gates; or any person either entering or being by night in such places, with any gun, net, engine, or other instrument, for the purpose of taking or destroying game, may be summarily punished for the first offence with imprisonment not exceeding 3 months, and at the expiration of such period be bound over for a year; for the second offence the above periods are doubled; and for the third offence penal servitude may be awarded to the extent of 7 years. Under the same Act, as similarly extended by the Act of 1844, if 3 or more persons by night unlawfully enter or are on any land for the purpose of taking or destroying game or rabbits, any of the party being armed with firearms or other offensive weapons, they shall be guilty of a misdemeanour punishable by penal servitude to the extent of 14 years. The Poaching Prevention Act of 1861 gives power to a constable to search

persons in public places whom they have good cause to suspect of coming from any land where they have been unlawfully engaged in pursuit of game; they may also search any cart or conveyance of the suspects, and seize game, guns, nets, and engines. By an Act passed in 1862, unlawfully taking or killing hares or rabbits in warren by night is punishable as for a misdemeanour; the punishment for the same offence committed in the daytime is a fine of £5. Unlawfully coursing, hunting, or killing deer in an unenclosed part of a forest is punishable by a penalty not exceeding £50 for a first offence, and, for a second offence, imprisonment not exceeding 2 years, which latter punishment also applies to a first offence where the deer were on any enclosed land. Strong measures to prevent trespassing or poaching may doubtless be adopted, but setting spring-guns, man-traps, or other engines calculated to destroy life renders the person so doing liable to penal servitude to the extent of 5 years.

A licence is required by every person who hunts or takes game, except persons (in Great Britain) taking woodcock or snipe with nets or springs; proprietors or tenants on enclosed land killing rabbits; persons hunting deer or hares with hounds; and others. Occupiers of enclosed land, or owners, having the right to kill game, may themselves kill hares, or authorise others to do so, without a licence, but such authority must be limited to 1 person at a time in any one par., and must be registered with the clerk of the petty sessions' justices. A gun licence is required even when the quarry is not legally game; but a game licence covers a gun licence. The charge for a licence taken out after 31 July, to expire on the next 31 July, is £3; to expire on 31 Oct. next ensuing, £2; for a licence taken out after 1 Nov., to expire 31 July, £2; and for any continuous period of 14 days, £1. See also CLOSE TIMES.

Game Reserves and Preserves, large tracts of country which have been set aside by gov. or other bodies for the preservation and protection of wild life native to those areas. In the U.S.A., Canada, Africa, Australia, and Malaya, in particular, care has been taken to estab. G. R. and P. See ALBERT PARK; BIG GAME; ELK ISLAND PARK; JASPER PARK; KENYA. **Divisions and Physical features** (for Tsavo and Nairobi parks); NATIONAL PARKS; YELLOWSTONE PARK; YOSEMITE PARK.

Gamein, Maurice Gustave (1872-), Fr. en., educ. at St Cyr. Chief of staff to Gen. Joffre in the First World War from 1914 to 1916. Gen. of brigade and a divisional commander in 1917. Led a military mission to Brazil, 1918-25. Gen. of div., 1925. Commander of the Fr. forces in the Levant, 1925-8. Chief of staff of the Fr. Army, 1931-5. Inspector-gen., 1935-7. Vice-president of Higher Council of War, 1935. Chief of general staff of national defence, 1938. Commander-in-chief of the allied forces in France in the Second World War, 1939.

Sustained a colossal defeat by the Germans in June 1940. He was one of the defendants at Riom in a trial for treason and in 1943 was imprisoned. He was liberated by the Allies in 1945. His book, *Servir: Les Armées françaises de 1940* (pub. in 1946), is his defence against charges of having contributed to the disaster of 1940. While this proves that G. was not the advocate of a 'defence first' policy with which he was credited at the time, his apparent laxity of command makes the responsibility for the disaster of 1940 at least partially his.

Gamete, in biology, the sexual protoplasmic body, which unites with another for reproduction. Typically G.s consist of the ovum, a large cell containing nutritive material, and the spermatozoon, smaller and frequently active. The individual bearing the former is the female, the latter the male. See BIOLOGY; EMBRYOLOGY; EXPERIMENTAL EMBRYOLOGY.

Gametophyte, see PROTHALLUS.

Gaming. A wager or G. transaction involves a promise to pay money or something of value solely upon the determination of an uncertain event. The policy of the Eng. law is to render practically all such agreements unenforceable, the only substantial exceptions being the various commercial transactions relating to insurance and the purchase of shares on the Stock Exchange. The Gaming Act of 1845 makes all G. or wagering contracts null and void. By the Gaming Act of 1892 no one can recover under a contract in any form commission or reward promised him for making or paying bets on behalf of another. The effect of this Act is that if A employs B, a betting commissioner or turf agent, to make bets for him and loses, B cannot recover from A money paid to discharge such bets; again, if A obliges his friend B by paying his racing debts, he cannot recover the money from B; and again, if A lends B money, knowing that B is going to make bets with it, he cannot recover from B the money so lent. But if A makes bets for B and receives the winnings he can be compelled to pay them over to B; and, again, if A deposits money with B, a stakeholder, he can recover it from B at any time before B has actually paid it away on the determination of the wager. Securities such as promissory notes or bills of exchange given in payment of a bet are void as between the original parties to it, and a subsequent holder even for value cannot enforce such an instrument if it be shown that he knew of the illegal consideration for which it was originally given. Speculating on differences in the Stock Exchange falls under the Act of 1845 where it can be shown that the contract was a 'time bargain,' or mere gambling transaction (see DIFFERENCES). Contracts of marine insurance are perfectly valid where the person effecting the insurance had an *insurable interest* in the subject matter of the policy at the date of the loss; the result of this is that a cargo owner may recover on a policy entered into many days after his cargo has been

lost at sea, provided he was ignorant of such loss at the time he made the contract. See INSURANCE. For the Acts forbidding certain games as criminal offences see GAMBLING; and for the prohibition of lotteries see GAMBLING and LOTTERY. See C. F. Shoolbred, *Law of Gaming and Betting* (2nd ed.), 1935; and H. A. Street, *Law of Gaming*, 1937.

Gamma Rays, electromagnetic waves (q.v.) of very short wavelengths (c. 10^{-10} – 10^{-11} cm.), shorter even than those of X-rays (q.v.). They were discovered by Villard in 1900 as a third component of the radiation from some radioactive materials, the other 2 being alpha- and beta-particles (q.v.). He showed that they are not deflected by a magnetic field, and are therefore not charged particles. The rays are very penetrating, requiring many cms. of lead to stop them, and they produce a correspondingly small amount of ionisation. It has been shown that they are emitted by excited nuclei—a nucleus with more than its usual amount of energy emits some or all of the excess as a quantum (q.v.) of G. R. These quanta have discrete energies, i.e. the nuclei emit a line spectrum of G. R., showing that the nucleus can possess only certain energies of excitation. Nuclei can be excited in many ways, e.g. by being bombarded with protons or neutrons, or by electromagnetic waves of appropriate wavelength. Following a radioactive transformation, the product nucleus can be formed in an excited state and G. R. will then be emitted. G. R. are also produced when electrons of very high energy are rapidly slowed down in the neighbourhood of a nucleus—an example of Bremsstrahlung (see X-RAYS). The interaction of G. R. with matter is similar to that of X-rays, but for very short wavelength G. R. an important phenomenon is noted. When the G. R. quantum passes very near to a nucleus it can produce an electron pair, i.e. a negative electron and a positron (q.v.) or positive electron. The energy of the quantum must be greater than 1.02 MeV (see ELECTRON VOLT) which is the energy equivalent of the mass of the 2 particles, and any excess energy appears as kinetic energy of the electron pair. The positron is annihilated after about 10^{-9} sec. by combination with an electron to produce 2 G. R. quanta, or more rarely 1 quantum. Artificially produced radioactive isotopes that emit G. R., e.g. cobalt of mass number 60, find applications in radiotherapy, and for the detection of flaws in metal castings (see X-RAYS). See RADIOACTIVITY.

Gamondio, see CASTELLAZZO BORMIDA. **Gamat**, in music, originally the note (G) on the bottom line of the staff in the bass clef, but afterwards a system of notation by which the musical scale was shown divided into hexachords, i.e. groups of 6 notes named by the syllables later adopted by the tonic sol-fa method.

Gand, see GHEHT.

Gandak, or Great Gandak, Indian riv. which rises in the Himalaya in Nepal,

and is a trib. stream of the Ganges, joining that riv. at Patna. Its length is about 400 m., and it is known also as the Narayani.

Gandersheim, Bad, Ger. tn in the *Land of Lower Saxony* (q.v.), 38 m. SSE. of Hanover (q.v.). It was famous for some centuries for its abbey-school for the daughters of nobles. Pop. 2500.

Gandharvas, one of the bands of semi-divine beings created in the beginning by Brahma. They were 6333 in number, and were b. 'imbibing melody.' There are different accounts of their origin. In later myth they are met with as the musicians of Indra's heaven, espoused to the *Apsarasas* (nymph-like beings). Man was the offspring of their unions. They have been identified with the Centaurs.

Gandhi, Mohandas Karamchand (1869-1948), commonly called Mahatma G., Indian Nationalist leader, was b. 2 Oct. at Porbandar, in the Kāthiāwār peninsula, on the coast of the Arabian Sea. His parents were of Bania caste and Jain religion. From early boyhood he was much concerned with a search for ethical and moral truth, and sought a synthesis of what appeared to him the best in all religious beliefs. Whether he ever found such a synthesis to his own satisfaction will never be known; but he certainly found an ethical guide to conduct which he applied to himself, though he could never expound it in dogmatic terminology.

In 1888 he arrived in England; he studied at the Univ. College, London, and was called to the Bar at the Inner Temple. He returned to India in 1891, and soon afterwards began practice in the supreme court of Bombay. In 1893 business took him to Pretoria. He resolved to stay in South Africa to support the cause of Asiatic immigrants, and he gradually abandoned his lucrative practice in Johannesburg. In 1899 he organised an Indian Red Cross for the Boer war. In 1903 he founded a paper, *Indian Opinion*, at Durban. He was prime mover in a great demonstration at Johannesburg, Sept. 1906, whereat the oppressive 'Asiatic ordinances' were denounced. During the African revolt in Natal in 1908 he organised, and served in, a corps of stretcher-bearers. For his political activities he was frequently arrested and imprisoned; even from extremists on his own side he suffered violence. The oppressive ordinances were removed in 1914; G. returned to India, and on the outbreak of the First World War came to London to organise an Indian ambulance corps. The attitude of the Brit. Gov. in India after the war entirely alienated him. He was the religious leader of the national movement till Tilak's death in 1920; he then became political leader by necessity. He proclaimed the *Harital*, or cessation of work of 6 April 1919, which was the precursor of the affair of Amritsar (q.v.). He supported the unrest of the Muslims provoked by the Allies' treatment of Turkey; and their Khilafat Committee, 1920, endorsed his non-co-operation policy. This consisted in denying and

ignoring the authority of the estab. Brit. Gov. The All-India Congress of Calcutta in that year approved the policy, which included the fostering of home industries, such as the use of the spinning-wheel.

The non-co-operation policy did not pursue the quiet course indicated by G.'s ethics. Strikes and riots were widespread in 1921, and, in the same year, G. superintended the burning of foreign merchandise in Bombay. 'Civil disobedience,' the next step, involved non-payment of taxes—it began in Nov., when the Prince of Wales arrived. There was rioting and looting, so G. suspended the disobedience

MAHATMA GANDHI

E.N.A.

order. At the end of the year Congress invested him with dictatorial powers. More violence by Nationalists (at Gorakhpur) caused G. to abandon civil disobedience; but he was arrested and tried at Ahmedabad in 1922, and sentenced to 6 years' imprisonment for preaching disaffection. After an operation for appendicitis in prison he was released (1924), and for a while suffered apparent eclipse. Near the end of 1927 he returned to active politics and was enthusiastically received in Ceylon. After a visit to Burma he was in Aug. elected to presidency of Congress; but he declined it, leaving it to his lieutenant, Motilal Nehru (d. 1931). In Mar. and April 1930 he made his celebrated march from Ahmedabad to the sea, and formally violated the unpopular salt monopoly of the gov. by publicly distilling salt from sea water on the shore. He was arrested 5 May and sentenced to be kept in Yeravda Jail, near Poona, during the gov.'s pleasure. He was released again in Jan. 1931 to attend the

Round-table Conference in London. Two months later he concluded a truce with Lord Irwin, the viceroy. During further unrest in 1933 he was once more arrested and again released. The following year he announced that he wished to give up politics, and retired to his *ashram* or retreat at Wardha. But he was by now so identified with the nationalist movement in India, and had so captured the heart of India as a saintly leader that he was compelled, even in retreat, to give his constant counsel. He entered public life again in 1937 when he acted as mediator between the gov. and the Congress party on the issue of the assumption of office by the party in the provs.

The outbreak of the Second World War caused G. much distress. He had no doubt that Hitler was the aggressor and that Britain morally deserved full Indian support. But he convinced himself that only a 'free India' could render effective moral support to Britain, and his demand for 'complete independence' became even more insistent. The invasion of India by Japan faced him with a flat challenge to his belief in non-violence. That belief held firm and when the Cripps Mission (see INDIA, *History*) had reached a hopeful stage, G. threw his weight against settlement and the negotiations with Congress leaders broke down. At a moment when the war situation was unfavourable he opposed the draft declaration whereby India was promised autonomy, and demanded that the Brit. should 'quit India,' that the Indian Army should be disbanded, and that Japan should be allowed to enter India and arrange terms with a non-resisting people.

In Aug. 1942 he concurred in the Congress decision to organise mass obstruction against the war effort. This 'open rebellion,' as he himself called it, led to his arrest and that of other Congress leaders and to widespread disorder and bloodshed. G. was interned in the Aga Khan's palace at Poona and forbidden political contacts—though he was allowed the companionship of Mrs Gandhi, who d. in Feb. 1944. He was released unconditionally on medical grounds on 6 May 1944. Subsequently all the Congress leaders were released to take part in the protracted discussions arising out of attempts to determine the questions of independence and partition. A series of conferences between him and Mr Jinnah (q.v.) at the latter's house in Bombay were fruitless, for G. stated that he spoke only for himself and had no mandate from the working committee of the Congress. For many years in fact he had withdrawn from actual membership of the party, only to dominate it from without. In the negotiations in the spring of 1946 at Delhi with the Brit. Cabinet mission under Lord Pethwick-Lawrence, G. took a large share, mainly behind the scenes; and when at length, amid very serious outbreaks of communal violence, the plans of the mission led to the formation at Delhi of an interim National Gov., with Pandit Nehru as vice-president of the council, G.

remained outside the Cabinet. He continued, however, to be regarded as the ultimate national leader, and his views and advice were constantly sought.

When Independence Day came in 1947 sanguinary unrest in Calcutta led to fears that the partition of Bengal between the new dominions of India and Pakistan would have disastrous consequences. G. who had been travelling through E. Bengal and in Bihar preaching brotherhood, went to Calcutta, and in Sept. undertook a fast until normal conditions were restored. The party leaders exerted their influence over the people and on the fourth day G.'s fast ended. On 30 Jan. 1948 he was assassinated in Delhi on his way to an evening prayer meeting by a Hindu fanatic named Nathuram Vinayak Godse.

As a social reformer G.'s personality and purpose excited the widest interest throughout the world. More than a politician, he long figured as a prophet in revolt against the ideas of an age of machinery, of science, of more complex organisation, and of ever-increasing state control. To W. minds many of his political activities, and his dependence upon the support of Indian big business for political finance, appeared inconsistent with his avowed principles. But often as he seemed to change his mind on matters of detail, and adept as he was in political expediency and tactics, the burden of his message was the same: the repudiation of violence and the exaltation of the individual conscience. Fundamentally this part of his doctrine was a conviction, based, in his belief, on the purest forms of Hindu religion, that the innate goodness of the common man was the essence of all social and political organisation. This was in later years the inspiration of the campaign against 'untouchability' which lost him a multitude of supporters among the orthodox. Revered as a saint by millions of his countrymen, there were many, both inside and outside India, who were puzzled or irritated by the contrast between the wise, humorous, kindly, and courageous social reformer and the hair-splitting politician and demagogue. Yet all would acknowledge that he was the most influential figure India has produced for generations. See R. Rolland, *Mahatma Gandhi*, 1924; C. F. Andrews, *Mahatma Gandhi's Ideas*, 1929; E. Privat, *Aux Indes avec Gandhi*, 1934; K. Shridharani, *War Without Violence*, 1939; C. Heath, *Gandhi*, 1944; and L. Fischer, *Gandhi, his life and message for the world*, 1954.

Gandia, Sp. seaport in the prov. of Valencia, on the Mediterranean. It has an anc. college, once a univ., a Gothic church, and the palace of the dukes of G. The busy port exports oranges, raisins, onions, and wine. Pop. 20,050.

Gandon, James (1743–1823), architect, b. London. Articled to Sir Wm Chambers (q.v.) and started practice c. 1764. Won the competition for the County Hall and Prison at Nottingham, erected 1770–2. Having been introduced to influential people in Ireland, he started practice in

Dublin, 1781, where he built the Custom House, 1781-81; the Parliament House (now Bank of Ireland), 1785; and the Four Courts, 1786-1802. He also designed the Court House and Gaol at Waterford, 1784.

Gandzha, see KIROVABAD.

Ganesha, or **Ganapati** (i.e. Lord of Hosts), name of a Hindu God, the son of Siva. His images represent him as a stout man with an elephant's head and 4 arms.

Ganges, riv. of N. India. This great stream is formed by the draining of the S. slopes of the Himalaya Mts. It rises in the Garhwal state and issues from an ice cave of the Himalaya, near Gangotri, 10,000 ft above the level of the sea. The riv. when it first issues forth is called the Bhagirathi. It is not until it is united with the Jahsari and the Alaknanda that the united stream is known as the G. The G., besides being the great riv. of India, is also an essential part of the Indian religious system. Both the source and the junctions of the rivs. are regarded as sacred spots by the Hindus. Emerging from the Himalaya Mts it turns to the SW. It can hardly, however, be regarded as a great riv. until at Allahabad it receives the Jumna, a stream which has its origin to the W. of the G. The junction of the Jumna and the G. is regarded by all Hindus as the holiest and most sacred of places, and is the scene of constant pilgrimages by the Hindus, who come there to wash away their sins. Other tribs. of the G. are the Gumti, Gandak, and Gogra. Opposite the confluence of the Gandak is the city of Patna, 140 m. E. of Benares. The riv. passes through the great city of Benares and then approaches the Bay of Bengal; 220 m. before reaching the shores of the bay it begins to spread out and form the delta. The main channel, which is called the Padma or Padda, flows in a south-easterly direction, and is met at Goaland by the main stream of the Brahmaputra, and these 2 streams form a great estuary which is known by the name of Neghka, and which enters the Bay of Bengal at Moanhall. This great channel is the most easterly of all the channels of the delta. On the other side we find the Hugli, which is the most westerly of all the channels. The land which forms the delta is in the N. fertile and rich, but in the S. is swampy and goes by the name of the Sundarbans. The great commercial stream of the delta is the Hugli, on which stands the tn of Calcutta, which is about 90 m. from the sea-coast. Formerly steamer communication existed as far as the tn of Allahabad, but nowadays, owing to present-day facilities for traffic by rail and the increasing shoals in the riv., steamers go no farther than Calcutta. Often great changes take place in the riv.-bed; i.e. are thrown up, new channels are sought. Such changes are so rapid that it is dangerous for any large or permanent structure to be erected on the banks. The G. is crossed by 6 railway bridges as far as Benares, and another in E. Bengal has been erected. There are 2 canals—the

Upper G. Canal and the Lower G. Canal—which together with the Jumna irrigate the greater portion of the land between the G. and the Jumna above Allahabad. There is no important navigation on them.

Ganglion (Gk *gaglion*, swelling or excrescence): 1. In anatomy, an enlargement occurring in the course of a nerve, and containing bi-polar or multi-polar nerve cells as well as nerve filaments. Ganglia form subsidiary nerve centres. Two systems of nerves have ganglia upon them. First those of common sensation, whose ganglia are near to the origin of the nerve in the spinal cord. Secondly the sympathetic nervous system has various ganglia on various parts of it. In the invertebrates these ganglia are centres of nervous force and are distributed through the body in pairs.

2. In surgery, an encysted tumour, situated somewhere on a tendon.

3. In botany, the mycelium of certain fungals. Lymphatic G.—a lymphatic gland.

Gangotri, Hindu temple and place of pilgrimage in the Himalayas, close to the source of the Ganges. Pilgrims to this temple are supposed to be relieved of their sins.

Gangre, see ORE AND ORE DRESSING.

Gangrene (Gk *gagraina*), or **Mortification**. G. is the condition in which putrefaction accompanies the death and degeneration of body tissues or of some of their constituent cells and is due to failure of arterial blood supply. G. may be either dry, that is mummified, or moist. Moist G. occurs from liquefaction of the gangrenous tissues by rapidly growing putrefactive bacteria. The cause of G. may be local, constitutional, or the 2 combined. It may be the result of changes in the vessel wall, as in senile G. of the old and feeble, and in certain diseases, such as diabetes, typhoid, measles, etc. Blocking of the arteries by emboli (q.v.) or thrombi (see THROMBOSIS) or by external pressure is another cause. For instance, a tourniquet left in position too long may cause G. Heat or cold (burns or frostbite), chemical agencies and bacillary affections, such as carbuncles, erysipelas, etc., may all cause G.

When the cause is removed, the gangrenous part separates. During the separation the affected parts should be kept aseptic, dry, and free from germs. In G. of a limb amputation is indicated when there is no prospect of a return of healthy blood to supply the part affected. A special form of G., known as Gas G., may occur when severely damaged tissues, particularly muscle, are infected with certain gas-forming bacilli. A highly dangerous and rapidly spreading form of G., Gas G. is a danger in war wounds when there is much tissue destruction and a deep penetrating wound. Also delay in treatment, which may be inevitable in war, favours the occurrence of Gas G. Better surgical technique, the use of antibiotics, and the performance of surgical operations on the actual field of

battle saved many lives in the Second World War, and the incidence of Gas G. was far less than in the First World War.

Ganja, see KIROVABAD.

Gannet, or *Sula bassanas*, web-footed, aquatic bird, a species of Sulidae. It is popularly called the Solan goose, and derives its specific name from the Bass Rock, one of its favourite haunts. It is solely an oceanic bird, with an easy and powerful flight; its entire length is about 3 ft. and the general colouring is white with a buff tinge on the head and neck; the bill is long and thick and compressed at the point. G.s are found nesting on

R. D. Robinson

GANNET

sev. rocky stations on the coast of the Brit. Isles, Ailsa Craig, St Kilda, Sullis-korry, and Grassholme (where it is estimated that there are over 6000 pairs belonging to the Royal Society for the Protection of Birds). In late autumn they migrate to North Africa. They feed on such fish as swim near the surface, herrings, pilchards, etc., diving swiftly and sometimes from a considerable height, upon their prey.

Ganshoren, suburb of Brussels, Belgium, N.E. of the city. Pop. 11,900.

Ganymede, son of Tros, king of Dardania, a Phrygian youth of surpassing beauty, who was carried by Zeus in the form of an eagle to heaven to serve as his cupbearer. Later Gk mythology represented him as the genius of the life-giving Nile, and anc. astronomers said he was Aquarius.

Gao, tn of Fr. Sudan, Fr. West Africa. It stands on the l. b. of the Niger, about 200 m. E. of Timbuktu direct, and by riv. nearly twice that distance. It was once

a prosperous tn, the cap. of the empire of the Songhais, and the ruins of the tomb of a Songhai leader, Mohamed Askia, are still to be seen. The Fr. estab. a military post here in 1900, and the new tn that has since sprung up has a pop. of 10,000. Mungo Park, Barth, and Houtart visited G. in the course of their explorations.

Gaol, see PRISON.

Gaol Delivery, see JAIL DELIVERY.

Gaol Fever, see JAIL FEVER.

Gaon (plural **Geonim**) properly signifies pride or majesty. In the hist. of Judaism G. was a title given especially to the heads of the Jewish academies of Sura and Pumbedita in Babylon. Sura was the senior academy, and the G. of Sura was recognised by the Babylonian court as the civil head of the Jews. During the Babylonian Gaonate there were 37 Geonim of Sura, beginning with Mar Rabbi Mar, AD 609, ending with R. Samuel ha-Kohen in 1034, and 50 Geonim of Pumbedita, from Mar ben R. Hanan in 589 to R. Hai in 1038. The age of the Gaonate was marked by an excellence in literary studies and an increase of culture, especially during the rule of R. Saadia, G. of Sura in 928. Studies were not confined to the Talmud, but one of the prin. works of the Geonim was replying to questions of ritual, submitted to them by Jewish congregations in distant communities. The traditions of the Gaonate survived in Damascus, where in 1170 the teachers there were spoken of as 'the scholastic heads of Israel.' The title was later given to outstanding religious authorities such as Elijah ben Solomon (1720-97), the 'Vilna Gaon.'

Gap (anc. **Vapincicum**), Fr. tn, cap. of the dept of Hautes-Alpes, on the Luye, a trib. of the Durance (q.v.), 477 m. S.E. of Paris. It stands 2425 ft above sea-level, and is the seat of a bishopric. There is a trade in timber and livestock. Pop. 16,400.

Garamond, Claude (1480-1561), Fr. type-cutter. About 1541, in collaboration with Robert Estienne, he designed the famous Gk type named *Grecs du roi* (in recognition of the patronage of François I), which was first used in *Alphabetum Gracum*, printed by Robert Estienne in 1543. The present type face Garamond was designed by Jean Jannon.

Garat, Dominique Joseph (1749-1833), Fr. politician and writer, b. near Bayonne. In 1790 he was a member of the Constituent Assembly whose debates he reported in the *Journal de Paris*. He won literary distinction by his *éloges* on Fontenelle and other famous Fr. writers, taking sev. prizes awarded by the Fr. Academy. G. became minister of justice during the early days of the Fr. Revolution, and it was he who told Louis XVI that the convention had condemned him to the guillotine. Under Napoleon he was ennobled and also became a senator and president of the institute; but he lost office on the restoration in 1815.

Garbett, Cyril Forster (1875-1955), prelate, educ. at Portsmouth Grammar School and Keble College, Oxford; was

vicar of Portsea, 1909-19; appointed bishop of Southwark, 1919, and of Winchester, 1932. He became archbishop of York in 1942. His custom of regularly travelling through the rural parts of his dioceses on foot endeared him to the people. G. was one of the Church's leading spokesmen in the House of Lords on the Church's attitude to social and international problems. Amongst his publications were *The Church and Social Problems*, 1939, *The Church and Social Problems in Peace and War*, 1940, *The Claims of the Church of England*, 1947, *Church and State*, 1950, *In an Age of Revolution*, 1952.

Garbo, Greta (Greta Louisa Gustafsson) (1905-), Swedish actress, b. Stockholm. At the age of 14 she entered a dept store. Took up dancing. Attended a dramatic school attached to the Royal Theatre, Stockholm. Began film career, 1922, appearing in *The Atonement of Gosta Berling* under the direction of Mauritz Stiller and changing her name to Garbo. Then went with Sjöller to Hollywood and starred in many films which brought her world-wide fame, including *Mata Hari*, *Anna Christie*, *Queen Christina*, *Anna Karenina*, *Marie Walenska*, *Camille*, and *Ninotchka*. She has become a film legend in her lifetime and was given a special Academy Award in 1954.

Garborg, Arne (1857-1924), Norwegian novelist, playwright, and poet, the most important writer of the *Landsmaal* movement, and the president of the *Norske Samlaget*, a literary society formed in 1868 for the propagation of the *Landsmaal* (New Norse) as a literary language. His first important novel *Bondestudenten*, 1883, gives an interesting picture of Norwegian life at the time. His later novels are *Kolbotnbroen*, 1890, and *Traette Maend*, 1891. As a dramatist he won some success with *Laeraren*, 1896, *Den burkonne faderen*, 1899, and *Hemkommin son*, 1903. His 2 verse cycles *Haugtussa*, 1895, and *I Helheim*, 1901, rank among the masterpieces of Norwegian literature. See R. Thesen, *Arne Garborg* (3 vols.), 1933-6, *Ein diktar og hans strid*, 1947; J. Dale, *Studier i A. Garborgs språk og stil*, 1950.

Garção, Pedro Antonio Correia (1735 or 1724-72), Portuguese poet, lived a sequestered life near Lisbon till, in his thirty-sixth year, he was thrown into prison, perhaps because some of his writings had offended the autocratic gov. There he d. In most of his dramas, sonnets, odes, satires, and epistles he was avowedly imitating classical models, and in the last 2 he has assuredly proved himself 'the Portuguese Horace,' a title given also to Ferreira. The purity of his taste and style undoubtedly lifted the national literature out of the mire of decadence into which it had fallen, but G. must be described as a writer of conscientious refinement rather than as a genius. See T. Braga, *Arcaidia Lusitana*, 1899.

García I, Sp. king, reigned over Navarre from 885 to 905. His reign was darkened by continual warfare against the Moors.

García II, the Trembler ('El Tembloroso'), ruled Navarre from 924 to 970. His surname was due to a physical infirmity, and in the active part he took in the struggles between Leon and Castile he proved a worthy successor to the warlike Sancho.

García III, king of Navarre from 1035 to 1054. He was the eldest son of Sancho II the Great. Defeated and killed in the battle of Atapuerca, his kingdom passing to Ferdinand's nephew, Sancho IV.

García IV, ruler of Navarre from 1134 to 1150. When Alphonso the Battler, the emperor, foolishly bequeathed Navarre to the Knights of St John, and Aragon to the Templars, the Navarrese, refusing a foreign yoke, chose G. Ramirez, a scion of the old royal stock, to be their king.

García, Manuel (1775-1832), Sp. vocalist and composer, was famous among his contemporaries for his splendid and artistic singing, and is still remembered as a great teacher. At first a chorister in the cathedral of Seville, he appeared successively in his own and other musicians' operas in Cadiz, Madrid, Paris, and London. After a profitable tour in America (1825) he was robbed of all his wealth whilst on his way to Vera Cruz. For the remainder of his life he taught his art in Paris, using the excellent system advocated in his *Metodi di Canto*. The numerous stage works he composed are forgotten. His son, Manuel Patricio Rodríguez G. (1805-1906), was no less famous as a teacher than his father. He was prof. at Paris Conservatoire, 1842, and Royal Academy of Music, London, 1846; and also inventor of the laryngoscope (1855). His daughters, Maria Malibran (q.v.) (1808-36) and Pauline Viardot (1821-1910), were also very famous singers. See M. Sterling Mackinlay, *García the Centenarian*, 1908; and J. M. Leven, *The García Family*, 1932.

García Calderón, Ventura (1883-), considered one of the best writers that Sp. South America has produced, b. in Peru. He is the son of a former president of Peru, who preferred imprisonment and exile to the shame of signing a treaty that he considered dishonourable for his country. As a result, the son has lived a large part of his life in France and Spain. In his books he writes of Peruvian native subjects in the Sp. language, but with a grace he has partially borrowed from the Fr. His best-known vols. are *The Vengeance of Condor*, *Danger Death*, and *Colour of Blood*, all of which are collections of short stories.

García Lora, Federico, see LORCA.

Garcilaso de la Vega (c. 1503-36), Sp. poet and soldier, b. Toledo; became at the age of 17, guardsman of Charles V, and from 1532-4 served Don Pedro de Toledo, the viceroy of Naples. Wounded during the Tunis expedition of 1535, he met his death the following year whilst storming a small fort in Mury during the retreat from Marseilles. He is the finest pastoral poet of Spain, and with Boecan, his friend, shares the honour of having popularised the It. hendecasyllable verse.

His finest poem is the first of his 3 eclogues, penned in Naples under the inspiration of Virgil's tomb. Only a few odes and sonnets are included in his scanty remains, but they are fine enough to enrol him among the classics. He was the author of that great sonnet which begins 'O dulces prendas por mi mal halladas.' See study by H. Keniston, 1922, who also ed. his *Works* (New York), 1925; M. Arce Blanco, *G. de la Vega*, 1930; R. Lapesa, *La trayectoria poética de Garcilaso*, 1948.

Garcilaso the Inca (1539-1616), as he called himself, was a Sp. historian, son of Sebastián G. de la Vega and a princess of the royal line of Incas. B. at Cuzco in Peru, he early (c. 1580) migrated to Spain and passed most of his life at Córdoba, where a chapel in the cathedral bears his name. Considering his intimate knowledge of his native language, his Peruvian hist., entitled *Comentarios Reales que tratan del Origen de los Incas reyes, que fueron del Perú*, 1609-17, is disappointing. See study by J. Fitzmaurice-Kelly, 1921.

Gard, dept of S. France, formed of part of the anct prov. of Languedoc. It has a short coastline on the Mediterranean, and is watered by the Rhône and its tribs. the Cèze, the Ardèche, and the G. In the NW. are ridges of the Cévennes, of which Mont Aigoual is 5120 ft high, whereas the S. is low, with marshy plains yielding salt. The Garrigues in the SW. are forested limestone hills. The dept suffers from the mistral (q.v.). Olives, vines, mulberries (for silk-worms), fruit, and cereals are produced in great quantities, and cattle are raised. There is much mineral wealth, including coal, iron, lignite, copper, zinc, and lead, and there are metallurgical, silk, leather, and oil industries. The prin. tns are Nîmes (the cap.), Alès, and Le Vigan (qq.v.). Area 2270 sq. m.; pop. 396,750.

Gard, Pont du, celebrated Rom. aqueduct in France, crossing the R. Gard 18 m. W. of Avignon. Built by Marcus Agrippa (q.v.) in 19 BC to bring water to Nîmes (q.v.), it has 3 tiers of arches, one above the other. It is 902 ft long and 160 ft high. See E. Esparandieu, *Le Pont du Gard et l'aqueduc de Nîmes*, 1929.

Garda, Lake of (It. Lago di Garda; anct Lacus Benacus), It. lake, lying mainly between Lombardy and Veneto (qq.v.). At its N. extremity, which is in Trentino-Alto Adige (qq.v.), it is fed by the R. Sarca from Alpine glaciers. From the S. end of the lake the R. Mincio (q.v.) issues. G. contains 4 small ls., and its area is 143 sq. m. It is 32 m. long, and 2-11 m. broad. The N. shores are mountainous; in the NE., in particular, the lake is overlooked by the precipitous grey cliffs of Monte Baldo. The climate is Mediterranean, and vines, olives, and citrus abound. Since early times the lake has been famous for its beauty; it has been praised by, amongst others, Catullus, Virgil, and Dante. Tns on its banks include Riva, Peschiera, and Sirmione (qq.v.).

Garde Nationale of France, a body of armed citizens, organised in Paris in 1789 for civic defence. In 1795 they helped to put down the Parisian mob, and in the revolutions of 1830 and 1848 supported the revolutionaries. In 1871 they were dissolved by Parliament.

Garden Art. The first gardens were made when the early nomadic tribes settled down on an approved spot, surrounded themselves and their herds with a hedge as a protection against wild beasts, and within their enclosure planted vegetables and fruit trees for their sustenance. Little art was used in their formation, but planting in regular rows was recognised as a useful measure in order that the plants should receive the attention they required. Anct tablets from Egypt show orderly rows of sycamore, fig-trees, and date-palms under cultivation for their enjoyable shade, profitable fruits, and wood. That flowers were grown for pleasure is indicated by a representation in a Theban tomb of early date of beds of cornflowers, poppies, and papyrus growing by the side of a canal. Parks of trees with cared-for paths and bushy undergrowth were instituted by the Babylonians, who also invented about the 9th cent. the 'hanging gardens of Semiramis'—one of the wonders of the world—a series of terraced gardens supported by strong arches. The acclimatisation of foreign trees in his own land began with Tiglath-Pileser I, c. 1100 BC. The early gardens of Greece were strictly utilitarian, consisting of vegetable beds, and our modern pot-gardening began when the votaries of Adonis sowed in earthen pots fennel, lettuce, wheat, and barley—plants which sprang up soon and as quickly withered, thus symbolising the early violent death of the beautiful youth. The gymnasiums of early times were finely ornamented with park grounds, and were later constructed with the addition of baths. Both in Greece and in Italy fountains, water-works, and statuary have always played a leading part in the formation of a garden; and in Spain and France these are also important. The wonderful water devices in the ruined garden of the Villa d'Este at Tivoli still reflect in some measure the marvels of the Renaissance. In England during the early part of the Christian era useful plants constituted the gardens, while the rose and lily were regarded as being heathenish plants; later they became the symbol of Mary and the reward of martyrdom. During the Middle Ages ladies of the household used to attend to the gardens, having learned from the monks the art of growing healing herbs among their vegetables (an early garden was called *Ortus sanitatis*, the place of health). Flowers were planted in the grass; clipped trees, arbours of roses and honeysuckle, turf seats, and outdoor baths added to the later pleasures of gardens; and meals in the open air became popular.

Among great garden artists or architects were Rainaldi, Le Blond (who worked for Peter the Great), Boyceau

(Fr. Renaissance garden artist and architect of the Versailles garden), André Le Nôtre (q.v., 17th-cent. Fr. garden artist, who worked at Versailles and Vaux-le-Vicomte), Léon Battista Alberti (It. Renaissance), Bramante (It. Renaissance), Lancelot Brown (q.v., Eng. landscape garden artist), Sir Joseph Paxton (who laid out the Chatsworth gardens), and Winckelmann. England has learned much from other countries in the making of gardens—as her Dutch sunk gardens show, and the oriental influence at work in

clipped trees and shrubs and statuary are very little used. *See also* GARDENING; LANDSCAPE GARDENING. For a full, illustrated, scholarly work consult *A History of Garden Art* by M. L. Goehe, trans. by L. Archer-Hind and ed. by W. P. Wright, 1928; G. Gromort, *L'Art des jardins*, 1934; and H. F. Clark, *The English Landscape Garden*, 1948.

Garden Cities were originated by Sir Ebenezer Howard (q.v.) in his famous book of 1898. He proposed, as a corrective to the overgrowth of cities and rural

First Garden City Ltd.

LETCHWORTH GARDEN CITY

the pagoda at Kew—but in naturalness she is supreme; the unrivalled lawns with herbaceous borders, or rock borders planted with alpine flowers, are part of her glory. Hampton Court, Kew Gardens, Hyde Park, and Regent's Park all supply beauty and inspiration to dwellers in London; and among exquisite private gardens are those at Sandringham in Norfolk, Chatsworth in Derbyshire, Aldenham House in Herts, The Pleasance in Overstrand, Norfolk, and Wisley Gardens in Surrey. America has vast national parks and also charming domestic gardens; they are usually enclosed by hedges, vines on lattice screens, or masses of informal plantings; climbing vines on porches and walls are popular;

decline, and as a measure of land reform, the building of new towns of limited size (32,000–58,000), surrounded by permanent agric. belts, completely planned to provide houses, workplaces, and all urb. facilities near together, their whole sites to be held in trust for the public so that increments of land value should benefit the community. A limited-dividend company, First Garden City Ltd., was founded in 1903, acquired a site at Letchworth (q.v.) in Herts, 35 m. from London, and estab. a town on this model. Despite shortage of capital and public scepticism Letchworth has proved a social and financial success, with a great variety of industries, and at Jan. 1957 a pop. of about 22,000. Though the

company's self-imposed limit on profits has recently been removed, the original intentions have been adhered to. As an experiment in a new principle of healthy and economic urb. development, Letchworth Garden City created world-wide interest, though for many years the principle was misunderstood and confused with the idea of city extension by 'garden suburbs' (see below) or open housing development. Howard himself started in 1920 a second new tn, Welwyn Garden City (q.v.), also in Herts, 21 m. from London, of which it was described as a 'satellite town.' Profiting by the earlier experience and imposing a stronger architectural control, Welwyn has been even more attractively planned and an equal social and economic success. It also has a wide range of industries and a pop. at Jan. 1957 of about 27,800. Welwyn was taken over by a gov. corporation in 1948 under the New Towns Act.

In both the G. C. the great majority of inhab. are employed locally and many workers come in also from adjoining rural areas, whose prosperity they have much enhanced. These 2 demonstrations that the building of new self-contained tns in country dists. is practicable as a means of relieving the congestion and limiting the growth of great cities have had a profound effect on the evolution of Brit. planning policy, and the principle is now being attentively studied in many other countries. See GREEN BELTS; NEW TOWNS; TOWN AND COUNTRY PLANNING; also books listed under NEW TOWNS, and C. B. Purdom, *The Garden City*, 1913, and *The Building of Satellite Towns*, 1949; F. J. Osborn, *New Towns after the War*, 1918 (new ed. 1942), and *Green-Belt Cities*, 1946; *Town and Country Planning*, Sept. 1953 (Letchworth Jubilee issue).

Garden Suburbs and Garden Villages. Before the garden city movement, some excellent housing estates, openly laid out, were built by industrial firms, notably Bournville (Birmingham), Port Sunlight (Birkenhead), and New Earswick (York). These were carefully planned, controlled under the leasehold system, and laid out with gardens at low densities (7-10 houses an ac.) and good community facilities; they have much influenced later housing practice. Similar methods of planning and control have been applied to many residential suburbs in Great Britain and abroad; Hampstead Garden Suburb is a notable example. All these differ from G. C. and new tns in that they are not complete self-contained tns isolated from others by green belts. Sev. municipal corporations have built well-planned garden suburbs on city fringes; outstanding examples are Wythenshawe (Manchester), Speke (Liverpool), and the out-co. housing estates of the London Co. Council. Though in the main dormitory suburbs, some also provide industrial zones and a measure of local employment, and where this happens they are usefully termed 'quasi-satellites' to distinguish them from new tns proper.

Garden of the Gods, dist. of Colorado, U.S.A., NW. of Colorado Springs. It covers about 500 ac., and is remarkable for its strange and extremely beautiful formations of eroded sandstone, some of which resemble in form cathedral spires, etc. It is a tourist centre.

Gardenia, family Rubiaceae, genus of about 60 species of evergreen shrubs or trees of tropical Africa and Asia. *G. jasminoides*, of China and Japan, is much grown under stovehouse conditions for its pure, white, salver-shaped, fragrant flowers, and has sev. varieties. New plants are propagated from cuttings every 2 to 3 years, and with ample heat and moisture, the plants grow readily. The double form, variety *florida*, is much esteemed.

Gardening. Development of G. in Britain and America since the latter part of the 18th cent. has been rapid and almost continuous. It was not checked either by the First World War or by the Second World War as were many other branches of art and industry. Both wars did, however, change its direction. War-time demands for economy and home-raised food led, in each case, to increased efforts to grow vegetables and fruits in home gardens and on allotments. Increasing taxation and labour stringencies were reflected in a reduction of large private estates or their amenities. In the Second World War gov. direction of horticult. cropping and their sponsored 'Dig For Victory' campaigns led to a great decline in flower cultivation and ornamental G., but a vast increase in the ranks of gardeners. The human need for beauty is irrepressible, and the indications are that ornamental G. on more labour-saving and less spacious lines than in the past is now finding new and greater expression. The ever-growing awareness of the need for open spaces, municipal parks, gardens, and playing-fields only serves to emphasise the increasing and valuable part that G. now plays in national life.

History.—G. has been pursued from the earliest ages of which records exist. Nor should it be assumed that the art of the pre-Christian era was mean and crude. Egyptian, Assyrian, Babylonian, and Persian monarchs had skilled gardeners in their service long before the days of Virgil. Auct Egypt, auct Greece, auct Rome, all had beautiful gardens. Persepolis and Palmyra, Babylon and Nineveh, Thebes and Memphis, Bagdad, to name but a few great tns of the past, were famous for their parks and gardens. It is probable that Gk and Rom. G., which in due course spread its influence and gave its lessons to W. Europe, derived in the main from the Near and Middle E., but the Far E. must not be overlooked, because gardens were also cultivated in India and China from very early times. The Romans were the chief agents concerned in introducing G. into England, and they instructed the early Britons in the growth and use of many vegetables and fruits hitherto unknown to them. When the Romans were compelled to leave

Britain G. languished, but it revived under the influence of the monks after Christianity had been introduced, and a considerable variety of vegetables and medicinal herbs, together with many fruits, were grown. Flower cultivation was little practised at first, but in the 3 centuries which followed the Norman Conquest there were developments in ornamental culture, and in the Middle Ages gardens gradually increased around the palaces, castles, and granges; walks, terraces, steps, balustrades, summer-houses, statues, lakes, and fountains, etc., being formed. Labyrinths became popular.

The Renaissance brought a remarkable development in ornamental G., both in France and Italy, and its influences spread to Britain; they were, however, formal. Topiary work, i.e. clipping yews, etc., into fantastic shapes, came into fashion. Even in the 18th cent. formalism reigned, and it was left for Addison (essay in the *Spectator*, 1712), Pope (essay in the *Guardian*, 1713, and *Epistle on Taste*, 1731), Whately (*Observations on Modern Gardening*, 1770), and Horace Walpole (*Essay on Modern Gardening*, 1785) to condemn the monotonous repetitions of the formal school. Pope, aided by the famous gardener Kent, carried his principles into practice. The latter, with Bridgeman and 'Capability' Brown, estab. the Eng. or natural system. Briefly this is an imitation of nature: the most beautiful trees, shrubs, and flowers for the space required being arranged in as natural and happy a combination as possible. Later, Chambers, Knight, Loudon, and others did good service, while in quite modern times Robinson, Veitch, Wilson, Farrer, Kingdon Ward, Forrest, and others exercised great influence as gardeners, writers, or introducers of new plants. (See also GARDEN ART).

Layout.—While some operations can be carried out in large gardens which are impossible in small ones, it may be assumed that most gardens have sufficient space for a flower garden, a kitchen garden, and a lawn of greater or less size. Except in very small gardens ornamental trees and shrubs should be used as freely as possible. Roses should be planted in beds and on walls, arbours, and fences. A rockery, large or small according to space and means, is an attractive feature, and a pool for water-plants can often be associated with it to advantage. Shrub borders are valuable for their permanence and labour-saving. Herbaceous borders are still popular, though the tendency is to introduce flowery shrubs and *Polyantha* roses to save labour. In small gardens annuals and biennials, raised from seed, are excellent, while bulbs for autumn and spring planting provide beautiful flowers with little trouble.

Shelter.—Most gardens are more or less enclosed. If hedges form boundaries, they are ornamental in themselves when kept trimmed. Yew, holly, beech, hornbeam, hawthorn, privet, box, Lawson's cypress, thuya, and *Lonicera yunnanensis* are good subjects for boundary hedges.

Laurels and privet are too troublesome, except for larger gardens. For internal low hedges, barberries, escallonias, lavender, *Lonicera nitida*, rosemary, sweet briar, and veronica are suitable. Walls should be decorated with some ornamental plant or trained fruit tree. Actinidias, roses, clematis, honeysuckle, and wisteria are ready choices, but even a N. wall will favour winter jasmine, Virginian creepers, kerria, or ivy. Fences may similarly be made ornamental.

Paths.—For hard wear in all weathers paths may be of stone, bricks, concrete, macadam, or gravel, but occasional paths within the garden may be of grass. All hard paths should be made on foundations of 4-8 in. broken brick or stone, with 2 in. of ash or sand, on which to lay the final surface, finished with a slight crown or slope to one side ($\frac{1}{4}$ in. per foot width) for drainage. The surface of gravel paths may be fixed with a cold bitumen product. An ann. dressing of weed-killer keeps paths free from greenness. Edgings of metal, stone, or bricks are best to keep a walk in place. Plant edgings are only good for occasional paths, and here dwarf box is right.

Lawns.—As the base ground or carpet against which flowers and ornamental plants are seen at their best, well-kept turf is an essential feature of most gardens. A lawn may be made from turf or seed. In either case the soil should be adequately prepared, drained, levelled, cultivated, and fertilised beforehand. A lawn from turf is best laid between Sept. and Feb. Good sods are cut 12 in. wide, 1 in. thick, and 1 to 3 ft long, from heath moorland, parkland, or sea-washed marsh turf. Laying is done in a forward direction, with a board on the new-laid sods, which are alternated to overlap at the joints. Lawns from seed are best made in early Sept., or April for second choice. The finest lawns are made with such grasses as Cheiving's Fescue and New Zealand Browntop or Bent, but the seed mixture should be made up to suit (1) the soil, (2) the situation, and (3) the purpose of the lawn. To sow evenly at 1-2 oz per sq. yd. divide seed into 2 lots, mix with an equal bulk of dry sand, and sow a sq. yd. at a time, sowing one way with one lot of seed, and crosswise with the other. Protect from birds by a network of black cotton thread on sticks. A light rolling when the grass is 2 in. high, followed by a high cut, removing no more than 1 in. of grass blades, and a sifting of rotted organic matter as a top-dressing, will give the sown lawn a good start. The management of existing turf may be based as follows: autumn—top-dress with sharp sand and finely broken charcoal. Winter—aerate thoroughly by spiking or piercing turf mat with spiking tool or fork. In Feb., top-dress with soil compost (2-3 parts, by bulk, good loam, 1 part rotted organic matter, 1 part sand) at 1-2 lb. per sq. yd. Spring—apply complete lawn fertiliser in Mar. Use weed-killers from April to June. Selective hormone herbicides (MCPA or Methoxzone, DCPA or

2:4-D) destroy plantain, star-weed, self-heal, cat's-ear, dandelion, and many common weeds. Lawn sand is best for daisy and clover. Summer-mowing frequently, and with not too close a cut, strengthens grass growth and inhibits weeds best. Moss implies diminishing soil fertility, poor drainage, or matted turf. Applying a mercurised eradicator or a 10 per cent solution of tar-oil wash kills moss in winter, but basic causes must be removed for permanent improvement.

Trees and Shrubs.—Forest trees belong to the estate or park, and such species as sycamore, chestnut, alder, beech, sweet chestnut, ash, walnut, tulip-tree, plane, poplar, oak, lime, and elm are best excluded from the small garden. Here, a choice should be made from birch, thorns, laburnum, magnolia, prunus, cherries, almond, peach, crab-apple, rowan and service trees, dogwood, and willows, which have foliage, floral, bark, or berrying colour to offer. Evergreens such as holly, strawberry-tree, *Azara microphylla*, and laurels are useful for screening. Conifers need to be planted judiciously in a country where so many of them are foreign. The native yew and juniper seldom come amiss. It is among the cypresses, cedars, retinosporas, and thuyas that pleasing conifers of suitable stature and shades of green are to be found, while pines and spruces supply miniatures for the rock garden. Shrubs combine permanence with floral and colourful grace, and are increasingly planted for their labour-saving virtues. They may be planted singly, in groups, in borders, or in combination with herbaceous flowers. A list of the popular species according to their flowering season would include: Winter—*Elaeagnus* sp., *Jasminum nudiflorum*, *Erica darleyensis*, *E. carnea* and varieties, *Viburnum fragrans*, *Chimonanthus praecox*, *Hamamelis mollis*, *Lonicera standishii*, *L. fragrantissima*, *Prunus davidiana*, *P. kansuensis*, *Viburnum tinus*, *Camellia sasanqua*, *Clematis calycina*, *Azara microphylla*, *Cornus mas*, *Daphne mezereum*, *Garrya elliptica*, *Corylus* sp. Spring—*Magnolia stellata*, *M. conspicua*, *Forsythia* sp., *Prunus cerasifera*, *Erica mediterranea*, *E. veitchii*, *Ribes* sp., *Corylopsis* sp., *Daphne blagayana*, *Stachyurus* sp., *Rhododendron* sp., *Prunus persica* and varieties, *Berberis* sp., *Prunus laesiana* and varieties, *P. serrulata*, *P. acuta*, *Pieris* sp., *Viburnum carlesii*, *Osmanthus delavayi*, *Azalea*, *Malus* sp., *Cytisus* sp., *Syringa* sp., *Ceanothus* sp., *Laburnum* sp., *Cistus* sp., *Helianthemum* sp., *Spiraea* sp., *Philadelphus* sp., *Genista* sp., *Deutzia* sp., *Lonicera* sp. Summer—*Kalmia latifolia*, *Zenobia pulverulenta*, *Buddleia* sp., *Styrax japonica*, *Viburnum tomentosum* and varieties, *Fabiana imbricata*, *Escallonia* sp., *Daboecia polifolia*, *Erica cinerea* and varieties, *E. tetralix*, *E. mackayi*, *E. ciliaris*, *Spartium junceum*, *Genista aetnensis*, late *Ceanothus* sp., *Lavandula* sp., *Veronica* sp., *Olearia haastii*, *Clethra* sp., *Euonymus glutinosus*, *Hydrangea* sp., *Erica vagans*, *Yucca* sp., *Clematis jackmanii*. Autumn—*Hibiscus* sp., *Clerodendron fargesii*, *Perovskia*

atriplicifolia, *Caryopteris* sp., *Romneya* sp., *Colletia armata*, *Fuchsia* sp., *Abelia* sp., *Hoheria populnea*, *Fatsia japonica*, *Salix bockii*; and for their berries—*Cotoneaster* sp., *Malus* sp., *Pyraeantha* sp., *Pernettya* sp., *Skimmia* sp., *Berberis* sp., *Rosa* sp., *Stranvaesia* sp., *Arctostaphylos* sp., *Sambucus* sp., *Rhus* sp.

Herbaceous Borders.—There is nothing better suited to skirt a lawn than a border of hardy herbaceous perennials. No matter how small the garden it can be provided, the point being to adapt the selection of plants to the area available. Herbaceous (i.e. non-shrubby) plants vary greatly in height and spread; some require only a sq. foot of space each, others a yd or more. While large plants should not be put into small borders, small plants may be used for the front areas of large borders, as in many cases they are very beautiful and also easily grown. The following selection of plants will be useful in either case, because the plants marked 'middle' and 'back' are suitable for such positions in large borders, whilst those marked 'front' will come in handy for the front areas of large borders and the main area of small ones.

Achillea ptarmica. The Pearl (front).
Aconitum (monkshood) (front). Root poisonous.
Alstromeria (front). Very graceful.
Anchusa (front).
Anemone, poppy and Jap., the latter the taller, but both front.
Anthemis (front).
Anthericum (front), very graceful.
Aquilegia (columbines) (front).
Armeria (middle).
Artemisia (middle).
Asters (Michaelmas daisies), alpinus and ericoides (front, most middle and back).
Astilbe (back).
Rocconia cordata (back).
Boltonia (back).
Campanula (most front).
Calananche (front).
Celsia (front).
Centaurea (back).
Chrysanthemum, koreanum, maximum, and leucanthemum (middle or back).
Cimicifuga (back).
Coreopsis lanceolata and *grandiflora* (front).
Delphinium nudicaule, *cardinale*, and Blue Butterfly (front, most back).
Dicentra (front).
Doronicum (front). Early bloomers.
Echinops (middle).
Eremurus (back).
Fragaria (front).
Frygium (sea holly) (middle and back).
Funkia (front).
Gaillardia (front).
Galega (back).
Geranium sanguineum and *pratense* (front).
Geum (front).
Gypsophila paniculata (gauze flower) (middle and back).
Helianthus (front).
Helianthus (sunflowers) (most back).
Heliopsis (back).
Helleborus (Christmas and Lenten roses) (front).

Hemerocallis (day lilies) (front).
Heuchera sanguinea (front).
 Hollyhocks (back).
Hyacinths (front).
Isula glandulosa (front).
Iris (front).
Kniphofia or *Tritoma* (red-hot poker) (middle).
Linaria (front).
LOBELIA cardinalis and *fulgens* (front or middle).
Lupinus polyphyllus, hybrids and varieties, splendid (middle).
Lychnis chalcidonica, *L. Viscaria splendens plena*, etc. (front).
Lythrum (middle).
Meconopsis Wallichii, *nepalensis*, and *Baileyi*, beautiful poppies (front or middle).
Mimulus (front).
Monarda (bergamot) (front).
Narcissi (front).
Oenothera (evening primrose) (front).
Paeonia, magnificent (front).
Papaver, perennial poppies (middle or even front), also *nudicaule* (front).
Pentstemon (front).
Phlox (middle).
Phlox, one or two dwarf varieties, such as Mont Blanc, front, most middle. Invaluable plants.
Physalis franchetii (winter cherry) (front).
Platycodon (middle).
Polemonium (front).
Polygonatum (front).
Potentilla (front).
Primula sp. (front).
Pulmonaria (front).
Pyrethrum (front). Brilliant colours, early bloomers.
Rodgersia (back).
Romneya (back).
Rudbeckia (front or middle, in rich soil).
Salvia (middle).
Scabiosa, including *caucasica* (front).
Scutellaria (front).
Sedum spectabile (front).
Senecio (middle to back).
Sidalcea (back).
Solidago (golden rod) (back).
Filipendula hexapetala and *rubra* (back); *palmata* and *purpurea*, with their varieties (front).
Stachys (front).
Statice latifolia (front).
Thalictrum minus (Maidenhair-like) (front).
Tiarella cordifolia (front).
Trollius (front).
Uvularia (front).
Valeriana (middle).
Verbascum (middle to back).
Veronica, sev. species (front).
Viola (front).

For full descriptions see *Everyman's Encyclopaedia of Gardening*.

Clearly, there is no lack of hardy herbaceous plants suitable for small borders. Empty spaces can be filled with anns. and biennials. Squat plants like double daisies, pansies, polyanthi, primroses, and bulbs such as snowdrops, narcissi, scilla, and tulips, and corms such as crocus and gladioli may be used to lend added colour. Most soils can be made suitable

for herbaceous plants. Light soils need rotted organic matter (dung, compost, leafmould, peat, shoddy, etc.). Heavy soils are improved by draining, liming, and incorporating dryish organic litter (peat, compost, hop manure, etc.). An ann. dressing of organic manure should be given in autumn or early winter. If herbaceous plants are to prosper they must be lifted and divided every 2 or 3 years, usually in autumn, or spring. The centre and older part of the lifted plant is discarded, the younger, more vigorous outer parts being retained for replanting and propagation.

Rock Gardens.—Although there is much potential interest and charm in a rock garden, its construction requires skill, its planting care, and its maintenance regular attention. The ideal site is sunny, yet with partial shade during the day. It is easier to build on a natural slope than on the flat, which presents difficulties in blending a raised rock garden with the garden as a whole. Good drainage is essential for alpine plants, and on heavy soils a good bed of rubble or hard core should underlie the construction. A rock garden should represent a natural stone outcrop in miniature. It may incorporate a ravine, stream, or scree. The stone used should be chosen from sedimentary rocks—Westmorland, Cumberland, or Cheddar limestone, or a good sandstone; not igneous granite, gabbro, or basalt. Two principles should guide the placing of rocks; the strata of the rocks must run in the same plane with the graining parallel, and joints between stones should be at right angles; the exposed rock should be sunk well into the soil, to suggest a preponderant mass of stone underneath. The soil should be reasonably, but not too fertile, and well rammed about the stones. Planting pockets and crevices are best filled with soil compost to suit the chosen plants. A good basic mixture is 1 part by bulk loam, 2 parts each sand and leafmould, plus 2 handfuls of bonemeal per barrowful. For lime-loving plants add a handful of crushed chalk or limestone dust. Calcifuge plants may need extra leafmould or peat. Alpine plants dislike wet around their necks, and a collar of limestone chippings is often helpful to drainage. Others, chiefly those with downy leaves, should be given the protection of small glass cover in winter. Alpine plants are now generally sold *ex pots*, and so planting can proceed at almost any time of the year, weather conditions permitting. Many alpine can also be raised from seed without much trouble. The following list includes selected species of good character. Fuller descriptions and information on culture will be found in *Everyman's Encyclopaedia of Gardening*.

Acaena microphylla, etc.
Achillea clavennae, *lewisii*, *tomentosa*.
Aethionema × *Worley rose*.
Alyssum saxatile, *serrifolium*.
Andromeda polifolia compacta.
Androsace carnea, etc.

Anemone apennina, *blanda*.
Anihyllis montana.
Antirrhinum asarinum, *sempervirens*.
Aquilegia akitensis, *glandulosa*, etc.
Arabis sp.
Armeria caespitosa.
Asperula suberosa.
Aster dumosus × *Novi-Belgii*.
Aubrieta deltoidea varieties.
Calceolaria tenella.
Campanula sp.
Cassiope lycopodioides.
Ceratostigma griffithii.
Corydalis lutea, *nobilis*.
Crocus sp.
Cyclamen coum, *hiemale*, *europaeum*, etc.
Dianthus sp.
Eranthis hyemalis.
Erica carnea, *cinerea*, *tetralix*, *vagans*.
Erinus alpinus.
Frankenia thymifolia.
Galanthus sp.
Gentiana sp.
Geranium argenteum, *farreri*, etc.
Helianthemum alpestre, *vulgare*, etc.
Iberis sp.
Incarvillea grandiflora.
Iris sp. (dwarf bulbous types).
Leontopodium alpinum (edelweiss).
Linaria sp.
Linum alpinum, etc.
Lithospermum diffusum.
Muscari sp.
Myosotis rupicola.
Narcissus sp. (miniatures).
Omphalodes cappadocica.
Onosma albo-roseum, *echinoides*.
Papaver alpinum.
Penstemon sp.
Phlox sp. alpine.
Polemonium confertum.
Polygala chamaebuxus.
Potentilla nitida.
Pratia angulata.
Primula farinosa.
Primula × *Garryarde* varieties.
Primula × *Juliana* varieties.
Ranunculus myconi, etc.
Ranunculus sp.
Saponaria ocyroides.
Saxifraga sp.
Sedum sp.
Sempervivum sp.
Silene acaulis.
Soldanella alpina, *pusilla*, etc.
Stokesia cyanea and varieties.
Thlaspi rotundifolium.
Thymus sp.
Tulipa kaufmanniana, etc.
Veronica sp.
Viola cornuta, *gracilis*, etc.
Wahlenbergia sp.

Annual Flowering Plants.—In common with other classes of flowers, anns., hardy and tender alike, have undergone considerable development during recent years, particularly in the cases of sweet peas, clarkias, godetias, asters, stocks, and snapdragons (not strictly anns. but generally treated as such). The development of sweet peas has been remarkable, and the number of varieties is now enormous, while cultivation as an exhibition flower has led to what is called cordon

training, the plants being grown on single stems like cordon fruit trees. As regards most hardy anns., however, the older time-honoured principles of cultivation apply to-day, fertile deeply tilled soil, thin sowing, and subsequent timely thinning of the seedlings, so that the plants cannot get crowded and thereby become attenuated. Nevertheless, failures are not infrequent, because many growers sow too early in spring while the soil is still cold. However good and however finely raked the soil, however thin the sowing, failure is probable unless the soil has been warmed up by adequate spring sunshine. This applies to chalky as well as to clayey soils, because chalk does not warm up quickly. Sowing may be earlier, as a rule, on sandy loams than on either clay or chalk; in any case, local conditions should be considered. The class known as half-hardy anns. is best sown in pots, pans, or shallow boxes and shaded with glass and paper till germination has taken place, then gradually inured to light on a greenhouse shelf or near the glass in a frame. Abundance of air, careful watering (strictly avoiding excess), and timely pricking-out 3 to 4 in. apart in other boxes should then ensure sturdy and healthy plants, suitable for putting out in the garden when summer weather comes; or, at will, potted singly for greenhouse decoration. The following are selections of hardy and half-hardy anns.; detailed descriptions will be found in *Everyman's Encyclopaedia of Gardening*.

Hardy Annuals

<i>Abronia umbellata</i> .	<i>Lavatera rosea</i> .
<i>Adonis</i> .	<i>Leptosiphon</i> .

Biennials such as wallflowers, foxgloves, Canterbury bells, forget-me-nots, Brompton stock, and sweet williams, suitable for sowing outside in May or June to flower the following year, should also be used.

Roses.—Wherever the atmosphere is reasonably pure, and the soil fairly substantial, roses can be grown successfully. A light dry soil is distinctly unfavourable, although some of the rambling Wichuriana roses will thrive in shallow chalky ground if well fed at the surface. The deeper, richer and more substantial the soil, the more likely roses are to thrive year after year. In poor ground frequent renewal will be necessary. Another great factor in maintaining health is to keep the plants free from injurious insects and fungi. Shelter without shade is desirable. Any time in open weather between Nov. and Mar. is suitable for planting. On the whole bushes are more satisfactory than standards for beds, although the latter have their uses. Liberal use should be made of rambling roses for walls, fences, arbours, and pillars, and polyantha roses for bedding.

Kitchen Garden.—Productivity of a garden, especially the kitchen garden, rests on maintaining and improving soil fertility and structure. The 3 essentials are (1) organic manuring, (2) liming, and (3) fertilising.

Under cultivation the organic soil content is lost more quickly than it is replaced. In light soils this means loss in moisture-retentiveness; in heavy, loss in aeration; in all soils loss of humus, the chief reservoir of plant foods. The soil needs at least once every other year a dressing of organic manure. In the scarcity of farmyard and stable manure substitutes must be used, such as leafmould, peat, hop manure, shoddy, and compost. Organic compost consists of organic refuse (plant remains, leaves, mowings, etc.) and household refuse (kitchen waste, vacuum cleaner dust, etc.), scientifically rotted with an accelerator of decomposition. A common method is to heap the material in layers like a sandwich; thickish layers of

mixed organic debris being interleaved with an accelerator (dung, nitrogenous chemical mixture, or proprietary compound), sprinkling of soil and lime, and left 4–12 months to decompose. Such compost is roughly equivalent to good farmyard manure, and a compost heap should be a permanent asset in every garden.

With few exceptions, notably rhododendrons, certain ericas, cranberries, strawberries, and raspberries, garden plants thrive best when there is adequate calcium (lime) in the soil. Lime also liberates other plant foods, and improves soil structure by causing the particles to flocculate. Sour clay soils benefit greatly from liming, so do acid sands, silt, and peat. Also some crops need more lime than others. Onions, beets, celery, spinach, brassicas, lettuce, and leafy greens need a well-limed soil. Peas, beans, carrots, sweet corn, and runner beans need a moderately limed soil. Potatoes, tomatoes, turnips, marrows, cucumbers, and melons need very little or no lime except when grown in most acid soils. The type of lime used influences the amount. Ground limestone or chalk is used at rates of 1–2 lb. per sq. yd.; ground burnt lime or quicklime at $\frac{1}{2}$ –1 lb. per sq. yd.; and hydrated lime at $\frac{1}{2}$ –1 lb. per sq. yd. The latter can be applied at any time of the year. Other limes are best applied in autumn or winter. Fertilisers are necessary to make good soil deficiencies and to get increased yields. Briefly, fertilisers are designed to supply 3 major plant foods: nitrogen, phosphorus, and potash. The common nitrogenous fertilisers are: Inorganic or chemical—sulphate of ammonia (20·6 per cent), nitrate of soda (16·0 per cent), nitro-chalk (15·5 per cent); Organic—dried blood (12–14 per cent), hoof and horn meal (14 per cent). Phosphatic fertilisers: Inorganic—superphosphate of lime (17–18 per cent), basic slag (9–18 per cent), triple superphosphate (40–48 per cent); Organic—steamed bone flour (27·5 per cent), bone meal (20–24 per cent). Potassic fertilisers: Inorganic—muriate of potash (50–60 per cent), sulphate of potash (48·6 per cent), kainit (14 per cent), potash salts (20–30 per cent), wood ash (2·5–6 per cent). Certain fertilisers contain more than one element, notably guano (10–14 per cent nitrogen, 9–11 per cent phosphorus), meat meal (3–7 per cent nitrogen, 9–16 per cent phosphorus), and fish guanoes (9–14 per cent nitrogen, 9–20 per cent phosphorus). Inorganic fertilisers are quickly exhausted; organic fertilisers tend to have residual effects for 2–4 years. The essence of good fertilisation is to combine chemical carrying the 3 major elements to suit the needs of the crop and the soil in which it is grown. Such combinations are known as 'complete' fertilisers. In practice, deficiencies of other elements, many known as trace nutrients, may occur, and other chemicals be used to correct them. Borax, for instance, is used to correct a boron deficiency. In the well-tended garden, however, unusual soil

deficiencies are rare. One-sided exhaustion of the soil, and susceptibility to insect pests and diseases in the kitchen can be minimised by crop rotation. — practice, this means that like vegetables of the same plant family do not follow one another on the same ground. For instance, peas should not follow beans; tomatoes potatoes, cabbage cauliflower,

sev. years. It is also permissible for swedes or turnips to follow carrots, since they are of different plant families. Insect pest and disease control are important aspects of vegetable growing, require some knowledge of their character, so that proper preventive of remedial measures can be taken. The chief preventive is good culture which

YELLOW TURK'S CAP LILY

Lilium pyrenaicum, one of the earliest lilies to bloom. Although it has a heavy strong smell, and has newer and more showy rivals, the peculiarly bright greenish-yellow flowers with their dark vermillion anthers make it very pleasing.

ENGLISH GARDEN PINKS

From the earliest days the *Dianthus* has lived up to an old description as 'a genus furnishing plants of the herbaceous flowery ornamental order.' From left to right, descending: laced pinks; Delight (race of pinks); *alwoodii* (the perpetual flowering pink); Alpine pinks; show pink; village pinks; Scotch pink.

Drawings by Miles Hadfield from 'The Gardener's Companion.'

and so on. For a 4-year rotation the plots are four. No. 1 plot is cropped with potatoes; No. 2 with peas, beans, onions, leeks, celery; No. 3 with root vegetables; No. 4 with brassicas and saladings; the 1st year. In 2nd year No. 1 is cropped as for No. 2; No. 2 for No. 3; No. 3 for No. 4, and No. 4 for No. 1. In subsequent years the cropping is rotated similarly, until by the 5th year the rotation begins again, as for the 1st year. There are some exceptions to rotation. Perennial crops, like asparagus, and onions may be grown on the same soil for

fosters vigorous growth, robust health, and resistance in the plant. A short calendar of operations for the year follows.

January.—Rough-dig all vacant ground when opportune. Lay stiff clay in ridges to be frosted. Wheel on organic manure, and spread. On sheltered border and in favourable weather make sowings of round peas and broad beans, and plant shallots and horseradish. Under glass start tomatoes, cucumbers, and melons in heat. Prepare hot-beds for early crops and mushrooms. Sow in boxes in frames leeks, onions, lettuce, and radish. Force

rhubarb, chicory, seakale. Sow spinach and plant out lettuce under cloches. Make up seeds order. Treat vacant slug-infested ground with dry powdered Bordeaux mixture (1 lb. per 20 sq. yds).

February.—Continue winter cultivations when possible. Use aldrin to defeat wireworms. Lime and slow-acting fertilisers, such as bone mē

cabbage, kale, kohlrabi, etc.), spinach, onions, peas, leeks, turnips, carrots, and vegetables generally. Under glass in heat start celery, celeriac, angelica, marrows, capsicum, cardoon, and tomatoes for outdoors. Divide artichoke roots. Clean and mulch asparagus bed. Transplant autumn-sown onions.

April.—Weed seed-beds. Hoe fre-

AUTUMN FLOWERS

Crocus speciosus, so called from the showy orange stigmata, has the merits of being beautiful and hardy as well as plentiful; *Cyclamen hederifolium*, hardy autumn flowering, is not so widely known as it should be; and ivy, *Hedera helix* variety *conglomerata*, a small, slow-growing bush of deep green colour.

WINTER BERRIES

The snowberry, *Symphoricarpos rivularis*, has been called the 'aspidistra of the shrubbery,' because of its tolerance of bad conditions. Its odd little flowers and white berries are attractive. *Hypericum elatum* is one of the few tall members of the genus; its dark fruits follow many small waxy flowers.

basic slag, hoof and horn, etc. Put up seed potatoes in boxes in light, frost-proof quarters to sprout. Outdoors sow broad beans, parsnips, thyme and pot herbs, and parsley. Plant garlic, Jerusalem artichokes, and divide chives. In frames with gentle heat sow celery, onions, leeks, lettuce, Fr. beans, mustard and cress, and early cauliflowers. Plant out autumn-sown lettuce under cloches. Place cloches over early strawberries.

March.—Prepare seed-beds out of doors, and fertilise with complete fertiliser 7-10 days before sowing. Outdoors sow brassicas (Brussels sprouts, cauliflower,

quently. Prepare marrow beds, celery trenches, and plant asparagus. Make successional sowings of saladings, brassicas, roots, etc. Sow beet late in month. Under glass start sweet corn, marrows, runner beans, etc. Prevent onion fly with calomel dust, flea beetles with D.D.T., and slugs with crushed metaldehyde and food bait (bran). Thin out seedling crops, and prepare beds for transplanted brassicas.

May.—Complete potato planting. Stake peas. Protect tender crops from wind. Watch for late frosts on clear nights after sunny days. Outdoors sow

runner beans, Fr. beans, beet, sweet corn, and successions of peas, saladings, etc. Sow colewort and cabbage for autumn-croppings. Earth-up potatoes. Begin planting out marrows, tomatoes, and cucumbers late in month. Transplant maincrop brassicas for winter-cropping, and leeks. Check early aphides with nicotine or derris insecticide. Use quick-acting fertiliser, such as dried blood, nitrate of soda, to feed leafy crops. Cut asparagus. Train cucumbers under glass.

June.—Hoe to control weeds, but mulch growing plants to conserve moisture, using rotted compost, peat, sawdust, etc. Plant out cabbage, tomatoes, ridge-cucumber, marrows, and capsicums out of doors. Sow vegetables and saladings for succession. Cease cutting asparagus. Continue earthing-up potatoes. Sow parsley for winter use, and early peas for autumn cropping. Prevent cabbage-root fly with calomel dust. Dust brassicas with derris or D.D.T. to prevent caterpillar attacks. Control thrips on peas with nicotine. In greenhouse, ventilate to keep even temps. Shade glass in very hot weather.

July.—Cultivate ground cleared of early crops, and prepare for winter greens. Mulch against drought. If you must water use a weak liquid manure solution. Sow turnips and beets after peas. Feed celery, globe artichokes, etc. Stake outdoor tomatoes. Take up shallots and garlic. Sow runner beans, early cabbage, prickly spinach, and salads for succession. Lift early potatoes. Spray maincrops with copper fungicide to prevent blight. Cut herbs for drying.

August.—Sow spring cabbage, cauliflower, kale, endive, winter lettuce, yellow turnip, colewort, and onions for overwintering. Lift early beets and carrots for storing. Earth up celery. Spray potatoes again against blight with copper fungicide. Disbud tomatoes and restrict to 4 trusses out of doors. Cut down globe artichokes and mulch with manure. Bend over tops of maturing onions. Under glass make sowing of Fr. beans, tomatoes, and cucumbers for winter fruiting.

September.—Lift and ripen off onions. Begin harvesting potatoes, roots, etc. Dry herbs. Earth up leeks and celery. Lift chicory for blanching. Prevent weeds seeding. Transplant lettuce in frames for winter. Under glass sow quick-maturing carrots. Thin spinach. Plant out endive, spring cabbage. Sow corn salad in frames. Use derris and D.D.T. to deter caterpillars on brassicas. Dust with sulphur against mildews.

October.—Complete harvesting and storing of roots and potatoes. Lift salsify and scorzonera. Trench and humus-mature vacant ground. Sow cauliflower for wintering in frames. Under cloches sow lettuce (May King, Cheshunt Early Giant). Replant watercress beds. Remove decaying foliage of brassica crops from soil promptly. Make up compost heaps of plant debris. Make first sowing of broad beans in south.

November.—Early digging and trenching of vacant ground should go hand in hand with organic manuring and liming. Treat pest-infested soil with soil fumigant. Plan next year's rotation. Broad beans (Seville and Claudia Aquadulce) and round peas may be sown. Lift asparagus for forcing. Plant horseradish. Cover seakale and rhubarb with organic litter for forcing.

December.—Plant perennial vegetables, such as seakale, asparagus, etc. Protect celery from frost. Divide mint bed. Look over stored potatoes, carrots, etc., periodically, and remove diseased tubers; treat with synthetic hormone product to prevent premature sprouting. Clean up vegetable plots; hoe spring cabbage, etc.; overhaul potting shed and equipment. Rough-dig vacant ground. Under glass sow early horn carrots. If heat available begin sowing tomatoes for next summer cropping.

Fruit.—Fruits succeed on a wide range of soils given good root aeration and adequate but not too free drainage. Heavy soil needs to be lightened by use of basic slag or lime and organic material. Light soils need liberal manuring, mulching, and special attention to potash content. Aspect should be open, preferably southerly. Site must be frost-free. Fruit does better on hillside or slope than in valleys or frost pockets. Modern tree fruits are grown on selected rootstocks which modify growth and fruiting habit. Standards, planted 20-40 ft apart, and half-standards, planted 18-25 ft apart, are best for orchards, specimen planting and long yields. For small gardens pyramid and bush trees, planted 12-15 ft apart, and cordons, planted 2-3 ft apart are best. In stone fruits, trained wall trees are best, not cordons. Apricot nectarine, and peach are usually grown as trained wall trees, but as bushes in warm dists. Medlars and nuts, planted 10-18 ft apart, are useful. Soft bush fruits, such as currants and gooseberries, need 4-6 ft apart, raspberries are planted 2-3 ft apart in rows 6-8 ft apart, and blackberries, loganberries, and other hybrid berries are trained on wire fences 10-12 ft between plants, and 6 ft between rows. Strawberries are best planted separately, 12-18 in. apart, in rows 2½-3 ft apart. Planting of all fruits can be done from Nov. to Mar. in mild open weather. Trees should be staked at time of planting; soil rammed firm around their roots; and a mulch of organic litter applied.

Manuring.—A good general plan is ann. application of organic manure (dung, compost, hop manure, etc.), especially to raspberries, strawberries; application of bone meal (2-3 oz per sq. yd) or basic slag (4-6 oz) every 2nd or 3rd year; to all fruits. Dessert apples, red currant, and gooseberries need potash most, and should get 1½ oz sulphate of potash and 1 oz sulphate of ammonia per sq. yd in Mar. Cooking apples, pears, raspberries, bramble fruits, and strawberries need 1 oz sulphate of potash and 2 oz

sulphate of ammonia; while stone fruits black currants, and nuts respond to $\frac{1}{2}$ oz sulphate of potash with 2 oz sulphate of ammonia per sq. yd in spring.

Pruning.—It is impossible to detail the various systems of pruning followed here, but the basic principle for fruit-tree pruning is severe pruning encourages shoot or wood growth, light pruning encourages development of fruiting wood. It follows that where new wood growth is wanted, as in training trees in early years, pruning should be severe. This is also true in the case of the trained trees of Morello cherry, apricot, and peach, where new wood is needed each year to replace old. But once the framework of apples, pears, plums, sweet cherries has been built up, pruning should be light to encourage bearing. Generally, the weaker the year's growth the harder it may be pruned in winter. Summer pruning consists of tipping leading shoots in Aug. to help new wood to mature. Bearing trees generally need light pruning, thinning of crossing branches, and removal of dead wood. Care is needed as some trees bear on the tips of young shoots. Red currants are pruned like apples or pears. Black currants are pruned by removing about a third of the oldest branches at their base each year, letting new shoots take their place. Gooseberries may be pruned like black currants, or, like red currants, especially if cordons. Raspberries are pruned by cutting away the fruited canes at the soil level each Nov. Non-fruiting apples and pears often respond to bark-ring (removal of narrow $\frac{1}{4}$ - $\frac{1}{2}$ in. ring of bark in 2 half circles, 2-3 in. apart) in May. Plums, damsons, and stone fruits which fail to crop may respond to root-pruning, the roots being bared around the trees in winter, and all coarse roots 2-3 ft from the stem severed.

Spraying.—Adequate control of insect pests and fungus diseases depends upon preventive spraying. All tree and bush fruits should be sprayed with a winter wash (tar oil, D.N.C. petroleum oil, or thiocyanate) while dormant, to kill eggs of aphides, etc., and to clean trees of moss and lichen. In spring there should be at least one pre-blossom and one post-blossom application of lime-sulphur or captan to control scab and other fungus diseases, to which may be added an insecticide (B.H.C., D.D.T., or nicotine) to control such pests as caterpillars, capsid bug, etc., in apples and pears. Black currants need lime-sulphur in early April to destroy big bud mite. Derris, nicotine, lonchocarpus dust, and petroleum oil are used for contact control of insects in summer, while karathane fungicides are used for mildews.

Choice of Fruits.—Fruit varieties are propagated vegetatively. It is important to begin with healthy, vigorous stock of good strain from reputable growers. **Apples:** Dessert—Tydeman's Worcester, Beauty of Bath, Worcester Pearmain, Epicure, James Grieve, Ellison's Orange, Lord Lambourne, Cox's Orange Pippin, Blenheim Orange, Laxton's Superb Winter

King. **Culinary**—Emneth Early, Grenadier, Golden Noble, Lane's Prince Albert, Bramley's Seedling, Lord Derby, Edward VII, Crawley Beauty. **Pears:** Dessert—Clapp's Favourite, Laxton's Superb, Williams's Bon Chrétien, Beurré Superfin, Dr Jules Guyot, Beurré Hardy, Conférence, Durondeau, Doyenné du Comice, Winter Nellis. **Culinary**—Beurré Clairgeau, Pit-maston Duchess, Vicar of Winkfield, Catillac, Uvedale's St Germain. **Apricots:** Breda, Moorpark, Royal, Shipley's. **Cherries:** (plant in pairs) Elton Heart and Florence; Early Rivers and Waterloo; Bigarreau Napoleon and Governor Wood; Black Tartarian and Elton Heart. Bigarreau Schrecken and Monstrueuse de Mezel; Belle d'Orléans and Frogmore Early. **Plums:** Blaisdon Red, Belle de Louvain, Czar, Denniston's Superb, Early Laxton, Jefferson, Kirk's Blue, Victoria, Purple Pershore, Giant Prune, Transparent Gage. **Damsons:** Merryweather, Farleigh. **Black Currants:** Boskoop Giant, Mendip Cross, Seabrook's Black, Baldwin, Tiple X, Cotswold Cross, Victoria, Davison's Eight. **Red Currants:** Laxton's No. 1, Raby Castle, Laxton's Perfection, Fay's Prolific. **White Currants:** White Dutch, White Transparent. **Gooseberries:** Careless, Lancer, Whinham's, Warrington, Whitesmith, Lancashire Lad, Leveller. **Raspberries:** Lloyd George, Norfolk Giant, Pyne's Royal, Red Cross, Malling Promise, Golden Hornet. **Strauberrries:** Royal Sovereign, Paxton, Tardive de Léopold, Giant Prolific.

Market Gardening, including French Gardening.—Increased pop., and consumption of fruit and vegetables, and the food situation during and after the Second World War have encouraged great developments in commercial cultivation. With competition from imports from abroad increasing, however, successful market gardening with economical and intensive cultivation demands skill, knowledge, and first-class equipment. With adequate glasshouses, Dutch lights, and cloches the skilful home grower can produce quality food, and should be able to bring produce to maturity early enough for profitable returns. Capital outlay for a 10-ac. holding is between £3000 and £4500. At least one year should be spent working on an existing holding, and it is wise to take one year's instructional course at a co. farm institute beforehand. Site, soil, water supply, accessibility, and markets are the important considerations to be studied. Fr. G. demands considerable equipment, and cap. outlay may approach \$1500 per ac.

P. Wright), 1957.

Garderobe (Fr.), normally a term for a wardrobe; but, in architecture, a privy built into the wall of a medieval castle, e.g. at Orford Castle, Suffolk.

Gardiner, Alfred George (1865-1946), journalist and essayist, b. Chelmsford, Essex. He wrote under the pen-name 'Alpha of the Plough.' He was editor of the *Daily News* from 1902 to 1919. His *Prophets, Priests and Kings*, 1908, is a series of caustic character sketches of contemporary celebrities, notably politicians. It was followed in 1913 by *Pillars of Society* in a similar vein and by *War Lords* in 1915. He produced a biography of Sir Wm Harcourt in 1922, and one of George Cadbury, formerly proprietor of the *Daily News*, in 1923. He also pub. some vols. of essays.

Gardiner, Samuel Rawson (1829-1902), historian, b. Ropley, Hants, and educ. at Winchester, Christ Church, Oxford, at Edinburgh, and at Göttingen. He was elected fellow of All Souls' College, Oxford, in 1884, and of Merton in 1892. He held the position of prof. of modern hist. at King's College, London, until 1885. He was granted a civil list pension in 1882. G. set the example for a new school of historians who confined themselves to facts, putting aside the partisanship and brilliant rhetoric which added literary interest, but tended to detract, historically, from the histories of his immediate precursors. He threw a new light on the Stuart period, to which he devoted years of patient research, often among documents hitherto unstudied, and his work still forms the basis for modern historical scholarship on the period. His works include *The Thirty Years' War*, 1874, *History of England from the Accession of James I to the Outbreak of the Civil War*, 1883, *History of the Great Civil War*, 1893, and *Oliver Cromwell*, 1899. See H. B. Learned, S. R. Gardiner, 1902; and R. G. Usher, *A Critical Study of the Historical Method of S. R. Gardiner*, 1915.

Gardiner, Stephen (c. 1493-1555), bishop, b. Bury St Edmunds, and educ. at Trinity Hall, Cambridge, of which he became master in 1525. He was sent by Henry VIII to try to secure the pope's consent to the divorce of Catherine of Aragon, and later he conducted the case against the

queen. He then became successively archdeacon of Norwich, archdeacon of Leicester, secretary of state, and bishop of Winchester (1531). He was chancellor of Cambridge Univ., 1540-1. From c. 1540 G. had great influence over Henry VIII; during Edward VI's reign he was imprisoned and deprived of his see, but was reinstated by Mary and made lord chancellor. In 1535 he had written a justification of Henry's claim to supremacy over the Eng. Church; in Mary's reign he headed the submission to Rome. There is no doubt that G. was ambitious, but his change of views can also be explained by the intervening events of Edward VI's reign, which probably made G., a religious traditionalist, regret his earlier position. He is remembered for his severity towards Princess Elizabeth; but it is unlikely that he was responsible for the mass persecution of Protestants during Mary's reign. He is buried in Winchester Cathedral. See life by J. A. Muller, 1926; and F. M. Powicke, *The Reformation in England*, 1941.

Gardner, Erle Stanley (1889-), Amer. detective-story writer, b. Malden, Massachusetts. He studied law, was admitted to the Californian Bar, and practised for 22 years. He started writing in 1921, his famous lawyer-detective Perry Mason first appearing in *The Case of the Velvet Claws*, 1932, and after that in many other stories of cases. Another series, beginning with *The D.A. Calls it Murder*, 1937, had District Attorney Douglas Selby as hero. G. was in his time the most popular detective-story writer in the U.S.A. See DETECTIVE STORY.

Gardner, Ernest Arthur (1862-1939), archaeologist, b. London. From 1887 to 1895 he was director of the Brit. School of Archaeology in Athens. Yates prof. of archaeology, Univ. College, London, 1896-1929. He wrote *Ancient Athens*, 1902, *A Companion to Greek Studies*, 1905, *The Inscriptions of Attica*, 1905, *Six Greek Sculptors*, 1910, *Religion and Art in Ancient Greece*, 1910, *The Art of Greece*, 1925, and *Greece and the Aegean*, 1933.

Gardner, tn in Worcester co., Massachusetts, U.S.A., 24 m. NW. by N. of Worcester city. There are manufa. of toys, baby carriages, silver goods, heaters and stoves, and foundry and machine-shop products, and it possesses the largest chair factory in the world. Pop. 19,600.

Gare-fowl, or **Great Auk** (Icelandic *Geirfugl*, Gaelic *Geardhuil*), large sea-bird of the family Alcidae, the *Alca immutabilis* of Linnaeus, similar in appearance to the razor-bill (*Alca torda*). It inhabited the N. hemisphere (temperate region of the N. Atlantic), and has been extinct since 1844, 'owing to the ruthless trade in its eggs and skin.' The G.s had wings so small that it was impossible for them to fly, but they were good swimmers. The chief breeding places were skerries off the coast of Iceland, Funk Is. off Newfoundland, and Spitzbergen. See S. Grievé, *The Great Auk*, 1885; J. Milne, 'Relics of the Great Auk,' in the *Field*, 1875; and J. Fisher, *Bird Recognition*, vol. 1, 1947.

Gareloch, inlet of the Clyde, situated in SW. Dunbartonshire, Scotland. It is about 7 m. in length, and has an average width of a m. It is now mainly used by the Admiralty. The vil. of Garelochhead is a holiday resort.

Garfield, James Abram (1831-81), 20th president of the U.S.A., b. Orange, Ohio, and forced, owing to the death of his father, to earn his own living at a very early age. However, he did not neglect his education, and went to Hiram College, Ohio, and from there to Williams College, Massachusetts. He graduated at the latter place and then went back as a prof. to his old college. Of this he ultimately became president, and he still continued to study law and to practise. On the outbreak of the Civil war he was appointed to command a volunteer regiment, and by his gallantry and ability quickly raised himself, until he was appointed a major-general. In 1863 he resigned his command and entered Congress, where he was quickly recognised as one of the leaders of the Republican party. He retained his seat in Congress until 1880, when he was put forward as the Republican candidate for the presidency. He was elected and took up office in Mar. 1881. He identified himself with the movement for the reform of the civil service and alienated in this way many of his supporters. In July of the same year he was shot by a disappointed fanatic who had unsuccessfully sought office, and d. in Sept. His speeches were collected into 2 vols. in 1882-3. See W. M. Thayer, *From Log Cabin to White House*, 1881; and T. C. Smith, *Life and Letters of James A. Garfield*, 1925.

Garfield, city of New Jersey, U.S.A., in the co. of Bergen, on Passaic R. There are woollen mills and chemical works, also manufs. of clothing, paper, rubber goods, pharmaceuticals, and essential oils. Pop. 27,500.

Garfield Heights, city in Ohio, U.S.A., a residential suburb SE. of Cleveland. Pop. 21,700.

Garfish, *Garpike*, see BONY PIKE.

Gargano, peninsula in the E. of Italy, in the prov. of Foggia (q.v.). It extends into the Adriatic Sea for about 31 m., and is from 15 m. to 30 m. in breadth. Monte Calvo is a summit which rises to a height of 5295 ft and is composed chiefly of limestone. The head of the peninsula is Testa de G.

Gargantua, see RABELAIS.

Gargoyle (from Fr. *gargouille*, a throat), projecting lead or stone spout on a building, often designed in the shape of a grotesque monster, to carry the water from a gutter clear of the walls. Among famous G.s are those on the cathedral of Notre Dame, Paris.

Garhmukhtesar, tn. of India, in the United Provs. It is situated on the r. b. of the Ganges in the dist. of Meerut. The inhab. are Hindus, with about 25 per cent Muslims. It is annually the scene of a very large 'mela' or fair, attended by vast numbers of pilgrims.

Garhwal, area of Uttar Pradesh, India. It is somewhat remote and hilly and is

best known in Britain because of the fine G. soldiers recruited there. The former adjoining state of Tehri-Garhwal has been absorbed into the Uttar Pradesh state administration.

Garibaldi, Giuseppe (1807-82), It. patriot, liberator, and guerrilla leader, b. Nice. A fisherman's son, he went to sea, commanding a brig by 1830. About this time (c. 1833) he became acquainted with Mazzini and the leaders of Young Italy, and became an enthusiastic republican nationalist. For his share in the outbreak at Genoa (1834) he had to flee to France. He then sailed to South

GIUSEPPE GARIBALDI

E.N.A.

America, and there offered his services to the rep. or prov. of Rio Grande do Sul, which was in revolt against the emperor of Brazil. He distinguished himself as a guerrilla warrior and in South America married a beautiful creole, Anita Riveira de Silva, the companion of his early It. campaigns and the mother of his children, Menotti, Ricciotti, and Teresa. In 1842 he offered his help to the Montevideans (1836-48) against the Argentine dictator, Rosas. He gives a full account of his colourful exploits in South America in his autobiography.

Returning to Europe, G. took part in the campaign against the Austrians and Fr., and was the leading spirit in the revolutionary gov. at Rome, 1848-9. But the rebellion failed; his wife d., and in 1850 G. was an exile in the U.S.A. In 1854 he returned and settled in Caprera, near Sardinia. He fought for Sardinia against Austria in 1859 and protested vehemently against the cession of Nice

(his bp.) and Savoy to Napoleon III in 1860. After the peace of Villafranca, secretly supported by Sardinia's request, G. organised an expedition against the Sicilies, in the hope of bringing about the union of Italy. This is perhaps his most famous undertaking. He landed at Marsala with his 'thousand volunteers,' defeating the Neapolitan troops, which far outnumbered his own, at Calatafimi, and thus opened the way to Palermo. G. became dictator of Sicily, and crossing to Italy expelled Francis II from Naples and entered the city in triumph. When Victor Emmanuel, king of Italy, appeared with his Sardinian troops in the kingdom of Naples, G. delivered up to him his army and absolute sway over the Neapolitan provs., retiring to Caprera in 1860. This was the moment of his greatest statesmanship; subsequently his career was to be marred by impetuosity; and he imagined himself slighted by the forces he had helped to create. He was severely wounded at Aspromonte (1862), fighting against the royal troops, after his lone attempt to take Rome from the pope, and taken prisoner, but pardoned shortly afterwards. On his second attempt to oppose the papal power (1867) he was utterly defeated by the papal and Fr. troops at Mentana, but was allowed to return to Caprera. In 1870-1 he attempted to help the Fr. Rep. against the Germans, commanding the Fr. volunteers in Burgundy. He entered the It. Parliament in 1874, finally consenting to accept an ann. pension from it. See memoirs (trans. by A. Werner in 1889 as *Autobiography of G. Garibaldi*); A. Mario, *Garibaldi e i suoi Tempi*, 1884; J. Marriott, *The Makers of Modern Italy*, 1889; G. M. Trevelyan, *Garibaldi's Defence of the Roman Republic*, 1907; *Garibaldi and the Thousand*, 1909; and *Garibaldi and the Making of Italy*, 1911; and P. Frischauer, *Garibaldi: Der Mann und die Nation*, 1934.

Gariep, see ORANGE RIVER.

Garigliano (ancient Liris), riv. of Italy, in SE. Lazio (q.v.). It rises in the Apennines SW. of Subiaco (q.v.) and flows SE. and then S. to the Gulf of Gaeta (q.v.). In its upper courses it is called the *Liri*. The Eighth and Fifth Brit. and Amer. Armies in their offensive against the Gustav line, crossed the G. on 12 May 1944. (See ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON.) Length 75 m.

Garland, Hamlin (1860-1940), Amer. author, b. W. Salem, Wisconsin. He worked on mid-W. farms, then was a teacher for a time. In his realistic novels and short stories he took as his themes the lives of the people on the prairie farms, which he depicts as a narrow and monotonous fight for existence. He was awarded the Roosevelt Memorial Association gold medal for literature, 1930. Among his many vols. some of the best are *Main Traveled Roads*, 1890, *Prairie Folks*, 1892, *The Book of the American Indian*, 1923, *The Trail-makers*, 1926, *Roadside Meetings*, 1930, *My Friendly*

Contemporaries, 1932, *Forty Years of Psychic Research*, 1936, and *The Mystery of the Buried Crosses*, 1938. *A Son of the Middle Border*, 1917, is partly autobiographical, and its sequel, *A Daughter of the Middle Border*, 1921, was awarded the Pulitzer prize.

Garlic, or *Allium sativum*, lilaceous plant which grows wild in S. Europe, especially in Sicily. It is a hardy perennial with bulbous roots, which are much used in cookery and occasionally in medicine.

GARLIC

B, bulb

Garlic Mustard, see ALLIARIA.

Garlic Pear, see CRATAEVA.

Garment Design, see DRESSMAKING.

Garnet, Henry (1555-1606), Eng. Jesuit priest. He was educ. at Winchester, studied law, became a Rom. Catholic, went to Italy, where he joined the Society of Jesus and acquired a reputation for scholarship, then returned as prov. of the Jesuits in England. He was tried on suspicion of being implicated in the Gunpowder Plot and found guilty, possibly on insufficient evidence; but his zeal in furthering schemes in connection with his order no doubt weighed against him, and he was hanged.

Garnet, name of a group of closely related minerals, which crystallise in the cubic system, usually in rhombic dodecahedra or in icosa tetrahedra, with imperfect cleavage. The chemical composition and hardness vary. Gs. are a good example of an 'isomorphous' group. They are found in crystalline schists, gneiss, metamorphic limestones, granite, serpentine, and sometimes in volcanic rocks and veins. Their usual colour is red, but they occur in almost any colour but blue. (Hardness 7, sp. gr. 3.4-4.3.) Of the semi-precious stones used in jewellery, some of the best known are the pyrope or anet 'carbuncle' (red) from

Saxony and Bohemia, the almandine (bluish-red) from Ceylon, Burma, Brazil, and Scotland, and the uvarovite (green) from the Ural Mts (Siberia) and Canada. Fine red specimens somewhat resemble rubies in appearance, but common G.s have many flaws. Besides being cut as gems, G.s are used for abrasive and other purposes, G.-paper being a substitute for sand-paper, especially in America.

Garnett, David (1892-), novelist, b. Brighton, Sussex, the son of the author, Edward G. (1868-1937), and Constance G., who is celebrated for her trans. from Russian literature. His grandfather was Richard G. (q.v.). G. was privately educ., and then went to the Royal College of Science, where he studied botany. During the First World War he worked with the Friends' War Victims' Relief. In 1922 his first novel was pub., *Lady into Fox*, a story with an original theme which made his reputation. It was awarded the Hawthornden prize and the James Tait Black Memorial prize. Two years later he followed up his success with *A Man in the Zoo*. *The Sailor's Return* appeared in 1925, *Go She Must!* in 1927, *The Old Dovecote and other Stories* in 1928, and *No Love* in 1929. His themes, blending fantasy and reality, are treated with humour and imagination, for which he employed a clear and simple style. Having learnt to fly (see *A Rabbit in the Air*, 1932), he served with the R.A.F. during the Second World War. His *War in the Air* was pub. in 1941. Other books include *The Grasshoppers Come*, 1931, *A Terrible Day*, 1932, *Pocahontas: or, The Nonpareil of Virginia*, 1933, *Beamy-Eye*, 1935, and *Aspects of Love*, 1955. In 1938 he ed. the letters of T. E. Lawrence. *The Golden Echo*, 1953, and *The Flowers of the Forest*, 1955, are autobiographical.

Garnett, Richard (1835-1906), man of letters and librarian, son of Rev. Richard G., the philologist and one-time assistant keeper of printed books at the Brit. Museum. He was b. at Lichfield, Staffordshire, and in 1851 was appointed assistant in the reading-room of the Brit. Museum, becoming its superintendent in 1875. From 1881 to 1890 he had charge of the preparation of the great catalogue of authors, resigning his post of superintendent in 1884 in order to give all his time to this exacting labour. He was keeper of the printed books from 1890 to 1899, when he retired to devote himself to writing. Among his works are *History of Italian Literature*, 1897, *An Illustrated Record of English Literature* (with Sir Edmund Gosse), 1903-4, and his lives of Carlyle, 1887, Emerson, 1888, Milton, 1890, and Dryden, 1895, contributed to the Great Writer series. His most important pub. are *The Twilight of the Gods and other Tales*, 1888, and *Relics of Shelley*, 1892, a small collection of unpub. verse found by G. He contributed many articles to the *Encyclopaedia Britannica*.

Garnier, Marie Joseph François (1839-1873), Fr. officer and explorer, b. St Etienne. In Cochinchina he served under Adm. Charner. He was the leading spirit

in the journey of exploration which was undertaken nominally under the superintendence of a superior Fr. officer but really under the direction of G., who was responsible for nearly all the observations made in a country which had previously been practically unknown to Europeans. The journey was undertaken from Kratie to Shanghai. In 1873 he undertook the founding of a Fr. protectorate in Tonking. He captured the cap., but was slain in subsequent fighting.

Garnier, Robert (c. 1545-90), Fr. dramatist and poet, b. La Ferté-Bernard. He became a law student, and whilst studying law wrote his first poem, which gained him a prize in the *jeux floraux* at Toulouse, 1565. He was held to be a great orator and was, even in his own generation, recognised as a tragedian of more than ordinary merit. He wrote mainly tragedies on classical subjects, which anticipate Corneille: *Porcie*, 1568, *Hippolyte*, 1573, *Antigone*, 1580, a tragicomedy *Bradamante*, 1582, and *Les Juives*, 1583, based on the Bible. See E. Faguet, *La tragédie française au 16^e siècle*, 1883; R. Lebegue, *La tragédie française de la Renaissance*, 1944.

Garnierite, nickel-containing mineral occurring in New Caledonia. G. is double silicate of nickel and magnesium, containing 24 per cent of the former metal. Its formula is $(\text{Ni}, \text{Mg})\text{SiO}_3 \cdot x\text{H}_2\text{O}$. It is worked upon a large scale in France for the preparation of nickel.

Garnish Island, see GLENGARRIF.

Garnishee, person in whose hands money or property belonging to a debtor or defendant has been attached at the suit of a creditor or plaintiff, and who has had warning or notice of such attachment (q.v.). A G., after receipt of such notice, must not part with the debtor's money or property except to answer the creditor's claim or until the attachment is dissolved. But there can be no execution against a G. in respect of such property unless there has been a judgment entered against the prin. debtor, and, further, a G. is entitled as against the creditor or plaintiff to set up the rights of third parties to whom he himself is under some liability in respect of the property.

Garó Hills, mountainous dist. of India, situated southward of the Brahmaputra, in W. Assam. The mts rise to a height of 4650 ft above sea level, and have the appearance of parallel ridges, with deep valleys between. The dist. covers an area of 3270 sq. m., and the inhab. the Garos, are a strong and energetic race, darkish brown in colour. The exports are cotton and forest products. Large quantities of coal and petroleum are to be found in the hills. The administrative H.Q. are at Tura. Pop. about 200,000.

Garofalo, or Benvenuto Tisio (1481-1559), It. painter, last representative of the Ferrara school, and follower of Raphael. In the church of San Niccolò at Ferrara he painted in 1580 the 'Virgin Mary and Infant Jesus,' in the church of Santa Maria de' Servi the 'Nativity,' and in San Lorenzo the 'Adoration of the

Magi. There are sev. examples of his eclectic style in the National Gallery.

Garonne, riv. of France, which rises in the vale of Aran, on the Sp. side of the Pyrenees. Its course is generally NW. Flowing through France, it passes the depts of Haute-Garonne, Tarn-et-Garonne Lot-et-Garonne, and Gironde. Its tribs. are the Save, Gers, Tarn, Lot, and Dordogne. Below Bordeaux it widens into the great Gironde (q.v.) estuary and enters the Atlantic. At Toulouse the Canal du Midi links it with the Mediterranean. Length 350 m.

Garonne, Haute-, dept of S. France formed of parts of the anct. provs. of Languedoc and Gascony. The S. is mountainous, containing some of the highest peaks of the Pyrenees, including Mt Perduère (10,560 ft.). The intervening valleys are very fertile. The centre of the dept is a hilly plateau. The chief riv. is the G., and the Canal du Midi and the Canal latéral à la G. cross the N. of the dept. Vines, cereals, fruit, and potatoes are cultivated, and livestock is raised. There are chemical, metallurgical, paper, foodstuff, engineering, leather, and hydro-electric industries. The prin. tns are Toulouse (the cap.), Muret, and St-Gaudens (qq.v.). Area 2457 sq. m. Pop. 525,700.

Garpiké, see BONY PIKE.

Garrett, João Baptista de Almeida-, see ALMEIDA-GARRETT.

Garrick, David (1717-79), actor and playwright, b. Hereford, descended on his father's side from Huguenot refugees called De la Garrique. He was educ. at Lichfield Grammar School and partly under Dr Johnson, with whom he came to London about 1737. He studied at Lincoln's Inn, and set up in the wine trade with his brother for a time, but soon gave up both for the stage. His first public appearance was at Ipswich in 1741, in *Oroonoko*. Later in the year he appeared in his famous role of Richard III. He went over to Dublin twice, becoming joint manager with Sheridan in 1745, and roused much enthusiasm there. Don Felix, in *The Wonder*, was one of G.'s favourite parts, first played in 1756, and also at his last performance, 1776. In 1747 G. and Lacy were joint managers of Drury Lane Theatre, and G. continued in this office till his retirement (1776). In 1749 he married the Viennese danseuse, Mlle Violette. Quarrels among members of his company led to the famous rivalry between Drury Lane and Covent Garden, sev. of his performers joining the opposition house. In 1750 *Romeo and Juliet* was acted by G. and Mrs Bellamy at Drury Lane, and by Spranger Barry and Mrs Cibber at Covent Garden. Drury Lane, however, triumphed in the end. In 1769 G. conducted a notable jubilee in Shakespeare's honour at Stratford-on-Avon. He did much to restore the original form of that great dramatist's plays and do away with the altered versions then in common use. With him ended the old custom of admitting spectators on the stage itself, and he introduced

various other reforms, including more suitable costumes for the actors, dressing players more or less in the period of the plays presented and also according to the country in which the play was set. He had costumes made, and every one bore a tab stating 'The Property of the Management.' This was the origin of the word 'properties,' in the sense of things used on the stage. With Goldsmith, Johnson, Burke, and others G. was a member of the Literary Club. Among his comedies and farces are *The Lying Valet*, 1741, *Lethe*, 1745, *High Life below Stairs*, 1759, and *The Clandestine Marriage*, 1766. Selections of his dramatic works were brought out in 1768 and 1798. One of Sir Charles Wyndham's great parts was that of D. G. in the play of that name (adapted from the Fr. *Sullivan* by Robertson), the last

DAVID GARRICK

revival being at his theatre in 1900. See T. Davies, *Memoirs*, 1780; J. Boaden (ed.), *The Private Correspondence of D. Garrick*, 1831-2; F. Hedgcock, *A Cosmopolitan Actor: David Garrick and his French Friends*, 1912; C. R. Williams, *David Garrick, Actor-Manager*, 1929; E. P. Stein, *David Garrick, Dramatist*, 1938; and lives by P. Fitzgerald, 1868; J. Knight, 1894; A. Murphy, 1901; C. Gaehde, 1904; D. MacMillan, 1934; and Margaret Barton, 1948.

Garrick Club, social and dramatic club named after the famous actor and dramatist David G. (q.v.). It was founded in 1831, its avowed objects being 'the general patronage of the drama, and the formation of a theatrical library, with works on costumes, making-up, etc.' The entrance fee is 35 guineas, and the ann. subscription is 25 guineas. The club possesses a collection of more than 600 theatrical portraits and other pictures, and numerous theatrical relics. It is situated at 15 Garrick Street, W.C.2. See also CLUBS. See G. Boas, *The Garrick Club*, 1948.

Garrick Theatre, Charing Cross Road, London, built by W. S. Gilbert, first opened by Sir John Hare in April 1889 with Pinero's *The Profligate*. It must be

distinguished from the G. T. opened in Whitechapel in 1830, which was rebuilt in 1845 and used for *opéra bouffe* as late as 1879. Some of the more important plays produced at the present theatre were Grundy's *A Pair of Spectacles*, 1890, Pinero's *Lady Bountiful* and Robertson's *School*, 1891, and Grundy's *A Fool's Paradise*, 1892. Pinero's *The Notorious Mrs. Ebbesmire* was produced in 1895, in which year Mme Réjane appeared here in *Mme Sans-Gêne* and *Ma Cousine*. Later successful productions were *Cyrano de Bergerac*, with Robert Loraine in the name part, 1910, Eden Phillpotts's *The Runaways*, 1928, *The Lady with a Lamp*, Jan. 1929, *The Stranger Within*, June 1929, *Happy Families*, Oct. 1929, *My Wife's Family*, 1931, *One Wild Out*, 1948, *The Gay Invalid*, 1951, and *La Plume de Ma Tante*, 1955.

Garrison, William Lloyd (1804-79), Amer. philanthropist, leader of the abolitionists in the anti-slavery struggle. In 1826 he became editor of the Newburyport *Free Press*. He ed. the *National Philanthropist*, 1827, and pub. at Boston the celebrated *Liberator*, a jour. urging the abolition of slavery in the S., from 1831 to 1865. He was much influenced by Lundy, and joined him at Baltimore, 1829, in editing the *Genius of Universal Emancipation*. His vigorous denunciation of slavery involved him in a charge of libel, and brought about his imprisonment at Boston in 1831. In 1832 he founded the New England Anti-Slavery Society, the first of many similar organisations. The Amer. Anti-Slavery Society was formed in 1833 in Philadelphia. Of this G. was president 1843-65. His extreme views made him many enemies, and his life was often threatened, but he lived to see his hopes in great part realised. He pub. *Thoughts on African Colonisation*, 1832, and *Sonnets and Other Poems*, 1843. *The Words of Garrison* appeared in 1905. See also ABOLITIONISTS. See William Lloyd Garrison, *The Story of His Life*, by his children, 1885-9; F. E. Cooke, *An American Hero: the Story of W. L. Garrison*, 1910; and J. J. Chapman, *Garrison*, 1913.

Garrod, Heathcote William (1878-), scholar, b. Wells, Somerset. Educ. at Oxford, where he won the Newdigate prize for Eng. verse, he became a fellow of Merton in 1901. During the First World War he was at the Ministry of Munitions, and in 1918 was awarded the C.B.E. From 1923 to 1928 he was prof. of poetry at Oxford, and in 1929 Norton prof. at Harvard, his lectures being pub. as *Poetry and the Criticism of Life*, 1931. He ed. the *Oxford Book of Latin Verse*, 1912, and the poems of Keats, 1939. Others of his works are *The Profession of Poetry*, 1929, *Poetry and Life*, 1930, *The Study of Poetry*, 1936, *Scholarship: its Meaning and Value*, 1946, and studies of Byron, 1923, and Keats, 1926.

Garron, see HORSE, *Pontes*.

Garrotte (Sp. 'cudgel') is an appliance which is used in Spain for the execution of criminals. The condemned man is

seated on a scaffold and fastened to an upright post by an iron collar (the G.), and a knob worked by a lever dislocates his spinal column. *Garrotting* is the name given in England to a form of robbery which became rather common in 1862-3. The Act of 1863, which imposed flogging for this offence, is generally accepted as having put a stop to it, though humanitarians contend that the outbreak of garrotting was already coming to an end. See also CAPITAL PUNISHMENT. See H. S. Salt, *The Fallacy of Flogging*, 1916.

Garstang, John (1876-1956), archaeologist. Educ. at Blackburn Grammar School and Jesus College, Oxford. G. was engaged in archaeological research from 1897, notably on Rom. sites in Britain, in Egypt, Nubia, and Asia Minor. After the First World War he was appointed director of the Palestine Gov.'s dept of antiquities, which he was instrumental in founding in 1920. From 1907 to 1941 he was prof. of the methods and practice of archaeology at Liverpool Univ. G. was leader of the Marston archaeological expedition to Jericho, and his discoveries there (1930-1) afforded the strongest evidence of the authenticity of O.T. narratives (see also JERICHO). Head of the Brit. Institute of archaeology in Ankara, Turkey, 1948. Pubs.: *Roman Ribchester*, 1899, *The Third Egyptian Dynasty*, 1904, *A Short History of Ancient Egypt* (in collaboration with Prof. Percy Edward Newberry), 1904, *The Land of the Hittites*, 1910, *The Foundations of Biblical History: Joshua and Judges*, 1931, *The Heritage of Solomon*, 1934; reports on the excavation of Abydos, Merö, Jericho, and Mersin in *Liverpool Annals of Archaeology*, 1932-9; *Prehistoric Mersin*, 1953.

Garstin, Sir William Edmund (1849-1925), civil engineer, b. in India, son of a civil servant there. Educ. at Cheltenham and King's College, London. Returning E., he served for 12 years in the Indian public works dept. From 1892 to 1904 he was inspector-general of irrigation in Egypt, being also under-secretary for public works. He explored the Nile from source to delta, a 7000-m. journey, much of it through terrible malaria-ridden country, and presented a brilliant report. His investigations convinced him that, with so vast a loss of Nile water through enormous swamps and evaporation, the water of the lower riv. should be stored in great quantities during the ann. flood, and distributed through irrigation canals when the riv. reached its lower levels. The work of control of the flow of the riv. was carried out mainly under G.'s administration and in accordance with his plans. It comprised the construction of the Aswan dam and the barrages at Asyut and Esna, which were all parts of one system of water storage and control. The subsequent heightening of the dam and the construction of the Esna barrage were not completed before he retired. The Asyut barrage was constructed, according to G.'s directions, from the

original design of (Sir) Wm Willcocks (q.v.) (1898-1902). In addition G. caused the clearing of the White Nile of its floating forests of rotting vegetation (sudd) which made navigation difficult or impossible. Lord Cromer says that it would be difficult to exaggerate the debt of gratitude which the people of Egypt owed to G. (see *Modern Egypt*, vol. 1, p. 686); and on another occasion he described G. as the greatest hydraulic engineer in this or any other country. The Egyptian Nationalist press styled G. 'the treasure of Egypt.' Knighted 1897, and in 1904 he was appointed a director of the Suez Canal Company.

Garston, suburb of Liverpool, Lancs, England, incorporated in the city in 1902, with an extensive dock system operated by the Dock and Inland Waterways Executive. G. imports largely West Indian produce and Scandinavian timber; it has sev. old-estab. industries in addition to those at Speke new township, industrial estate, and airport, which adjoin.

Garter, Order of the, see ORDERS OF KNIGHTHOOD, GREAT BRITAIN AND IRELAND (1).

Garter King-of-Arms, one of the officers of the order of the Garter, the others being the prelate, chancellor, registrar, and gentleman usher of the black rod. He is also *ex officio* senior member of the College of Heralds under the earl marshal.

Garth, Sir Samuel (1661-1719), doctor and poet, b. Holm, Durham. Educ. at Peterhouse, Cambridge, he studied medicine at Leyden, and in 1693 was elected a Fellow of the College of Physicians. A zealous Whig, he was a friend of Addison and Pope, and became physician to George I, who knighted him in 1714. He is chiefly remembered as the author of *The Dispensary*, 1699, a mock-heroic satire on apothecaries, which introduces a scheme for setting up charitable dispensaries where the poor could obtain advice and prescriptions. He also wrote *Claremont*, 1715, and ed. a trans. of Ovid's *Metamorphoses* to which Addison, Pope, and others contributed. He is included in Johnson's *Lives of the Poets*. See also R. Bond, *English Burlesque Poetry*, 1932.

Gartokh, or **Gartok**, tn in Great West Tibet in the Nari-Khorsum (Ali) prov. to the E. of long. 80° E., S. of lat. 32° N. It stands at a height of 14,240 ft above the sea in one of the loftiest mt regions in the world. To the E. of the tn are salt-mines, and the important gold-mining dist. of Thok-Jalung lies 85 m. to the NE. An active trade is carried on in shawl wool, tea, etc. In accordance with the Tibet Treaty of 1904 it was open to Brit. trade. In winter G. contains only a few dozen people, but in summer trade passing through makes it a busy place.

Garvie, Alfred Ernest (1861-1945), religious author; b. Zyrardov, Russian Poland, and educ. privately and at George Watson's College, Edinburgh. He took his M.A. at Oxford in 1892, was minister of Macduff Congregational church, 1893-5, and of Montrose Congregational church, 1895-1903. Prof. of

theology in Hackney and New Colleges, London, 1903-7. Principal of New College, Hampstead, from 1907. His publs. include *The Ethics of Temperance*, 1895, *The Ritschian Theology*, 1898, *The Gospel for To-day*, 1904, *My Brother's Keeper*, 1905, *The Christian Certainty*, 1910, *The Christian Belief in God*, 1933, *Revelation through History and Experience*, 1934, *The Christian Faith*, 1936, *Memories and Meanings of My Life*, 1937, and *Christian Moral Conduct*, 1938.

Garvin, James Louis (1868-1947), journalist, b. Birkenhead, Cheshire, of Irish parentage. Entering journalism, he was a leader-writer on the *Newcastle Chronicle* from 1891 to 1899, when he joined the staff of the *Daily Telegraph*. In 1905 he ed. the *Outlook*, from 1912 to 1915 the *Pall Mall Gazette*. As editor of the *Observer* from 1908 to 1942 he was one of the best-known and most influential journalists in the country. His works include *The Economics of Empire*, 1905, *Tariff or Budget*, 1909, *The Economic Foundations of Peace*, 1919, and a monumental *Life of Joseph Chamberlain*, 1932. From 1926 to 1929 he was editor-in-chief of the *Encyclopaedia Britannica*. He received honorary doctorates of Edinburgh and Durham and in 1941 was made a Companion of Honour. See life by Katharine Garvin, 1948.

Gary, city in the heart of the Calumet region of Indiana, U.S.A., at S. end of Lake Michigan, 25 m. from the centre of Chicago. Now one of the world's greatest steel-making centres, it was built up, 1905-9, on sand marshes and dunes. It has 700 ac. of parks and is known for its development of the 'platoon' (work-study-play) system. Pop. 133,900.

Gas, **Coal**, see GAS MANUFACTURE.

Gas, **Nascent**, see NASCENT STATE.

Gas, **Noble**, or **Rare**, see INERT.

Gas, **Poison**, see CHEMICAL WARFARE.

Gas and Gases. The word **gas** was invented by J. B. van Helmont (c. 1640) to describe the G. now known as carbon dioxide. It was formerly supposed that the word was derived from the Dutch *geest* (Ger. *Geist*), spirit, but that this is an incorrect view is shown by van Helmont's words: 'I have called this spirit **gas**, as it is not distinguishable from the Chaos of the ancients.' The term is now used to describe one of the 3 states of aggregation of matter. In simple language these 3 states of aggregation may be defined thus: 'A solid has volume and shape; a liquid has volume, but no shape; a gas has neither volume nor shape' (Sir O. Lodge). 'Vapour' is the term applied to a G., which by comparatively small changes of temp. or pressure may be liquefied. The first G. to be studied in detail was atmospheric air. It was probably suspected in the 17th cent. by Rey and Mayow that the increases in weight which a metal undergoes during burning in air is due to a combination of the metal with some constituent of the atmosphere. The recognition of this important fact and of its full significance was greatly retarded by the influence exerted by the phlogistic

school (see phlogistic theory under *History in CHEMISTRY*). The discovery of oxygen by Priestley and Scheele, and of nitrogen by Cavendish, failed to explain what happened during combustion, until these facts were interpreted by Lavoisier, who gave the first satisfactory explanation of the phenomena of combustion, and thereby estab. the principle now known universally as the conservation of mass. The early workers on the nature of G.s (or 'airs' as they were then called) were Cavendish, Black, Scheele, and Priestley, and to their credit must be set the discovery of oxygen, hydrogen, nitrogen, carbon dioxide, oxides of nitrogen, etc., and the investigation of their properties. Towards the end of the 19th cent. sev. 'rare' G.s (q.v.) were identified and isolated by Ramsay, Rayleigh, Travers, and other workers. These G.s are argon (now used in G.-filled lamps), krypton, xenon, neon (familiar in advertising signs), and helium (found first in the sun and subsequently in the atmosphere and on the earth near radioactive springs). The properties of G.s have been studied extensively, and the fruits of these investigations are (a) the atomic theory of matter, (b) the kinetic theory of matter, and (c) the electrical theory of matter. Dalton, Gay-Lussac, and Avogadro are associated with the important discoveries that led to the first theory; Bernoulli, Maxwell, and Clausius with the second theory; while J. J. Thomson and Rutherford are 2 of the most famous scientists associated with the discoveries that estab. the third theory. There are 4 fundamental rules or laws governing the behaviour of G.s, viz.:

1. *Gay-Lussac's Law*.—The vols. of reacting G.s bear a simple relation to each other and to the vol. of the resulting product.

2. *Boyle's Law*.—The vol. of a given mass of G. varies inversely as its pressure, provided that its temp. remains constant. Mathematically this is stated as follows: $PV = \text{a constant}$, where P is the pressure and V is the vol. of the given mass of G. at the given temp.

3. *Charles's Law*.—The vol. of a given mass of G. increases by $\frac{1}{273}$ of its vol. at 0° C. for a rise of 1° C., when the pressure of the G. is kept constant.

4. *Avogadro's Law*.—Equal vols. of all G.s measured under the same conditions of temp. and pressure contain equal numbers of molecules.

The above laws apply only to 'perfect' G.s (see below). They are approximately obeyed at ordinary temps. and pressures by the so-called 'permanent' G.s, e.g. oxygen, air, hydrogen, helium, etc., which are liquefied only at temps. far below 0° C.

Kinetic Theory of Gases (q.v.).—The striking successes of this theory are (1) the explanation of the pressure, vol., and temp. relations of a G. mentioned above, (2) the determination of the sizes, speeds, and 'free paths' of the molecules of G.s, (3) the explanation of the phenomena of viscosity, diffusion, and conduction of heat in G.s, (4) the explanation of the

specific heats of G.s, and (5) the interpretation of the laws of thermodynamics (q.v.). The mathematical calculations underlying this theory begin by postulating a *perfect gas*, viz. a G. whose molecules are comparable to perfectly elastic particles of negligible dimensions that exert no force of attraction on each other. These molecules are in constant motion, and their velocities are changed only when they collide with each other. The molecules travel in straight lines between collisions. Subsequently the properties and behaviour of real G.s are explained, and the following data give an idea of some of the results of this theory: (1) *diameter of molecules*: hydrogen 2.4×10^{-8} cm.; oxygen 3.0×10^{-8} cm.; nitrogen 3.2×10^{-8} cm.; helium 1.9×10^{-8} cm.; (2) *mean velocity* at 0° C. and a pressure of 760 mm. of mercury of molecules hydrogen, 169,400 cm. per sec.; oxygen 47,000 cm. per sec.; nitrogen 50,000 cm. per sec.; helium 132,000 cm. per sec.; (3) at 0° C. and 760 mm. of mercury pressure, the number of molecules in 1 c.c. of a G. is 2.9×10^{19} . Some idea of the state of affairs in a G. may be gathered from the fact that a molecule suffers something like 8,000,000,000 collisions per sec. at normal temp. and pressure. The walls of the containing vessel are bombarded by the molecules of the G. and this bombardment accounts for the phenomenon of the pressure exerted by a G.

Densities and Molecular Weights of Gases.—Since equal vols. of G.s under the same conditions contain equal numbers of molecules, the densities are in the same ratio as the molecular weights. This principle of Avogadro furnishes a method of determining molecular weights of substances in the gaseous condition. If hydrogen be taken as the unit in determining densities, then since the molecular weight of hydrogen is 2, the molecular weights of G.s are twice the respective densities. In order to determine the density of a G. 2 methods are available: (1) by weighing a known vol. of the G., (2) by measuring the vol. of a known mass of G.

In order to determine the density of a vapour, Victor Meyer's method is used. It consists essentially in volatilising a small known mass of the substance, and collecting and measuring its vol. by the vol. of air it displaces from the apparatus. Vapour densities are of importance in determining the molecular complexity of substances. Hydrogen, chlorine, and nitrogen, for example, are shown to be diatomic, i.e. to contain 2 atoms in the molecule. Zinc, cadmium, and mercury, on the other hand, are monatomic. It is interesting to notice that in many cases the number of atoms in the molecule varies with the temp. In the case of sulphur, for example, the vapour density at 500° C. shows that there are 6 atoms in the molecule, whilst at 1100° C. there are only 2 atoms in the molecule.

Specific Heats of Gases (see *SPECIFIC HEAT*).—The first law of thermodynamics

(q.v.) states that work (q.v.) may be performed at the expense of heat energy, and that the amount of work so performed is equivalent to the amount of heat energy supplied to do this work. When a G. is heated it may expand and do work; in this case only part of the heat supplied will be available for raising the temp. of the G. As the G. may be allowed to expand in an infinite variety of ways, it follows that when a given amount of heat is supplied to a given mass of a G. its rise of temp. may be one of an infinite variety of values. In other words, a G. has an infinite number of specific heats. Two of these are of considerable importance, viz. the specific heat of a G. at constant vol. (C_v) and the specific heat of a G. at constant pressure (C_p). For hydrogen $C_p = 3.41$; $C_v = 2.40$. For monatomic G.s the kinetic theory of G.s gives $C_p/C_v = \frac{5}{3}$; for diatomic G.s $C_p/C_v = \frac{7}{5}$; for triatomic G.s $C_p/C_v = \frac{9}{7}$. Although these theoretical deductions are made for perfect G.s, the success of the theory may be gauged from the following typical results for this ratio for G.s that approximate to a perfect G. under ordinary conditions: argon (monatomic) 1.667; hydrogen (diatomic) 1.407; nitrous oxide (triatomic) 1.324.

Diffusion of Gases (see DIFFUSION).—Diffusion takes place more readily in G.s than in solids or liquids, by reason of the greater velocities of the molecules in the gaseous state, and because the force of attraction between the molecules of a G. is exceedingly small. Graham's researches on the diffusion of G.s led to the conclusion that the rate of diffusion is inversely proportional to the square-root of the density of the G. Hydrogen, being the lightest G., will diffuse most quickly, but when any G.s are mixed together diffusion results in a uniform mixture of the G.s.

Liquefaction of Gases.—When a G. contained in a vessel is subjected to a continually increasing pressure, the vol. may continually decrease, the contents remaining homogeneous, or a separation into G. and liquid may result. The deciding factor is the temp. It has been found that for every G. there is a temp., known as the *critical temperature* (q.v.) above which it is impossible to liquefy the G. however much it is compressed. The behaviour of G.s during compression is well illustrated by the case of carbon dioxide, which was studied exhaustively by Andrews. He found that the critical temp. for carbon dioxide is 30.92°C . The pressure required to cause liquefaction at this temp. is called the *critical pressure*. Although the problem of the liquefaction of G.s received early attention and the possibility of the liquefaction of air was vaguely hinted at by Lavoisier, the cause of the 'resistance' offered by the so-called permanent G.s was not understood until the above critical phenomena had been examined. The early experimenters included Mouton and Clouet, who liquefied sulphur dioxide, Davy and Faraday, who liquefied chlorine, and Bussy, who in 1824 showed that when liquid sulphur dioxide

was allowed to evaporate a much lower temp. was obtained. This observation has been of prime importance in later work on the liquefaction of G.s, for it has enabled experimenters to cool the 'recalcitrant' G.s below their critical temps. when liquefaction can be obtained by compressing the G.s sufficiently. Cailletet in 1877 liquefied oxygen and carbon monoxide by subjecting the G. to a pressure of 300 atmospheres, cooling it by evaporating sulphur dioxide, and then suddenly releasing the pressure. Pictet also succeeded in liquefying oxygen, and thought he obtained evidence of having prepared liquid hydrogen. Wroblewski and Olszewski in 1883 liquefied oxygen, previously cooled by liquid ethylene at -130°C ., and then liquefied hydrogen previously cooled by liquid oxygen. Many of the so-called permanent G.s were also solidified. More recent work is that of Linde, Hampson, Dewar, and Kammerlingh Onnes. The same principle was adopted by each worker, viz. the G. is compressed and then cooled. After cooling it is allowed to expand by passing through a porous plug (Joule-Thomson effect), whereby the temp. is further reduced. The cold G. is used to cool more of the compressed G., and the process of cooling continues until finally liquid is formed. The last G. to be liquefied was helium (Kammerlingh Onnes, 1908). It is interesting to note that this G. and other rare G.s were isolated by the fractional distillation of liquid air. The following are the boiling-points of some of the so-called permanent G.s under a pressure of 760 mm. of mercury: hydrogen -252.7°C ., oxygen -183.0°C ., nitrogen -195.8°C ., argon -185.7°C ., helium -269°C . Liquid G.s are stored in *Dewar glasses* ('vacuum flasks'), which are double-walled, the space between the walls being evacuated in order to minimise conduction and convection of heat to the liquid, and the inner surfaces of the walls are silvered in order to prevent radiation to and from the liquid G.

Van der Waals's Equation.—The 'characteristic' equation for a perfect G. obtained by combining the laws of Boyle and Charles, is $PV = RT$; P = pressure, V = volume, R = a constant, and T = absolute temp. of the G. The value of R depends on the mass of G. under consideration; for a mass of G. equal to the molecular weight in grams it has the value 8.3×10^7 , where the vol. of the G. is measured in c.c., and its pressure in dynes per sq. cm. T is measured from the absolute zero of temp., viz. -273°C ., the lowest possible temp. Real G.s—even the so-called permanent G.s—obey this equation only approximately at ordinary temps. and pressures, whilst at temps. not far above their critical temps., or at high pressures, the deviations from the behaviour of a perfect G. are serious. This is due to 2 causes: (1) The molecules of a real G. are of finite size, (2) the attraction exerted by the molecules on each other is not zero. The importance of these 2 factors is relatively small when

the pressure of the G. is small and the temp. is considerably above its critical temp., for then the vol. occupied by the incompressible material (the molecules themselves) is very small compared with the vol. occupied by the G., and the distance between the molecules is relatively great. A vapour is defined as a G. at a temp. below its critical temp., and its properties differ considerably from those of the perfect G. Van der Waals's equation is an attempt to obtain a characteristic equation for a real G.—an equation that will be true for all temps. and pressures, so that it does not differentiate between a G., a vapour, and a liquid, but attempts to account for the observed differences in their properties. This

equation is $(P + \frac{a}{V^2})(V - b) = RT$, a and

b being constants for the G. We can compare this equation with that of the perfect G., viz. $PV = RT$, and interpret

the term $\frac{a}{V^2}$ as representing the effect on

the pressure of the molecular attraction resisting the expansion of the G. The constant b is about 4 times the total vol. of the molecules. These terms are relatively unimportant at ordinary temps. and pressures for G.s like air, hydrogen, etc., and hence these G.s approximate to perfect G.s under such conditions. Qualitatively van der Waals's equation has been successful in accounting for the deviations from the perfect G. laws, and for the existence of a critical temp. Its quantitative success is fairly good for carbon dioxide, but its success for other G.s is not striking. Following van der Waals many attempts have been made to obtain a characteristic equation for a fluid, and of these the equations proposed by Clausius, Chappuis, Dieterici, and Lees are the most noteworthy.

Gas Cookers. Among the earliest attempts to use gas for cooking were those of J. Sharp about 1835, when he constructed ovens heated by gas for baking. In one that he constructed for a Leamington hotel a dinner was prepared for a hundred persons.

The modern gas cooker is a very efficient and well-designed appliance, consisting of an oven and a hot-plate, with boiling and simmering burners and a grill. In some G. C. the grill is fitted above the hot-plate at eye-level. The hot-plate can be placed either above the oven or alongside it. Cookers can be free-standing or built into cupboard fittings. Thermostatic control of the oven gives precise reproducible cooking conditions and eases the cook's

tasks. A low-temp. cabinet for keeping food and plates warm or for long-period slow cooking can be an integral part of the cooker or fitted independently of it. G. C. are finished in easily cleaned enamel with safety taps of chromium or plastic material, and ovens are well insulated to prevent heat loss. From 8,000,000 to 9,000,000 homes in Great Britain use gas for cooking.

Gas Discharge, luminous electric discharge (q.v.) in certain gases or vapours, neon, sodium, mercury vapour; used in electric lamps (q.v.).

Gas Engines are internal-combustion engines (q.v.) using a gaseous fuel. The first real gas engine was built in 1820 by Wm Cecil of Cambridge, who used the explosion of a mixture of hydrogen and air in the cylinder to drive the piston. This engine did not achieve commercial importance, but it is interesting to note that during 1939-45 the Germans used hydrogen peroxide as working substance

FIG. 1. LENOIR CYCLE

in submarine engines. The first practically important gas engine was made by Lenoir in 1860. In construction this resembled an ordinary single-cylinder horizontal steam engine. Slide valves worked by eccentrics controlled the admission of air and gas and the escape of the combustion products to the air. As the piston moved forward it drew in an explosive mixture of air and gas, and at mid-stroke the inlet valve closed and the mixture was ignited by an electric spark. During the remainder of the stroke, work was done because of the rapid rise of pressure of the hot products, and simultaneously the products of a previous explosion on the other side of the piston were expelled. In the course of the backstroke the products formed by the explosion described were expelled, and a fresh explosive mixture drawn in on the other side, and so on. An indicator diagram from Lenoir's engine is shown in Fig. 1. The action takes place in the direction shown by the arrows.

The curve AB represents the gas and air being drawn in at an almost uniform pressure. Then there is a rapid rise of pressure as the mixture explodes, shown by BC; after which, while the products continue to expand, the pressure gradually diminishes, as shown by the curve CD. Finally the backstroke expels the products at atmospheric pressure as represented by the horizontal line DA. On account of its excessive consumption of gas—nearly 100 cu. ft per h.p. per hr (about 5 times

the quantity used in a modern gas engine), due to the small expansion of the explosive mixture, and the low pressure on the piston—the engine was soon superseded, though a number of Lenoir engines were actually:

a vertical engine with a cylinder open at the top, in which a heavy piston was forced up by explosion of a gas-air mixture at the bottom, and did work on descending by its own weight. This engine was not a success, but 10 years later Otto made the first practical use of a cycle of operations suggested by Barnett

stroke. Then as the piston moves back over the exhaust stroke, and gradually sweeps the chamber clear, the pressure falls back to the atmospheric level, as shown by F.A.

The irregularity of motion arising from the fact that only one stroke in 4 is a power stroke may be partly overcome by using a large flywheel, or 2 or more cylinders may be used on the same crank-shaft, and their action so timed that uniformly distributed impulses are given to the shaft, but in any case an engine working on the 4-stroke cycle will have greater weight per h.p. developed than

FIG. 2. DIAGRAM OF OTTO ENGINE

in 1838 and worked out by Beau de Rochas in 1862.

Fig. 3 shows the Otto cycle diagram. AB represents the first or charging stroke of the cycle, when the mixture is being taken in at what is practically atmospheric pressure. BC corresponds to the compression stroke. Ignition takes place at C, and the pressure rapidly rises as shown

FIG. 3. OTTO CYCLE

by the steep curve to D. DEF indicates the working stroke. From D to E indicates the ordinary expansion and consequent gradual fall of pressure. Towards the end of this stroke the exhaust valve opens, allowing the waste gases to escape, with the resultant sudden decrease in pressure, as shown by EF. So CDEF represents the full effect of the working

one working on a 2-stroke cycle. A 2-stroke gas engine was invented in 1880 by Dugald Clark. Gas and air were mixed and slightly compressed in a separate cylinder (the 'displacer') and discharged into the working cylinder at the end of the power stroke, as the piston overran and uncovered the exhaust portholes in the cylinder wall. Owing to the compression of the charge in the displacer the charge sweeps out the burnt gases. On the return stroke the piston covers up the exhaust ports, and the charge is compressed, ignition occurs at inner dead centre, the expansion drives the piston forward, and as soon as the exhaust ports are uncovered the new charge is drawn in. Against the advantage of the engine producing one power stroke in every 2 must be set the addition of the displacer cylinder, but this may be of comparatively light construction, as it deals with the charge at ordinary temp. and low pressure, just sufficient to sweep the combustion products out of the working cylinder. The fact that some of the incoming gases may be mixed with the exhaust and lost, is of minor importance when waste gases are used, as these are produced in large quantities at low cost. All modern G. E. work on either the 4-stroke or the 2-stroke cycle, and, in addition may be single-acting or double-acting. In the latter combustion takes place on either side of the piston alternatively.

The temp. developed at the explosion in G. E. may reach 2000° C., and exceeds the melting-point of the iron used in the

cylinder and piston. It is therefore necessary to enclose the cylinder in a jacket in which cooling water is circulated. But as heat is thereby extracted from the working substance the efficiency is appreciably reduced. Moreover steep temp. gradients are set up in the wall, from the explosion temp. to that of the cooling water, and, further, the cylinder wall is alternately heated (at explosion) and cooled (at expansion), and this temp.

suction stroke, thus increasing the compression without raising the explosion temp. Tests showed an increase in thermal efficiency from 27 per cent to 34 per cent.

The usual vertical or horizontal ball governors (see STEAM ENGINES) are used on G. E. in 3 different ways, acting on a lever which (1) cuts off the entire fuel supply for one or more strokes until normal speed is restored ('hit and miss,'

Crossley-Premier Engines Ltd.

CROSSLEY-PREMIER 1500 B.H.P. GAS ENGINES IN DUPLICATE SET

This is the largest British-made set in the world, operating on natural gas, in Trinidad. Each engine has 12 cylinders arranged in 4 groups of 3. Two of these groups are placed on each side of a centrally disposed flywheel, to the arms of which the rotating field of the 1000-kw. alternator is bracketed

variation only penetrates a thin layer of the inner wall. This uneven and varying heating gives rise to cracks in the material and may lead to complete breakdown. Two methods have been suggested for dealing with this problem. In one method, due to Messrs. Crossley, a small spray of water is introduced into the cylinder during suction, the mist is converted into steam at the explosion thereby absorbing heat from the gases, but the steam also expands. Tests have shown an appreciable increase in efficiency over that of an engine working with water jacket only. The other method, suggested by Clark, consists in the injection of a further charge of air at the end of the

used on small engines only), or (2) cuts off part of the fuel (gas), thus reducing the thermal value of the mixture ('quality governing'), or (3) throttles the mixture on entering the cylinder, thus reducing the pressure. This is the method of 'quantity governing,' and is now used on all large engines.

Ignition of the gases was effected in the Otto engine by a gas flame admitted to the cylinder by a valve operated and timed by the engine itself. This method was later superseded by the hot-tube method, in which part of the gases pass through a short porcelain or platinum tube kept hot by a gas flame. Modern engines use ignition by electric spark, the spark gap

being placed in the cylinder, and usually supplied by a high-tension magneto (see MOTOR CARS).

Starting of small G. E. can usually be done by hand, but for engines larger than 30 h.p. it is necessary to have some other means of starting. Some engines are started by introducing a small explosive charge, but more often a special compressor is used or the valves are so set as to make the engine start as a compressor.

G. E. are made in sizes up to about 3000 h.p., and usually run at speeds of 80-300 r.p.m. Modern developments mainly concern the cooling and governing systems. Two types of continental 2-stroke engines merit special mention, the Koerting double-acting engine in which the long piston acts as part of the valve gear by covering and uncovering the exhaust port as explained above, and the Bechthausen engine in which there are 2 pistons in the cylinder, moving alternately towards and away from one another. The Fullagar engine works on a similar principle.

Gas Industry, British. The Gas Act, 1948, provided for the vesting, as from 1 May 1949, of former G. undertakings, whether limited, municipal, or G. holding companies, in one of the 12 area boards estab. by the Act. Each area board became responsible, as from the vesting date, for the supply of G. within its dist., together with the supply of coke and other residuals. Each area board was made responsible for balancing revenue with expenditure, taking one year with another, and was empowered to fix G. charges by means of a tariff. The B. G. I. is subject to the general control of the Minister of Fuel and Power, who is entitled to give directions of a general character either to the G. Council or the area boards. The G. Council was estab. by the Act for the purpose of advising the minister and promoting and assisting the efficient performance by the area boards of their functions. The G. Council has responsibilities with regard to research, training of employees, and the maintenance of machinery for negotiating terms and conditions of employment; it consists of a chairman, deputy chairman, and the chairmen of the 12 area boards. Under certain circumstances the G. Council can give directions to area boards.

Gas-liquor, watery fluid which, together with coal-tar (q.v.), forms the liquid product of the distillation of coal. This liquor, which separates as a layer above the tar, consists chiefly of a solution of ammonium salts, partly condensed from the hot gases and partly derived from the subsequent washing of the gas in the scrubbers. The carbonate and chloride are the most important of the salts present and occur to the extent of about 4 and 1.5 per cent respectively. Smaller quantities of the sulphide, thiosulphate, and sulphate are also present. G. was at one time the most important source of ammonia from the commercial point of view. This product is obtained from it by decomposing with lime, and blowing over

the ammonia with steam. If the sulphate, which is largely used as a fertiliser, is required, the gas is passed into sulphuric acid, and the salt crystallised out. Nowadays G. is of minor importance as a source of ammonia, which is mostly prepared synthetically from hydrogen and nitrogen.

Gas Manufacture. Gas is made by the destructive distillation of that variety of coal, rich in hydrogen, known as bituminous coal. A typical bituminous coal has the following composition: carbon, 77 per cent; hydrogen, 5 per cent; sulphur, 1.7 per cent; nitrogen, 1.7 per cent; oxygen, 7 per cent; ash, 3.5 per cent; moisture, 3.4 per cent.

The products of the distillation of coal may be divided into 3 main classes: (a) solids such as coke and gas carbon which is left on the walls of the retorts; (b) liquids consisting of tar and ammoniacal liquor; (c) gases consisting of the unpurified coal gas. The coal tar is a particularly valuable liquid and consists of an exceedingly complex mixture of hydrocarbons, phenols, etc. It contains more than 200 recognisable chemical compounds; some of the chief products obtained by distillation of tar into fractions are: (1) benzene and its homologues from which motor fuels and aniline, the source of coal-tar colours, are derived; (2) phenol or carbolic acid, used in the manuf. of plastics such as bakelite and in drugs such as aspirin and phenacetin; (3) naphthalene, used as a disinfectant and in moth-balls; (4) pitch, extensively used for road making. By chemical reactions on the many products obtained by the distillation of tar many valuable drugs, dyes, plastics, perfumes, and colouring matters are obtained.

The gases may be divided into (1) light hydrocarbons, such as methane, acetylene, ethylene; (2) other combustible gases such as hydrogen, carbon monoxide; (3) non-combustibles, such as nitrogen and carbon dioxide, and impurities, such as hydrogen sulphide and carbon disulphide and other organic sulphur compounds, and also ammonia. Of the last class, ammonia and hydrogen sulphide are completely extracted by purification processes, and frequently most of the organic sulphur compounds are also removed.

The series of operations involved in G. M. embraces the processes of distillation, condensation of the products of distillation which are liquid or solid at atmospheric temp., exhaustion of the uncondensed gas from the retorts, wet purification, by washing with water, dry purification, estimation of the vol. of the purified gas, and distribution to the mains from which the customer draws his supply. From the accompanying diagram an idea of the order in which operations in G. M. are carried out, and the arrangement of the plant, can be gained.

Retorts.—The distillation of coal is carried out by the following systems: (1) horizontal retorts; (2) continuously operated vertical retorts; (3) intermittent vertical retorts or chambers; (4) coke

ovens; although large amounts of gas are produced as a by-product in coke ovens, their main concern is with the manuf. of hard, dense coke for use in the steel industry. Most of the tn gas supplied by the gas industry is made in horizontal or vertical retorts.

Horizontal Retorts.—These are made of fire-clay or silica; their cross sections are usually beehive shaped (\square), a form adopted on account of the large heating surface presented by the base and the fact that it remains unchanged after continued heating. To the open ends of each retort

of heat. It is usual to have an admixture of steam with the primary air supply which forms carbon monoxide and hydrogen by contact with the hot coke. This system of heating possesses the following advantages: (1) A great economy of fuel; (2) a high temp.; (3) a uniform distribution of heat around the retorts. In modern installations the heat in the waste gases is used to preheat the secondary air used for combustion of the producer gas in recuperators, thus effecting a considerable economy in fuel. With a modern recuperative setting it is possible to carbon-

DIAGRAM OF A COAL-GAS PLANT

The lower left-hand position shows carburetted water-gas plant, which is not always used

a cast-iron mouthpiece is bolted; this carries a socket to receive the pipe through which the gases pass after leaving the retort. The retorts are heated externally, being arranged in 'beds' of from 3 to 12. Each bed of retorts has a separate furnace and carbonisation takes about 8–12 hrs at a temp. of about 1000°C . Each retort is 20 ft long, 16 in. wide, 13 ins. high, and holds about 14-cwt of coal. The retorts are heated by the combustion of producer gas which is made by the passage of air through red-hot coke in a furnace or 'producer' placed below the bed of retorts. The oxygen of the air is converted into carbon monoxide, and the mixture of carbon monoxide and nitrogen enters the combustion chamber surrounding the retorts at a high temp.; it is here supplied with sufficient air to complete the combustion of the carbon monoxide to carbon dioxide, a reaction which is accompanied by the evolution of a great quantity

of heat. Formerly horizontal retorts were charged by hand, but they are now almost entirely effected by machinery operated by compressed air or hydraulic or electric power. Various types of machines are available for the purpose, some of which charge from one side of the retorts only, others charging simultaneously from both sides. In some of these machines the principle of the conveyor chain is employed, while in others, of the projector type, the coal is thrown into the retort from a rapidly rotating belt by centrifugal force. The coke is discharged from the retorts by means of a telescopic ram which enters the retort at one end, pushing the red-hot coke out at the other, the coke then being quenched with water.

Vertical Retorts.—Carbonisation in vertical retorts may be continuous or intermittent. In the case of the former coal is fed continuously into the top of a

retort by means of gravity, and is carbonised in its passage through the retort, coke being extracted by a slowly moving mechanical extractor at the base. As the coal is carbonised it swells considerably, and in consequence the retorts are wider in both dimensions at the bottom than at the top. The retorts in cross-section are either rectangular (e.g. Woodall-Duckham system) or oval (e.g. the Glover-West system) and are of various sizes to carbonise from 3 to 12 tons per day. The actual amount of coal passing through the retort depends upon the class of coal being carbonised and the calorific value of the gas produced. Steam is introduced at the base of the retort for the primary purpose of cooling the coke before it is discharged, but in so doing it produces water gas, thus increasing the gaseous yield. With continuous vertical retorts there is great possibility of flexibility in output and calorific value through variations in the rate at which coal is carbonised and in the amount of steaming. Steam is generated in waste-heat boilers in which the heat of the waste gases is utilised. Carbonisation in intermittent vertical chambers is not unlike that in horizontal retorts, except that coal is fed into the retort by gravity from overhead charging machines, and the coke is similarly discharged by gravity into a coke car, which is then cooled by means of water in a quenching tower. Carbonisation takes 12 hrs and steam is admitted for the last 2 hrs. The retorts are made in various sizes to accommodate from 1 to 5 tons of coal. Full accounts of various installations of continuous and intermittent vertical retorts may be found in the *Transactions of the Institution of Gas Engineers*.

Hydraulic Main.—The gas passes from the retort to the hydraulic main. This is a long horizontal tank supported above the top of the retort stack, through which is maintained a constant slow stream of water, the level of which is not allowed to vary. The ascension pipe dips about 1 in. into the water, which acts as a seal to allow any retort to be charged singly without the possibility of gas produced in the other retorts of the same bed escaping through the open retort. Some of the high boiling constituents in the gas condense in the ascension pipe, which must be periodically cleaned. In the hydraulic main, where the gas bubbles through water, condensation takes place to a still great extent, and also solution of a considerable quantity of ammonia. The products of condensation form a black, viscous fluid of peculiar smell called coaltar, which is a mixture of an extremely complex character. The tar, being heavier than the ammonia liquor, forms a layer at the bottom of the main, and the ammonia liquor is run off from the top of it at a constant rate into a storage tank. The gas leaves the main at a temp. of about 60° C., and is reduced to the temp. of the air by condensers which are air-cooled or water-cooled, or both. Water condensers are more efficient, because the degree of cooling can be better regulated

with water than with air. The efficiency of a condenser is judged by the efficacy with which it removes naphthalene; this compound condenses to a white glistening solid, which causes great trouble when it is deposited in the works or distributing pipes.

The Exhauster.—Since the stream of gas has to work against the pressure of the seal in the hydraulic main, the pressure of the gas in the retort must be greater than the pressure in the combustion chamber surrounding it. Some of the gas would naturally percolate through the porous wall of the retort and be consumed in the chamber. The exhauster is a rotary gas pump, which serves the purpose of sucking the gas out of the retort and thus neutralises the effect of the water pressure. The exhauster also serves to force the gas through the purifying plant. The amount of gas produced is increased through the use of an exhauster by about 10 per cent and, moreover, the quality of the gas is improved, because it leaves the heated retort more quickly. After leaving the condensers, the gas contains the following impurities which must be removed: (1) Hydrogen sulphide; (2) carbon bisulphide; (3) carbon dioxide; (4) ammonia.

Wet Purifiers or Washers.—These contain ammonia liquor through which the gas is made to flow in finely divided streams. The compounds hydrocyanic acid, carbon dioxide, and hydrogen sulphide are acidic, so they combine with the ammonia (a base) to form salts which are non-volatile. The greater proportion of these impurities are therefore removed. The final removal of the ammonia is effected in scrubbers, in which the ascending coal gas meets a descending spray of water.

Dry Purifiers.—The final purification is effected by passing the gas over wooden trays made in the form of grids and covered with the purifying material. Oxide of iron, called bog iron ore, is used as the purifying agent. The oxide of iron removes the last traces of hydrogen sulphide. Sulphide of iron is formed, and by regulated introduction of about 2 per cent of air into the gas at this stage, together with a trace of ammonia, this sulphide is continuously re-oxidised to iron oxide and free sulphur. The oxide begins to lose its efficiency when it contains about 55 per cent of free sulphur and is then sold to manufacturers of sulphuric acid to be roasted in kilns for the production of sulphur dioxide. Carbon disulphide is removed by passing the gas over a nickel catalyst at 450° C., the hydrogen sulphide formed being removed as above. The coal gas is then stripped of benzole and naphthalene and passed to the gas holder where it is stored. In small gasworks the holder is a simple cylindrical vessel inverted in a tank of water. Large gasworks have adopted a telescopic cylindrical vessel, thus saving much ground space, as the same sized tank serves for a holder of much greater capacity than the simple form. The tankless holder consists of a tall cylinder or polygon in which the gas is confined by a large sealed

piston which rises and falls according to the amount of gas in the holder. Such a holder gives the same pressure whatever the height of the piston. The holders of this type now constructed in Great Britain have an aggregate capacity of about 74,000,000 cub. ft. An advantage of these holders is that, not being stored over water, the gas does not go into the mains saturated with water vapour, as is the case with ordinary holders.

Gas for fuel or power is prepared by the incomplete combustion of coal or coke. There are 2 methods of producing gaseous fuel, entirely different in principle: (1) Air is passed upwards through a deep layer of red-hot carbon at 1000 to 1200° C. The carbon combines with the oxygen of the air to form carbon monoxide, CO. The nitrogen of the air is unaffected, so the resulting gas consists of a mixture of carbon monoxide and nitrogen, with a small percentage of carbon dioxide, CO₂. This mixture is called *producer* or *Siemen's gas* and since it is of low calorific value due to incombustible nitrogen it is used as soon as it is made which enables the heat the gas possesses by virtue of its high temp. to be utilised. (2) Steam is passed through red-hot carbon when the following reaction takes place. $C + H_2O \rightarrow CO + H_2$. The mixture of carbon monoxide and hydrogen is called *water gas*, which differs from producer gas in that it is wholly combustible. The reaction by which water is produced is endothermic in character, because the amount of heat required to decompose 1 gramme molecule of steam is greater than the amount of heat liberated when C combines with O to form CO. This explains why steam directed upon incandescent coke will produce water gas only for a very short time. The heat required for the reaction is absorbed from the hot coke which is cooled to such an extent that at first a gas of different composition from water gas is formed, and quickly the process ceases altogether. This difficulty is overcome by blowing air and steam alternately through the coke for periods of a few min. each. During the first stage, producer gas is formed with the evolution of heat. This heat is employed in raising the temp. of the remaining mass of fuel which soon attains the temp. appropriate for the reaction $C + H_2O = H_2 + CO$. This reaction, being endothermic, abstracts heat from the hot fuel which cools down, so that the process must be reversed by blowing air in, and so on. Hence in all processes for the manuf. of water gas, 2 alternating operations are involved: (1) The temp. of the fuel is raised to about 1200° C. by blowing a current of air through it; (2) steam is injected until the temp. falls to about 900° C. If the temp. falls below 900° C. the reaction $C + 2H_2O = CO_2 + 2H_2$ predominates. In some plants, 2 generators are blown in parallel and run in series, a practice which is equivalent to using a shallow fuel bed for the blow and a deep bed for the run periods. The time of the flow period is thereby reduced and the time of run period increased.

Coal gas, water gas, and producer gas are all widely employed for industrial purposes, since they form clean, reliable, and easily manipulated fuels. By the Gas Regulation Act of 1920 coal gas is now sold not by the cubic foot as previously, but by heating power measured in therms (see also BELBY). One therm is equal to 100,000 Brit. thermal units, i.e. it is the amount of heat required to raise the temp. of 100,000 lb. of water 1 F. degree. See A. Meade, *New Modern Gasworks Practice*, 1934; and A. Key, *Gasworks Effluents and Ammonia*, 1938. See also GAS AUTHORITY, BRITISH.

Gas Meter. The G. M. was invented about 1815 by Clegg. Consumers' G. M.s are either wet or dry. The wet type has a measuring drum enclosed in a case containing water up to a level known as the water-line. The drum, which contains div. plates set at an angle, is caused to revolve by the gas pressing upon the surface of the water, arrangements being made to compensate for fluctuations in water level due to movement of the drum. The rotation of the drum spindle is communicated to a train of wheels and registered on dials.

The dry meter, which is much more extensively used, usually has a case of tinned iron, and is divided into 1 horizontal and 2 vertical compartments by div. plates. In each vertical compartment is a movable diaphragm with prepared flexible leather sides, thus making 4 chambers in the lower part of the meter. The gas enters and leaves the chambers alternately through valves which are made to open and close at the correct time. The alternate expansion and contraction of the diaphragms, like ordinary bellows, by the pressure of the gas is communicated by levers and cranks to the recording mechanism. There are various forms of pre-payment or slot meters for extending the sale of gas among the smaller consumers. By means of a simple mechanism attached to the meter, and operated by the insertion of a coin, an amount of gas appropriate to the value of the coin is allowed to pass through the meter, after which a valve closes until another coin is inserted. Meters, as tested under the provisions of the Gas Act, 1948, are stamped as correct when their registration does not vary from the standard by more than 2 per cent in favour of the seller or 3 per cent in favour of the consumer, a total range of 5 per cent.

Gas Oil, a heavy distillate of petroleum, used in the form of diesel oil as a fuel for automotive diesel engines.

Gas Poisoning, see POISONS and RESUSCITATION.

Gas Space Heaters. As a fuel gas is clean and produces neither smoke nor soot. No fuel storage space is required, nor is the removal of ash involved. A gas fire will give an immediate and flexible supply of heat; the temp. of a room heated by a gas fire can be kept under close control merely by the operation of the tap on the fire. Since a gas fire is normally fitted to a flue, it will promote adequate and positive

ventilation of the room in which it is installed; a coal fire, on the other hand, needs a much larger flue to dispose of the smoke produced and, in consequence, causes a much higher rate of ventilation than is needed. This results very often in unpleasant draughts and an undesirable wastage of heat up the flue.

Most of the heat from gas fires is by radiation, but later types, called convector fires, produce in addition a certain amount of convected heat in the form of warmed air, which is directed into the room and which further increases the total heat output of the fire. Gas fires of both the radiant and convector types are designed to give an efficient and wide distribution of heat, the first type in the form of well distributed radiant heat, and the latter with an additional circulation of warm air. The output of heat from a gas fire, as compared with the heat input in the form of fuel consumed, is about 50 per cent in the case of the normal fire, and 60 to 65 per cent in the case of a well-designed convector fire. The modern gas fire is silent in operation, and requires very little attention to maintain it in good working order; it has radiants which are much more robust than the older types. Automatic ignition is usually provided.

From an artistic point of view gas fires can be made to harmonise with any scheme of decoration. They may be designed to be fitted at hearth level or raised to a convenient height to form a panel nearly flush with the face of the wall. Small portable gas fires are also available to give local warmth by radiant or convected heat, or a combination of the two. These, as a general rule, need no flue. Another form of domestic gas heater is the flueless radiator, which either stands on the floor or is fixed to the wall; this heats mainly by convected warm air which gives a background of warmth to the whole house. Balanced flue radiators have special ducts which pass through the wall behind the appliance, so that both the intake of air for the combustion of the gas and the discharge of the gaseous products of the combustion are connected to the outside air. Many premises of a commercial and industrial character are heated by gas convectors of a larger size than the domestic type, and also by overhead heaters of various designs which employ radiation to warm the occupants of the premises. Gas space heating appliances lend themselves admirably to automatic controls arranged to maintain the temp. of the premises at a desired level.

Gas Turbine. *see* AERO-ENGINES and JET PROPULSION.

Gas Water Heaters. Modern G. W. H. fall under 2 main headings: instantaneous and storage. In the former water is heated as it passes through the appliance; the supply is instantaneous and continuous so long as the hot-water tap is turned on. In the latter a quantity of water is heated and stored for use as desired. Single point instantaneous heaters serve 1 hot tap; multipoint heaters can deliver

hot water to every hot tap in the home. They have a high thermal efficiency, but the rate of gas must be sufficient to provide the heat needed to cope with the rate of flow of the water. The multipoint heater is connected up to a cold-water supply, and to the hot-water pipes of the house. It incorporates a small pilot jet, and operates automatically by the opening and closing of the hot tap at bath, basin, or sink. A common type of multipoint heater delivers about 2 gallons of hot water per min. at bath temp. The provision of an automatic device prevents gas passing to the main jets should the pilot be extinguished. Bathrooms in which instantaneous G. W. H. are fitted must have adequate ventilation. Multipoint and bath-type single-point instantaneous, and the larger storage, G. W. H. need to be fitted with efficient flues.

Storage G. W. H. can be subdivided into 2 types: the circulator and the self-contained storage heater. The circulator is designed for connection by external flow and return pipes to an independent storage cylinder which should be lagged, or it can be inter-connected with an existing system to work as an alternative to, or in conjunction with, a solid fuel boiler. In the latter case the existing storage cylinder is used. The self-contained storage heater consists of a completely lagged storage vessel and a heating unit as one appliance and can, if required, be connected to an existing system to work as an alternative to a solid fuel boiler. In both cases the rate of draw-off is determined by the head of water available, and by the bore of the draw-off pipe to, and the size of, the tap concerned.

With storage water heaters water is heated until the full quantity is stored at the predetermined temp. in a tank or cylinder, which should be insulated; the gas consumption is then automatically reduced by thermostat to a rate sufficient to maintain the water at that temp. When hot water is drawn off the gas rate is automatically increased. Instantaneous and storage heaters are made in sizes to serve the kitchen sink or the whole house; some types provide hot or boiling water for kitchen needs. In the home gas is also used for heating the water in boilers and washing machines used for clothes washing. Large gas-fired plants provide hot water for commercial premises or heat the water in swimming baths. Specially designed heaters provide a continuous supply of boiling water for use in cafés, restaurants, etc.

Gascoigne, *see* GASCONY.

Gascoigne, Golfe de, *see* BISCAY, BAY OF.
Gascoigne, George (c. 1525-77), poet and dramatist, b. Cardington, Beds. the son of Sir John G. He was educ. first at Canterbury and then went to Trinity College, Cambridge. In 1555 he was entered at Gray's Inn, and from 1567 to 1559 was M.P. for Bedford. Owing to his prodigality he was disinherited by his father, and fled from his creditors to Holland, where he took service under the Prince of Orange against the Spaniards.

from 1572 to 1575. On his return he accompanied Queen Elizabeth on one of her royal progresses, and to celebrate the event wrote a masque entitled *The Princely Pleasures, at the Court at Kenilworth*, 1576. His well-known satire in blank verse, *The Steele Glas*, appeared in the same year. This satire on the vices and foibles of the age shows monarchs, soldiers, prelates, merchants, and peasants as they really are, without flattery or idealisation, as in the crystal glass 'wherein all men choose to look.' He is also the author of the *Supposes*, 1573, a trans. of the *Suppositi* of Ariosto and the earliest extant comedy in Eng. prose; *Jocasta*, 1573, a version of the *Phoenissae* of Euripides, the second earliest tragedy in blank verse; *The Glasse of Government*, 1575, and the *Complaynte of Phylomene*, 1587. Mention may also be made of his prose romance, *The Pleasant Fable of Ferdinando Jeronimi*, 1587, which, in its sentimental colloquies and alliterative style, is a forerunner of *Euphues*; *Dan Bartholomew of Bath*, 1573, a kind of novelette in verse; and the *Fruit of Fethers*. He also wrote *Certain Notes of Instruction concerning the Making of Verse or Rhyme in English*, 1575, said to be the first attempt at a treatise on prosody in the language. He is, however, much more entertaining in undisguised verse-narrative of his own experiences, as in the *Voyage into Holland*, 1573, and *Dulce Bellum Inexpertis*, 1575—the last-named giving a vivid picture of his experiences in Flanders. His works were ed. by W. C. Hazlitt, 1869-70, and J. W. Cunliffe, 1907-10. See G. Whetstone, *A Remembrance of the well employed life and godly end of George Gascoigne, Esquire*, 1577 (ed. by E. Arber, with *The Steele Glas*, 1868); and studies by F. E. Schelling, 1893, and C. T. Prouty, 1942.

Gascoigne, Sir William (c. 1350-1419), lawyer; eldest son of Wm G., b. in Yorks. In 1397 he became one of the king's serjeants and was appointed attorney to the banished duke of Hereford. He was made chief justice of the king's bench in 1400, and in 1403 was commissioned to raise forces against the insurgent earl of Northumberland. The stories told about him, that he committed Prince Henry for contempt of court and that he refused to judge Archbishop Scrope on the ground that he had no jurisdiction over spiritual persons, prove that he was regarded as a just judge, possessed with a high sense of the dignity of his office and indifferent, in the pursuit of duty, to his personal interest.

Gascoigne, see GASCONY.

Gascony (Fr. *Gascogne* or *Gascogne*), old prov. in the SW. of France. It derived its name from the Vasques, or Vascones, a Sp. tribe which crossed the Pyrenees about 580. It now forms the depts of Landes, Gers, Hautes-Pyrénées, and part of Basses-Pyrénées. Formerly it was a dependency of Guyenne (q.v.), and its cap. was Auch. Part of it belonged to the sovereigns of Navarre, and it was united to France in 1598.

Gascoyne-Cecil, James Edward Hubert, and Robert Arthur James, see SALISBURY, MARQUESSES OF.

Gaskell, Elizabeth Cleghorn (1810-65), novelist, b. Chelsea. She was the daughter of Wm Stevenson, a Unitarian minister and keeper of the treasury records. Most of her youth was spent at Knutsford, Cheshire, and this quaint town supplied her with her material for *Cranford*. In 1832 she married the Rev. Wm G., a Unitarian minister of Manchester, and the marriage proved a very happy one. In 1848 she became famous by the pub. of her novel *Mary Barton*, in which she depicts with insight and sympathy the life and feelings of the manufacturing working classes. The book was a

ELIZABETH CLEGHORN GASKELL

great success and was praised by Carlyle, Maria Edgeworth, and Landor. She was a friend of Dickens, and was intimately acquainted with both Carlyle and Thackeray. It was at Dickens's invitation that she wrote for *Household Words*, and in this paper appeared, from 1851 to 1853, *Cranford*, which, according to Lord Houghton, is 'the purest piece of humorous description that has been added to British literature since Charles Lamb.' She has some of the characteristics of Jane Austen, and if her style and delineation of character are less minutely perfect, they are, on the other hand, imbued with a deeper vein of feeling. She was the friend of Charlotte Brontë, to whom her sympathy brought much comfort, and whose life she wrote, 1857. Her other novels were *Lizzie Leigh*, 1853, *Ruth*, 1855, *North and South*, 1855, *Sylvia's Lovers*, 1863, and *Mr Harrison's Confessions*, 1865. Her last work was *Wives and Daughters*, 1865, which appeared in the *Cornhill Magazine*, and was left unfinished. The fullest ed. of her works is that of C. K. Shorter (11 vols.), 1906-19. See E. A. Chadwick, *Mrs Gaskell: Haunts, Homes, and Stories*, 1910;

and Elizabeth Haldane, *Mrs Gaskell and Her Friends*, 1930; also lives by J. J. van Dulleman, 1924; G. A. Payne, 1929; A. S. Whitfield, 1929; and G. de W. Sanders, 1930.

Gasoline is a fraction of petroleum produced by distillation within the approximate range 20-180° C. It is the main constituent of petrol, which is often known by this name. See PETROL; PETROLEUM REFINING.

Gasometer, see GAS MANUFACTURE.

Gasparri, Pietro (1852-1934), It. cardinal, b. Ussita; educ. at the Pontifical Seminary, Rome. He became prof. of canon law, Catholic Institute, Paris, 1880-98. In 1898 G. went to South America as apostolic delegate, where he remained until 1901. He was entrusted, 1904, by Pius X with the codification of canon law. Cardinal, 1907; secretary of state, 1914. He conducted negotiations leading to the Lateran Treaty between the Vatican and the It. Gov., which was signed 11 Feb. 1929.

Gaspé Peninsula, E. section of the prov. of Quebec, Canada, between Gulf of St. Lawrence and Chaleur Bay. It consists mainly of forest land and has good fisheries. Area 4450 sq. m.

Gasperi, Alcide de (1881-1954), It. politician, educ. at Trento and Vienna Univs. He was the president of the Popular party when he was arrested by the Fascists in 1926; he took no further part in political life until the downfall of Mussolini. After the Second World War he became leader of the Christian Democrats; he was foreign minister 1945-6 and 1951-3, and Prime Minister 1945-July 1953, when he resigned after his eighth consecutive ministry, this time made up entirely of members of his own party, had been defeated in Parliament. His previous ministries had been coalitions. G. was instrumental in restoring his country to a major international status after her war-time defeat; he brought her into the W. alliance, and his domestic policy, with its emphasis on progressive moderation, did much to restore the devastation of the war years, and to combat the growth of Communism in Italy. His long period of office (though the ministries he headed varied in their composition slightly) gave Italy a period of relative political stability which encouraged her economic and moral revival as a democratic nation. G. was undoubtedly the outstanding figure in It. politics in the immediate post-war era.

Gasquet, Francis Aidan (1846-1929), cardinal and historical writer, b. London. He was educ. at Downside College, Bath, and from 1878 to 1884 was prior of the Benedictine monastery and college of St. Gregory, Downside. Up to his death G. was the abbot president of the Eng. Benedictines and president of the international commission for the revision of the Vulgate, in virtue of which he was created cardinal-deacon by Pius X in 1914. On the occasion of his sacerdotal jubilee Pius XI raised him to the dignity of cardinal-priest. He wrote many works

on pre-Reformation monasticism in England but, although exceptional at the time, they are now largely superseded. His works include *Henry VIII and the English Monasteries*, 1888-9, *A Short History of the Catholic Church in England*, 1903, *English Monastic Life*, 1903, *Parish Life in Medieval England*, 1906, *The Greater Abbeys of England*, 1908, *Monastic Life in the Middle Ages*, 1922, and *His Holiness, Pope Pius XI*, 1922.

Gassendi, or Gassend, Pierre (1592-1655), Fr. philosopher and mathematician, b. Champtercier in Provence. He studied at Aix with a view to entering the Church, but abandoned the idea and took up the study of philosophy. He made an examination of the Aristotelian systems, and pub., in 1624, *Exercitationes paradoxicae adversus Aristotelem*, in which he protests against the acceptance of the dicta of Aristotle as final in all matters of philosophy. In 1645 he was made prof. of mathematics at the Collège Royal in Paris. While there he wrote his main work, *Syntagma philosophiae Epicuri*, 1649, which contains a complete sketch of the system of Epicurus. G. was a disciple of Bacon and friendly with Galileo (q.v.), keeping pace with the moderns in natural and physical science. His *Institutio astronomica* is a book on the science of his own day, while *Tychonis Braheii, Nicolai Copernici, Georgii Puerbachii, et Joannis Regiomontani Vitae* contains a complete hist. of astronomy down to his own time. G.'s complete works were pub. in 6 vols., 1658. See G. S. Brett, *The Philosophy of Gassendi*, 1908.

Gasset, José Ortega y, see ORTEGA Y GASSET, JOSÉ.

Gassmann, Florian (1729-74), Bohemian conductor and composer, had a Jesuit education and studied music with Padre Martini at Bologna. He began by producing operas at Venice and ballet music in Vienna, where he became court conductor in 1772. Apart from over 20 operas, more than half of which were produced in Vienna, but all of which are in Italian, he wrote more than 50 works for the Church, as well as 16 symphonies and chamber music.

Gastein, valley in the prov. of Salzburg, Austria, known for its scenic beauty. Its prin. towns are Badgastein and Hofgastein (qq.v.).

Gaster, Moses (1856-1939), Rumanian philologist and Heb. scholar, b. Bucharest. Lecturer in the univ. of Bucharest, 1881-5, but exiled from Rumania for his activity on behalf of the persecuted Jews. In 1886 and 1891 he was Ilchester lecturer in Graeco-Slavonic literature at the univ. of Oxford, and in 1887 he was appointed Haham of the Sephardic communities of England. He played a prominent part in the learned life of London and was president of a number of learned societies. His writings cover a very wide field, and include *History of Rumanian Popular Literature*, 1883, *Rumanian Translation of the Hebrew Prayer-Book*, 1883, *Graeco-Slavonic Literature*, 1887, *Chrestomathie roumaine*, 2 vols., 1891, *The Chronicles of*

Jerahmel, 1899, *Hebrew Illuminated Bibles*, 1901, *The Jewish Divorce*, 1911, *Rumanian Fairy Tales*, 1923, *The Ketubah*, 1923, *The Samaritans*, 1925, *Studies and Texts in Folklore, Magic, etc.*, 3 vols., 1925-8, *Conjurations and the Ancient Mysteries*, 1932, *Samaritan Eschatology*, 1932, *The Maaseh Book* (Eng. trans., 2 vols.), 1934, and contributions to the *Ency. Brit.* and *Hastings's Encyclopedia of Religion and Ethics*.

Gasteropoda (Gk *gaster*, stomach, and *pous*, foot), name given to one of the 3 large classes into which molluscs are divided and, as the name indicates, all its genera are characterised by the ventral position of the foot. The head and foot are bilateral, but the viscera undergo varying degrees of torsion; the reproductive organ and genital duct are single. The free-swimming forms known as Heteropods sometimes acquire a superficial symmetry. The Streptoneura, as their name implies, are G. in which the nerve loop is twisted, owing to the asymmetry of the viscera already mentioned—they include *Patella*, the limpet, *Littorina*, the whelk, *Purpura*, the dogwhelk, etc.; the Euthyneura, or straight-nerved, include the Opisthobranchs, *Aplysia* (the Sea Hare), *Bulla*, *Doris*, *Colts*, etc.; and the Pulmonata *Helix*, the snail, *Arion*, the black slug, etc. Some gasteropods are voracious animals, being furnished with powerful rasping organs which enable them to prey on other marine molluscs, while the terrestrial forms, such as snails, work havoc among flowering plants and vegetables; many of them—whelks, etc.—are used for human consumption and as bait. Fossil gasteropods occur in the Cambrian rocks, and many modern types have their origin in Cretaceous times.

Gaston de Foix, see FOIX and FOIX, GASTON DE.

Gastrostomy. This operation consists in removal of part or the whole of the stomach for the purpose of excising an ulcer or a cancer. Continuity of the alimentary canal is re-established after the removal of the stomach, or part of it, by anastomosing (joining) the first part of the duodenum to that severed part of the stomach which is nearest to the oesophagus. See **PEPTIC ULCER**.

Gastric Juice, colourless acid fluid, secreted by certain cells in the stomach, containing enzymes and hydrochloric acid in addition to small amounts of organic and inorganic materials. The prin. enzyme, or ferment, present is pepsin, which is derived from a precursor, propepsin. The latter, on coming into contact with acid, is converted into the ferment which acts upon the protein of the food. Pepsin therefore can only act in acid solution, and both the ferment itself and the hydrochloric acid of the G. J. are secreted by special cells in the stomach. The amount of the secretion, and also its composition, is determined by the nature of the food. Pepsin acts on protein matter, converting it into soluble forms, albumoses and peptones, which are

passed on to the intestine, there to undergo further change. Another ferment, rennin, is also present in G. J.; it brings about the clotting of milk by catalysing the change of caseinogen into casein. Recently another substance has been identified by Castle (Castle, W. B., Amer. physician, b. 1897) in G. J., and has been named Castle's intrinsic factor. Together with the extrinsic factor, which is contained in certain foods such as beef muscle and yeast, the intrinsic factor produces the blood-forming substance (the anti-pernicious anaemia principle) which is stored in the liver, from whence it is liberated to promote the development of red blood corpuscles. The exact nature of these factors is not known but the anti-pernicious anaemia principle of the liver appears to be folic acid, a vitamin of the B complex.

Gastritis, see STOMACH; (in horses) see HORSE DISEASES.

Gastroenterostomy, the operation of making a passage from the stomach to the small intestine (jejunum), thus short-circuiting the duodenum. The object is to prevent food passing through the pyloric end of the stomach and the duodenum so that an ulcer of these parts may be freed from irritation and given a chance to heal. See **PEPTIC ULCER**.

Gastrolobium, genus of leguminous plants, contains over 30 species, all of which are evergreen shrubs found in W. Australia.

Gastronomy, the science or art of good eating. The first gastronomic experiments were probably purely accidental, but for over 3 thousand years deliberate experiments have been made. The earliest gastronomists discovered that cooked fish and meat were more appetising than raw foods. Hunger, local conditions, and the natural pleasure derived from palatable food have combined to continue the experiments until we arrive at *sauce tartare* with sole, mint sauce with lamb, red-currant jelly with game, etc. In the experimental field the Fr. have been the foremost gastronomists and have discovered many attractive and unusual food combinations. Like most arts, that of G. has frequently become debased, for at times it has degenerated into gluttony. For the consumer, the best expression of the art is in the enjoyment of appetising dishes eaten with the fullness of appreciation that is accompanied by restraint. Modern G. as a science has to consider not only the combination of appropriate flavours but also the food value of the dishes. This value is assessed on the capacity of the food to supply fuel and building and regulative materials, balanced in the right proportions to meet the needs of the individual. See also **COOKERY**; **FOOD AND DIET**. See A. Brillat-Savarin, *Physiologie du goût*, 1825; E. and Lorne Bunyard, *The Epicure's Companion*, 1937; R. Hutchison, H. V. Mottram, and G. Graham, *Food and Principles of Dietetics*, 1948; and Constance Spry and Rosemary Hume, *The Constance Spry Cookery Book*, 1956.

Gastrostomy, operation of establishing an artificial opening into the stomach through the abdominal wall so that fluid nourishment may be passed directly into the stomach. It is performed when the gullet or oesophagus is obstructed, making normal swallowing impossible.

Gastrula, a stage in the early development of animals with 3 germ layers, which are all animals higher than the 2 layered coelenterates. The G. merely consists of ectoderm (the outer germ layer) and the endoderm (inner germ layer) and is a stage before the middle layer or mesoderm is formed.

Gatacre, Sir William Forbes (1843-1906), soldier, b. near Stirling. He commanded a brigade in the Sudan campaign of 1898. In the South African war he made an attempt to seize the railway junction at Stormberg. The attempt was unsuccessful and G. was blamed by Lord Roberts for his want of judgment. In 1900 he failed to come to the assistance of the troops at Reddersburg and was recalled. He retired as major-general in 1904.

Gatchina (after 1917 Trotsk, then Krasnogvardeysk until 1944), tn in the Leningrad Oblast of NW. Russia, 28 m. S. of Leningrad. In the 19th cent. it was a favourite residence of Russian emperors. The famous G. palace (1766) suffered great damage in 1941-4. Pop. (1936) 42,000.

Gate, Gateway. For gateways in medieval fortifications, see CASTLE and PORTCULLIS.

Gate of Tears, strait of Bab-el-Mandeb, in the Red Sea, so called from the shipwrecks associated with it.

Gates, Horatio (1728-1806), Amer. gen., b. Maldon, Essex, England. He took part under Braddock in the expedition to Fort Duquesne, which ended in disaster (1755). He escaped with difficulty and settled down in America. On the outbreak of the War of Independence he sided with the colonists and quickly made a name for himself. He obtained the N. command and forced the surrender of a Brit. army at Saratoga (1779). He then aimed at the chief command of the Amer. Army. In 1780 he was badly defeated at Camden by Cornwallis, and as a result of a court-martial was superseded. He finally retired to Virginia, and thence to New York, where he d. See life by S. W. Patterson, 1941.

Gateshead, municipal co. and parl. bor. of Durham, England. It is situated at a point where the Great North Road crosses on to the S. bank of the R. Tyne. The tn has been very largely restored since the great fire of 1854, which destroyed a very large part of it. The riv. is bridged in 5 places, and so connects the tn with Newcastle. The Shipcote dist. in the centre of the tn has many buildings noted for their architectural beauty; these include the Shipley Art Gallery and the Central Public Library. There is a fine grammar school, besides technical and art schools. The Queen Elizabeth Hospital (maternity and general wings), formally opened by H.M. the Queen in 1948, and the Infectious Diseases Hospital, both at Sheriff

Hill, provide the most modern hospital services. In Saltwell Park, 57 ac. in extent, G. has one of the finest tn parks in the N. of England. The tn has large iron-works and foundries, shipbuilding yards, tanneries, and soap works. The industrial feature of the tn is the Team Valley Trading Estate, of 700 ac., estab. by the gov. and planned for factory accommodation. It has its own internal railway connecting with the local railway station, and recreational centres, etc., for employees. It has attracted many new industries and assisted in the post-war (1945) industrial development of G. G. is thought by some to have been the Rom. military station of *Gabrosentum*, named in the Itinerary (q.v.). There has been some doubt as to the origin of the place-name, but it is probably derived from 2 A.-S. words meaning 'head of a road,' for it was literally the 'head' of the Rom. road that led from Chester-le-Street to Newcastle. G. was first mentioned under its modern name towards the end of the 11th cent., in connection with the burning of the church and murder of the bishop of Durham by the populace—a tragic incident which arose out of the murder of an Eng. nobleman who had protested to the bishop against the exactions of his tax-gatherers. The tn obtained a charter from the bishop of Durham as lord palatine in 1164, and the common seal of the bor. is referred to in a charter of 1480, the inscription on which anct charter was 'Sigillum commune de Gatyshedde.' Rivalry and disputes subsequently arose with Newcastle over fishing and trading rights, and in the reign of Edward VI the 2 tns were united for a short time. G. remained under the nominal headship of the bishop of Durham until the end of the 17th cent. It became a parl. bor. in 1832 and a co. bor. in 1889. The tn was not given an M.P. until 1832. Some damage was done to the tn by bombing raids in the Second World War, chiefly to houses and small industrial concerns, but there were few fatal casualties. Pop. 113,500 (est.).

Gath, one of the royal cities of the Philistines, situated near the borders of Judah, the bp. of Goliath. During the early years of the Lat. kingdom of Jerusalem it was fortified by the crusaders. It fell into the hands of Saladin in 1191, but was recaptured in the next year by Richard I. The exact site of the tn is not now known, but Tell-es-Safi is supposed to occupy it.

Gâtinals, anct name for a dist. of France, SE. of Paris, now comprising the greater part of the depts of Seine-et-Marne and Loiret (qq.v.). It is traversed by the R. Loing, is low-lying and swampy, and is famous for its honey.

Gatineau, riv. of Canada, a trib. of the Ottawa, which has its source in some lakes situated in about lat. 48° N. and long. 75° 30' W. The direction of its course is chiefly SSW., and it eventually enters the Ottawa, after flowing 400 m.

Gatling, Richard Jordan (1818-1903), inventor of the Gatling gun, a species of machine-gun. He was an Amer. citizen

and an inventor of some note. He turned his attention in many directions and patented a sowing machine (for seeds) and a steam plough. In 1861 he patented his gun, which was of great service during the Amer. Civil war, but was much improved in 1865. By means of a revolving handle a constant rifle fire was kept up from 8 to 10 rifle barrels which revolved on an axis.

Gatooma, tn of Southern Rhodesia, 100 m. SW. of Salisbury. It is the centre of a cotton-growing country and the site of the State cotton-spinning mills and of sev. textile factories. It is also the centre of a mining area. Pop. (Europeans) 2000; (Africans) 8000.

G.A.T.T., see GENERAL AGREEMENT ON TARIFFS AND TRADE.

Gatty, Margaret, see EWING, JULIANA.

Gatun, tn in N. Panama Canal zone, where part of the canal works, including 2 famous locks, are situated. G. lake, in the vicinity, has been converted into a reservoir by the construction of the G. dam. The dam is 1½ m. long and ¼ m. wide at its broadest point, and 115 ft high. Pop. 2250.

Gau (German), self-governing community of the old Germanic state; later, in the Frankish empire, the dist. of a co. In Nazi Germany G. was applied to the unified political parts of the Reich, including occupied ters.

Gauchos, name given to the inhab. of the pampas of Argentina and S. Brazil. They are chiefly of Sp.-Amer. origin, but the strain is tinged with Indian blood. Their horsemanship is superb, and they are also exceedingly clever with the lasso and bolas. The habits of the people themselves are sordid. Gambling and profligacy are rife among the men, whilst the women are treated very badly. They are, however, externally polite and hospitable. Their whole life is rapidly being encroached upon by modernisation, both at work and by recreations such as the cinema and television.

Gaudeamus, Lat. student song of very anct origin. The name is derived from the first word of the song, 'Gaudeamus igitur, juvenes dum sumus' ('Let us then rejoice while we are young'). It is still extremely popular in the student world, especially in Germany and in Scotland. A modified version of an adaptation dating from 1776 appears in *The Scottish Students' Song-book*.

Gauden, John (1605-62), Eng. writer and bishop, possibly author of the *Eikon Basilike* (q.v.). He was b. at Mayland, Essex, and educ. at St John's College, Cambridge. He became chaplain to Robert Rich, earl of Warwick, who was one of the parl. leaders. At first his sympathies were with the Parliament, but the excesses of the advanced parliamentarians drove him to the Royalist side. He became bishop of Exeter after the Restoration, and later became bishop of Worcester. G. claimed authorship of the *Eikon Basilike* but the actual identity of its writer remains a mystery.

Gaudens, Augustus Saint-, see SAINT-GAUDENS.

Gaugamela, vil. in Assyria, situated near the anct site of Nineveh, and near the modern tn of Mosul. The battle which is usually called Arbela was fought near here, and the tn from which it receives its name is in reality some 30 m. further E. At this battle Alexander the Great defeated the Persians under Darius III, 331 bc. See ARBELA.

Gauge, term applied to the width of a railway track. The G. varies in different countries, and depends upon the measurements adopted by most of the railways. The measurement is made from inside to inside of the head of the rails. The measurements for some of the countries of the world are 3 ft 6 in. in parts of Australia and South Africa, Egypt, and the Sudan; 4 ft 8½ in. in Great Britain, most European countries, and in U.S.A. Tramway G.s are usually 4 ft 8½ in. Narrow G. lines are used for the sake of economy in preference to standard G., because the rolling stock is lighter and cheaper; more important is the fact that with the contraction of G. the engineer is able to sharpen his curvature, and thus, in rugged country, adapt his routes to the folds of the hillsides. High speeds, however, are not possible.

Gauguin, Paul (1848-1903), Fr. painter, b. Paris. Son of a Fr. journalist and a mother of Sp.-Peruvian origin, he was taken as a child to Peru; on his mother's return he entered the merchant service. After the war of 1870 he went into a Paris bank and was financially successful. He married a young Dan. woman, 1873. He began to paint in his spare time, being influenced by the Impressionists, especially Pissarro. In 1883 he gave up both family and financial career to paint. In 1886 he was painting at Pont-Aven in Brittany. After his famous stay with Van Gogh at Arles he set sail for Tahiti—an escape from civilisation—and from 1895 quitted Europe for ever, living in poverty and isolation but leaving many records of a riot of light and vegetation among a 'gentle people.' He was a 'post-impressionist' in his free use of colour, indulging 'in colour combinations of unsurpassed liberty.' The roads were red, the fields violet, tree-trunks green, and foliage yellow; yet 'the ensemble gives one a feeling of truth' (Raymond Cogniat, 1947). His work was marked also by a new simplicity of design (in which the style of Puvis de Chavannes can be traced). He ranks as one of the founders of 20th-cent. art and his Brittany and Tahitian paintings are both highly valued. His last important work was a native group entitled 'D'où venons-nous? Que sommes-nous? Où allons-nous?' A friend of Mallarmé, he was of far from 'primitive' intellect, as his letters, journals, and the writings collected under the title *Noa-Noa* reveal. See also FRENCH ART. See lives by P. G. Rotonchamp, 1906; B. Becker, 1931; R. Burnett, 1936; and R. Cogniat, 1947; also *Lettres à D. de Montfried*, ed. by V. Segalen, 1918, and *Letters to his Wife and Friends*, ed. by M. Malingue, 1948.

Gauhati, or **Gowhatty**, tn of Assam state, India, standing on the Brahmaputra, 70 m. E. of Goalpara. It is the largest tn in Assam, and until superseded by Shillong in 1874 was the centre of Brit. administration. It is still an important trading centre, and is remarkable for the number of ruined temples, etc., in its vicinity. The temple of Kamakhya is a Hindu place of pilgrimage.

Gaul, Gilbert William (1855-1919), Amer. painter, b. Jersey city, New Jersey. He became an associate, National Academy of Design, 1880, and academician, 1882. He painted 'Indian Girl,' 1880, and 'Old Beau,' 1881. He specialised in battle-pictures—especially scenes from the Civil war, e.g. 'Charging the Battery,' 'Saving the Colors,' 'Battery H in Action' (in the Toledo Museum), 'Silenced,' 'Exchange of Prisoners' (in Democratic Club, New York), and 'Guerillas returning from a Raid.'

Gaul, see GALLIA; FRANCE.

Gaulle, Charles de (1890-), Fr. soldier, b. Lille. In 1910 he entered the military academy of St Cyr. At 21 he was given a commission in the 33rd Infantry Regiment. His commanding officer was Pétain (q.v.), then a colonel. G. became a company commander in Pétain's regiment during the First World War. He fought at Douaumont (q.v.), Verdun, and was captured by the Germans. After the armistice he served as a major under Weygand (q.v.) during the 1920-1 Bolshevik campaign in Poland. Then he returned to St Cyr as prof. of military hist. His success led to his being sent to the École de Guerre, the Fr. staff college, when he became aide-de-camp to Pétain, the commander-in-chief. In 1929 he was sent on a secret mission to Iraq, Persia, and Egypt. In 1932, as general secretary of the Committee of National Defence, he reached a post from which he could propound his theories on mechanisation. In 1937 he was given command of the 507th Regiment of Tanks, from which he rose, with the rank of colonel, to command the tank brigade of the Fifth Lorraine Army. On 15 May 1940, the day before he was allowed to demonstrate his theories on the battlefield around Laon, he became brigadier-general in command of the 4th Armoured Div. He then tried to induce Pétain, Weygand, and Reynaud (Prime Minister) to allow him to defend the Marne, the Seine, or Paris. Reynaud finally consented to let him establish his defences around Bordeaux, and the seat of gov. was moved there. But he was now fighting virtually alone. The Fr. Gov. had decided to capitulate. He strove to steel Reynaud's courage to continue the fight in Africa, and flew to London to ask for the necessary shipping. His request was granted, but it was too late. Reynaud had resigned, and de G. realised that the only place to continue the struggle for France was from London. He founded there a Fr. National Committee, over which he presided, and himself assumed the title of leader of all Free Frenchmen, and began to organise a Fr. Army and

Navy in Britain. He failed in an attempt to seize Dakar, but was successful in bringing the Chad and Fr. Equatorial Africa over to the Allies.

He was commander-in-chief of the Fighting Fr. Forces controlled by the National Committee until 1943, when he became president of the Committee for National Liberation. After the entry of the Allies into Paris he became head of the Fr. Provisional Gov. and chief of the armed forces. The elections of 1945 confirmed him as president of the gov.,

Press Portrait Bureau

GENERAL DE GAULLE

minister of national defence, and head of the armles. In 1946 he resigned on the grounds that his task was ended, but re-entered the political arena in 1947 as leader of the Rassemblement du Peuple Français, an organisation which claimed to be a movement for the regeneration of France rather than an ordinary political party. The Rassemblement, after winning sweeping successes in the general election of 1951, soon assumed a normal political role. De G. withdrew from it in 1953 and in the 1956 general election it lost most of its seats.

His reputation as a professional soldier was enhanced by the pub. of *Vers L'armée de métier*, 1934, in which he advocated a small highly trained professional army more nearly approximating to the *Reichswehr* of von Seeckt than to the large conscript army, predominantly infantry, on

which the military traditions of the Third Rep. rested. He favoured the concentration of armoured troops in armoured divisions, as against the general staff policy of parceling them out as army tank brigades in a supporting role, and his ideas on the tactical employment of armour were, ironically, most conclusively demonstrated by such commanders as Guderian in the Polish and Fr. campaigns of 1939 and 1940. His 2 most important military works are *Au fil de l'épée*, 1932 (Eng. trans. as *The Philosophy of Command*), and *Vers l'armée de métier*, 1934 (trans. as *The Army of the Future*). His predictions in this book were extraordinarily accurate, even to indicating the places where the Germans would break through the Fr. lines in the war that was to come. But the traditionalists, brought up on the tenets of Foch and Joffre, were against him, and none would listen to his revolutionary ideas. Besides the above he has pub. *La Discorde chez l'ennemi*, 1924, and *La France et son armée*, 1938 (trans. into Eng. 1945), and his memoirs, trans. into Eng. as *The Call to Honour*, 1940-42, 1955. See P. Barres, *Charles de Gaulle*, 1942.

Gault, the lowest div. of the upper part of the Cretaceous System (q.v.). In S. England the G. consists of stiff clay; it is overlain by the Upper Greensand which in turn is covered by the Chalk.

Gaultheria, a genus of ericaceous evergreen shrubs of over 100 species. *G. shallon* is the salal or shallon, often used in game covers; others are grown for their flowers and berries on lime-free soils in gardens.

Gaulus, see GOZO ISLAND.

Gaunt, John of, see JOHN OF GAUNT.

Gauntlet (Fr. *pant*, a glove) was the name given to the glove forming part of the armour of knights. It consisted of a metal cuff, back of the hand, and fingers made flexible by rivets. The fingers could be covered separately by small overlapping plates, or collectively by broad horizontal plates ('mitten' G.s). The phrase 'to throw down the gauntlet' is a synonym for issuing a challenge. 'To run the gauntlet' is a punishment where the culprit runs between 2 rows of persons, each of whom strikes him as he passes. The use of the word G. here is due to a mistaken derivation from *gallope*—Swedish *gata*, street, and *lopt*, a course.

Gaur, anct city of N. Bengal state, India, now in ruins. It is situated on the R. Bhagirathi. From 1100 until the decline of the Muslim power it was the residence of the viceroys and kings of Bengal. It is about 70 m. ESE. of Bhagalpur, and is now close to the boundary of E. Bengal, Pakistan. See G. H. Ravenshaw, *Gaur: its ruins and inscriptions*, 1878.

Gaur, see GHUR.

Gaur (*Bibos frontalis*), species of wild cattle found in most of the regions of India and Burma. The hill tribes have succeeded to a slight degree in domesticating it, but, on the whole, it is much more

frequently found in the wild state. It is almost black in colour, and has a high convex ridge between the horns. The ears are large, but the animal has no dewlap. Often the bull attains a height at the withers of 6 ft, but the back slopes very much, so that it is much lower at the loins. The animal is very shy and is usually found in large herds.

Gauss, Karl Friedrich (1777-1855), mathematician. He was b. of humble parentage at Brunswick and quickly attracted attention by his ability. In 1801 he pub. *Disquisitiones arithmeticae*, on the theory of numbers. Six years later he became director of the Göttingen observatory, an office which he retained until his death. He erected an observatory free from iron, from which he continued his researches on the subject of the magnetism of the earth, which had worldwide effects, and produced new methods for computing the orbits of planets and comets. He founded the Magnetic Association. The word 'gauss', unit of magnetic flux density (hence 'degaussing', in relation to the protection of ships' hulls against magnetic mines in the Second World War), is adopted from his name. His works were pub. in 11 vols., 1870-1924. See PHYSICAL UNITS.

Gautama, see BUDDHA AND BUDDHISM.

Gautier, Léon (1832-97), Fr. literary historian and palaeographer, b. Le Havre. From 1893 he was chief of the historical section of the national archives. As prof. of Palaeography at the Ecole des Chartes he furthered research into the literature of the Middle Ages. His works include *Les Épopées françaises*, 1865-8, 1878-97, and *Histoire de la poésie liturgique au moyen âge*, 1886. He also pub. an ed. of the *Chanson de Roland*, 26th ed., 1903.

Gautier, Théophile (1811-72), Fr. poet, critic, and novelist, one of the most famous personalities of the 19th cent. He was b. at Tarbes in the Pyrenees, but came to Paris while still a child, and was educ. at the Lycée Louis-le-Grand and at the Collège Charlemagne. With the intention of becoming a painter he entered de Rioult's studio, where he remained 2 years. But he was a great lover of poetry, and Sainte-Beuve had just made known to the modern world the romantic writers of the 16th cent.—the poets of the *Pléiade*. The reading of these and of the writers of the new Romantic school, especially Victor Hugo, raised G.'s enthusiasm to a high pitch. Pétrus Borel, struck with some verses he had written, introduced him to Victor Hugo, who found in G. something more than discipleship—a fervent fanaticism. Sainte-Beuve too was astonished by the work of this young writer, not yet 18, who already showed an almost unsurpassable gift of style, drawn very evidently from Marot, Ronsard, du Bellay, etc., whose tradition, abandoned by Malherbe and those who followed, he now, with the new poetic school, determined to carry triumphantly forward. He threw himself with extravagant fervour into the movement and became an extreme opponent of

the classic school. His defiance of conventionality led him even into grotesqueness of personal appearance. And indeed 'shocking the philistines' became one of his prime motives, to the detriment later of some of his work. He became one of a band of 'brigands de la pensée' calling itself 'Jeune-France.' In 1832 he produced his first long poem, *Albertus*, an extravagant theological legend remarkable for its perfection of style, its colour and imagery. Then followed *Comédie de la mort*, 1838, *Les Jeunes-France* (an attack upon the 'false romantics,' 1833), and *Mademoiselle de Maupin*, 1835, a novel which shocked public opinion by the contempt for morality displayed therein. At this point G. became a journalist and for 30 years his chief work was that of art critic and *feuilletoniste*. In *Émaux et camées*, 1852, G.'s style reaches its climax of perfection; here is seen, fully realised, that 'science of form' which was his religion. In these exquisite little poems in octosyllabic verse, the words have what he held they should always have, like precious stones, a beauty and a value all their own. It might be said of him that he did not abandon the career of a painter, but that he merely changed his tools. This feature is most pronounced in his collection *Émaux et camées*, in which everything is regarded from the point of view of the painter. 'Le style, c'est l'homme' is true of G.—his subject interested him far less than the form in which he presented it. He was not inspired by great ideas; he was an artist with a supreme love of beauty and great power of humour, irony, and charm. His theory and creed of the supreme importance of form in art at the cost both of sentiment and ideas was the side of G.'s work which inspired those who were later known as the Parnassians. If this doctrine was essentially false and harmful in its influence, G. certainly exerted a very wholesome influence on literature in liberating Romanticism from what was in danger of deteriorating into an over-subtle and morbidly introspective sentimentalism. His *Ménagerie intime*, 1869, is an informal biography, full of grace and lightness of touch, in which his favourite cats figure daintily. His other works include *Fortunio*, 1838, *Jettature*, *Une Larne au diable*, 1839, *Le Capitaine Fracasse*, 1863, *Spirite*, 1866, *Tra los Montes*, 1848, and other travels, *Histoire de l'art dramatique en France*, 6 vols. 1872, and the posthumously pub. *Histoire du romantisme*. His daughter Judith (1846-1917), who became the wife of M. Catulle Mendès, wrote novels in her name of Judith Gautier. See E. Feydeau, *T. Gautier, souvenirs intimes*, 1874; R. Jasinsky, *Les amis romantiques de T. Gautier*, 1929; H. van der Tuin, *L'évolution psychologique, esthétique et littéraire de Théophile Gautier*, 1933; J. Tild, *Gautier et ses amis*, 1951.

Gautland, see GOTHLAND.

Gauze, light transparent fabric, used for dress purposes. The name is thought to have been derived from the fact that Gaza, in Palestine, was the place of its origin.

The warp threads of the material are crossed between each thread of the weft, which passes through a succession of loops in the warp. Thus the threads are kept apart, with no tendency to slide, and the transparent character of the fabric is maintained. Other materials have this gauze-like quality, such as muslin, etc. The manu. is extensively carried on in France and Switzerland.

Gavarni, Paul (1801-66), Fr. caricaturist. His real name was Hippolyte Guillaume Sulpice Chevalier. He was b. at Paris and became a mechanical engineer, but he abandoned this profession and became caricaturist for *Les Gens du monde* and *Le Charivari*. His work gradually assumed a more serious tone and some bitterness entered into his caricatures. He visited London in 1849, was deeply impressed by its scenes of sordidness and misery, and recorded his impressions in *L'Illustration*. He illustrated also a number of books pub. about this time, amongst which may be mentioned the works of Balzac, Sue's *Wandering Jew*, and the Fr. trans. of Hoffmann's tales. See E. and J. de Goncourt, *Gavarni, l'homme et l'œuvre*, 1873; H. France and O. Uzanne, *Daumier et Gavarni*, 1906; and study by J. Robiquet, 1932.

Gavelkind. Tenure in G., which was only met with in Kent, was a species of socage tenure dating from the earliest days of the feudal system of land holdings. Lands held in G. descended not to the eldest son but to all the sons together. G. was abolished by the Law of Property Act, 1925. See also CO-PARCEENERS, and cf. BOROUGH ENGLISH.

Gaveston, Piers (d. 1312), earl of Cornwall, favourite of Edward II, son of a knight of Gascony. He was the foster brother of Edward, and was banished for his insolence by Edward I. Edward II recalled G. on his accession, and his evil influence over the king was the cause of much trouble at home. He was regent of England (1308) but was again forced to leave the country. His return was the signal for a rising by the barons, and he was captured at Scarborough by the earl of Pembroke and executed.

Gävle, or Gefle, seaport of Sweden in the län (co.) of Gävleborg on the gulf of Bothnia at the mouth of the Gefle R., 93 m. NW. of Stockholm. The tn is situated on 2 is. as well as on the riv.-banks. It has a good harbour; there is an old castle and a fine tn hall. The chief exports are iron goods, joinery, timber, and wood-pulp. It has shipbuilding yards and factories of machinery, tobacco, and cloth. Pop. 49,779. The län has an area of 7600 sq. m. Pop. 290,876.

Gavotte, name of a Fr. dance, said to be derived from the Gavots, the inhab. of the Pays de Gap. The music of the dance is in common time, beginning on the third beat of the bar. It is in 2 sections, each of which is repeated. The classical composers sometimes introduced G.s into their suites.

Gawain (Welsh *Gwalchmei*), one of the knights of the Round Table, nephew of

King Arthur and son of Lot, king of Norway and the Orkneys. About 1130 William of Malmesbury speaks of G.'s tomb in Wales and says he was king of Galloway. In Geoffrey of Monmouth's account he is a most courteous and virtuous knight, and Wace, in his trans., carries on this tradition. In Chrétien de Troyes' continuation of the Anglo-Norman tales G. is still a model of all the knightly virtues, and he is the hero of a great part of *Perceval*. In the *Tristan* and *Lancelot* of a later period the 'gay, gracious, and gude' knight becomes cruel, treacherous, and 'light o' love.' Malory, deriving his material from this source, and Tennyson, following Malory, present G. in this light. Some writers identify G. with the Irish hero Cuchullin (q.v.), and trace to Ireland this undeserved change of reputation, ascribing it to misconception arising out of the fact that G., whom tradition made to be a knight 'out of faerie,' as Chaucer puts it, was the champion of women and came from that part of the anct Irish 'other world' called the 'Isle of Women.' See Jessie L. Weston, *The Legend of Sir Gawain*, 1897, 1900; J. D. Bruce, *Evolution of Arthurian Romance to 1300*, 1923-4; R. S. Loomis, *Celtic Myth and Arthurian Romance*, 1927.

Gay, Delphine, see GIRARDIN, ÉMILE DE.

Gay, John (1685-1732), dramatist and poet, b. Barnstable. Educ. at the grammar school there, he was apprenticed to a silk mercer in London, but having a strong taste for poetry and no aptitude for business, he was soon set free. Little is known of his life until 1713, except that in 1708 he pub. his first poem, *Wine*. From 1712 to 1714 he was secretary to the duchess of Monmouth. In 1713 he wrote *Rural Sports*, a georgic, which he dedicated to Pope, whose fame was by this time estab. This brought him the patronage and life-long friendship of Pope, with introduction into the company of wits associated with him: Arbuthnot, Swift, Bolingbroke, and Congreve. These friendships stood him in good stead ever after; all loved and helped the happy, simple-hearted, improvident 'good fellow' and mediocre poet who was always suffering from the 'large promise with performance scant' of aristocratic patrons. In 1714 he pub. *The Shepherd's Week*, a series of pastorals written at Pope's request to satirise the pastorals of Ambrose Philips. He also pub. the poems *The Fan*, 1714; *Trivia*, 1716, written with Swift's help; *The Wife of Bath*, 1713, an unsuccessful comedy; *The What d'ye Call It?* 1715, a dramatic skit; and *Three Hours after Marriage*, 1717, a play which was a complete failure. His *Fables*, 1727, 1738, are his best work; they are little masterpieces of their kind. But the work which made him famous was a lyrical drama, *The Beggar's Opera*, first produced by Rich in London in 1728 and afterwards performed throughout the Brit. Isles, making 'Gay rich and Rich gay' (see also LYRIC THEATRE). It is a satire on the corruptions of society. *Polly*, 1729, its sequel, was prohibited, unacted.

G. wrote sev. ballads, of which the best known is *Black-eyed Susan*. He lost all his money and spent the later years of his life in the home of the duke and duchess of Queensberry. He was buried in Westminster Abbey. The *Poetical Works* have been ed. by G. C. Faber, 1926. See lives by E. Curll, 1733; W. Coxe, 1797; L. Melville, 1921; and W. H. Irving, 1940; also W. M. Thackeray, *English Humorists of the Eighteenth Century*, 1853; and P. F. Gaye, *John Gay, His Place in the Eighteenth Century*, 1938.

Gay-Lussac, Joseph Louis (1778-1850), Fr. chemist and physicist, b. St Léonard, Haute-Vienne. In 1797 he entered the École Polytechnique, where he met Berthollet, who appointed him demonstrator to his class and assistant in the gov. works at Arceuil. In 1809 he was elected prof. of chem. at the École Polytechnique. In 1832 he was chosen prof. of general chem. at the Jardin des Plantes, Paris. He is famous for his chemical and physical investigations. In 1804 he made a balloon ascent with Biot to ascertain whether the terrestrial magnetism ceased out of contact with the earth. In a second ascent he observed the regular decrease of pressure, temp., and moisture in the air. He also affirmed that the air has the same composition at the greatest height as at the surface of the earth. In 1804 and 1805 he made experiments with Humboldt and discovered that water is composed of oxygen and hydrogen in the ratio 1 : 2. He also made a study of other gases and pub. in 1808 his *Law of Volumes*. In 1811 with Thénard he discovered that potassium could be obtained by a purely chemical process. In 1813 he pub. some valuable information about iodine, and in 1824 he discovered and investigated fulminic acid, and experimented in fermentation. He is also famous for his experiments regarding the manuf. of sulphuric acid, glass, and chloride of lime. The more important of his papers are scattered through journals, often difficult of access. The most complete list of them will be found in the catalogue of scientific papers of the Royal Society. Two of his most important works are *Recherches physico-chimiques faites sur la pile*, 1811, and *Cours de physique*, 1832. Accounts of some of his discoveries and views are to be found in J. Thomson's *History of Chemistry* (vol. ii), 1830; H. Kopp, *Entwicklung der Chemie*, 1871; J. B. Dumas, *Leçons sur la philosophie chimique*, 1878. See also P. Lenard, *Grosse Naturforscher*, 1929.

Gaya, city of Bihar state, India, 87 m. S. of Patna. G. is a great centre of Hindu pilgrimage, the particular point of interest in G. itself being the Vishnupad Temple, where the 'footprint of Vishnu' forms the Inner Sanctum.

Gayal, or *Bos frontalis*, species of ox found in the highland regions of NE. India. The animal is often found wild, but just as frequently in a semi-domesticated condition. Compared with the gaur (q.v.) it is a smaller animal, and its horns are much straighter. The forehead has no

frontal crest. The G. and the gaur frequently interbreed.

Gaza, Theodoros (*Gazes Theodoros*) (1398-1475), Byzantine humanist, b. Thessalonica. In Mantua (1442-6) he studied Lat. under Vittorino da Feltre. Was prof. of Greek (1447-9) and rector of the univ. of Ferrara; prof. of philosophy in Rome (1449-55). Trans. Gk works into Lat. (Aristotle, Theophrastus, etc.) and Lat. works into Greek (*Commentaries* by Caesar; *De senectute* by Cicero). His Gk grammar (*Grammatikē eisagōgē*, 1st ed., Aldus Manutius, 1495) was the first to include the syntaxis, and became a standard text for learning Greek; numerous eds. of and commentaries on this text were pub. until early 19th cent.

Gaza, Palestine, was the most southerly of the 5 chief cities of the Philistines. Situated about 3 m. from the sea, where the trade routes from Egypt and Petra met, G. was long an important fortress and trading tn. The prin. surviving monuments of G. are the orthodox church of St Porphyry; the great mosque—Jami' al-Kebir—also originally a Christian church and restored after the damage suffered in an earthquake (1927); the Jami' al-Sayid Hashim, containing the tomb of Hashim; and the sanctuary of Abu al-'Azam ('father of strength'), with the reputed tomb of Samson. The Tel-el-Amarna tablets mention G. for the first time, and in biblical times it was the scene of many struggles between the Israelites and the Philistines owing to the fact that through the land of Peleshet, the low-lying plain between Mt Carmel and Egypt, lay the only route practicable for armies between Egypt and Babylon. It was the Philistine tn. of which Samson carried away the gates (Judges xvi. 3). G. was famous under the Philistines for the worship of the fish-divinities Dagon and Derketo, who probably had Minoan affinities. Besides the main transit route from Egypt to Damascus an important route reached the sea at G. from the Yemen through the Hejaz; this, the frankincense route, was vital for G. because the immense demand for frankincense and myrrh could only be met in the one way, and when Alexander the Great took G. (332 BC) the booty included immense stores of frankincense in the city's warehouses. G. was then the largest city in Palestine and Syria. Although G.'s first traditional bishop was the Philemon to whom St Paul addressed the epistle of that name, paganism continued almost up to the time of the Arab conquest. In 634 G. was occupied by the caliph Omar and became important to Muslims, partly because the prophet's grandfather Hashim (a direct ancestor of the Sherifian dynasty) is buried there, partly because it is the bp. of Ibn Idris al-Shafi, the founder of the Shafi rite or school of Sunni Islam. During the crusades G. was bitterly contested between the Saracens and the crusaders, but suffered a terrible blow in 1244, when the Christians and Muslims, in alliance, were defeated by the Khwarizmians. In the 16th cent. the Mamelukes

were finally defeated here by the Turks, and in 1799 G. was taken by Bonaparte. Finally it was the scene of 2 battles (26-27 Mar. 1917) between the Brit. and the Turks in the First World War, and was very largely destroyed by the Turks and by subsequent bombardments. It was occupied by Gen. Allenby's troops on 7 Nov. 1917. Of late years the cultivation of barley has caused a partial return of prosperity. It was made an episcopal see by Constantine the Great, and has a mission with schools of the Church Missionary Society, including a hospital. Recent (1930-1) researches by the Brit. School of Egyptian Archaeology estab. that the obvious site of G. would be at the mouth of the Wady Guhzeen, the estuary of which riv. is too malarial for permanent occupation. This site, the site of Tell-el-Ajjul, is practicable only in the rainy season, beginning Jan., and, according to Flinders Petrie, was occupied from the Neolithic to the Bronze Age, and appears to have been the old G. After the age of the Shepherd Kings it was evidently abandoned like Ostia and the Gk cities of S. Italy. Pop. 45,000. See also GAZA STRIP.

Gaza Strip, SW. Palestine, 6 m. wide and 26 m. long, extending NE. from the Egyptian frontier. The bulk of the area is rural and is geographically part of the Negeb (q.v.). It formerly constituted an integral part of the Brit. mandated ter. of Palestine. The main centres of pop. are Gaza (q.v.), 45,000, Khan Yunis, 14,000, and Rafah, 5000. The main occupations are citriculture and date-growing. There are some handicrafts and small industry. Also within the Strip live some 200,000 Arab refugees from Israel, dependent on international relief agencies.

The Strip came into existence in consequence of the armistice agreement between Israel and Egypt of 1949, representing the area of Palestine left in Egyptian hands after the fighting of 1948. The G. S. was never annexed by Egypt, being treated as occupied ter. The Egyptian Gov. had at first hoped to make G. the centre of a Palestine Arab state. Later they maintained the separation of G. from Egypt in order to prevent the Arab refugees from moving into Egypt proper.

Between 1948 and 1956 the area was the scene of numerous incidents between Egypt and Israel. These took the form of infiltration from the Egyptian side, occasionally reaching the outskirts of Tel-Aviv, 35 m. distant, and involving murder, theft, sabotage, and mine-laying. Israel retaliated with large-scale raids and shelling. In Nov. 1956 Israel succeeded in expelling Egyptian forces from G. as well as from the Sinai peninsula. In Mar. 1957, however, as a result of repeated U.N. resolutions, Israel troops were withdrawn from Gaza in favour of the U.N. Emergency Force, and Egypt forthwith recovered the civil administration.

Gazebo, in architecture, a small open summer-house, usually placed at the end of a terrace.

Gazelle, or *Gazella*, genus of antelopes, the majority of which are inhab. of the deserts of the Old World. They have narrow upper molar teeth, like sheep, and their muzzles are covered with hair. There is frequently a gland below the eye and the tail is rather short. The horns are generally compressed and lyrate or recurved, or cylindrical and spiral with distinct rings for a considerable portion of their length. The G.s are amongst the most elegant of all antelopes and are characterised by their sandy colour and a white streak on the side of the face from the base of the horn nearly to the nose.

Mirrorpic

GAZELLE AND YOUNG

Gazetteer. In Mod. E. this term signifies an alphabetical arrangement of place-names, in other words a geographical and topographical dictionary containing more or less abundant information, comprising statistics, descriptions, and historical details. In the 18th cent. the word was used in the sense of a writer in the gazettes or newspapers (Fr. *gazetier*), and in 1703 the *Gazetteer's* or *Newman's Interpreter* was pub. by Lawrence Echard, followed in 1704 by a second part, called the *Gazetteer*. Although expressed by a new word, the idea was of ant. date, and considerable fragments of the 6th cent. geographical dictionary of Stephanus Byzantius remain to this day. Echard's method was soon adopted by other compilers, viz. Bryce, who pub. his *Grand Gazetteer* in 1759, and Crutwell, with his *Universal Gazetteer* in 1808. More modern works have now superseded these, including Longman's (*Times*), Blackie, Chambers, Lippincott, Jack, Oliver & Boyd, etc., etc. Foreign general G.s are represented by Ritter's *Geog. Statist.* (1898) and *Le Nouveau Dictionnaire de géographie universelle* of Vivien de St Martin. Cassell & Mackenzie (1893) for Great Britain; Lewis, Wilson & Brabner for England and Wales; F. H. Groome for Scotland; and Lewis &

Leggatt for Ireland come under the heading of special G.s. Among foreign G.s may be mentioned Neumann for Germany, Hunter for India, Altavilla for Italy, Semenov for Russia, Rosenberg for Sweden, and Weber for Switzerland, as also a series of departmental G.s for France. In India the British Gov. bore the cost of the compilation of numerous G.s for the different states. Hunter's *Imperial Gazetteer of India* is on a magnificent scale, and remarkable for its accuracy. The individual states of the Amer. Union also have special G.s.

Gaziantep (formerly Antep, Aintab), tn of E. Turkey, cap. of the il of the same name. It contains cotton goods factories, and was the centre of Turkish resistance to Fr. occupation of Syria, 1920-1. Pop. (il) 370,808; (tn) 97,144.

Gazna, see GHAZNI.

Gdańsk: 1. Prov. (*województwo*) of N. Poland, bordering on the Baltic Sea. Its coastline is low, and includes the W. part of the Gulf of Danzig and the W. part of the Frisches Haff (q.v.). The prov. is mainly agric., and is drained by the lower Vistula (q.v.). It was formed in 1945 out of the dist. around the former Free City of Danzig (see 2, below), and parts of the Ger. prov. of Pomerania and the Polish prov. of Pomorze (qq.v.). It has ship-building and fishing industries. Area 4141 sq. m.; pop. 800,000.

2. (formerly Danzig) City of Poland, cap. of G. prov. It is a Baltic seaport on the gulf of Danzig, at the mouth of one arm of the Vistula, 170 m. NW. of Warsaw (q.v.). It once belonged to the Hanseatic League (q.v.). In 1308 it became the property of the Teutonic Knights (q.v.) and in 1466 became an autonomous Polish city. In 1793 it was incorporated in Prussia. It was made a free city by Napoleon I (q.v.), 1807-14, but then reverted to Prussia and until 1919 was the cap. of the prov. of West Prussia (q.v.). By the treaty of Versailles (q.v.) it became the cap. of the ter. of the Free City of Danzig (area 731 sq. m.; pop. 400,000). It was under a high commissioner appointed by the League of Nations, but, in order to give Poland a seaport, its railways were under Polish control and the ter. was part of Poland for customs purposes. It lost much of its former trade, however, because of the construction by the Poles of the rival port of Gdynia (q.v.). Hitler's demand for the return of Danzig to Germany was one of the main causes of the Ger. invasion of Poland in 1939 and the outbreak of the Second World War. At the end of the war, when the city became Polish, the Ger. inhab., who formerly comprised over 90 per cent of the pop., were expelled. A great part of the city had been destroyed during the war.

G. is a bishopric, and has a technical univ. It has manufs. of iron, machinery, and foodstuffs, is a transhipment point for Vistula steamers, and has an outer port at Nowy Port (formerly *Nieufahrwasser*); the chief trade is in timber, cereals, coal, and iron. Pop. 240,000.

Gdingen, see Gdynia.

Gdynia (Ger. Gdingen), Baltic seaport of Poland, in Gdańsk prov., on the gulf of Danzig, 12 m. NNW. of Gdańsk (q.v.). Before the end of the First World War it was only a fishing vil. In 1921 the Poles decided to turn it into a major seaport in the Polish Corridor (q.v.), in order to end their dependence on the Free City of Danzig (see GDAŃSK). Channels were dredged, a large new breakwater was constructed, docks were built, and quays were equipped. By 1934 G. was handling more freight than Danzig, and it became Poland's chief shipbuilding centre and naval base. The authorities of Danzig tried to limit these developments, arguing that as Danzig had been created a free city in order to provide Poland with a port there remained no reason for the continued separation of Danzig from the Ger. Reich. During the Second World War the Polish pop. evacuated the city (which was renamed *Gotenhafen* by the Germans). The city was retaken by the Russians in 1945. It had suffered little damage, apart from damage to its harbour. Pop. 117,000.

Ge, see GAEA.

Gean, see MAZZARD.

Gearing transmits energy from one part of a machine to another. It may consist of toothed wheels, belts (q.v.), friction rollers, etc. The ratio of the velocities of wheels in gear is the inverse of the ratio of their diameters. If there are more than 2 wheels in the G. the wheels between the first and the last affect the sense of rotation but not the speed of the last in relation to that of the first. Straight G., by means of spur wheels, is used when the planes of motion are parallel. When the planes are not parallel bevelled G. is used. The shape of the teeth on any wheel must be such that the friction when in gear with another wheel shall be as small as possible. The pitch (q.v.) is the circumference of the pitch circle divided by the number of teeth. When speaking of the diameter of a gear wheel, the diameter of the pitch circle is always meant.

In helical G. the pitch surfaces are cylindrical or conical, and the teeth intersect the surface in helical lines. This is a modification of tooth G., which enables the wheels to work more smoothly and greatly strengthens the teeth. For speed reducing, screw and worm G. may be used. In this the teeth of the wheel consist of portions of screw threads. The worm which drives the wheel consists of from 1 to 3 complete threads. Thus for each revolution of a worm which has only 1 thread, the wheel would move just 1 tooth forward. A special form of G., known as Houldsworth's differential G., is used in spinning-machinery for regulating the speed of bobbins. Friction G., used in lifts and other places where a rapid connection is necessary, consists of rollers or wheels which are pressed together in the direction of the line joining their centres. Pitch chain G. consists of a chain running in projections on sprocket wheels. To minimise friction

the pins forming the links are provided with rollers. Toothed wheels are usually made of brass, cast steel, or cast iron, although sometimes in high speed G. rawhide teeth are used, and occasionally wooden teeth are employed. The rollers in frictional G., on the other hand, usually have at least one with an acting surface of wood, leather, or compressed paper. Plastic gears are also used. See also MOTOR CARS; MOTOR CYCLES. See W. Unwin, *Elements of Machine Design*, 1877; Sir A. Kennedy, *Mechanics of Machinery*, 1886; C. W. MacCord, *Kinematics*, 1901; and H. E. Merritt, *Gears*, 1944.

Fox Photos

STRAIGHT GEARING

Geber, or Gebir, supposed author of certain works on alchemy and chem. which are written in Arabic or Lat. So little is known of him that his existence has been doubted. He has frequently been identified with Jabir ibn Hayyan, a famous Arabic alchemist who lived at Kufa and Bagdad in the 8th or 9th cents. His bp. has been given variously as Kufa, Tarsus, and Harran in Mesopotamia, and some have asserted his death to have taken place in 776. But the Lat. writings from internal evidence appear to have been written in the early part of the 13th cent., and it has therefore been denied that a man of the name of G. ever lived. It is presumed that they were written by various hands. The chief writings which go under this name are *Summa perfectionis*, *Summa collectionis complementi secretorum naturae*, and *Liber investigationis*, which were trans. into Eng. by Russell in 1678. Recent researches on the subject have led to the conclusion that the Arabic works ascribed to Jabir ibn Hayyan must have been written about a century after the time of their supposed author. They are intimately connected with the doctrines of the Ima'ite sect. The Lat. works are noteworthy as the clearest and most important of medieval chemical treatises. See E. Darmstadter, *Die Alchemie des Gebers*, 1922; and E. J. Holmyard, *The Arabic Works of Jabir ibn Hayyan*, 1923.

Gebweller, see GUEBWILLER.

Gecko, name given to all lizards belonging to the family Geckonidae of the

order Lacertilia; they are small in size, dull in colour, and the soft skin is covered with granular tubercles. Most of them have adhesive digits, which enable them to run along smooth, horizontal, or vertical surfaces with astonishing rapidity. G.s. are found in nearly all hot climates, and in Egypt and India frequently enter houses; their name indicates the sound emitted by certain species. *Phyllodactylus* is the most widely distributed genus, *P. mauritanicus* being found in S. Europe. The individuals of *Ptychozoon* are remarkable for the web-like expansions which serve them as parachutes.

Ged, William (1690-1749), inventor of stereotyping, b. Edinburgh, where he worked as a goldsmith. He patented his invention in 1725, when he entered upon a partnership with a London stationer, Jenner, and a typesetter, James, who treated him unjustly. He stereotyped 2 prayer books for Cambridge Univ. (1731) and an ed. of Sallust (1744), but his enterprise was not successful. *Consult* a narrative by his daughter and a life by Nichols, 1781.

Geddes (1879-1954), Auckland Campbell, 1st Baron, Brit. prof. of anatomy and politician, educ. at Edinburgh. Before the First World War he was prof. of anatomy at McGill Univ., Montreal. His reputation rests on his organisation, during the First World War, of a scheme of national service. In 1916 he was appointed director of recruiting, in 1917 chief of the national service ministry, in 1919 president of the board of trade. He was Unionist M.P. for Basingstoke and Andover from 1917 to 1920 and ambas. to the U.S.A., 1920-4. In 1942 he was raised to the peerage.

Geddes, Sir Eric Campbell (1875-1937), businessman and politician, b. in India; elder brother of Baron G. He was educ. at Edinburgh, and went to America to do railway engineering work. In 1906 he became general manager of the N.E. Railway Company and, in the First World War, was appointed deputy director-general of munitions and, later, director-general of military railways. He then entered Parliament, and became successively controller of the navy, First Lord of the Admiralty, and minister of transport. In the post-war Coalition Gov. he was entrusted with 'the axe' to cut departmental expenditure. In 1922 he left politics to become chairman of Dunlop Rubber Company and, later, of Imperial Airways. He was knighted in 1916.

Geddes, Jenny, Edinburgh kailwife who, on 23 July 1837, hurled her stool at the head of Laud's dean as he was going from the desk of St Giles's to read the collect for the day, in protest at the imposition on Scotland of Laud's Prayerbook. Rioting followed.

Geddes, Sir Patrick (1854-1932), scientist and sociologist. Educ. at the univs. of London, Paris, Edinburgh, and Montpellier; prof. of botany at Univ. College, Dundee. He wrote many important articles on biological and sociological subjects. His works include *Cities in*

Evolution, 1913, and, with Sir J. Arthur Thomson, *Evolution of Sex*, 1890. G. held the chair of sociology and civics at Bombay in 1919 and wrote *The Life and Work of Sir Jagadis C. Bose*, F.R.S., 1920.

Geel, tn. of Belgium in the prov. of, and 27 m. E. of, the city of Antwerp. It is known as a colony for mental patients, as feeble-minded people have from earliest times been sent here to be under the control of, and employed by, the citizens. There is an infirmary for the temporary accommodation of those in need of medical assistance. The tn. has a trade in dairy produce, has tanneries, breweries, and dye-works, and manufs. of woollen goods, lace, and tobacco. Pop. 24,800.

Geelong, city in co. of Grant, on Corio Bay and Barwon R., Victoria, Australia. Corio Bay has 13 wharves, where ships of large tonnage can unload, there are facilities for shipping wool and wheat to overseas markets, also large silos for bulk handling of wheat; connected by rail with all parts of the state. Industries include textile, cement, salt, rope and cordage, stoves, spirits, medicines, unbreakable glass, fertilisers, motor-cars, canneries, aerated waters, fibro-plaster, and wool scouring works. The city contains a city hall, hospitals, orphanages, churches of all denominations, free public libraries, art gallery, gov. tourist bureau, 6 colleges, textile college, technical and high schools, law courts, fire brigade stations, theatres, large wool stores, wool exchange, and large woollen mills. There are many sporting arenas—Kardinia Park Oval, main football and cricket ground, accommodates 30,000. Johnstone Park, adjoining the city hall, is beautifully laid out, and contains a memorial art gallery, bandstand, and peace memorial. Well planned botanical gardens overlook the bay and the modern shark-proof swimming enclosure and children's pool. Electric trams and also buses run to the suburbs and beach. Pop. (including suburbs) 80,000.

Geer, Louis Gerhard, *see* DE GEER.

Geeraardsbergen (Fr. Grammont), tn in the prov. of E. Flanders, Belgium, on the R. Dender. It has a 15th-cent. tn. hall. A traditional fête called *Krakelingen en Tonnenkenbrân* (Cracknels and Bonfires) is held on the first Sunday of Lent. Pop. 10,200.

Geestemünde, *see* BREMERHAVEN.

Geg, *see* ALBANIA, *Language and Literature*.

Gegenbaur, Karl (1826-1903), Ger. comparative anatomist, b. Würzburg, where he was educ. In 1855 he was appointed prof. of zoology and comparative anatomy at Jena, but after 3 years lecturing confined himself to the latter subject. From 1873 to 1901 he held a similar post at Heidelberg. He made his reputation chiefly with *Grundriss der vergleichenden Anatomie*, 1874 (trans. into Eng. by F. Bell and E. Lankester, 1878). His pubs. include *Lehrbuch der Anatomie des Menschen*, 1883, *Vergleichende Anatomie der Wirbeltiere*, 1898-1901, *Erbliches*

und Erstrebens, 1902, and a short autobiography, 1901. He ed. the *Mor-Jahrbuch* from 1875.

Gehenna (Heb. *Ge Hinnom*, valley of Hinnom), deep, narrow gorge, a few m. SW. of Jerusalem, where some of the later kings of Judah offered human sacrifice to Moloch (cf. 2 Kings xvi. and xxiii; Jer. vii.). King Josiah made it the rubbish dump of Jerusalem, where the bodies of criminals also were burnt. Hence it came to be used as a symbol for hell. In the N.T. there is a clearly marked distinction between the state of the dead (R.V., 'Hades') and the place of eternal punishment (R.V., 'Gehenna').

Geibel, Emanuel von (1815-84), Ger. poet, b. Lübeck. He graduated at Bonn (1836), travelled considerably in the Grecian archipelago, and lived a quiet and studious life among literary friends in various Ger. tns. In 1843 he received a royal pension, and in 1852 was appointed prof. of aesthetics at Munich by Maximilian II. of Bavaria. G. composed 2 tragedies, *Brunhild*, 1858, and *Sophonisbe*, 1868, and a comedy, *Meister Andrea*, 1865. His fame rests chiefly on his lyric poems, which were pub. in *Gedichte*, 1840, *Juniuslieder*, 1848, *Neue Gedichte*, 1856, *Spätherbstblätter*, 1877, and *Gedichte aus dem Nachlass* (pub. posthumously), 1896. He trans. poems from Sp. and Fr. classics, in collaboration with Ernst Curtius, Paul Heyse, and others, and also wrote trans. from the Gk and Lat. poets. An ed. of his collected works appeared in 8 vols. in 1884. His correspondence with P. Heyse was ed. by E. Petzet, 1922. His biography has been written by C. Leimbach, 1894; K. T. Gaedertz, 1897; A. Kohut, 1915.

Geio Acid, see HUMUS.

Geiger, Abraham (1810-74), Jewish reformer, b. Frankfurt-on-Main. In 1832 he became a rabbi at Wiesbaden. He subsequently officiated as rabbi at Breslau (1838-63), Frankfurt (1863-70), and Berlin (1870-4). He assisted in starting the *Zeitschrift für Jüdische Theologie*, and from 1862 till his death he ed. the *Jüdische Zeitschrift*. See life by L. Geiger, 1910.

Geiger, Hans (1882-1945), Ger. physicist, b. Neustadt an der Hardt. Worked with Rutherford (1906-12) in Manchester. Made prof. of physics at Kiel (1925) and at Tübingen (1929). He is best known for his work with Rutherford (1908) and later with Mueller (1928) in the development of the Geiger-Mueller counter for the detection of atomic particles and radiation. See ALPHA-PARTICLES.

Geiger and Nuttall Relation, see ALPHA-PARTICLES.

Geiger-Mueller Counter. The G.-M. C. or Geiger-counter, invented by Rutherford and Geiger (1908) and developed by Geiger and Mueller (1928), is used for the detection and counting of fast electrically charged particles and ionising radiation. The simplest form consists of a metal cylinder (commonly about 1 in. in diameter and 2 in. long) one end of which is closed by a thin aluminium or mica window through which the particles

enter. A wire along the axis of the cylinder passes out through an insulating seal in the other end and a high potential of about 1500 volts is applied between the wire (+) and the cylinder (-). The interspace is filled with a gas, e.g. argon, at a pressure of a few mm. of mercury.

Although differing in detail, the principle is the same in all forms, and depends upon the fact that the current passed by the source of high potential through the gas is a function of the number of ions present. The passage of a charged particle produces ions in the gas—alpha particles (q.v.) from radioactive sources produce 50,000-100,000 ion pairs per cm. of air, but beta particles produce no more than a few hundred. Under the action of the high electric field near the wire these ions rapidly attain speeds sufficient to produce ions from other atoms with which they collide, and hence there is a large increase in the number of ions and the current begins to increase. This current is mainly caused by the negative ions (electrons) which move more rapidly than the heavier positive ions, and the latter form a sheath of positive space charge round the wire. This reduces the effective field and can cause the current to die away after a short time so that only a pulse of current passes. However, a multiple discharge can be caused by the impact of the positive ions on the cylinder, which leads to the production of secondary electrons. If another particle enters the counter before the first sequence is completed its pulse may be confused with that due to the first particle and the 2 pulses will not be resolved. It is necessary therefore to suppress or quench the discharge to improve the resolving power. Two methods have proved to be useful; *self-quenching*, in which the filling gas contains a few per cent of an organic vapour or halogen; and *external quenching*, in which an electronic device ensures that the initial rise of current due to a charged particle is quickly followed by a decrease in the applied voltage for a suitable period. A G.-M. counter can have a recovery time as small as 2×10^{-8} sec., i.e. it could count 5000 particles per sec. provided they arrived at regular intervals. But most radioactive disintegrations are random events and a counting rate of about 1000 per sec. is a convenient maximum; even so corrections must be made for losses due to the arrival of particles at times when the system is still recovering from the effects of a previous particle. The pulses are fed into a valve relay circuit which automatically records the number of pulses, i.e. the number of particles detected.

The size of each pulse is independent of the initial number of ions produced by the particle, therefore the G.-M. counter is unable to distinguish between alpha and beta particles, protons and gamma rays. This distinction is possible however with the *proportional counter*, which is similar to the G.-M. counter but is operated at lower voltages, 600-800 volts. In this voltage region the size of the current

pulse is proportional to the initial number of ions; it is much larger for alpha particles than for gamma rays. Electronic devices known as pulse height analysers or 'kick-sorters' enable the pulses to be sorted out and the number of each type of particle can be found, due allowance being made for the energies of the particles. *Ionisation counters* operate at yet lower voltages, 100-500 volts, and the pulse size is a direct measure of the initial number of ions as there is no amplification due to collision processes. The pulse size is therefore much smaller than that for the other 2 types of G.-M. counter and demands more sensitive recording apparatus, but it has the advantage over the proportional counter that it is not affected by small variations of the applied voltage. See CERENKOV COUNTERS; SCINTILLATION COUNTERS. See also J. Sharpe, *Nuclear Radiation Detectors*, 1955.

Geijer, Erik Gustaf (1783-1847), Swedish historian and poet, b. Ransäter, in Värmland, and educ. at Uppsala Univ. He was one of the founders of the Gothic Society (1816), and was appointed a member of the academy (1824). His poetical works, though distinguished, are now considered less important than his *History of the Swedish People*, 1832-6.

Geikie, Sir Archibald (1835-1924), geologist, b. Edinburgh; educ. at the Univ. there. He joined the Geological Survey, 1855; became director for Scotland, 1867, and in 1871 prof. of Geology at Edinburgh Univ., holding both appointments until 1882, when he was made director-general of the Geological Survey of the U.K. Knighted, 1891; O.M., 1913; F.R.S., 1865. His chief publs. are *The Story of a Boulder*, 1858, *Scenery of Scotland*, 1865, *Memoir of Sir R. Murchison*, 1875, *Text-book of Geology*, 1882, *The Ancient Volcanoes of Great Britain*, 1897, *The Founders of Geology*, 1897, *Scottish Reminiscences*, 1904, *Landscape in History*, 1905, and *Charles Darwin as Geologist*, 1909. His autobiography, *A Long Life's Work*, was pub. in 1924.

Geikie, James (1839-1915), geologist, brother of Sir Archibald G., also b. and educ. in Edinburgh. He served on the Geological Survey of Scotland from 1861 to 1882, when he succeeded his brother as Murchison prof. of geology at Edinburgh. His writings include *The Great Ice Age in its Relation to the Antiquity of Man*, 1874, *Historical Geology*, 1875, *Prehistoric Europe*, 1881, *Outlines of Geology*, 1886, and *Structural and Field Geology*, 1905. His literary sympathies are manifest in his excellent trans. of *Songs and Lyrics of Heine*, 1887.

Geller, von Kayserberg, Johannes (1445-1510), Ger. preacher, b. Schaffhausen. He studied at Freiburg and Basel. G. was a great pulpit orator and preached in Strasbourg Cathedral from 1478 till his death. His chief writings are *Das Narrenschiff*, 1511, *Das Irrig Schaf*, 1510, *Christliche Püßerschaft zum Ewigen Vaterland*, 1512, and *Das Evangelienbuch*, 1515. An ed. of his *Schriften* was pub. at

Freiburg, 1877-83. See biographical studies by L. Dacheux, 1876; W. Lindemann, 1877; and E. Roeder von Diersburg, 1921. See also C. Schmidt, *Histoire littéraire de l'Alsace du quinzième siècle*, 1878.

Geisha, Jap. dancing or singing girl. The G. usually learns to dance when a child of about 7, and is contracted by her parents to a master or mistress for a period of 3 years; frequently poverty-stricken parents sell their children outright to the owners of 'geisha houses.' The G. is kindly treated and beautifully dressed by her patrons, who arrange for her public appearances at restaurants and tea-rooms, and themselves receive the profits. The dancing is mainly posturing and is without rhythm. One or more of the G.s depict a story in dance, while others play upon the *shamisen* and sing the theme of the story. But with the adoption of European forms of entertainment the institution is dying out.

Geislingen, Ger. tn in the Land of Baden-Württemberg (q.v.), on the Stelze, 32 m. SSE. of Stuttgart (q.v.). It is in mountainous country, and has a Gothic church, a castle, a ruined fortress, and old houses. There are glass and metal works, and wood- and ivory-carving. Pop. 24,000.

Geitonogamy, see ALLOGAMY.

Gela: 1. Anct Gk colony on the S. coast of Sicily, founded by Rhodians and Cretans in 690 bc. It rapidly grew in importance, and in 582 founded Acragas (Agrigento). G.'s most flourishing period was the reign of Hippocrates (d. 491 bc). He was succeeded by Gelon, who took Syracuse (485) and transported thither half the pop. of G. Aeschylus d. at G. in 456 bc. The tn was finally destroyed by the Mamertines c. 281 bc.

2. (formerly Terranova di Sicilia) Tn in Sicily (q.v.), on the S. coast, 31 m. SSE. of Caltanissetta (q.v.). It was founded in 1230 by the Emperor Frederick II (q.v.) on the site of the anct Gk colony of G. (see 1. above). It possesses a fine 18th-cent. church. There are manufs. of coarse cotton and woollen goods, tunny and sardine fisheries, and a trade in agric. produce, wine, and sulphur. Pop. 80,500.

Gelasius, name of 2 popes: St Gelasius I (492-6), successor of Felix III. He was a native of Africa, but the date of his birth is unknown. He was autocratic in his rule, sternly repressed Pelagianism, and removed the name of Acacius, bishop of Constantinople, from the diptychs. He succeeded in driving out the Manichaeans from Rome. On his death he was canonised, 18 Nov. being set aside in the calendar as St G.'s Day. Sev. of his letters are extant, and also a treatise on the Eutychians and Nestorians, *De duobus in Christo naturis adversus Eutychen et Nestorium. Liber Sacramentorum, et Decretum Gelasii de libris recipiendis et non recipiendis* have erroneously been ascribed to him, though he may have written parts of the former. The classical definition of the relation between Church and State was made by

G. at the end of the 5th cent. According to him, in Christian society the spiritual and temporal powers are entrusted to 2 different orders, each deriving its authority from God. Each of these powers is supreme in its own sphere, and within its own sphere is independent of the other power. Yet the 2 authorities are not completely separate. Both seek and serve the welfare of the same men and women, living in the same society. The principle is that while each is supreme in its own sphere, each is subordinate in relation to the sphere of the other. In spiritual matters the civil ruler is subject to the bishop; in temporal matters the bishop is subject to the civil ruler. See study by K. W. Grzelak, 1922.

Gelasius II (1118-9), formerly John of Gaeta. He succeeded Pascal II, but shortly after his election he was expelled from Rome by the Emperor Henry V, who set up an anti-pope, 'Gregory VIII' (Burdinus), with the help of the Normans. G. returned to Rome in July 1118, but was soon compelled to withdraw to France, where he d. in the monastery at Cluny. See also POPES, LIST OF THE.

Gelatine, a derived protein, obtained from collagen (q.v.), prepared especially from cattle and calf skin, and from demineralised sun-dried Indian bone, by extraction with warm water, after prolonged pretreatment with a cold suspension of lime; prepared also from pigskin by extraction with a warm, very dilute acid. The most characteristic property of G. is the reversible gel-forming property of its solutions, which melt on warming and set on cooling. Both gel-forming power, and the viscosity of solutions, under standard conditions, depend on the process of manuf. The commercial products are graded. G. is used commercially and in scientific research as a protective colloid. Edible G. is used in making table jellies, prepared meat products, marshmallow, and confectionery. Other uses of G. include preparing photographic emulsions, textile sizing, paper sizing, etc. G. is the main component of animal glue (q.v.). It is manufactured in Great Britain, U.S.A., Australia, France, Belgium, Germany, U.S.S.R., and to lesser degree elsewhere. See also ADHESIVES; GLUE.

Gelderland (Guelders), prov. of the Netherlands, bounded on the SE. by Germany, on the SW. by the R. Maas, and on the NW. by the IJsselmeer, with an area of about 1939 sq. m. The chief riva. of this prov. are the Rhine, IJssel, Maas, and Waal. Agriculture is carried on, and in some parts the soil is fertile, producing wheat, fruit, and tobacco; main manufs. are cotton and paper. The prov. was originally part of the Holy Rom. Empire, but after many vicissitudes was at the beginning of the 19th cent. divided between Prussia and the Netherlands. The cap. is Arnhem, which was the scene of a great battle in 1944 between Brit. airborne troops and the Germans. For details of the fighting in the battle of Arnhem and at Nijmegen, see WESTERN

FRONT IN SECOND WORLD WAR. Pop. 1,186,465.

Gellée, or Gellée, Claude, see CLAUDE OF LORRAINE.

Gelibolu, see GALLIOLI.

Gellimer (fl. 533), king of the Vandals (530-4), was the great-grandson of Genserik (q.v.). He was successful in deposing Hilderic in 530 and in obtaining the throne for himself. He was, however, defeated by Belisarius in 533 at the battle of Carthage, and gave himself up as a prisoner in 534, walking in Belisarius's triumphal procession in Constantinople the same year.

Gellert, Christian Fürchtegott (1715-69), poet, b. Hainichen in Saxony. In 1751 he became a prof. at Leipzig, where he had been educ. His works, mainly educational in aim, are important in that they broke away from the formalities of earlier writers and prepared the way for Goethe and Schiller. His writings, particularly his fables, were popular even outside his own country. He wrote a novel *Das Leben der schwedischen Gräfin von G.*, 1746, *Fabeln und Erzählungen*, 1748-51, and *Tagebuch aus dem Jahre 1761*, 1863. He was greatly esteemed for his *Betrachtungen über die Religion*, 1760, and *Moralische Vorlesungen*, 1770. His works were ed. by J. L. Klee, 1839, and F. Behrend, 1910. See Goethe, *Dichtung und Wahrheit* (vi.-viii.), 1811-22 (trans. 1897); K. May, *Das Weltbild in Gellerts Dichtung*, 1928; M. Durach, C. F. Gellert, 1938.

Gellert, traditionally Llewellyn the Great's dog, given to him by King John. Legend has it that the dog was left one day in charge of the prince's baby son and was successful in killing a wolf who came to attack him. When Llewellyn returned and saw his blood-stained dog and the baby's overturned cradle he imagined that G. had slain his child, and immediately killed the dog. He then discovered his mistake when he found the child quite safe lying under the cradle, and the body of the wolf. Versions of the same story are found in sev. countries, some of earlier date than this one, and its historical authenticity is doubtful. A tomb stands to the dog's memory at Beddgelert (q.v.) near Snowdon.

Gelligaer, urb. dist. and vil. near Cardiff, Wales. Excavations carried out in 1900-1 yielded further information on Rom. forts in Britain. Pop. (vil.) 1090; (dist.) 35,980.

Gellius, Aulus, see AULUS GELLIUS.

Gellivara, see GALLIVARE.

Gelnhausen, Ger. tn in the *Land* of Hessen (q.v.), on the Kinzig, 43 m. E. by N. of Wiesbaden (q.v.). On an is. in the riv. are the ruins of a castle built by the Emperor Frederick I (q.v.).

Gelon, tyrant of Gela and Syracuse (qq.v.). He refused help to the Greeks against Xerxes (480 BC), and in the same year gained a victory over the Carthaginians at Himera. He d. about 478 BC.

Gelsenkirchen, Ger. industrial city in the *Land* of North Rhine-Westphalia (q.v.), in the Ruhr basin (q.v.), 24 m. NE.,

of Düsseldorf. It stands on the R. Emischer and the Rhine-Herne canal. It was so repeatedly and heavily bombed during the Second World War that the Germans made efforts to transfer its industries elsewhere. The city was in ruins when it was taken by the Allies in 1945, but since then there has been much reconstruction work. The coal mines are of great importance, and there are iron and steel, glass, chemical, and textile industries. Pop. 368,000.

Gem (Lat. *gemma*, a bud, from the root *gen*, meaning 'to produce,' or precious stone). Strictly speaking, the word G. is applicable only to such hard and precious stones as have been worked by engraving; but this is in its narrowest sense, and the word is applied to precious stones that have been cut and polished as jewels, such as the diamond, emerald, ruby, sapphire, etc., and it is sometimes extended even to include the pearl. The stones of the G. engraver are almost entirely confined to the variously coloured and striped varieties of chalcedony quartz. The banded stone, usually known as onyx, is the chief material employed for cameo (q.v.) and seal engraving, and other stones important from the G.-engraver's point of view are jasper, agate, chalcedony, bloodstone, etc. The ancients, Babylonians and Egyptians seem to have first developed the art of G. engraving, and abundant remains of seals of high antiquity have come down to us. The scarabæus, or sacred beetle, was the form in which early Egyptian seals were cut, with the intaglio design engraved in a flat base; and the early Greeks and Etruscans followed this form. Gk Gs are remarkable for their exquisite sculptural beauty. An essential property of a G. stone is a high degree of hardness, so that it may stand the abrasion to which it is subjected at the hands of the jeweller in order to render it an article of personal decoration. The more precious stones, such as the diamond, ruby, emerald, etc., possess this quality, in particular the first named, which is the hardest G. in existence. These rare and more costly precious stones are seldom, if ever, treated by engraving, their high value resting on their brilliance of sparkle and colour and lustre. Most G.-stones are harder than quartz, though a few such as the opal, moonstone, and turquoise are inferior to it in hardness; but the degree of hardness of a precious stone is soon ascertained by the lapidary when cutting it.

Gravels and other deposits of a similar nature frequently contain G.-stones, where they occur as crystals, or fragments of crystals, which have been reduced in many instances to the form of pebbles. The great majority of precious stones occur in a crystallised form, which form, however, is soon destroyed in cutting. Amongst the few ornamental stones which occur without crystalline form may be mentioned opal, turquoise, and amber. Although some stones, notably diamonds, are valued for their lack of colour, in most cases is the prin. element of attraction, and

the beauty of many G.s depends entirely upon their colour, which, however, is often due to the presence of pigmentary matter, and is not an essential property of the mineral. Tourmalines and sapphires, for instance, are often parti-coloured. The most common mineral pigments are probably compounds of iron, manganese, and copper. Exposure to light makes some stones change or lose their colour altogether; certain kinds of turquoise and topaz are particularly liable to do this. Artificial light also makes some stones appear to change colour, as typified in sapphires and amethysts, which frequently acquire an inky, murky tint when

Hulton Picture Library

THE OULLINAN DIAMOND

Discovered in the Premier Mine, Transvaal, in 1905, it weighed 3026 carats (over 1½ lb) before cutting

displayed in artificial light. A cut stone depends largely on the amount of light reflected from its facets for brilliance, the light being reflected back or refracted from the facets at the back. The highest refractive power of any G.-stone is possessed by the diamond. The peculiar lustre and fiery flashes exhibited by this stone are due to its high refractive index and dispersion. G.-stones present variety in chemical composition. The diamond is composed of 1 element only; ruby and sapphire are oxides; turquoise is a phosphate, and so on. In ancient times stones were held in esteem for their supposed medicinal and magical powers as much as for their beauty and rarity. For example, up to comparatively recent times the toadstone was worn for its occult power, and stones such as jade are often valued for a similar reason at the present day. Uncivilised peoples value small stones, especially those of a peculiar shape and colour, as amulets or charms. Many of the superstitions regarding stones have

come down to us, and the belief in 'lucky' stones is prevalent even nowadays.

A considerable trade has been carried on in modern times in the making of artificial G.s for jewellery purposes, and paste copies of existing G.s are manufactured with comparatively little difficulty. The rutille is the most spectacular and successful of synthetic stones. In nature it is nearly always a dark reddish brown to black, large transparent pieces being unknown. The synthetic is made in various colours and is perfectly transparent. It has great 'fire' and high refractive index, but can be identified without elaborate tests. The most famous maker of paste was James Tassie, a Scotsman, who settled in London in the latter half of the 18th cent., and was successful in copying over 15,000 of the most famous and artistic G.s of both ancient and modern times. Imitation stones are chiefly produced from a heavy glass lead of high refractive powers, and they are easily coloured by the addition of various metallic oxides.

Attempts to make diamonds artificially have been numerous within recent years. Tiny fragments produced by the Glasgow chemist, Hannay, presented to the Brit. Museum in 1880, are the only examples to survive stringent modern tests. Moissan and Crookes are also said to have experimented successfully. In 1955 the General Electric Company of America announced that they had successfully produced diamonds of industrial size and quality. The artificial diamonds manufactured have not been larger than microscopic specimens; but in lustre, crystalline form, density, and hardness they are identical with the natural stone.

Artificially made but genuine rubies and sapphires have also been put on the market. They have been obtained by heating barium fluoride with alumina, in the presence of a trace of potassium bichromate in the case of rubies, and of cobalt oxide in that of sapphires. These synthetic G.s are thus composed of the same elements as the natural rubies and sapphires, but experts in the trade can detect them readily by means of tests which would not occur to the layman, e.g. under a strong microscope round air-bubbles can be detected in the manufactured G.s, while when present in natural stones they are irregular in shape. A great many of these G.s are made to-day in France, Germany, and Czechoslovakia to meet the demand for less expensive jewellery. They were produced as early as 1904 by the Fr. chemist Verneuil in his laboratory. Artificial pearls are made by inserting an irritant in the oyster-shell, and thus 'blister pearls' are produced. The cutting and polishing of G.s is a difficult and delicate operation, and one requiring much skill on the part of the worker, especially when dealing with large stones, which may possibly be of great value. Small diamonds are often treated in what is known as 'rose' cut, that is, the upper surface is shaped to triangular facets of nearly equal size throughout.

Stones that are too thin to be cut as brilliants are often treated in this way.

Gem State, see IDAHO.

Gembloux, tn in the prov. of Namur, Belgium, 24 m. SE. of Brussels. At G. Don John of Austria defeated the army under Antony de Golgnies in 1578. The tn contains the Royal Institute of Agriculture, founded in 1860. Pop. 5600.

Gemina Urbanorum, see OSUNA.

Gemini, or the Twins, constellation and third sign of the zodiac (q.v.). The sun enters the sign of this constellation at or about 21 May. It derives its name from 2 bright stars in close proximity, α Geminorum of second magnitude and β Geminorum of the first magnitude—in this case the order of alphabetical arrangement is reversed, α being usually the brightest star. They were known from the time of classical antiquity as Castor (q.v.) and Pollux. The feet of the Twins are crossed by the Milky Way. Near G. is a cluster, M. 35, which looks like a nebula to the naked eye. See CASTOR.

Geminiani, Francesco (1687-1762), It. violinist and composer, b. Lucca. He studied music under Alessandro Scarlatti and Corelli, following the latter very closely. In 1714 he visited England, where he very quickly became famous and decided to settle. A few years later he went to Dublin, where he d., after dividing his time between England and Ireland. He is the composer of many concertos and sonatas, and the author of excellent theoretical works.

Gemmi Pass crosses the Alps in Switzerland. It rises to a height of 7641 ft. and connects the canton of Valais with that of Bern. Near it, on either side, are the little tns Leukerbad and Kandersteg, both health resorts.

Gemsbok, or *Oryx gazella*, species of antelope which inhabits the desert regions of SW. Africa. It stands about 4 ft in height, and its general colour is greyish. The horns of the male animal measure 42 in. in length, while those of the female may reach 46 or 47 in.

Gendarmes, originally a cavalry regiment of France, and up to the time of Louis XVI served as the king's body-guard. After the Fr. Revolution their functions were necessarily altered, and

they are now a military police, consisting of infantry and cavalry. They are a part of the army, although they are better paid than the rest of the army, and may be called out on active service if needed. They have various duties, among them those of policemen. In Palestine, after the First World War, the Brit. Gov. organised a Jewish and an Arab gendarmerie to keep the peace.

In mountaineering parlance, G. are the formidable isolated vertical obstacles that occur at intervals on every difficult ridge climb.

Gender, distinction made in grammar between words to indicate a difference of sex in the objects denoted by these words. As a general rule in the Eng. language this grammatical distinction agrees with the natural distinction known as sex. Thus names denoting the male sex are masculine G., those denoting the female sex feminine G., and those denoting inanimate objects are neuter G., that is, neither masculine nor feminine. These are cases of natural G., that is to say, the sex and G. agree. This rule is departed from, however, sometimes when inanimate things are personified, as when a ship or engine is made feminine, and the sun and time are made masculine. These are cases of grammatical G., sex and G. being different. In O.E., and also in Lat., German, and Greek, this grammatical G. is much more common, many inanimate objects being either masculine or feminine G., while in modern Fr. and other romance languages the neuter G. does not exist.

Gene, the theoretical unit of heredity (q.v.), as first demonstrated by J. G. Mendel's experiments in the breeding of plants, 1865. See also GENETICS. See T. H. Morgan, *Theory of the Gene*, 1926.

Genealogy, science by means of which the descent or pedigree of a family may be ascertained. Though perhaps hardly of sufficient importance to rank as an independent science, it forms a very important part of hist., and there is a growing interest shown in matters pertaining to genealogical research. G. has formed the basis of all true hist. from the earliest times, and many of the old G.s have arisen from the desire to explain the origin of the various groups included in them. The first Gk records were those of ancestry, and a wide scope for G. was afforded by the progress of civilisation in states, and, more particularly, by the institution of corporations and guilds in towns. In modern times the laws of inheritance and the desire to assert the privileges of an hereditary aristocracy have combined to give G. its importance; more especially those laws of inheritance governing the descent of real estate. It was long, however, before G.s were found in the possession of private families, and scarcely one, no matter how distinguished, can trace ancestors even to the middle of the 11th cent. Only after the close of the Middle Ages did G.s multiply in men's houses and become collected in vols., but from the 16th cent. onwards they are found in plenty in MSS. and printed vols.

Antiquaries have, for some centuries, made G. a favourite study, and their researches have been of the utmost value to the historian and biographer. A host of works are occupied with the G. of Eng. noble families, at the head of which stand Dugdale's great works on the Eng. language. Genealogical research has made great advance during the last generation, and its study at the present time is growing rapidly, not only in England but in the U.S.A. and, to a certain extent, in Germany. Much genealogical material has become available by the pub. of par. registers, marriage licence allegations, and such-like; and particularly the mass of evidence contained in the vols. issued by the Public Record Office. The records of the College of Heralds form, perhaps, the greatest genealogical collection in the world; but they are not open to public inspection. See H. F. Waters, *Genealogical Gleamings*, 1901; D. G. Jordan and S. J. Kimball, *Your Family Tree*, 1929; J. H. Round, *Family Origins*, 1930.

Genée, **Dame Adeline** (Genée-Isitt) (1878-), Dan. ballerina, b. Aarhus, Jutland. A pupil of M. and Mme Alexandre Genée, she came to England in 1897. She was the prin. ballerina at the Empire Theatre, London, 1897-1907, 1908-9, and later danced at the Coliseum and the Alhambra, retiring as a dancer in 1917. She also danced in Berlin, Copenhagen, and New York. She continued to play a leading part in Eng. ballet, being concerned in the foundation of the Camargo Society in 1930, and being the first president of the Association of Operatic Dancing of Great Britain (later Royal Academy of Dancing) from 1920 until 1954. Created D.B.E., 1950.

General: 1. Title of an officer in the Brit. Army who holds the rank next below a field-marshal. There are 2 other ranks bearing the title G., lieutenant-general and major-general, both of which are ranks below G. In some other armies there are 2 other ranks of this character, colonel-general and brigadier-general.

2. In the Rom. Catholic Church the title is popularly given to the head of certain religious orders under the Pope. To the G. all the members of the order and all the officials are responsible, and he holds office as a rule for 3 years, though in the case of the Jesuits it is for life. The G. is responsible only to the Pope himself, and is accorded certain privileges in Rome, where he usually resides.

3. The highest official of the Salvation Army (q.v.).

General Agreement on Tariffs and Trade (G.A.T.T.), the product of Clause 4 of the Atlantic Charter, 1941. Article 7 of the Mutual Aid or Lend-Lease Agreement, 1942. Article 23 of the Hot Springs Resolutions, 1943, the U.K.-U.S. Loan Agreement, 1945, and the I.T.O. (International Trade Organisation); estab. to liberalise international trends by reducing tariffs and clearing away quantitative restrictions on trade. It has a small secretariat which organises and documents conferences of the 23 member

nations. The first 3 conferences (Geneva, 1947, Annecy, 1949, Torquay, 1951) estab. some 60,000 tariff rates associate with about three-fifths of world trade. Such 'bindings' were to last until 1958, when most were expected to be renewed or extended. At the 1947 Geneva congress the U.K. reduced duties on 260 articles and restored free imports of gas mantle ash and silica refractory bricks. At Torquay U.K. specialities were tariff-cut on hazel nuts not in shell, dried figs, 15 dental instruments, hair-clippers, razor-blades, accordions and concertinas, white pastels, white chalks, and white crayons. U.S.A. tariff rates of 1945, if applied to the 1952 pattern of trade, would have averaged 17.9 per cent; 1953 rates would have averaged 12.2 per cent. This reduction illustrates the partial success of G.A.T.T. A notable example is wool cloth, on which the U.S.A. import duty, formerly 50 cents per lb. plus 45 per cent *ad valorem*, was by 1956 37½ cents per lb. plus 25 per cent *ad valorem*. On Scotch whisky the U.S.A. pre-war duty was \$2.50 per proof gallon, and in 1956 \$1.50.

G.A.T.T. declared that subsidies on exports of manufactured goods should cease by the end of 1957. As regards controversies over protection for 'infant industries' in under-developed communities (which infants, Free Traders argue, never grow up), G.A.T.T. confines itself to consultations at 2-yearly intervals. G.A.T.T. furnishes a forum and a medium for settlement through the good offices of disinterested member-nations. The percentage of world trade accounted for by commerce within and among the industrial areas of the world rose from 34 in 1950 to 40 in 1954. Economists believe that changes of this order in the pattern of the trade in which G.A.T.T. functions reinforce the case for further liberalisation, which makes for rising living standards and political pacification. See FREE TRADE: PROTECTION.

General Assembly, highest ecclcs. court in the Presbyterian Church of Scotland, Ireland, and the U.S.A. In the G. A. of the Estab. Church of Scotland sit representatives from each presbytery. This assembly meets every year in May, and sits for about 10 days. It contains both laymen (elders) and clergymen, and has judicial and legislative power, and cases brought from lower courts are settled in this one. It is also connected with the State, as a lord high commissioner always attends to represent the queen. In the other Presbyterian churches the G. A.s are very similar, the only difference being in their constitution and in certain unimportant particulars.

General Paralysis of the Insane, syphilitic degeneration of the brain. It is a late manifestation of an untreated syphilitic infection in early life, usually coming on in from 5 to 20 years after. Fortunately, owing to the well-organised facilities for the diagnosis and treatment of venereal disease, and to the specific action of penicillin on the spirochaete

of syphilis, G. P. I. is now becoming uncommon in this country. It is characterised by a progressive deterioration of mental and physical powers. It most often starts in middle life and the mental symptoms are usually noticed first. They take the form of delusions, particularly delusions of grandeur. The patient may make extravagant claims of wealth and social position. There is increasing loss of muscular power, with inco-ordination of movement and loss of balance. The patient cannot stand with his eyes shut or in the dark. The pupils cease to contract in the light and the reflexes generally are diminished or abolished. The disease is slowly progressive and the patient eventually becomes bedridden. Anti-syphilitic treatment will arrest the progress of the disease but will not repair any damage already done. A form of juvenile G. P. I. may occur from an inherited syphilitic infection. See under SYPHILIS and INSANITY.

General Staff, body of military officers (with their staff) responsible for the organisation and training of an army, together with its operations and intelligence activities. To-day the G. S. is a part of an army H.Q., working in conjunction with the adjutant-general's branch and the quartermaster-general's branch. The 3 parts of what is generally referred to as 'the staff' are colloquially known as 'G., A., and Q.' See Maj. R. G. Jessel, *G., A., and Q.*, 1947; Lieut.-Col. J. D. Hittle, *The Military Staff*, 1949. See also STAFF, MILITARY.

General Steam Navigation Company Ltd., shipping line which owes its origin to a group of steam packets which in 1820 plied between London and Margate. The company was founded under its present name in 1824. In 1842, when steamships had been greatly improved, Queen Victoria journeyed in the G. S. N. C. vessel *Trident* from Scotland to London. In 1902 the company became a limited liability company, and in 1909 it occupied the offices at 15 Trinity Square, London, where it is housed to-day. Between the 2 world wars offices were reopened or estab. in Germany, Holland, Belgium, France, and Italy. During the 2 world wars nearly all the company's vessels were engaged on war services, and many were lost. To-day the company maintains regular cargo services between the U.K. and most of the near continental ports, and also to the Mediterranean. It also operates, during the summer months, the well-known 'Eagle Steamers' which carry out day excursions from Tower Pier to Southend, Margate, Ramsgate, Clacton, etc. The company is part of the P. & O. group. In 1949 the company owned about 50 sea-going vessels, with a total gross registered tonnage of about 50,000 tons. See L. Cope Cornford, *Century of Sea Trading, 1824-1924*, pub. on the occasion of the centenary of the company, 1924.

General Strike (1926), see STRIKE.

Generalisation, term denoting the inclusion or grouping under one general

head of a number of individual objects or persons, ignoring all incidental differences and minor qualities and considering them solely from the point of view of their common characteristics. The genus is a higher class including the lower class or species. Hence it follows that the wider a G. is the less specific it becomes.

Generalissimo, title given to a man who is commander-in-chief of sev. armies, or of sev. divs. of one army acting separately.

Generations, Alternation of, see **ALTERNATION OF GENERATIONS**.

Generators, see **ELECTRIC MACHINES**.

Gènes, see **GENOA**.

Genesis (Heb. *Bereshith*, 'in the beginning'), first book of the Pentateuch (q.v.), containing the earliest traditions of the Hebrews as to the origin of the world and of man, his fall, his cultural development and moral and spiritual decay, and of the intervention of God to prepare a people for himself through whom all the nations of the world should be blessed. So the story passes into the record of the Heb. patriarchs, from Abraham to Joseph, and ends with the sojourn of the Children of Israel (Jacob) in Egypt. The material used in the book must originally have come from oral tradition, though written sources are now known to be possible. The substantial Mosaic origin of the Pentateuchal tradition is regarded by the best authorities as certain. The historicity of the patriarchal narratives in G. seems to have been estab. by our increasing knowledge of ant. times. The early chapters are in a category by themselves, as they purport to describe events that happened (as modern physical and palaeontological science tells us) hundreds of thousands of years before the patriarchs. They are not hist. in the strict sense of the word. Whatever primitive lore lies behind them, however, they cannot be equated with the similar legends of Babylonia, nor is there any direct literary connection between them, as used to be thought. The contrasts are as striking as the coincidences, illuminating as the latter may be, and not least is the contrast in moral and theological depth, in which the Heb. stories have a unique quality that can only adequately be explained by inspiration.

Genet, Jeanne Louise Henriette, see **CAMPAN**.

Genet, see **GENETTE**.

Genetics is concerned with the origin of individuals, varieties, and species, and with the causes of similarities and differences between individuals and their ancestors. The term G. was suggested in 1906 by Bateson, who did much to establish and forward the study of the science by his careful observations and experimental work in connection with the breeding of plants and animals (see **BREEDING AND BOTANY**).

G. is intimately connected with the study of heredity (see **HEREDITY AND BIOLOGY**) and with cytology (see **CELL**), for its great problems are those of the ways in which offspring inherit certain characteristics and yet at the same time have in-

dividual differences. How these arise, how resemblances are contained in the egg, manifest themselves at various stages during development, and are again passed on to generations of descendants, are problems for the geneticist to solve. The elucidation of certain problems arising in the study of groups of individuals has been made possible by biometric methods. The science of G., which owes much to T. H. Morgan and his collaborators, reached its culmination in 1934, when the cytologist, Painter, of the univ. of Texas, proved by ocular demonstration that the genes are in fact arranged in lineal order along string-like chromosomes, as had long been surmised by geneticists on theoretical grounds as a result of their experiments in hybridisation. The manner in which the genes are passed on by the chromosomes is complex, but our understanding of it is remarkably accurate and complete. The main facts—the Mendelian 'ratios' (see **MENDEL** and **MENDELISM**), or proportions in which various kinds of offspring are produced, in all their complex variety—are as firmly based as any of the facts of biology. Results of research in G. have been successfully applied to eugenics, to scientific breeding, and to the study of evolution. It may be mentioned here that the study of G. (as the word is understood in the W. world) was recently forbidden throughout the Soviet Union, because one Lysenko denied the validity of the whole of G. and of the chromosome theory of heredity. In the early days of the Soviet regime G. was pursued as a matter of course, but later the authorities explained to scientists that it was not their function to investigate, but solely to serve the material wants of mankind. This meant that scientific research would eventually be directed by politicians through their chosen scientists, one of whom was Lysenko. Lysenko, partly by reintroducing some old agric. practices as if they were his own discoveries and by using the language of dialectical materialism, so imposed upon the Soviet authorities that finally they handed over the control of biological research to him—despite his dismissal of the science of G. It remains to be seen if, with his subsequent fall from grace (1954), the study of G. will again be permitted there.

See W. Bateson, *Problems of Genetics*, 1913; C. H. Waddington, *An Introduction to Modern Genetics*, 1939; H. Kalmus, *Genetics*, 1948; H. Riley, *Genetics and Cytogenetics*, 1948; T. Dobzhansky, *Genetics and the Origin of Species*, 1951.

Genette (Arabic *jarnail*), or **Genet**, name given to a genus of carnivorous mammals belonging to the Viverridae; they are allied to the civet, but differ in being smaller and in the comparative faintness of their musk-like odour. Their fur is soft and often beautifully marked, the general colour being grey. They range over the S. of Europe, Syria, and Africa. *Genetta genetta*, the common G., runs wild in France and Spain, and is sometimes domesticated and trained to kill rats and mice.

Geneva (spirit), see HOLLANDS.

Geneva (Fr. *Genève*; Ger. *Genf*): 1. Canton in the SW. of Switzerland, bounded by the lake of the same name, the canton of Vaud, and France. The Rhône and numerous mt streams water the country, which is hilly; but the soil had been made fertile by persistent cultivation. The chief industries are fruit-growing and the manuf. of articles of jewellery and clocks and watches. G. was admitted into the Swiss Confederation in 1815. Area 109 sq. m.; pop. (1955) 218,800.

2. City in Switzerland, cap. of the canton of the same name. It is of great antiquity and is mentioned in Caesar's *Commentaries*. It acknowledged Rom. supremacy in 120 BC. In 456 it came

streets were narrow and ill drained; but after that year the town was entirely rebuilt in modern style. Its monuments are of no very great magnificence, though it has some antique and picturesque buildings, and a fine statue of Rousseau is erected in its public pleasure-grounds. It is also beautifully situated, the course of the Rhône through the town forming 2 small is. The prin. edifices are the 12th-cent. cathedral of St Peter, the academy founded by Calvin and now converted into a univ., the fine theatre, ranking next in size to the Paris Opera House, the Athenaeum, and sev. museums, notably the Museum of Natural Hist., containing De Saussure's geological collections. An institute of higher international studies was founded in 1927. G. was chosen as

Swiss Federal Railways

GENEVA, WITH ROUSSEAU ISLAND

The snow-covered peak on the left is Mont Blanc

under the Burgundian sway, and was incorporated with the kingdom of the Franks in 534. G. is one of the most conspicuous places in Europe, owing to the celebrated part it has played in European civilisation as the centre of Calvinism. Calvin went to G. in the year 1536, and by his work there made it one of the chief religious centres throughout Europe. It was then the leading city of Protestantism, and a refuge for the persecuted from Italy, England, and France, thus acquiring a cosmopolitan character. During the Fr. Revolution G. was annexed (1798) to France, but on the fall of Napoleon it regained its liberty, and in 1815 joined the Swiss Confederation. Since the end of the 18th cent. it has become the centre of a remarkable scientific activity. It is famous as having given birth to Rousseau, De Saussure, De Luc, and many other celebrated men, and its educational institutions and scientific collections are deservedly noted. Among G.'s famous residents were Voltaire, Gibbon, Shelley, Ruskin, Byron, and Necker. Prior to 1847 G. was surrounded by walls, and its

the seat of the League of Nations, for which a magnificent new palace was built, following the choice of designs, after an international competition held in 1927. The main block is in Ariana Park, on the heights above Pregny. G. is also the seat of the International Red Cross (see GENEVA CONVENTION). Its chief industry is the manuf. of watches, clocks, jewellery, scientific instruments, and musical boxes. Pop. (1955) 158,800, Fr.-speaking.

3. The lake of G. is situated between Switzerland and France, the larger portion belonging to the former country. It is in the form of a crescent and is 45 m. long and 8 m. broad, its total area being 225 sq. m. At certain periods of the year the surface of the lake is subject to sudden rises and falls, probably due to differences of barometric pressure on different parts. These phenomena are known as *seiches*. Mirages are also at times observed on the lake. The S. Fr. shore has the Savoy Mts in the background, and is of a solemn and stern character, while the shore on the N. side of the Pays de Vaud has become quite a classic spot on account of its

association with men of note. J. J. Rousseau mentions it in his *Nouvelle Héloïse*, and Byron in *Childe Harold* and *The Prisoner of Chillon*. Mont Blanc, though 60 m. distant, is visible from the lake. At the upper end of the lake the Rhône enters it, turbid and yellow, but at the top of G. leaves it limpid and azure-tinted. Lake dwellings have been built on its shores in prehistoric times, piles of which can still be seen near G. There are many historical resorts which attract both tourists and winter residents—Vevey, Montreux, Coppet, Ferney, etc. A railway runs along its N. and S. shores. In the harbour of G. are 2 great granite rocks, named Pierres du Niton, which project above the water, and are known as Neptune's Altars.

4. City of Ontario co., New York, U.S.A., situated at the N. end of Lake Seneca. It is the seat of the State Agric. Experiment Station and of the Colleges of the Seneca (Hobart College (Protestant Episcopal) and William Smith College). G. was settled about 1788 near the site of an Indian vil., and chartered in 1898. There are large nurseries, and manufs. of motors, engines, optical instruments, canned goods, etc. Pop. 17,140.

Geneva Conferences: 1. Held by the foreign ministers of 19 countries at Geneva, April–July 1954, to discuss (a) the unification of Korea and (b) a settlement in Indo-China. The Chinese People's Rep. was represented at the conference by Chou En-lai, but the Amer. secretary of state did not negotiate with him, leaving the conference early in May. No settlement was reached in Korea; but an armistice ending the Indo-China war was signed on 21 July. Viet-Nam was partitioned into Communist and non-Communist states, and it was proposed that free elections to determine a final settlement should be held in 1955, but this last arrangement has not been (1957) carried out.

2. The heads of gov. of Britain, France, Russia, and the U.S.A. met at Geneva 18–23 July 1955, the first such meeting since Potsdam (1945). At the end of their talks future negotiations were proposed between their respective foreign ministers on subjects including Ger. unification, disarmament, and E.-W. contacts. The 4 foreign ministers subsequently met at Geneva 27 Oct.–16 Nov., but no agreement was reached on any of the topics discussed.

Geneva Conferences (Naval Disarmament): 1. Conference of 1927, the sequel to the Washington Conference of 1922 (q.v.). Like the latter it was initiated by the U.S.A. It met at Geneva in 1927 for the purpose of closing the gap left by the Washington Treaty, which dealt only with capital ships and aircraft carriers. The problem of cruisers, destroyers, and submarines, however, remained unsolved. Furthermore, the prospects of the Geneva Conference were clouded at the outset by the refusal of France and Italy to send delegates on the ground that naval disarmament could not be discussed in

isolation. Great Britain and the U.S.A. found themselves divided by an unbridgeable gulf: parity in tonnage, which was accepted by both, was not necessarily parity in fighting strength, and on this difference the conference broke down. Its sequel was the London Conference in 1930 (q.v.).

2. Conference of 1932. After the London Conference of 1930 Britain and the U.S.A., both of whom had reduced their land forces to little more than token size, were concerned to find some way of reducing the world burden of armaments, and the unrest to which it gave rise. The chief impediment was France's unwillingness to reduce her armies without full guarantees of security; and the question was by this time further complicated by Germany's growing insistence on equality of rights in the matter of armaments. These were the factors which wrecked the Disarmament Conference that opened at Geneva in 1932. At this conference Britain and America advocated the restriction or elimination of offensive weapons, but could not agree as to what weapons came under that description. The conference was given its death-blow in Oct. 1933 when Hitler announced Germany's withdrawal not only from the conference but from the League of Nations as well. See *Disarmament: a Review of the Acts of the League of Nations and of Governments, of Deliberation and the Trend of Public Opinion and Action relating to the World Disarmament Conference of 1932* (Disarmament Committee, Geneva), 1932.

Geneva Convention. This convention or treaty was originally adopted at a national conference held at Geneva, Switzerland, in 1864, but was afterwards replaced by the convention of 6 July 1906, also adopted at Geneva. It was an international agreement, chiefly respecting the succour of the wounded in time of war, and it forbade all cruel methods of warfare. In 1870–1, during the Franco-Ger. war, a Red Cross Society was formed which did most valuable work, the Geneva cross flag, adapted from the insignia of the old military Order of St John, being recognised as neutral. International conferences promoting the same objects were also held at Paris and Berlin. The adoption of the new G. C. of July 1906 resulted in a new ed. being adopted at the Peace Conference of 1907. A further convention was made in 1929, dealing especially with the treatment of prisoners of war and civilians in the light of the experiences of the First World War, and there have been further amendments since. In 1949 a new convention was signed, after preliminary talks in 1946, incorporating amendments suggested by the experiences of the Second World War.

Geneva Protocol (1924), or protocol for pacific settlement of international disputes, represented an attempt by the League of Nations to find a solution of the ambiguities and vagueness of the Covenant of the League (see COVENANT OF THE LEAGUE OF NATIONS). It was adopted

by the fifth assembly of the League, and though it was rejected by the govs. concerned, it is of historical importance in that it reveals in clear relief the salient problems concerning Europe in the post-war period. In the protocol the League sought to tighten up the sanctions (i.e. penalties) against aggressive wars, and also to increase the number of occasions on which those sanctions should become applicable; and these reforms involved a determined attack on the problem of disarmament. But the Brit. representatives at the Council of the League would agree to nothing which should compel them to state in advance their country's quota contributions to the military, naval, and air forces (necessary to ensure the fulfilment of the obligations of the Covenant), nor surrender the right to determine for themselves those contributions. Thus, though the protocol added nothing to the legal sanctions (of Article 16 of the Covenant), it raised the moral obligations imposed on League members. In its next aspect the protocol, in a proposed amendment of Article 12 of the Covenant, ruled out absolutely the legality of war except when the nation in question was, in self-defence, resisting an act of aggression, or when it was acting on behalf of the League against a recalcitrant state. The test of aggression in the protocol was the refusal to submit a dispute to the procedure of pacific settlement provided by Articles 13 and 16 of the Covenant as amplified by the protocol, or, in other words, a party to a dispute would not only have to refer to one or another form of arbitration, but be compelled to comply with the judicial sentence or arbitral award which resulted therefrom. From the Brit. point of view, however, the fundamental weakness of the protocol was that the Brit. Parliament was asked, in effect, to surrender to what might be a group of unknown men in no way responsible to it those powers of peace and war which it had claimed to exercise for centuries, and that is why Great Britain refused to ratify the protocol. See D. Hunter Miller, *The Geneva Protocol*, 1925; G. Butler, *A Handbook of the League of Nations*, 1925; and P. J. N. Baker, *The Geneva Protocol for the Pacific Settlement of International Disputes*, 1925.

Geneviève, or Genovefa, St. c. 422-c. 500), patron of Paris. According to tradition she was b. at Nanterre, then went to Paris, where she became famous for her benevolence and for her predictions of the future. She encouraged the citizens to defend their city against the Franks and the Huns. Her feast is on 3 Jan., and relics connected with her are preserved at the church of St Étienne du Mont. The great frescoes of Puvis de Chavannes in the Panthéon in Paris illustrate her life.

Geneviève of Brabant, heroine of medieval legend. Said to have been the wife of the palatine Siegfried, she was falsely accused of adultery and condemned to death, the punishment being commuted to exposure in a forest. The story goes that she wandered Diana-wise for some years

when she was found by Siegfried during one of his hunting expeditions, and her innocence acknowledged. There is no historical basis for the legend.

Genghis, or Jenghiz, Khan (1162-1227), Mongol emperor; the son of Yesukai, his mother's name being Yulun. He was b. by the R. Onun, and was only 13 when his father d. His name was Temuohin, which he changed in 1206 to Jenghiz, in Chinese 'Ch'eng Ch'i-ssu.' His victory over the Naiman Mongols left him undisputed ruler in Mongolia, and after crushing the Merkit Khan on the R. Irtysh he moved towards N. China, then occupied by the Chin Tatars. By 1213 3 of his armies were sweeping from victory to victory, wiping out cities till the whole country N. of the Yellow R. was in his hands, except Yenking (Peking). G. moved back to the W. and crushed the Khitanes and the Shah of Khwarizm (Khiva), whose ter. on the Oxus was the key to the Caspian and so to Europe. G. or his sons then in turn conquered Bokhara, Samarkand, and Merv, sacking and destroying the tns and putting all the inhab. to death. His powerful rival, Mohammed of Khwarizm, d., and G. pursued his son, Jeleleddin, to Herat and thence to India. Meanwhile other armies had invaded Russia with the same astonishing success, and when G. d. in 1227, on a journey in Mongolia his empire stretched from the Yellow Sea to the Dnieper. G.'s tomb is now in Huhshot, Inner Mongolia, China. See Sir R. K. Douglas, *Life of Jenghis Khan*, 1877; H. Lamb, *Genghis Khan, the Emperor of all Men*, 1933; R. Fox, *Genghis Khan*, 1937; and V. G. Yan, *Jenghis Khan*, 1942, trans. 1945.

Genie (dgrinn), see GENIUS.

Genil, see JINN.

Genista, genus of hardy leguminous shrubs found in the old world and represented in Britain by 3 species. *G. tinctoria*, the dyer's green-weed, found in Brit. fields, pastures, and thickets, is noted for the yellow colour obtained from its flowers and used in dyeing wool. The seeds act as a mild purgative. *G. pilosa* is rare and local. *G. anglica*, a spinous plant, is common in England and Scotland. Altogether at least 70 species are known. *G. virgata* and *G. cinerea* are tall brooms growing up to 12 ft high with small pointed leaves, silvery underneath, covering themselves with cascades of fragrant little pea-flowers of brilliant yellow in late June and early July. The chief difference is that the first-named flowers a little earlier. *G. dalmatica*, Dalmatian broom, *G. delphinensis*, *G. januensis*, *G. sagittalis*, and *G. villarsii* are dwarf forms from S. Europe. *G. radiata* and *G. hispanica*, Sp. gorse, are useful garden shrubs.

Genius. The Romans believed that every man at birth is endowed with a special guarding spirit, influencing his character and deciding his good or ill fortune, happiness or misery. As it presides over the generating principle (*genius*, root *gen-*, *gignere*, to beget), the

G. is masculine; women looked to Juno (q.v.), in childbirth to Juno Lucina. Though not a household god, offerings were made to the G. of the father of the family (*paterfamilias*), and the marriage bed is named *genialis*, dedicated to G. A Rom. swore by his G. The Gk *daemon* is parallel, but the idea of evil or good *daemones* was purely Greek, and the G. purely Rom., or, rather, Italian. When Rom. religion, influenced by the pantheon of the Greeks, began to take a more anthropomorphic view of the various deities, they, too, had *genit* designed to them, and so too did cities, trades, and guilds, and especially the nation itself; there was a *genius publicus populi Romani* as well as a *genius urbis*, i.e. of Rome. The G. of the emperors was publicly worshipped. Eng. has taken the word 'genil', altered to 'genie', as a trans., usefully representing the pronunciation of the Arabic *djinn* or *jinn*, the beneficent or malevolent spirits of Arab mythology.

Genk, tn in the prov. of Limbourg, Belgium, 8 m. ENE. of Hasselt. There are important coal-mines at the hamlets Waterschee, Zwartberg, and Winterslag. In 1920 the first coal of the Kempen (Campino) basin was mined here. Brewing and the manuf. of fibre are carried on. Asparagus is largely cultivated in its sandy soil. Pop. (1955) 42,800.

Genlis, Stéphanie Félicité, Comtesse de (1746-1830), Fr. writer, b. Champcéry, near Autun. In 1770 she became lady-in-waiting to the duchess of Chartres, and was made governess to her daughters; in 1781 the duke appointed her as tutor (*gouverneur*) to his sons, and she carried on their education until 1793, when she had to leave France. After the Restoration she wrote in defence of monarchy and of religion. When she was past 80 years of age she wrote her memoirs. She lived to see the events of July 1830, and her former pupil, Louis-Philippe, raised to the throne. Her methods of education seem to have been considerably in advance of her time, and we hear of her illustrating her hist. lessons by magic-lantern slides, and teaching botany while out for walks. Her works are numerous and of some historical value; they include *Théâtre de l'éducation*, 1779-80, *Adèle et Théodore* (comedies for children), 1782, *Mémoires inédits sur le dix-huitième siècle*, 1825, and a romance entitled *Mademoiselle de Clermont*, 1802. See G. Maugras, *L'Idylle d'un gouverneur*, 1904; W. M. Kerby, *The Educational Ideas and Activities of Mme la Comtesse de Genlis*, 1926; J. Bertaut, *Mme de Genlis*, 1941.

Gennadius II, or George the Scholar (c. 1400-70), an Aristotelian and writer, was perhaps the 'Scholarius' who accompanied the Emperor John Palaeologus to Florence in an attempt to heal the schism between E. and W., but later, as a monk at Constantinople, opposed the union. After the fall of Constantinople (1453) G. was made patriarch by Sultan Mohammed II. After 4 or 5 years he retired, and d. in the monastery of St John the Baptist near Serrae, Macedonia.

Gennaro, San, see JANUARIUS, ST.

Gennesaret, Sea of, see GALILEE.

Genoa (It. *Genova*): 1. Prov. of Italy, in central Liguria (q.v.). It has a coastline on the Gulf of G. (q.v.), but is generally high-lying, with ridges of the Ligurian Mts (see APEENNINES). The coastal plain (see RIVIERA) and the riv. valleys are rich in vegetation and well cultivated. The prin. tns include G. and Rapallo (qq.v.). Area 705 sq. m.; pop. 951,000.

2. (anc. *Genoa*; Fr. *Gênes*) It. city, cap. of the prov. of G., and chief tn of Liguria, on the Gulf of G., 250 m. NW. of Rome (q.v.). It is the most important commercial port of Italy, and stands on the slopes and at the foot of the Ligurian Mts in a great natural amphitheatre, of which the harbour forms the centre. Founded in about the 8th cent. BC, G. was destroyed by Magro (q.v.) in 204 BC, but was afterwards rebuilt by the Romans. It was subsequently taken by the Goths and the Longobards (qq.v.), became part of the dominions of the Carolingians (q.v.), and by the beginning of the 10th cent. was an independent rep. By foreign trading it laid the foundations of its great commercial prosperity, its galleys took part in the Crusades (q.v.), and it imposed its rule on Corsica and Sardinia (qq.v.). The growing power and wealth of the city excited the rivalry of Pisa (q.v.) and a long-drawn-out struggle began, which culminated in the defeat of Pisa at Meloria (q.v.) in 1284. The Genoese traders developed colonies as far afield as Africa, Spain, Asia Minor, and the Black Sea, but this led to conflict with Venice (q.v.), and to the defeat of the Genoese at Chiozza (q.v.) in 1380. The troubles of the city were further accentuated by internal strife between Guelphs and Ghibellines (q.v.) and by the rivalries of the prin. families. Other states intervened in these struggles, and G. was subjected in the 15th and 16th cents. by Milan (q.v.) and France. The city's independence was secured by Andrea Doria (q.v.); but its fortunes had begun to wane, it lost its oriental possessions to the Turks (q.v.), its trade declined as a result of the discovery of America, and it fell eventually under the domination of Spain. In 1684 it was bombarded by the Fr. because of an insult offered to the ambas. of Louis XIV, and the Doge (q.v.) was obliged to travel to Versailles (q.v.) to receive the king's pardon. In 1768 G. sold Corsica to France, and in the upheavals following the revolution in France the city was first made the metropolis of the 'Ligurian Republic' (1798) and was eventually incorporated in the Napoleonic empire (see FRANCE, History, and NAPOLEON I). After the fall of Napoleon, G. went to the House of Savoy (q.v.) as a duchy of the kingdom of Sardinia (1815), and thus it in time became part of united Italy. In 1922 the city was the scene of an unsuccessful economic conference, at which 29 countries were represented, among them for the first time Soviet Russia and the nations defeated in the First World War,

excepting Turkey. During the Second World War G. was bombarded by Brit. warships on 8 Feb. 1942, widespread damage being done to the docks and industrial estabs. Oil tanks, marshalling yards, and merchant ships also were hit, and large fires caused in shipyards and power installations. The port and tn also suffered severely in numerous air-raids. Altogether more than 50 churches, a dozen oratories, and 130 palaces and villas were damaged; the most serious and irreparable damage was that to the splendid interiors of the medieval palaces. G. was taken by the allied Fifth Army on

particular of works by Genoese artists. The archiepiscopal cathedral (partly 12th cent.) is mainly Gothic in style; it has a notable 16th-cent. campanile, and its façade is banded in black and white marbles. Among the other anc't churches are the basilica of Sta Maria Assunta di Carignano (16th-18th cents.), which has 5 cupolas and contains remarkable baroque statues; the 12th-cent. church of Sta. Maria di Castello; and the 17th-cent. church of the Annunziata, to which belongs an important collection of 17th-cent. Genoese art. The univ. dates from 1243, and has a library of 450,000 vols.

E.N.A.

GENOA

The town and port, showing in the background the snow-capped Ligurian mountains

27 April 1945, after some parts had already been captured by the partisans.

G. is a picturesque city, widely spread out along the coast, and enclosed by hill slopes covered with buildings, gardens, and orange groves. In the lower part of the city proper there are the curious anc't streets and *caruggi* (lanes) of the medieval tn; the splendid modern streets, fine squares, and imposing buildings of the commercial and residential dists.; the harbours, with their quays, moles, and famous *Lanterna* (lighthouse); and the magnificent sea promenade. Of the many palaces of G., the most celebrated are the Palazzo Ducale, once the residence of the Doges and now the Courts of Law; the 18th-cent. Palazzo Reale, containing many art treasures; the splendid 16th-cent. Palazzo Principe, which was once the 'court' of Andrea Doria; and the Palazzo Bianco, Palazzo Rosso, and Accademia Ligustica di Belle Arti, which have notable collections of paintings, in

Greater G. includes many industrial and other suburbs, and has metallurgical industries, and manufs. of marine and diesel engines, locomotives, armaments, electrical goods and components, cotton, and foodstuffs. There are important naval and merchant shipbuilding yards. The city has well-developed national and trans-Alpine road and rail communications, and the port is extremely busy; it is the outlet for a wide and productive region, and has imports of coal, oil, alcohol, ores, chemicals, textiles, foodstuffs, and tobacco, and there is also a large passenger traffic. Among the famous natives of G. were Columbus, Mazzini, Paganini, and, perhaps, Cabot (qq.v.). Pop. (city) 359,500; (greater G.) 656,400. See F. Donaver, *La storia della repubblica di Genova*, 1913; T. S. Mills, *The Genoa Conference*, 1922; M. Sibona, *Genova*, 1925; and H.M.S.O., *Works of Art in Italy, Losses and Surivals*, 1945.

Genoa, Gulf of, name given to the N. part of the Ligurian Sea (q.v.), between La Spezia and Imperia (qq.v.). Genoa (q.v.) is the chief city on the gulf.

Genocide, word of hybrid Graeco-Lat. etymology, coined by R. Lemkin, defined as the partial or wholesale destruction of religious, racial, or national groups. In 1941 Hitler, ruler of Nazi Germany, issued an order providing for the extermination of all Jews in Ger. hands. It is estimated that between 4,200,000 and 4,600,000 Jews perished between 1941 and 1945, about half the Jewish pop. of Europe at the time. Perhaps a third of these d. from overwork, disease, hunger, and neglect. The rest were killed in ghettos and concentration camps by shooting, gassing, etc. Hitler also decreed the extermination of the gypsies (q.v.) and a large number of them were killed. The U.N. War Crimes Commission took cognizance of G. and punished some of those responsible. In Dec. 1946 the U.N. Assembly issued a declaration against G. and 2 years later unanimously approved a Convention outlawing G. After being ratified by 20 states the Convention came into force in Jan. 1951. Although the Convention provides for reference to the International Court, some govts., notably that of the Union of South Africa, doubt whether it is a practical measure. Meanwhile the W. Ger. Gov. has paid compensation to the survivors and extensive reparations to the State of Israel. Some restitution has also been made by Austria. See R. Lemkin, *Axis Rule in Occupied Europe*, 1944; G. Reitlinger, *The Final Solution*, 1953.

Genova, see GENOA.

Genovesi, Saint, see GENEVIÈVE, St.

Genovesi, Antonio (1712-89), It. writer on philosophy and political economy, b. Castiglione. He started his career as an ecclesiastic, but very soon abandoned theology in favour of the law, which in turn was also given up for philosophy. In 1754 one of his patrons, Bartolomeo Intieri, a Florentine, founded the first It. or European chair of political economy on condition that G. was made first prof. His works include *Elementa Metaphysica*, 1743, et seq., *Logica*, 1745, and *Lezioni di Commercio*, the first complete It. work on economics. See G. M. Monti, *A. Genovesi e G. H. Galanti*, 1926.

Genre Painting takes for its subject the familiar scenes of everyday life, while 'historical painting,' in contradistinction to which the term has come to be used, takes great events.

Gens, in its historical and ethnological sense, a tribe or clan, or any group of primitive people forming a distinct branch of a race. The term was especially applied to a clan or house in anc. Rome which included a number of families bearing the same name and descended from a common ancestor, and also sharing certain legal privileges and obligations, and also religious rites. Originally these *gentes* were exclusively patrician, but later they included plebeians. The name

of the *gens* to which a Rom. belonged was indicated always by the middle of the 3 names which it was customary for a Rom. to possess.

Genesio, or **Gaiseric** (c. 390-477), king of the Vandals. He succeeded his brother Geoderic in 428. He invaded Africa from Spain, besieged the Rom. general Bonifacius in Hippo, and conquered the prov. with much pillage and slaughter. In 455 he invaded Italy and sacked Rome. G. also conquered Sicily, Sardinia, and the Balearic Isles. As an Arian he was a cruel persecutor of orthodox Christians.

Genthugge, tn in the prov. of E. Flanders, Belgium, forming an E. suburb of Ghent. It has manufs. of textiles, paper, nails, and rubber. There is a central workshop of the Belgian railways. Pop. 20,800.

Gentiana, family Gentianaceae; genus of over 200 species of alpine regions, N. hemisphere and Andes; named after King Gentius of Illyria, who is said to have discovered their medicinal value. They are noted for their brilliantly coloured flowers. *G. lutea*, yellow-flowering, perennial, is the source of Gentian-root of medicine. Native to Britain are *G. pneumonanthe*, marsh G., *G. verna*, spring G., and *G. nivalis*, the small G., an ann. *G. acaulis*, *G. septemfida*, *G. sino-ornata*, and *G. lagodechiana* are popular rock-garden plants.

Gentianaceae, family of dicotyledonous plants mostly of temperate regions. It contains about 900 species, mostly herbs, famed for their bitterness and the bright yellow, red, or blue of the flowers. The flowers are hermaphrodite; there are typically 5 united sepals and petals, 5 epipetalous stamens, 2 united carpels to form a superior ovary with numerous ovules; the fruit is a capsule or berry. Chief genera are *Erythraea*, *Gentiana*, *Helenia*, *Limnanthemum*, *Menyanthes*, *Orphium*, *Suertia*, etc.

Gentile, Giovanni (1875-1944), It. philosopher, b. Castelvetrano, Sicily. Educ. at the univ. of Palermo. In 1918 he became prof. of the hist. of philosophy in the univ. of Rome. He was made senator the same year. In 1920 he founded the *Giornale critico della filosofia italiana*. G. was in the Fascist ranks from the first, and became minister of education in Mussolini's first Cabinet. He was also Fascist minister of science and arts; president of the Academy of Sciences and Arts, Florence. His philosophy, which he implemented in his ministerial work, transcends that of Croce, being even more lyrical and objectless in its professions. It is, in practice, the philosophy of Fascism, with its roots in Vico, who believed in a something corporate, not composed of our individual selves, that makes for national glory. With Croce, precedent and idea have some controlling force; with G., apparently none—the dominant will is sufficient reason. G. was shot by partisans in 1944. See E. Chiocchetti, *La filosofia di Giovanni Gentile*, 1925; and

G. De Ruggiero, *Filosofi del Novecento*, 1934.

Gentile da Fabriano, see FABRIANO.

Gentili, Alberico (1551-1611), It.-Eng. jurist, b. San Ginesio, in the march of Ancona. He was a doctor of civil law of the univ. of Perugia, but left Italy in consequence of having adopted Protestantism. In 1588, through the patronage of the earl of Leicester, he became regius prof. of civil law at Oxford. His chief work is the *De Jure Belli libri tres*, 1598, but his earliest known work was the *De Legationibus*, pub. in 1585. The *De Jure* was an enlargement of the *De Jure Belli commentatio prima*, pub. in 1588, and 2 other treatises of the following year. They treat of the laws of war, the causes of making it, the mode of carrying it on, and the rights of conquerors and conquered—all opportune topics when England was threatened by the Armada (1588), and the attitude of the Eng. Catholics to the question whether a Papist was right in serving his prince in arms against the pope raised important issues. According to Prof. Westlake G. rushed into print in 1589 without giving himself time to elaborate his important subject with the fullness he afterwards gave it in the greatly expanded work of 1598. This classic, indeed, is admittedly superior to the work of Ayala (q.v.), being far more complete and free from the irrelevant consideration of tactics and military administration. But it is inferior to the work of Ayala in principles, notably in its manner of dealing with the cardinal problem of whether a war can be *justum bellum* on both sides, so as to have legal effects, i.e. in changing the ownership of things captured. Nothing, either, is to be derived from G. in mitigation of the ferocity of war; and, again, he agrees that it is both just and expedient to kill hostages. The best Eng. ed. of the *De Jure* is that of T. E. Holland, 1877. See also *The Collected Papers of John Westlake on Public International Law*, 1914.

Gentleman. The term 'G.' is of very vague and shifting meaning to-day, but though it has almost become a politer synonym of 'man,' as 'lady' has of 'woman,' everyone recognises that, properly regarded, it implies something of good manners, good taste, good education, and good feeling for others. In a more usual and general sense it is applied to one of a certain social position, and its definition may range from the celebrated one of a 'man who keeps a gig' to that of one who, by birth, education, wealth, or manners, occupies a certain place in society, without, nowadays, much reference to his profession, business, or trade. It is of more interest to turn to the hist. of the term, which has been much confused since, in the 16th and 17th cents., a fiction of official heralds made 'gentlemen' and 'gentry' a separate order or rank and confined its members to those who had the right to bear a coat of arms as recognised by the college of heralds. Antiquaries and historians have much disputed whether in England there ever

was a distinct order corresponding to the lesser noblesse of France or Germany (*Adel*). Certainly there never was a distinctive mark attached to a name, signifying such a rank as is found in the nobiliary particles *de* in Fr. or *von* in German. Early Eng. records in which 'de' occurs imply the place where the man or family lived, and in the 15th cent. the word was dropped; thus Wm de Pedlington became Wm Pedlington. Apart from this, the definite early meaning was that of its derivation, a man of 'gentle' birth, Lat. *gentilis*, and so in genealogies, etc., *generosus*. See W. Harrison's *Description of England*, ii. 5, 1577; and J. Selden's *Titles of Honour*, 1671; the most interesting researches of Sir George Sitwell, 'The English Gentleman,' *Ancestor*, April 1902; and for an exhaustive collection of quotations, etc., A. Smythe Palmer, *The Ideal of a Gentleman*, 1908.

Gentleman's, or Gentlemen's, Agreement, an informal undertaking, binding in honour but not ratified by any written contract, treaty, or the like.

'**Gentleman's Magazine**' was estab. in 1731 by Edward Cave, and was the first example of the use of the term magazine. It began by reproducing matter from the weekly journals, with a supplementary section giving the prin. news of the month, a list of births, marriages, and deaths, etc., and a register of books pub. A few years later original matter began to appear, including the 'Debates in the Senate of Lilliput.' It was valued for its plates and engravings, and especially for its biographical, historical, and antiquarian articles, which give its old vols. much interest. Samuel Johnson (q.v.) joined the staff in 1739, and wrote, from notes taken by others, the reports of debates in Parliament. The magazine was discontinued in 1914.

Gentlemen-at-Arms, in full the 'King's Bodyguard of the Honourable Corps of Gentlemen-at-Arms,' consists at present constituted of 39 'gentlemen,' being officers of the army who have been decorated for war services. Their officers are the clerk of the cheque, the adjutant, the sub-officer (or harbingers), the standard-bearer, the lieutenant, and the captain, the last of whom must be a peer and a member of the ministry, retiring with the gov. The corps was estab. as a purely military body in 1862, and officiates as the first bodyguard of the sovereign at palace functions and royal ceremonies. It directly descends from the body of 'pensioners,' founded by Henry VIII in 1509, who were the younger sons of noble families.

Gentz, Friedrich von (1764-1832), Ger. publicist and statesman, b. Breslau, and educ. at Berlin and Königsberg (under Kant). A trans. of Burke's essay on the Fr. Revolution, 1794, was followed by other trans. and the founding of a jour. in which his articles soon became famous. He served for a time under the Prussian Gov., but in 1804 he went to Vienna and entered the service of the Emperor Francis. Throughout the war between

Austria and France he was employed by Stadion in writing proclamations, etc., and, when Metternich succeeded the latter, he became his chief adviser. He was secretary to the congress of Vienna (1814-15), and to all those that followed, and remained a power until his death, becoming increasingly reactionary as he grew older. See life by G. Mann, 1946.

Genus, see GENOA.

Genus (plural **Genera**), in biological nomenclature, a group of species with common characters of structure, presumed to have derived in the remote past from a common ancestor. In animals, for instance, the main characters relied upon in defining genera are the limbs and toes, teeth, diet, skull and brains; in plants, they are found chiefly in the flower, seed, and fruit. The number of species in a G. may be large as in *Gentiana* (about 400 species), or it may be only one so distinguishable structurally from the nearest relatives as to stand alone, as in *Chioyia*. In designating an animal or plant, the name of the G. is placed first, in italics, with a capital initial letter. Genera having major characters in common are grouped to form a family. See CLASSIFICATION, PLANT.

Genzano di Roma, It. tn, in Lazio (q.v.), 16 m. SE. of Rome (q.v.), built on the hill slopes near Lake Nemi. It is famous for its traditional 'Infiorata.' On the feast of Corpus Christi a m. of the main street is carpeted with flower petals arranged in a series of pictures of religious themes. Only the Blessed Sacrament, borne by the archbishop, treads the carpet. Pop. 10,500.

Geochronology, young branch of science, which draws its methods from geology, botany, zoology, and physics, and whose chief objective is the development of time-scales in years which extend back into the distant past beyond the historical calendar. The first field of application of G. is in prehistoric archaeology and human palaeontology; the second is that of biological evolution in relation to time. See F. E. Zeuner, *Dating the Past: an Introduction to Geochronology*, 1950.

Geodesy (Gk *gē*, Earth; *daiein*, divide) is essentially the science and art of surveying on a large scale in order to ascertain the true form and dimensions of the earth. To this end the most rigorously exact methods of measurement at all stages must be employed. Angular measurements involve the use of theodolites of the most perfect construction, graduation, and workmanship, while linear measurements may be made by compensated metal rods, glass rods, pine rods, steel wires, steel or invar tapes or chains under precise tension, all carried on specially designed and accurately levelled supports and read by microscopes in conjunction with standard thermometers. Corrections are applied for the earth's curvature, reduction of observations to mean sea level and standard temp., variations in gravity, instrumental and personal errors, etc. Small errors, which would be negligible in a small survey,

multiply enormously over countries whose areas may cover hundreds of thousands of sq. m. Hence the need for the extremely high standard of accuracy involved in geodetical surveying and the explanation of its being accepted as the basis for all forms of surveying—of which there are many.

The problem of the earth's figure—quite apart from utilitarian aspects—has occupied men's minds from very early times. Probably the earliest recorded effort was that of Eratosthenes, a Gk mathematician, who, in the 3rd cent. BC, on Egyptian soil, essayed to measure an arc of the meridian between Syene and Alexandria. He found that at Syene, the modern Aswan, the sun was vertical at noon at the summer solstice, and that it was 7.2° from the vertical at the same time at Alexandria. From this he deduced that the arc on the earth between the 2 places was 7.2° and hence, as the circumference of the earth was 360° , the ratio of the earth's circumference to the distance between Syene and Alexandria was $360/7.2 = 50$. By measuring the distance between the 2 places, which was 5000 stadia, he found that the earth's circumference was 250,000 stadia—24,467 m., if his stadium was 516½ ft. Considering the crude instruments then available the result of this early operation was surprisingly accurate. More than a thousand years now intervened, until at last man's scientific instincts again slowly awoke.

The geodetic measures which most materially contributed to the historic determination of the figure of the earth are singularly few. They are: (1) the arc de Pérou measured by the Fr. academicians P. Bouguer and C. M. de la Condamine in the middle of the 18th cent.; (2) the Fr. arcs measured by Delambre and Méchain about the end of the 18th cent. and by Biot and Arago early in the 19th; (3) the Brit. arc from Dunnose in the Isle of Wight to Saxavord in the Shetlands; (4) the great arc of meridian of India; (5) the Russo-Scandinavian arc from Hammerfest to the mouth of the Danube; (6) various triangulations in central Europe by Schumacher, Gauss, and Bessel; (7) Maclear's arc at the Cape of Good Hope. Many efforts have also been made by different observers to determine the figure of the earth from the behaviour of pendulums at different lats. in different parts of the globe; but the results have been both unexpected and inexplicable. Observations on arcs of meridians have revealed similar discrepancies. By the middle of the 18th cent. it was definitely accepted for the N. hemisphere that the further one goes N. the greater is the distance corresponding to a degree of lat.; the flatter therefore is the earth towards the poles. But the result of the abbé de Lacaille's measure of an arc of meridian at the Cape of Good Hope was a contradiction—as it seemed to show that the S. hemisphere was prolate, the degree decreasing in length as the pole was approached! A somewhat similar dis-

crepancy was found in England—the curvature of the S. half of England appearing to be less than the N. half!

The origin of these and other abnormal results has been interpreted by local irregularities in the direction of gravity due to the unequal distribution of mass in the crust of the earth.

The principle of triangulation forms the sole foundation for all large-scale geodetic surveying (q.v.), in which the greatest attainable accuracy is essential. This principle rests on the basic mathematical fact that every triangle has 6 parts—3 sides and 3 angles; and that if any 3 of these parts (1 of them, at least, being a side) are known, the remaining 3 parts can be calculated, without any further measurement, either of sides or angles. With this new information, contiguous new triangles can be constructed by taking angular observations from the terminal points of the new sides to well-defined prominent natural objects such as church steeples or new artificially constructed stations with flag-staffs or other permanent signals—this process being continued indefinitely. The first requisite, therefore, of any geodetical survey is to start the triangulation with a very carefully selected base line, say from 5 to 10 m. long, reasonably level, measured with extreme accuracy as already generally described, and subject to complicated corrections and adjustments. The usual method of meridional triangulation is for a chain of 'well-conditioned' triangles to be formed in the required direction, as in France, Spain, and Austria; while in Italy, Sweden, Norway, Germany, Russia, and U.S.A. oblique chains of triangles are formed. Occasionally, as in India, the combination of triangles forms successive polygonal figures, the sides of the triangles seldom exceeding 40 m. in length. The whole area of India has now been surveyed. (For corresponding progress in Great Britain and Ireland, see *ORDNANCE SURVEY*.)

So far as is known, the principle of triangulation was first applied by Snellius, a Dutchman, in 1615, with the primitive instruments then available. The subsequent observations of Richer caused Huygens and Newton to question the hitherto current assumptions that the earth was a perfect sphere, and actual measurements of terrestrial arcs were accordingly undertaken, as already described, and are going on in many parts of the world to-day. Although for the purpose of geodetical surveying the figure of the earth is provisionally regarded as spherical (in order to admit the direct application of spherical trigonometry), it is now estab., as a result of the extensive surveys already made, that the figure of the earth is an irregular *geoid*, which closely approximates to that of an oblate spheroid. This latter is a regular geometrical solid generated by the rotation of an ellipse about its minor axis, the ratio of the minor (polar) and major axes in the case of the earth being about 300 to 301.

The importance of geodetic surveying

has been increasingly recognised, and advances in scientific knowledge and in the construction of instruments of remarkable precision have led to the formation of an International Geodetic Association which, among other matters, prescribes methods and the limits of allowable errors in the conduct of operations. Base lines are measured on either (1) the long-length or (2) the short-length systems. The former includes the apparatus of Jadarin, Wheeler, Guillaume-Carpentier, etc.; the latter that of Colby, Bessel, Borda, Struve, Ibanez, etc. There have been alternating vogues, but now the long-length system appears to be generally favoured.

As regards steel base tapes, these consist of corrections due to (1) temp., (2) elasticity, (3) sag, and (4) slope; reduction to sea-level datum being a later consideration. In calculating the lengths of the sides in a system of spherical triangles 3 methods may be employed: (1) spherical trigonometry, (2) Delambre's method, (3) Legendre's method. Most of the triangles of the U.K. Ordnance Survey were computed by Delambre's method and checked by Legendre's method, while all 3 methods were used in the calculations in connection with the meridional arc which formed the basis of the metric system. Instrumental and observational errors constitute another class requiring corrections. They may take the form of discrepancies between results obtained by different methods and different series of measurements. They involve the 'weighting' of observations and the theory of probabilities, and are generally adjusted by what is known as the method of 'least squares' (q.v.).

The *rigid* application of this most accurate method to the geodetical survey of the Brit. Isles would have entailed the solution of 920 equations of condition and the same number of unknown quantities as a part of the work. Avoiding this, the triangulation was divided into 21 'figures,' the equations being reduced to a maximum of 77, with an average of 44 in a figure. Each section (or figure) had its own staff of computers and they were thus enabled to complete the work within their lifetime! Having accomplished its primary aim of determining the figure of the earth the geodetical survey movement, as a whole, has fulfilled other important functions—for example, the preparation of accurate maps of nearly every country in the world, and the estab., both in the field and on the maps, of permanent stations, or 'trig-points,' between which subsidiary topographical or other surveys could be subsequently fitted in. Material for geological and archaeological survey, also, was incidentally accumulated, with great benefit in the case of Ireland. Theodolites (q.v.) used in a geodetical survey vary in size according to the importance of the station to which they are assigned and the quality of the work they have to do. In the U.K. Ordnance Survey the diameter of the horizontal circles ranged from 10 to 36 in. The instruments rested

on a firm foundation accurately centred over the station point, which was permanently marked for future identification and protected (not always successfully) from ignorant despoilers.

Scaffolding and signalling arrangements between stations are important. When it is necessary, for the purpose of commanding particular points, to elevate the theodolite, a framed triangular scaffold may be used; around this an independent rectangular scaffold for the observer; and, inside the instrument scaffold, a wooden tube will be provided to shield the plumb line—preferably made to rotate so that the leeward side can remain open for inspection. The scaffolds for the U.S.A. Great Lakes Survey ranged from 10 to 124 ft high, with an average height of 58 ft—the signal standards being from 5 to 30 ft higher. It is found desirable that all arcs at a station should have one point in common to which all angular measurements may be referred; this is known as the referring object. On mt tops 2 rectangular plates of metal are placed in parallel, so that light seen between them against the sky appears as a vertical line about 10 sec. in width; this artificial referring object will be set up at a distance of from 1 to 2 m. away from the observatory. See also GEOGRAPHY; GREENWICH OBSERVATORY; 'LEAST SQUARES'; ORDINANCE SURVEY; SURVEYING; THEODOLITE, etc. See T. Pilkington White, *The Ordnance Survey of the U.K.*, 1886; J. H. Gore, *Geodesy*, 1891; A. R. Hinks, *Maps and Survey*, 1942; and A. L. Higgins, *Higher Surveying*, 1944.

Geodorum, small genus of Orchidaceae which are found in the West Indies; they are called earthy-scented orchids, with leafless flowering scapes.

Geodynamics, see PHYSICAL GEOLOGY.

Geoffrey of Monmouth (c. 1100–1154), bishop of St Asaph and author of a Brit. hist. His first ed. of the famous *Historia Brittonum* of Nennius was pub. in 1139, though the text now preserved apparently dates from 1147. According to the author the book was a trans. of a Celtic MS, which Walter, archdeacon of Oxford, had brought from Brittany, but the work is actually a mixture of historical fact and tradition culled from Nennius and the author's own fertile imagination. In any case the result was immediate success, and his influence on the literature of the next hundred years was unmistakable. The Arthurian legend was the most popular and laid the foundation of an abundance of poetry and prose, becoming immortalised in Malory's *Morte d'Arthur*, printed by Caxton in 1485. *The Prophecies of Merlin*, long attributed to him, is now held by many critics to be not genuine. See E. K. Chambers, *Arthur of Britain*, 1927.

Geoffrin, Marie Thérèse (née Rodet) (1699–1777), Frenchwoman, b. Paris, who was for a time the leader of a brilliant literary salon in Paris. At an early age she married Pierre François G., a lieutenant-colonel in the National Guard, and it was not until a few years before his

death in 1750 that she became a leader in society. Twice each week she would entertain at dinner artists and literary men of her acquaintance, towards whom it pleased her to play the mentor. Montesquieu, Voltaire, Hume, and Horace Walpole were among those who visited her, also Stanislas Poniatowski, whom she afterwards visited in 1766 as king of Poland. Her great delight seems to have been to gather round her the encyclopaedists, she herself being one of the contributors to the *Encyclopédie*. Her *Lettres* and a work entitled *Sur la conversation* were pub. by Morellet. See *Correspondance inédite du roi Stanislas Auguste Poniatowski et de Madame Geoffrin*, 1764–77, ed. by the Comte de Mouÿ, 1875; P. de Ségur, *Madame Geoffrin et sa fille*, 1897; and Janet Aldis, *Madame Geoffrin, her Salon and her Times*, 1750–77, 1905.

Geoffroy Saint-Hilaire, Étienne (1772–1844), Fr. naturalist, b. Etampes, in the dept of Seine-et-Oise. From 1793 to 1798 he was prof. of zoology at the natural hist. museum in Paris, then he went to Egypt with the scientific expedition sent out by Napoleon Bonaparte. In 1809 he was appointed prof. of zoology in the Faculty of Sciences and pub. a number of works on his theory of the unity of all organic composition, a subject on which he had a famous controversy with Cuvier. His works include *Philosophie anatomique*, 1818–20, *Sur le principe de l'unité de composition organique*, 1828, and *Philosophie zoologique*, 1830. See life in Fr. by his son, 1847, and Cuvier et Geoffroy Saint-Hilaire, 1890, by Ducrotay de Blainville.

Geoffroy Saint-Hilaire, Isidore (1805–1861), Fr. naturalist, b. Paris. He was the son of Étienne Geoffroy Saint-Hilaire, and helped his father in his work until 1838, when he went to Bordeaux to organise a faculty of sciences, remaining there as prof. of zoology following his appointment in 1850.

In 1854 he founded the Acclimatisation Society in Paris, becoming the first president. He pub. the life of his father in 1847. Other works include *Histoire des anomalies de l'organisation chez l'homme et les animaux*, 1832–7; *Essais de zoologie générale*, 1841, and *Histoire naturelle générale des règnes organiques*, 1854–62 (unfinished).

Geographical Distribution. The problem of G. D. of animals and plants over the earth's surface has been the subject of close study in modern times. The greatest impetus to such study was given by Darwin's *Origin of Species*, which destroyed the idea that each species was the result of a separate act of creation. The allied species being regarded as having a common origin, it followed that they had a common place of origin, and an explanation of how they came to inhabit the different quarters of the globe in which they are at present found necessarily involves an explanation of many unsolved problems of biology. Both flora and fauna will thrive only in the environment

adapted to them, but it is found that animals and plants are absent from countries that appear quite suitable to their development. The existence of natural barriers offers some explanation of this. Thus, Australia is cut off from terrestrial communication with the rest of the world, and so possesses a fauna peculiar to itself, but fossil evidence indicates that Amer. opossums may have been related to the marsupials of Australia, and it is supposed that Antarctica was once continuous with New Zealand, Australia, and South America. Madagascar and Australia were probably cut off from the mainland mass in a comparatively recent geological period. Such isolated regions tend to contain specimens of the fauna which fl. before the separation. The Himalaya mark a great distinction in the fauna to the N. and S., while in Africa the Sahara desert does the same. On the other hand, the mammals of the West Indies are practically the same as those of America, and the inference is that they have in some way migrated from the mainland. Particularly enough, however, the West Indies possesses one mammal which 'belongs to an order, Insectivora, entirely absent from South America, and to a family, Centetidae, all the other species of which inhabit Madagascar only' (Alfred Russel Wallace). Similar interesting problems are offered by the fact that the fauna of Japan more closely resembles that of the Atlantic states than of the Pacific states of North America; that the mammals and birds of North America approximate more to those of Europe than of South America; that the fauna of Madagascar has much in common with that of the Malay Archipelago; and so on. In considering such questions attention must be paid to the processes by which the distribution of species can take place. Natural locomotion is, of course, the usual means, and birds possess the greatest power in this respect. Apart from normal methods, however, there are other agencies at work. The wind can convey the spores and seeds of plants many hundreds of m. Winds are also of great account in conveying insects, while birds are often blown immense distances out of their course, and the eggs of fish, frogs, etc., are often conveyed by the wind moving the surface of the water. Sea currents are an important factor in the distribution of plants and animals. Darwin (see *Origin of Species*, c. xii) conducted a series of experiments that showed the great vitality of seeds after immersion in salt water for periods varying from 28 to 137 days, and also the power that seeds possess of floating for prolonged periods upon the surface of the water. In addition, animals are conveyed by sea currents upon such natural rafts as icebergs and icefloes, drifting trees, &c. Birds may convey seeds or insects upon their feathers or in the earth adhering to their feet, while many seeds pass uninjured through the digestive organs of birds and beasts and are thereby transported to new lands.

Distribution is, on the other hand, pre-

vented by many methods. Mammals migrate slowly, and mts, deserts, and marked differences of temp. are barriers to their distribution. Forests hinder the migrations of camels, giraffes, zebras, etc., treeless regions those of apes and monkeys. Climate also impedes dispersal, while the presence of a natural enemy has also to be taken into account. The tsetse fly, for example, which conveys the parasitic trypanosome causing the disease nagana, has prevented the introduction of horses, dogs, and cattle into a certain area in Africa, while another fly acts in the same way in Paraguay. The more evenly the various species are distributed over the globe the less easy it is to map out the regions they inhabit, and the less valuable are the possible deductions to be made therefrom. The cryptogams, whose spores are carried in all directions by the wind, are so widely distributed that they are usually left out of all biogeographical schemes. In the same way it is difficult to mark off fixed limits for sea animals, although attempts have been made to do so by classification into littoral, pelagic, and abyssal fauna, according as the animals inhabit the sea near the shore, the open sea, or the depths of the ocean. Again, birds, having greater power of locomotion, are more widely distributed than other mammals. North America and Asia were great centres of evolution, and, as successful new species were evolved, the survivors of dying-out races were driven to the S. ends of the land masses.

Distribution of Animals.—The following is the scheme of distribution of animals adopted by A. R. Wallace in his *Island Life*. It is based principally upon the distribution of land mammals, but corresponds with a considerable degree of accuracy to that of birds. It includes 6 divs.: (1) Palaearctic region, including Europe, temperate Asia, and Africa to the N. of the Sahara. (2) Ethiopian region, including Africa, S. of the Sahara, and Madagascar. (3) Oriental region, including India, S. of the Himalaya, S. China, and the Malay Is., as far S. as the Philippines, Borneo, and Java. (4) Australian region, including Australia, New Guinea, Celebes, Lombok, and the Is. of the Pacific, New Zealand being regarded as a very peculiar sub-region. (5) Nearctic region, including North America as far as Mexico. (6) Neotropical region, including central and South America with the West Indies. The above scheme, though favoured by its simplicity, is nevertheless hardly sufficiently accurate. For example, it ranks the div. between the Nearctic and Palaearctic regions, whose faunas have much in common, as high as that between the Australian and Neotropical, where the faunas are of quite different character. For this reason modifications of it have been advocated by Hellprin and other biologists. These systems will be found fully dealt with in R. Lydekker's *A Geographical History of Mammals*, 1896. The following is the system now usually adopted: (1) Arctogealic realm, divided

into 5 regions—(a) Holarctic regions, including the Palaearctic and Nearctic regions of Wallace's div., with the exception of parts of Mexico and California; (b) Oriental region as in Wallace's system; (c) Ethiopian region as in Wallace's system, except Madagascar and adjacent isles which form the (d) Malagasy region; (e) the Sonoran region, embracing the NW. parts of Mexico and Lower California. (2) The Neogaëic realm, corresponding with the Neotropical region of Wallace's system. (3) The Notogaëic realm, including Australasia, divided into 4 regions—(a) Australian region, i.e. Australia proper, Tasmania, and New Guinea; (b) Austro-Malayan region, containing the is. between New Guinea and Bali; (c) Polynesian region, containing New Zealand and certain isles of the Pacific; (d) Hawaiian region, including the Sandwich and other is.

In the Holarctic region are found such distinctive mammals as the bear, sheep, gibbon or wolverine, marmot, reindeer, beaver, bison, skunk, and raccoon. The Oriental region includes the elephant, hyaena, tiger, leopard, panther, tapir, rhinoceros, monkey, ape, crocodile, as well as deer, cattle, and pigs. The Ethiopian region includes the elephant, hippopotamus, giraffe, zebra, rhinoceros, antelope, panther, leopard, lion, gorilla, chimpanzee, and lemur; the Malagasy region is characterised by a prevalence of lemurs, and by the absence of the African mammals; while the Sonoran region shows a mixture of Arctogaëic and Neogaëic forms. In the Neogaëic realm are to be found anteaters, llamas, sloths, armadillos, tapirs, and peccaries, marmosets, opossums, alligators, crocodiles, humming-birds, etc., while there is an absence of sheep, horses, and goats. In the Notogaëic realm we find in the Australian region an abundance of marsupial or pouched animals, such as the kangaroo, wallaby, etc., as well as the monotremes (duck-billed platypus and spiny anteater), which are peculiar to this region; in the Austro-Malayan region a mingling of Australian and Oriental forms; in the Polynesian and Hawaiian regions an absence of mammals, the 2 latter regions being distinguished only on account of the difference of their birds. The peculiar nature of the Australian fauna, which consists of a great variety of marsupials and lacks almost all species of mammals existing in the rest of the world, has been explained by Wallace as being due to the fact that the marsupials formerly spread over the rest of the world, but were gradually displaced by later types of mammals and only managed to survive in Australasia owing to their isolation. The boundary line between the Australasian and other systems is the deep channel between the is. of Bali and Lombok, and is known as Wallace's line.

The Distribution of Plants.—The distribution of plants has been the subject of many attempts at classification, but has not yielded any scheme which is so clearly defined as that given for animal life. As early as the middle of the 18th cent. we

find the Linnaeans attempting to account for the distribution of plants over the surface of the globe. At the beginning of the 19th cent. Alexander von Humboldt paid great attention to the question of botanical geography, and suggested the use of distribution maps, while J. F. Schouw. a Dan. botanist, enunciated a system in 1833, dividing the earth's surface into 18 kingdoms occupied to a greater or lesser extent by characteristic flora. He, however, made no attempt to deal with the origin and hist. of the various plant forms, but regarded them rather as created to a great extent in the locality in which they are found. Some years later, Meyen divided the globe into zones, adopting lines of lat. as the zone frontiers. His system comprised the following 8 zones: (1) Equatorial, lying between 15° N. and S. lat.; (2) Tropical, extending N. and S. from the 15th parallel to the tropics of Cancer and Capricorn; (3) Sub-tropical, from the tropics to 34° N. and S. lat.; (4) Warmer Temperate, between 34° and 45° lat.; (5) Colder Temperate, between 45° and 58° lat.; (6) Sub-Arctic, from 58° N. lat. to Arctic Circle; (7) Arctic zone from Arctic Circle to 72° N. lat.; (8) Polar zone, above 72° N. The Antarctic region was left out of account in this scheme as possessing no land flora. It was subsequently modified by the substitution of isotherms for parallels of lat. as the zone-boundaries, but was only a very general div. of the earth's flora. The 1st zone was characterised by palms and bananas and extremely luxuriant vegetation, the 2nd by tree-ferns and figs, the 3rd by myrtles and laurels, the 4th by magnolias, the 5th by forests of deciduous trees, the 6th by conifers, the 7th by dwarf birches, alders, and willows, and by lichens, the 8th by saxifrages and cryptogams.

After Meyen, de Candolle proposed a scheme of grouping plants, the main principle of which was the consideration of the temp. necessary for their growth. In it plants were divided into *megatherms*, *mesotherms*, and *microtherms*, according as they required a tropical, moderate, or cool temp. This scheme had the advantage of being applicable to vertical as well as horizontal distribution, but is now obsolete. The first real step towards classifying the distribution of plants upon modern lines was, however, made by Bentham in 1869, in his presidential address to the Linnean Society. He recognised the existence of 3 floral realms (1) the N., including conifers and deciduous forest trees, together with the ranunculuses (buttercups), spreading over Europe, N. and Central Asia, and the greater part of North America; (2) the Tropical, lying between the N. and S. realms and characterised by evergreen Polypetalae (i.e. with the petals of the flowers not fused) and palms; (3) the S., containing the flora of the lower part of South America, South Africa, and Australasia, much more complex than the N. realm, and broken up into many scattered floras, which also sent extensions northward across the equator into the N. realm, as

exemplified by the flora of Mexico and California. Benthams successors were led to study the question of distribution from a historical aspect, and arrived at the conclusion that the tropical flora during the Tertiary period extended far beyond its present limits. In particular de Saporta studied the fossil flora of the Eocene period in Provence, and found that it was closely akin to that of India, China, and the Philippines. These and other investigations led to a scheme of distribution based upon the state of the flora of the Tertiary period, in which Drude and Engler have specially distinguished themselves. The scheme made out by Drude is much the simpler. He distinguishes sea flora from land flora, and divides the latter into 3 main groupings: (1) the Boreal group, including the N., Inner Asiatic, Mediterranean, E. Asiatic, and Central N. Amer. sub-groups; (2) the Tropical group, including the Tropical African, E. African is., Indian, and Tropical Amer. sub-groups; (3) Austral group, including the South African, Australian, New Zealand, Andine, and Antarctic sub-groups.

Engler's system is far more complicated. He first distinguishes 4 main 'elements' in the flora of the Tertiary period, viz.: (1) the Arcto-Tertiary, characterised by abundance of conifers and numerous genera of trees and shrubs now common in North America, Europe, and Extra-tropical Asia; (2) the Palaeotropical, characterised by many families prevalent in the tropical parts of Africa and Asia, and by the absence of certain families found in the Arcto-Tertiary element; (3) the Neo-tropical or South American, which had, according to Engler, very much the same character as the present flora of Tropical Brazil and the West Indies; (4) the Old Oceanic, consisting of forms capable of traversing wide stretches of water and of developing upon is.

Upon the lines of these 'elements' of Tertiary flora Engler divided the flora of the present day into 4 'kingdoms,' each being further subdivided as follows: (1) N. Extra-tropical, including the 9 divs.: Arctic, Sub-Arctic, Central European, Central Asiatic, Micronesian Is., Mediterranean, Manchu-Japanese, Pacific North America, and Atlantic North America; (2) Palaeo-tropical, including the 10 divs.: West African, Afro-Arabian, Malagasy, Further Indian, Tropical Himalayan, E. Asian, Malayan, Araucanian, Polynesian, and Sandwich Is.; (3) South American, including the 5 divs.: the Mexican Highlands, Tropical America, Andean, the Galapagos, and Juan Fernandez; (4) Oceanic, including the 8 divs.: Antarctic South America, New Zealand, Australian, Kerguelen, Amsterdam Is., the Cape, Tristan da Cunha, and St Helena. Since Darwin drew attention to the operation of natural selection, it has been generally accepted until quite recently that species and genera few in number were relics of unsuccessful and moribund races. J. C. Willis, however, has given conclusive evidence that this is

not necessarily the case, for just as natural selection requires long periods for the conclusion of its operations, long periods of time are also essential for the dispersal of new species. If natural barriers prevent this dispersal, the new species will remain local and cover only a comparatively small area. Even so, it may maintain its position without decreasing if it be well estab., but any new species not adapted to the environment will be killed almost immediately by the operation of natural selection. On the other hand, if no natural barriers hinder the distribution, the species, given sufficient time, will gradually spread. Thus the areas occupied by plants may give an indication of the relative ages of the species, the oldest being those which have had time to become widely distributed. Moreover, in the case of is. separated early in geological hist. from the mainland, birds probably were some of the most active agents of plant dispersal, but in the course of time the birds became better adapted to conditions of life on the is. and visited the mainland less frequently, until at the present time birds take very little part in plant dispersal beyond the boundaries of such is. Consequently, new species arising in such isolated positions have more limited means of dispersal and will spread very slowly, if at all.

On account of the cooling of the N., plants and animals have migrated southwards. At some time in the future a northward migration will almost certainly be evident, for as species living near the present N. temp. barriers become acclimatised, or better adapted species are evolved, these barriers will recede. The importance of time for distribution cannot be too strongly emphasised.

See C. Darwin, *Origin of Species*, 1859; A. Murray, *Geographical Distribution of Mammals*, 1866; G. Benthams presidential address to the Linnæan Society, 1869 (*Journal Linnæan Society*, x); H. Bergson, *Creative Evolution*, 1907; M. I. Newbigin, *Plant and Animal Geography*, 1936; A. MacTaggart, *Plant Immigrants and Slowways*, 1945; R. O. Good, *Geography of Flowering Plants*, 1947.

Geography is that branch of science which deals with the phenomena of the earth's surface. The early Gk concept of the earth was that of a flat disk in the shape of an ellipse bounded by an ocean riv. This concept was generally held during the Homeric period. The Phœnicians were among the first people to explore unknown lands, and they navigated the whole of the Mediterranean and the Euxine, and passed through the straits of Gibraltar into the Atlantic. They planted colonies in Asia Minor and along the shores of Africa, one of which, Carthage, founded in the 9th cent. bc, was later to dispute with Rome the supremacy of the world. Certain Phœnician explorers were also reputed to have circumnavigated Africa during the 7th cent. bc. Thales of Miletus is claimed as the first advocate of the spherical earth, which was afterwards adopted by the

Pythagorean philosophers, mainly upon the theoretical ground that the sphere was the most perfect figure. Herodotus of Halicarnassus (b. 484 BC) has left us in his *History* a complete account of the earth's surface as known in his time, when it was held to be bounded by the Atlantic on the W., the Red Sea and Indian Ocean on the S., and Persia on the E. (The conquests of Alexander, however, opened up new realms to human knowledge, and the conqueror himself sent forth expeditions to survey the various regions he had subdued. About the same time, Pytheas of Massilia led an expedition into the Atlantic, through the Eng. Channel to the North Sea, and it is reputed to have reached Thule, which is supposed to be the modern Iceland.) Aristotle (384-322 BC) devoted considerable attention to the subject of G., and urged 3 reasons for holding the earth to be a sphere: (1) the tendency of all objects to fall together towards a common centre; (2) the fact that the earth's shadow upon the moon during an eclipse was circular; (3) the shifting of the horizon and appearance of new constellations during a journey from N. to S. He also extended Parmenides's idea of the earth's zones, defining the temperate zone as extending from the tropics to the Arctic Circle, though it is not clear in what sense he used the latter term. Aristotle was also aware of the connection between seas, rain, and rivers, and studied the effect of climate upon the character of the different races. Further progress in scientific G. was made by Eratosthenes (b. 276 BC), who was the first to use the parallels of lat. and long. He held the earth to be a sphere revolving in space, but to him the inhabited portions included only S. Europe, S. Asia, and N. Africa.

During the Rom. empire G. became more a question of actual description of the known world, and Strabo, at the very beginning of the Christian era, summarised all the knowledge of the earth's surface that had been acquired up to the time of Augustus. To Strabo succeeded Pliny (b. AD 23), who had himself travelled extensively in Germany, Gaul, Africa, and Spain, and also collected all the information he could from the work of other writers. His work, *Historia Naturalis*, contains accounts of Scandinavia, the course of the Niger, and Mt Atlas, as well as giving a clearer notion of the G. of Asia. His work was carried on by Claudius Ptolemaeus (c. AD 150), who verified the lat. and long. of the principal places and corrected all estimates of distances.

Exploration and Cartography.—During the Middle Ages the knowledge of G. was submerged in the obscurity that overspread all science, but happily Ptolemy's works lived on in Islam. It was only when the journeys of Marco Polo (1271-1295), the Venetian explorer, in the Far E. had again aroused interest in the subject, and subsequent explorations had led to a knowledge of the extension of land from E. to W., that Ptolemy's works were

rescued from their obscurity and retranslated into Lat. (1410). The 15th cent. saw a great impetus given to geographical discovery. In 1486 Diaz discovered the Cape of Good Hope, while in 1497 Vasco da Gama doubled it and proceeded to India. In 1492 Columbus made his momentous voyage across the Atlantic and discovered America, and this feat was speedily followed by an exploration of the coasts of Africa, Asia, and America, while Magellan passed to the S. of America and succeeded in circumnavigating the globe. The rapidly accumulating mass of knowledge led to an improvement in the production of maps and to the development of the cartological side of G., the New World being first shown on Juan de la Cosa's map in 1500, while Mercator, in 1569, showed the world upon the system of projection which still bears his name. Ptolemy's work rapidly grew obsolete under such a wealth of discovery, and in 1524 Apian pub. his *Cosmographicus Liber*, basing it upon Ptolemy's system of mathematics and measurements, while Münster followed in 1544 with *Cosmographia Universalis*, which is a descriptive work containing an account of the manners of various peoples and the different industries. The next important book on G. was pub. by Varenus in 1650. He treated G. as a science, dealing with the form, dimensions, and substance of the earth, the distribution of water, mts, woods, deserts, and atmosphere, with the celestial properties, i.e. lat. and long., climatic zones, etc., while he gave only a secondary consideration to the human side of the science. He was not content with a mere narrative of phenomena, but sought for their explanation, and his system dominated G. for more than a century.

In the meantime geographical discovery had progressed on all sides. During the 16th cent. endeavours were made to discover a NW. passage to India, in which Frobisher, Davis, Hudson, and Baffin took part. Sir Humphrey Gilbert wrote a famous *Discourse*, 1576, arguing for the existence of such a passage. In the 17th cent. the Dutchmen, Tasman and Van Diemen, discovered Australia, and in the 18th cent. Capt. Cook reached New Zealand and discovered many of the Polynesian Is. (see *TERRA AUSTRALIS INCOGNITA*). During the same period cartography had also greatly improved owing to the use of better instruments, the introduction of the telescope, pendulum, barometer, and application of the system of triangulation, thus rendering possible the production of reliable maps. The method of showing heights by *contours* is due to Ph. Buache (1737), while *hachures* were devised by Lehman in 1799. The next important step in the hist. of scientific G. was made by the great Ger. philosopher, Immanuel Kant, who lectured on physical G. at Königsberg from 1765, and dealt with the subject under the 5 headings of (1) Mathematical G., including the form, size, and movements of the earth; (2) Moral G., the customs

of different races; (3) Political G., dealing with countries according to their govts.; (4) Mercantile G., the G. of commerce; (5) Theological G., the study of the various religions in its geographical aspect.

Geophysics.—The beginning of the 19th cent. led to the foundation of that branch of G. known as geophysics, due to the researches of Newton, Engler, Leibnitz, Laplace, and others upon the phenomena of gravitation, tides, and the earth's density, while geology was estab. by the investigations of Desmarest, Werner, and Hutton upon the nature of rocks and the shiftings due to volcanic disturbances and denudation. These researches were collated by Sir C. Lyell in his *Principles of*

the importance of comparative G. and endeavoured to show the effect of terrestrial relief and climate upon human hist. His colossal work, *Vergleichende Geographie*, begun in 1817, was never completed, only Asia and a portion of Africa being dealt with. He adopted the teleological argument of Christian theologians, and endeavoured to show that the earth had been created so as to meet the needs of mankind in every respect, and looked upon the arrangement of land and sea and the earth's configuration as instruments for guiding man along the line mapped out by divine providence. His bias in this direction led him to devote himself more closely to the historical aspect of G. The

SIR HUMPHREY GILBERT'S MAP

This map appeared in his *Discourse*, 1576.

Geology, 1830-3. Botanical G. was promoted by the works of Linnaeus and the 2 Forsters, father and son, who accompanied Cook on his voyages and directly interested Alexander von Humboldt (1769-1859) in the study. Humboldt has many claims to be considered the greatest of all geographers. He was a great traveller and acquired a mass of first-hand knowledge as well as doing immense work in classifying the knowledge collected by others. He showed that the forms of land exercise a deciding influence upon climate and upon the plants and animals, including human races, that inhabit them. The results of his investigation were pub. in his great work *Kosmos*, 1845-58, which remains a classical work on G. He also introduced the use of isotherms and isobars, and by directing attention to the question of vertical relief and the mean height of countries he founded the science of geographical morphology. Humboldt was almost equalled in the immensity of his labours by his contemporary Karl Ritter (1779-1859), who laid stress upon

undue stress laid by Ritter upon the historical side was corrected by Peschel, who carried on Humboldt's work, and again brought into prominence the physical aspect of the science. His successors have more or less each presented their own personal point of view, devoting special attention to and bringing into special relief one particular aspect of the science. The evolutionary theory had necessarily a great effect upon the view of geographers, and led to the conception of the earth's origin and its gradual cooling through long geological ages, and the effect of its celestial environment upon the form assumed by land and water, thus serving to complete geographical knowledge and invest the subject with a new philosophical dignity.

Geographical Discoveries in the Nineteenth and Twentieth Centuries.—During the 19th cent. the work of geographical discovery went on unabated and many expeditions were sent forth. Amer., Eng., and Fr. expeditions under Wilkes, Ross, and d'Urville visited the Antarctic seas in 1840

and led to a whole series of similar expeditions. In 1880 Baron Norden-skjöld sailed round the N. of Europe and Asia. The interior of America was explored by Humboldt and others. Africa was penetrated by Bruce, Speke, Livingstone, Emin Pasha, Baker, and others. Sturt and Eyre explored the interior of Australia, while the continent was traversed from Melbourne to the Gulf of Carpentaria in 1860 by Burke and Wills. Among explorations interesting to note is

by Andr  , a Swedish engineer, who left Spitsbergen in a balloon with 2 companions in 1897 and was not heard of again till 1930, when his skeleton was discovered, with those of his companions; and by Scott in 1901 towards the S. pole. Prin. subsequent expeditions were those of Peary (N. pole, 1909), Amundsen (S. pole, 1911), Scott (S. pole, 1912), and Fuchs (trans-Antarctic crossing, 1957-8). In addition, sev. deep-sea explorations have been carried out by the Brit.

A general view of the base at Halley Bay, showing the main base hut and the dumps in the background

the journey of Prince Peter Kropotkin in the Trans-Baikal prov. of Siberia and N. Manchuria in 1864, which led to a new conception of the mt system of Asia. In 1871 Przhevalsky commenced his exploration of Tibet, in which he was followed by many Russian, Brit., and Fr. explorers. The last quarter of the 19th cent. also saw many important explorations in W. China, Indo-China, and Inner Asia. Between 1894 and 1897 Sven Hedin carried out some highly interesting explorations in the Pamir region, and on the N. boundary of Tibet, while the exploration of Africa is associated with the name of Stanley. Special attention has been given to the exploration of the Arctic and Antarctic regions and to the discovery of the poles. The chief expeditions were conducted by Nansen in 1895, who reached $86^{\circ}14'N.$; by the duke of Abruzzi in 1900 to $86^{\circ}33'N.$;

ships *Challenger* (see CHALLENGER EXPEDITION) and *Discovery I* and *Discovery II* (see DISCOVERY COMMITTEE), the Ger. *Valdivia*, and the U.S.A. steamer *Albatross*. See also OCEAN AND OCEANOGRAPHY. Of recent years much exploration and geographical survey work has been carried on by means of aeroplanes, while motor vehicles have been used in exploration of the Sahara (Haardt and Audouin-Dubreuil, 1923) and the Gobi desert (Andrews, 1928), etc. In 1926 Amundsen's dirigible *Norge* crossed the N. Pole on a flight from Spitsbergen to Alaska, and in 1928 he was lost on an expedition for the relief of the wrecked dirigible *Italia*. In that year useful observations on meteorological and navigation conditions were made by Capt. Sir Hubert Wilkins on a flight from Alaska to Dead Man's Is., Spitsbergen. In

Sept. 1936 the famous Fr. explorer, Jean-Baptiste Charcot (q.v.), was lost when the Fr. polar research ship *Pourquoi Pas* foundered off Iceland. In the same year a Soviet hydrographic expedition claimed to have mastered a new sea-route near the Nordenskiöld Archipelago. The Soviet Gov. estab. a polar station in the vicinity of the N. Pole in 1937, and Prof. Otto Schmidt headed a Soviet expedition in 1937-8. His report stated that the N. polar summer climate was considerably milder than was expected, and that the Polar Sea was more than 3000 ft deeper than Nansen's researches had seemed to indicate.

See ANTARCTIC EXPLORATION; ARCTIC EXPLORATION.

Modern Conception of Geography.—From the foregoing outline of the development of geographical knowledge it will be seen that the conception of G. has greatly altered from time to time, and can indeed be hardly said to be rigidly defined at present. In general G. may be said to be the study of the phenomena of the earth's surface and of its inhab. It can be divided into the following branches: (1) mathematical G., dealing with the figure and dimensions of the earth, its position relative to other celestial bodies, its movements as a planet and the effect of such movements upon its crust; (2) physical G., sometimes called physiography, dealing with the actual physical condition of the various portions of the earth's surface and capable of sub-divisions into geomorphology or the constitution of the lithosphere, oceanography, that of the sea, and climatology, the phenomena relating to the atmosphere; (3) biogeography, or the G. of animals (zoogeography) and of plants (phytogeography), the former including the study of mankind (anthropogeography), which is again divided into political and commercial G. according as the subject is treated from the point of view of the gov. or commerce of the country in question. The discussion of the relation of man to his environment is also known to-day as economic G., and the accepted basis upon which to found such discussion is a knowledge of the structure or 'build' of a country (*see below*). The elucidation of the many questions involved in the foregoing divs. leads to a study of the processes by which the present situations have arisen, which is termed historical G. or palaeogeography, a distinct subject from the hist. of G., which refers both to the hist. of the development of geographical ideas, a branch of the hist. of philosophy, and to the progress of actual geographical discovery, a branch of human hist. How far these branches are to be carried is not easy to determine. Mathematical G. borders upon mechanics, geomorphology is closely allied to geology, and biogeography leads naturally to biology. Another div. may be made between general G. and regional G., sometimes termed chorography, which is simply the application of geographical study to a limited area, and in its turn leads to topography, the description of a special place or

locality. For fuller information relating to any of these special branches the reader is referred to the various articles and to the books mentioned in the bibliography below.

Economic Geography and the 'Build' or Structure of a Country.—It is remarked above that a knowledge of the structure or build of a country is the best basis for discussing economic G. 'Build' is defined by Prof. Griffith Taylor as the essential geological pattern, whether anct shield, crustal trough (syncline), or ridge (anticline), raised relic of an old range or young mt, either with broad or narrow folds. This aspect of G. has been presented in the better text-books in Europe since 1910, but is by no means universally adopted in America. Its chief advantage, however, is that it enables us to account for the distributions of various commodities such as metals, coal, oil, or water-supply in a way impossible by any method which ignores structure. A study of structure or build shows, for example, that erosion is much more rapid on the exposed surfaces of mts and plateaux, with their swift rivs. and streams eating into the steep slopes, and that it is only when such land-forms are worn down to their roots to form peneplains that they become relatively stable. It tells us, too, that the most permanent portions of the earth's crust are the very anct land-surfaces known as coigns or shields. These shields flank the Atlantic and Arctic oceans, while the greatest elevations of to-day flank the Pacific and Indian oceans, and the most important shields occur in Brazil, E. Canada (the Laurentian), E. Siberia (Angara), Russia, and W. Africa. Many geologists believe that the tetrahedral earth-plan is a relic from the original cooling and contraction of the molten earth, and certainly the tetrahedral theory affords some explanation of the world-plan—the central Asiatic land-mass with the 3 great continental 'peninsulas,' America to the SE., Euro-Africa to the NE., and Australasia to the NW. (as shown on a form of polar projection with the N. Pole at the centre). The climatic arrangements of the world-plan are determined primarily by lat. and secondly by aspect. A study of the arrangement of the vegetation in the Amer. 'peninsula' shows that it is identical with that in Africa, except that the gulf of Mexico and the Caribbean Sea have very deeply embayed America on the tropic of Cancer. Again, such study serves to explain the remarkable monsoon climate for which India is noted; and again why there is always a belt of warm temperate forest and savanna about 500 m. wide on the E. or windward side of the desert belt which stretches from the Sahara almost to China. Early man, says Prof. Griffith Taylor, 'had no greater love for the desert or tundra than the average man of to-day. Hence his chief abiding places would be found in the belt between the desert and the forests. The park-land type of country, just on the drier edge of the forests, would seem to be best suited to early man. Probably the

primitive negroid peoples would prefer the warmer savanna woods, while the higher races would expand on the edge of the temperate forests. These belts would also be the great corridors of migration until man tamed cattle and horses, when the drier steppes would be equally available. With the use of bronze and iron tools, some progress would be made in cutting down the deciduous forests of the temperate zone, but as regards tropical forests, man has not even yet made much impression on them. . . . These belts of vegetation have varied in position during the life of man on the earth. Everyone knows of the swing from tropic to tropic of the sun during each half-year. The effect of this swing is first felt as a change of temp. and this brings about a similar seasonal swing in the wind-belts and also in the rain-belts. 'There is thus a direct connection between the change in a temp. belt and the change in a rainfall belt.' (Griffith Taylor, *Environment, Race, and Migration*, a valuable work on the 'fundamentals of human distribution,' pub. by Toronto Univ. in 1937.)

While it is thus evident that G. as a branch of knowledge is capable of progressive div. into various subsections, each of which can be treated in itself, it is nevertheless necessary to point out that the tendency is rather towards unification. This is due to the influence of Poschel and Ritter in Germany, whose views have gradually made their worth felt also in England and America. While the old system of G. as taught in schools consisted simply in treating each portion of the globe with reference to its physical, political and commercial features quite objectively without any special scheme or order, the modern system endeavours to show the immediate or underlying connection each geographical fact has with the pupil himself. Hence it is customary to begin with those geographical features which intimately concern the pupil, such as the surroundings of the class-room, thence to deal with the immediate vicinity, and afterwards to enlarge the scope of the study until it deals with the characteristics and interrelation of the general features of the earth's surface and their influence on mankind and animal and plant life, leading on to the reasons for the distribution of mankind in time and country and to the study of geographical hist. This new system of dealing with the subject has given G. a place among the highest branches of knowledge, and many univs. now have special profs. of G., and grant degrees in the subject. Geological Societies. The chief G. Society in Great Britain is the G. Society of London, founded in 1807 and incorporated in 1826 (address, Burlington House, London, W.1). Among foreign G. S. some of the prin. are the G. Society of America (New York), Société Géologique de France (Paris), and the Società Geologica Italiana (Rome). International Congresses of geology are held at intervals, the first having taken place at Paris in 1878. Much work of a G. nature is carried out by members of crystallographical, petrological, mineralogical, and palaeontographical societies, while smaller bodies (natural hist. societies, etc.) afford a focus for local activities.

Geological Survey. The G. S. of Great Britain is the oldest gov. G. S. in the world; it was estab. in 1835, in the first place as a branch of the Ordnance Survey, whose director at that time, Maj.-Gen. T. F. Colby, wished to see the topographic survey serve as a groundwork for geological and other surveys. Sir Henry de la Beche (q.v.) had already begun a survey of SW. England (1832) and had produced a G. map of Devon (1834) by his own efforts, though with some gov. support. In 1835 de la Beche was appointed the first director of the G. S. and remained in charge until his death in April 1855. During these 20 years this remarkable man estab. the G. S. as a separate institution in a building specially designed for it (almost certainly the first building after Greenwich Observatory

erected to house a scientific institution); founded the Museum of Practical Geology, now at S. Kensington; brought about the opening of the School of Mines to train geologists and mining men (now a part of the Imperial College of Science and Technology); and instituted a Mining Record Office to maintain records of mineral workings (now under the Home Office). The G. S. during de la Beche's directorship surveyed the W. half of England and Wales S. of the lat. of Liverpool, started to publish maps of Ireland, and began work in S. Scotland. Since that date the G. S. has continued with the primary G. S. of the Brit. Isles; England, Wales, Ireland, and the greater part of Scotland have been surveyed, mostly on a scale of 6 in. to a m., and maps of the geology have been pub. The Rep. of Ireland now has a separate G. S. Geological maps of the U.K. are pub. on the following scales by the G. S.: 25 m. to the in.; 10 m. to the in.; 4 m. to the in.; 1 m. to the in.; and, in economically important areas such as the coalfields, on a scale of 6 in. to a m. The smaller-scale maps are reduced from the surveyors' field maps, usually on a scale of 6 in. to a m. The originals may be consulted at the offices of the G. S. Memoirs describing the geology of the country shown on each 1 in. to a m. sheet are pub., as are special memoirs devoted to the economic resources of the country. These include pubs. on minerals and on water supply. Shorter accounts of local geology are provided in a series of regional guides. These form a series covering the whole country and probably form the best means of becoming acquainted with the geology of any part of the kingdom.

The work of the G. S. at the present day is largely concerned with economic matters, in particular with coalfields, underground water supply, and with fissionable materials required for the production of atomic energy. A special dept has been formed to deal with the latter question and has extended its work outside the Brit. Isles. By Act of Parliament the G. S. is supplied with records of all wells over 50 ft deep, and must be informed in advance when such wells or bores are to be sunk. From such information and from the work of the surveyors, the G. S. has built up a quite unrivalled knowledge of the underground water-supply resources of the country. In addition to the work of immediate practical application, which covers many other spheres, among which may be mentioned the iron-ore fields, the oil shales, china clay, and many metallic and non-metallic minerals, the G. S. continues with its primary task of constant revision and improvement of the geological maps of the country, as a result of which new pubs. and maps are frequently issued. Geophysical methods have been introduced during the last decades to assist in this work. It is from the fundamental knowledge of the geology of a country gained in this way that a G. S. is able to answer the demands made for detailed and specialised information that arise

when new developments require the exploitation of new mineral resources. Thus during the last 2 wars advice was available on mineral deposits which might make good war-time shortages of imported material, just as advice was available on water-supply questions connected with the housing of large bodies of troops.

G. S.s are maintained in most countries of the world. Their functions are similar to that of the G. S. of Great Britain. The G. S.s in Brit. colonies, though usually financed by the countries concerned, are advised on certain matters by the directorate of colonial surveys, at the head of which is the G. S.'s adviser to the secretary of state for the colonies. This colonial G. S. service forms the second large G. S. organisation from Britain.

Location.—The museum (open to the public) and H.Q. of the G. S. of Great Britain are situated in Exhibition Road, South Kensington, London, S.W.7.

For the hist. of the G. S. of Great Britain see J. S. Flett, *The First Hundred Years of the Geological Survey of Great Britain*, 1937; E. B. Bailey, *Geological Survey of Great Britain*, 1952.

Geology (Gk *gē*, the earth; and *logos*, a discourse), the science dealing with the hist. of the earth from its creation to the present day. G. is concerned with the processes which operate on the earth, with the materials of which it is made and the way they are arranged, and with the sequence of events recorded by the rocks, including the appearance and evolution of living matter.

The prin. branches of G. are as follows: *physical G.* or the study of the surface of the earth and the processes which control its form; *petrology* or the study of rocks; *mineralogy* and *crystallography* dealing with minerals and crystals respectively. *Geochemistry* is concerned with the distribution of the elements through the earth and with the laws governing this distribution.

The study of the physical properties of the earth and of the forces which affect it is the field of *geophysics*. *Structural G.* deals with the structure of the earth and *stratigraphy* or *historical G.* with the historical record preserved in the rocks of the crust. *Geochronology* may be defined as the study of the absolute age of geological events in the hist. of the earth whether geological or archaeological. *Palaeontology* deals with the remains of plants and animals preserved in the rocks; *palaeobotany* is the branch of palaeontology concerned solely with fossil plants; *micropalaeontology* deals with the smaller forms of fossil life, principally with foraminifera, and *palaeoecology* is concerned with the habitat of fossil faunas and the influence of environment on life in the past. *Geomorphology* deals with land forms or the shape of land-masses at the present day; *oceanography* is the science of oceans. Both subjects are of great concern to the geologist, though they lie primarily in the field of the geographer.

The practical applications of *G.* have led to the study of *mining G.* or the study of mineral deposits and of the means by which they can be found; of *oil-field G.*, and of *engineering G.* The newly developed science of *soil mechanics* deals with the behaviour of unconsolidated material, such as sand or clay, under the various loads and conditions imposed by building and engineering works. Finally there is the work of the water-supply geologist, concerned with the distribution and use of underground water, or *hydrogeology*.

History of Geology.—Although geological phenomena were described by the ancients from time to time, particularly when their effect on mankind was catastrophic, as was, for example, the eruption of Vesuvius in AD 79 which destroyed Pompeii, *G.* as a science dates at the earliest from the Renaissance. One must not forget, however, the empirical knowledge shown by the mining operations of the Egyptians and Romans. Leonardo da Vinci (q.v.) observed fossil sea shells in the interior of Italy, recognised them for what they were, and deduced correctly that the rocks containing the fossils had been deposited below the sea and subsequently uplifted to form dry land. The drawings of da Vinci show that he was observing and recording such matters as the folds formed in rocks during mt building in a manner that has only become general at the present day. About the middle of the 18th cent. Lehmann (d. 1767) demonstrated that there was a succession of rocks recording a succession of geological events and thus laid the foundations of stratigraphy. Lehmann introduced the term *Primary* to distinguish the earliest rocks from those of the *Secondary* group which he recognised as having formed from layers of debris washed from the *Primary* group. Fuchsel, working in the same period as Lehmann, introduced the term *stratum* to describe one layer or bed of the *Secondary* deposits. The origin of the sedimentary rocks was thus clearly estab. Early in the 19th cent. Wm Smith (q.v.), 'the father of English geology,' took the next step when he showed that sedimentary rocks could be arranged in a definite sequence, that the oldest rocks lay at the bottom, and that each layer could be identified by the fossils it contained. In the meantime Abraham Werner (1749-1817) put forward the notion that all rocks originated in the ocean, an idea which the work of the Scotsman James Hutton (q.v.) (1726-97) finally demolished, when he showed that certain rocks were igneous and had cooled from a melt. These are the volcanic rocks such as the lavas, of which basalt is an example, and the intrusive or plutonic igneous rocks of which granite is the most familiar. Volcanic rocks cool on or near the surface, and plutonic rocks consolidate deep within the crust.

Hutton was the first to realise that the rocks, whether they were sedimentary or igneous, originated through processes

which are operating at the present time, such as the accumulation of sand on a sea-shore, or the outpouring of lava from a volcano. Hutton realised that the long geological record of the past could be interpreted through an understanding of the present, and was not the result of extraordinary events, unknown at the present time, as the 'Catastrophic' school would have it. The appearance in the years 1830-3 of *Principles of Geology* by Sir Charles Lyell (q.v.) estab. the validity of Huttonian ideas with a wealth of evidence which was immediately accepted. Lyell's clear exposition of the fundamental geological ideas to be found in this book may be said to open a period of research which has continued to the present day. Darwin (q.v.) has recorded his debt to this book, which he took with him on his voyage in the *Beagle*; it was, indeed, at Lyell's instigation that Darwin first set out the views on evolution which eventually appeared in 1859 in his *Origin of Species*. While palaeontological and stratigraphical knowledge was greatly advanced during the first half of the 19th cent., the study of petrology lagged until the use of the microscope for the examination of thin sections of rock, first employed by Henry Clifton Sorby (1826-1908), became general and until the chemical analysis of rocks and minerals began to be practised. During the present century our understanding of rocks formed at high temps. and pressures has been increased by laboratory experiments on rock melts subjected to such physical conditions as might be expected deep in the crust of the earth. The investigations in the Geophysical Laboratory in Washington have been pre-eminent in this field. To-day geochemical and geophysical work on such topics as the distribution of elements through masses of rock, their abundance in the crust, and on the physical properties of the crust play an increasing part in petrology.

Perhaps the most peculiarly geological line of enquiry is the making of the geological map. Such a map shows the nature of the underlying rock, the attitude of the beds or of the margins of the igneous rocks, together with details of other features which it may be particularly desired to record, such as the mineralisation, the structure, or the degree of alteration or of metamorphism, etc. The first map of Britain was made by Wm Smith and was pub. in 1815 as his 'Geological Map of England and Wales.' Since that date geological surveys have been estab. in practically every country, beginning with the creation of the official geological survey of Great Britain in 1835 with de la Beche (q.v.) (1796-1855) as the first member of its staff. The task of geological survey is to prepare geological maps, to collect information about the geological resources of the ter., and to publish the knowledge so gained. See GEOLOGICAL SURVEY.

Practical applications of Geology.—The work of the geologist is often of direct concern to the community. Although

the mining of coal and metallic ores has been practised for many more centuries than has the science of G., the modern expansion of the mining industries results directly from the ability of the geologist to locate new mineral resources. At the present day much of the surface of the earth has been so intensively explored that it is increasingly probable that few unworked reserves remain to be found near the surface. The geologist has developed methods of prospecting at depth in co-operation with the geophysicist, who determines the underground distribution of the rocks from measurements of local variations in the gravitational and magnetic fields of the earth and from a form of echo sounding which involves the measurement of shock waves from explosions reflected back to the surface by the underlying rocks. In recent years delicate tests for exceedingly small amounts of elements (a few parts per million) have been devised. These can be used to find minute concentrations of useful elements in plants, soils, or running water, which in turn may lead one back to the mineral deposit from which they have been derived. In this fashion mineral deposits, of which no other sign exists at the surface, have been located.

The search for oil has depended entirely on scientific prospecting, for oil lies within the crust as pools in the pore spaces of folded sedimentary rocks. In order to obtain the oil it is often necessary to determine the geological structure to a depth of sev. m. below the surface. A knowledge of the underground structure plays an important part also in determining the distribution of the underground water which supplies our wells. A successful well must not only enter a water-bearing rock, but one which is capable of yielding that water. Water present in fine textured rock such as clay is held so tightly that it does not readily leave the rock, which is said to be impermeable. Ideally, a well should reach water in a readily permeable rock such as a sand or gravel, which is lying below the permanent water table—the level at which water lies within the earth. The height of a water table depends on many geological conditions which are only sufficiently understood when a large area of the surrounding country has been geologically mapped. Geological maps also provide immediately useful information by showing the location of sources of lime, of sand and gravel, and of brick clays, etc., and by showing the nature of the underlying rock and thus enabling the agriculturist and the engineer to assess the probable suitability of a given dist. for farming and civil engineering works in so far as these are affected by the soil and the drainage, or availability of water. Such an assessment involves the interpretation of the geological map, a task for which some geological training is necessary; this raises the question of how the geologist works and how geological investigations are carried out in the field.

The geological method.—The oldest rocks are believed to have formed 3,500,000,000 years ago. The geologist has to interpret the record left in the crust of events occurring from that time to the present. The passage of geological time can be measured conveniently by the principle employed in the hr glass. In that instrument the rate at which sand passes is known and hence the amount that has passed to the lower chamber provides a measurement of time. Salt is accumulating in the oceans and has been through geological time; hence, since the total of salt in the seas can be computed, an estimate of the time it has been accumulating can be obtained provided the rate at which it accumulates can be found. Estimates of the age of the earth have been actually made on this basis, but to-day these are superseded by determinations based on the study of the radioactive decay of minerals. Radioactive isotopes break down at a constant rate and give rise to new isotopes. Thus an isotope of lead arises through the decay of uranium. It is possible to calculate the length of time this process has been operating, and thus the age of the mineral and rock in which it occurs, once the amounts of 2 isotopes have been determined. In this way estimates of absolute age have been estab. throughout the geological column. In the rocks formed during the last 500,000,000 years, that is to say since the Cambrian, fossils may be found. By the application of Wm Smith's law successions of strata have been estab. and have been correlated or equated from one locality to another when identical fossils occur in both places. In this way it has been possible to subdivide the rocks, placing those with similar faunas together and arranging each group in its correct chronological position in the geological column.

The nature of the rocks from places within this column indicates the kind of event which was taking place on the earth at that locality when the rock was laid down; thus desert deposits such as sand dunes indicate dry land, marine clays demonstrate that the locality lay below the sea, while volcanic rocks show that volcanoes were active nearby. By applying the doctrine of Uniformitarianism, as Hutton and Lyell first appreciated, we can interpret the past in terms of the present. Thus the study of the geomorphology and physical G. of the earth of to-day throws light on the nature of the earth in the past.

The attitude of the rocks as well as their nature throws light on their hist. If highly folded rocks are abruptly covered by flat unfolded rocks it is clear that the first group were folded at some period before the latter were deposited, and we have evidence of a period of folding which may be recognised in other areas as having taken place at the same geological time. In this way the existence of an old mt chain of folded rocks may be estab. even though all trace of the higher parts of the mts has been removed by erosion.

It is concerned not only with the past but also with the interior of the earth separated from our eyes not by time but by space. The geologist builds up a picture of the deeper parts of the earth in the following ways.

Inspection of rocks which have been deeply buried—in some instances it can be demonstrated by as much as 15 km. of rock—and which have been brought back to view by the erosion of the overlying rocks shows what the crystalline rocks below the surface at the present day are likely to be. These expectations can be confirmed by drilling, though to a limited

TALUS FORMED BY ACTION OF FROST,
NIPIGON RIVER, ONTARIO

extent, as the really deep drills, which approach 5 km. in length, are in the unmetamorphosed sedimentary rocks of the oilfields of the world. Such evidence shows that continents consist of thin veneers of superficial deposits such as boulder clay left by ice or the deposits of rivers, which overlie sequences of sedimentary rocks lying in huge depressions in the crust or in troughs or basins a few km. deep but up to sev. hundred km. in breadth. Below these basins are the crystalline rocks made up of the 2 groups of metamorphic rocks which once were sedimentary or volcanic and the intrusive igneous rocks of which granite is the most abundant. At depth the 2 groups become more and more intermingled and form extensive areas of mixed rocks or migmatites made up of granite and metamorphic rock intimately intermixed.

Over much of the earth at the present day the sedimentary cover is lacking and the crystalline rocks are exposed to view.

This is so over much of Canada in the Canadian or Laurentian Shield made up from pre-Cambrian rocks of different ages, most of which have been deeply buried since they were formed and slowly brought back to view by long, continued erosion. In Britain most of the SE. of the country is underlain by sedimentary rocks formed during the Tertiary and Mesozoic, while the older rocks are seen in the N. and the W. In the extreme NW. of Scotland the pre-Cambrian crystalline migmatitic rocks formed 1,200,000,000 years ago, together with those of even older periods, are seen in the Lewisian gneisses. Geophysical evidence suggests that each continent is underlain by a mass of rocks such as have been mentioned to a depth of some 35 km. Below this the thickness may be greater. Below this continental mass the material becomes more dense rather rapidly. This discontinuity is the Mohorovic discontinuity which separates the crust from the underlying layer termed the mantle. The mantle extends to 2900 km., where there is another break and the core is reached.

The core is more dense than the mantle and has some of the properties of a liquid. Our knowledge of it comes from a consideration of the weight of the earth, which is so great as to demonstrate that the deepest parts must be much more dense than any rock in the crust, and from a study of the way in which shock waves set up by earthquakes travel through the earth. There is an important distinction between the rocks below a continent and those underlying an ocean. It has long been known that granites are unknown from the is. in the central Pacific and over much of the other oceans, whereas, as has been shown, granite is common below continents. Geophysical evidence suggests that the granitic or Sialic layer (named after silica and aluminium, the 2 main constituents after oxygen) which makes up the continental crust is either absent or but a few km. thick below the oceans, where the Mohorovic discontinuity occurs but 10 or so km. below sea-level. As the ocean waters are some 4 to 5 km. deep, the total rock above the Mohorovic line is very much less than the 35 km. of Sial under the continents. The latter, in fact, appear to be rafts of matter with a density of about 2.8 floating on material of density 3.4 approximately which occurs everywhere below the Mohorovic and which is believed to be peridotitic in composition, that is to say rich in silica and magnesia and thus termed Sima. The higher level of the continents as compared with the ocean depths follows from this density difference of the underlying rock. The denser rock near the ocean bed can buoy up a greater thickness of the lighter subcontinental material, in the same way as the denser sea-water supports an iceberg. Realisation of this fact is expressed in the notion of isostasy.

Geomagnetism, or terrestrial magnetism, the magnetic properties possessed by the earth as a whole. The effective and practical study of G. in England is chiefly associated with the name of Edmond (or Edmund) Halley (q.v.), the astronomer, though the attraction of iron by loadstone was known to antiquity, and is mentioned by Plato and later writers. In our time the study has been pursued by Crichton Mitchell, and, before him, by Hellmann and Sylvanus Thompson. While still at St Paul's School Halley decided to devote his life to astronomy, but G. was his chosen secondary interest. In 1672, when only 16 years of age, he measured the magnetic declination (q.v.) in London. At Oxford he planned an expedition across

the equator to observe the S. stars, and in 1678 he was enabled, through the Royal Society, to go to St Helena, where he observed the magnetic declination. The Royal Society pub. his famous theory of the distribution of the declination in 1683. He suggested that 'the whole earth is one great magnet, having four magnetic poles, or points of attraction, near each pole of the equator two, and that, in those parts of the world which lie near adjacent to any one of these magnetic poles, the needle is governed thereby, the nearest pole being always predominant over the more remote.' In 1692 he extended his theory to explain the secular variation, the whole period of which he conjectured to be '700 years or thereabouts.' We now know that, despite the irregular distribution of the earth's magnetic field, there are only 2 magnetic poles, to which converge all the magnetic meridians, and Halley's own later knowledge would have enabled him to draw many of these meridians and to discover the fact. The first actual chart of the earth's magnetic meridians was made in 1817 by Thomas Yeates. The causes of the main field, of its irregularities, and of its secular variations are still unknown. In 1698 Halley was granted a ship by William III 'to improve the knowledge of the longitude and variations of the compass.' After a magnetic survey of the N. and S. Atlantic he returned in 1700, and next year pub. his first chart of the declination over the Atlantic. In 1702, having collected further observations by mariners in other oceans, he produced a world magnetic chart. These charts are his greatest contributions to G., and give the declination in a way very convenient to navigators. In time, as he foresaw, their practical value came to an end, owing to the secular magnetic variation, but the value of his observations as a record of the declination at the epoch 1700 remains unimpaired. One remarkable gap in his geomagnetic work was his apparent total neglect of the magnetic dip or inclination, and this in spite of the importance already given by Wm Gilbert to the phenomenon in his book *De Magnete*, 1600. For 2 centuries Halley had no comparable successor in this sphere, and the magnetic survey of the globe was not renewed with his zeal until in 1905 young American, Louis Bauer, with the support of Carnegie, resumed the task. See also MAGNETISM. See A. Crichton Mitchell, *Terrestrial Magnetism*, 1932; E. F. MacPike (ed.), *Correspondence and Papers of Edmund Halley*, 1932; S. Chapman and J. Bartels, *Geomagnetism*, 1940; S. Chapman, *The Earth's Magnetism*, 1951.

Geometric Mean, see MEAN.

Geometric Progression, series of quantities such that the ratio of any one of them to the one immediately preceding is the same throughout the series. This ratio is called the common ratio of the series. Thus 3, 6, 12, 24 . . . etc.; 6, - 2, 4, - 8 . . . etc.; and a , ar , ar^2 , ar^3 . . . etc. are

series in G. P., whose common ratios are respectively 2, $-\frac{1}{2}$, and r . In the last series the n th term is ar^{n-1} and the sum of

$$\frac{1-r^n}{1-r}$$

less than 1, it is found that the sum of an infinite number of terms of the series is the

finite quantity $\frac{a}{1-r}$, because $r^n \rightarrow 0$ when

n is infinite. A recurring decimal is an example of such a G. P., and is hence reduced to its equivalent fraction. Thus $0.\dot{7} = 0.777 \dots ad inf. = x$ say. Hence $7.777 \dots ad inf. = 10x$ and subtracting x from $10x$ and $0.777 \dots$ from $7.777 \dots$

$9x = 7$, or $x = \frac{7}{9}$. G. P. forms the basis

on which calculations of annuities and compound interest are made. See also MEAN.

Geometries, Finite, name given a class of G., in each of which there is a finite number of elements called *points*, falling into subsets called *lines*. The mutual relations between lines and points are closely analogous to those of lines and objects in ordinary projective geometry. See O. Veblen and J. W. Young, *Projective Geometry*, vol. 1, 1910, vol. 2, 1918, Boston, U.S.A.

Geometry may be defined as the investigation of the properties of space.

Historical.—As the name implies, its origin may be traced to what was necessary for the management of land. The frequent inundations of the Nile in Egypt destroyed landmarks, and so altered the value of land that the priests were driven to invent some method for finding areas. The first known attempt to classify these results was by a priest Ahmes in the 'Rhind' papyrus, which is at present in the Brit. Museum. For the historical development of G. see MATHEMATICS.

Elementary Pure Geometry embraces roughly the ground covered by Euclid's *Elements*, which forms an ordinary school course in plane and solid G. The latter treats of the ordinary space in which we move and is termed three-dimensional. A plane is two-dimensional, the upward direction out of the plane or third dimension being ignored. Similarly, a line is of one dimension, the direction sideways out of the line, in addition, being ignored. A point has no dimensions. The terms length, breadth, and thickness are popularly ascribed to the three dimensions. The conception of some unknown fourth dimension has occupied much attention, but that is hardly within the scope of the present discussion. It is sufficient to say that the algebraical methods of analytical G. can be applied to some extent to problems in four dimensions. Euclid's *Elements* filled 13 books, of which numbers VII to X, dealing with arithmetical and irrational quantities, and parts of XI, XII, XIII, dealing generally with solid G., are not usually read. Of the rest, Book I deals with lines and angles, finishing with certain propositions on areas; Book II

deals entirely with the areas of squares and rectangles; Book III with circles; Book IV with polygons; Book V is an introduction on proportion to Book VI, which deals with ratios. The retained parts of Books XI and XII deal with elementary properties of solid G. The whole series of propositions is based on certain assumptions and definitions. Euclid divided the assumptions into 2 parts. The first part contained what are now known as axioms 1 to 9; the second part, axioms 10 to 12 and the 3 postulates. An *axiom* may be defined as a self-evident truth, incapable of proof, which serves as a basis for future reasoning. Without some such assumptions no G. is possible, but there is much doubt as to exactly what may be justifiably assumed. Euclid has been criticised for making further assumptions in his propositions which are not mentioned initially in his list, and for mixing certain axioms with his definitions. What is now the 12th axiom, in particular, on which proof of theorems on parallel lines is based, is unsatisfactory, and in most modern eds. has been replaced by what is known as Playfair's axiom, but this, though more fundamental, is still open to some objections. The present method is to divide the assumptions into axioms and *postulates*, the latter being what must be necessarily assumed in construction, but it is questionable whether this is an improvement or not.

Until the beginning of the century the selected part of Euclid's *Elements* was universally accepted in almost its original form as a school text-book, and although it is not used now, those at present in use are little more than revised eds. A few propositions have been entirely omitted, the order has been altered in places, and some new methods have been introduced. There is no doubt that the alterations constitute a definite improvement. The new methods are worthy of notice. The idea of a locus is introduced, that is, of the path of a moving point. A circle is defined as 'the figure enclosed by a line traced out by a point which moves in such a way as to be always a given distance from a certain fixed point.' The principle of applying one figure to another is extended, and the *hypothetical construction* is introduced. It is assumed as axiomatic that a perpendicular can be drawn on a line from a point within it, a finite straight line bisected at a point, and an angle bisected by a straight line; whereas Euclid never used any one of these for a proof until he had found a method for its construction. The order of his propositions suffers in consequence, and some proofs are unnecessarily long. Thus Euclid, I. 5, the proposition known as the *Pons asinorum*, because its length made it a serious difficulty presented to the beginner, is now comparatively simple. The method of proof known as the *Reductio ad absurdum*, which Euclid often used, is still retained. It occurs principally in *converse* propositions, but is not confined to these. In

such a proof what is to be proved is assumed wrong and an obvious absurdity deduced. This absurdity occurs in every case but the one to be proved, and hence the proof is established.

Euclid's solid *G*, is of a very elementary nature, and is confined to a few propositions on planes and lines (which follow at once from the methods of plane *G*), and on simple solids, including the 5 regular polyhedra. It is obviously impossible to deal with the propositions in detail here,

FIG. 1. CONIC SECTIONS

and the student must be referred to the many school text-books.

Higher Pure Geometry.—On finishing the ordinary school course the student is usually introduced to the *conic sections*, (Fig. 1), and though these curves are generally best treated by the methods of projective *G*, a description here is advisable. As the name implies, they are the curves obtained by cutting a right circular cone by planes. When the cutting plane makes an angle with the base of the cone less than that made by a generating line (*AD* and *BC* are called generating lines), the resulting curve is called an ellipse (in the figure *EGF*). When the cutting plane is

parallel to a generating line, the curve is a parabola (*NKM* in the figure), and when it makes a greater angle with the base than with a generating line, the curve is an hyperbola (*QPR* and *UTF* in the figure). It is best explained here that the geometrical conception of a cone differs from the popular conception in that it is produced on the other side of the vertex *O*. Hence there are always 2 branches of an hyperbola. A particular form of hyperbola is 2 straight lines when the cutting plane passes through *O*. Similarly, a circle is a particular case of an ellipse, and is the resulting curve when the cutting plane is parallel to the base. A sphere may be inscribed in the cone to touch the plane of the ellipse at the point *S* called the *focus*, and it can be proved that any point on the ellipse is such that its distance from *S* is in a fixed ratio to its distance from the straight line *L* called the *directrix* (the intersection of the planes *EFG* and *XYZ*). The same is true for a

FIG. 2. ASYMPTOTES

second focus *H*, where another inscribed sphere touches the planes from below. The 2 foci (*S*₂ and *S*₃) of the hyperbola and the 1 focus (*S*₁) of the parabola may be similarly found, and the same properties are true for these points. Thus a conic may also be defined as the locus of a point which moves so that its distance from a fixed point bears a constant ratio to its distance from a fixed straight line, the conic being an ellipse, parabola, or hyperbola, according as the ratio is less than, equal to, or greater than unity. The point midway between the 2 foci of an ellipse or an hyperbola is called the *centre*, and these are known as *central conics*. The extreme importance of the geometrical properties of these curves may be gathered on realising that planets and satellites move in orbits which are ellipses, and comets (q.v.) in orbits which are ellipses or hyperbolas. Further, apart from questions of friction with the air, any body freely projected from the earth moves in practically a parabolic path in its flight from the point of projection until it returns to the earth, though to be strictly accurate this path is an arc of a very elongated ellipse, one focus of which is at the earth's centre. It may be mentioned also that as an hyperbola recedes from the centre it gradually approaches 2 lines known as its *asymptotes*, which pass through the centre and are tangents to the curve at points infinitely distant (Fig. 2). Most properties of

conics may be conveniently obtained by projective methods.

Projective Geometry.—Let π and π' be 2 planes (Fig. 3) inclined at any angle, and let O be any point outside both planes. If A is a point in the plane π and the line OA cuts the plane π' in A' , the point A' is called the projection of A on the plane π' . If B is another point on the plane π and OB cuts the plane π' in B' , the point B' is the projection of B on that plane, and so on. Obviously every point on AB is projected into corresponding points on the plane π' , so that a line is projected into another line and a triangle, such as ABC , into another triangle $A'B'C'$. The point O is called the *vertex* or *centre of projection*, the plane π' intersecting the plane π along the line XYZ is called the plane of projection, and the line XYZ is called the *axis of projection* or *perspective*.

FIG. 3. PROJECTION

The triangle ABC (or any other figure) may also be regarded as the projection of the triangle $A'B'C'$ on the other plane, and the triangles (or any other figures) are said to correspond. Many theorems in projection are so obvious that proofs are unnecessary, amongst which are the following:

Any plane curve is projected into a curve of the same degree.

A tangent to a curve projects into a tangent to the projected curve.

Every point on the axis of projection projects into itself.

Corresponding lines intersect on the axis of projection. Thus the lines AB and $A'B'$, BC and $B'C'$, AC and $A'C'$, meet at the points Z , X , and Y respectively, these 3 points lying on the axis of projection.

The relation of pole and polar (q.v.) with respect to a conic is unaltered by projection.

If through the centre of projection O straight lines be drawn to the points lying at an infinite distance on the plane π , these straight lines will lie in a plane through O parallel to the plane π' . The intersection of this plane with the plane π will be a straight line V parallel to XYZ , the axis of projection. We can regard v as the projection of a straight line v' (not shown in the diagram) which contains all

the points at infinity on the plane π' . In the circumstances v' is called the *vanishing point* of the plane.

In all the cases just considered the centre of projection O is at a finite distance, and the projection is known as *conical*. If, however, the axis of projection is at infinity, in which case the planes π and π' are obviously parallel and the centre of projection O is at infinity, the projection is known as *parallel*, and in the circumstances parallel lines are projected into parallel lines and the ratio of segments of parallel lines remains unaltered in projection. If the projecting lines are at right angles to π' , the plane of projection, the projection is known as *orthogonal*.

For further information on the subject special treatises should be consulted. See works on *Conic Sections*, such as Charles Smith's, chapter XIV; G. M. Minchin and J. B. Dale, *Mathematical Drawing*, chapter IV; Arthur Cockshott and F. B. Walters, *A Treatise on Geometrical Conics*, 'Orthogonal Projections.'

Non-Euclidean Geometry.—The theory of parallels in Euclid's 12th axiom did not appear to be self-evident to the successors of Euclid, and non-Euclidean G. arose from attempts to improve this theory. Although a number of mathematicians had worked on the subject before Gauss (q.v.), it seems probable that he was the first to recognise the possibility of the falsity of this axiom. The names of Gauss, Lobachevsky, and Bolyai (qq.v.) are associated in the subject, but it was not known till after the death of Gauss in 1855 that he had been interested in it for many years. Lobachevsky was the first to publish a non-Euclidean G., about 1830, and in 1831 John Bolyai, a Hungarian mathematician, pub. an appendix to one of his father's treatises, in which he presented a non-Euclidean system of G. similar to that of Lobachevsky. In 1854 Riemann delivered his famous lecture 'On the Hypotheses which form the Foundation of Geometry,' which was pub. 13 years later. Expanding the ideas of Bolyai and Lobachevsky, he developed the conception of a space capable of any number of dimensions (which he described in terms of 'manifolds'), measurements of curvature and of finite but unbounded space. Only one kind of space—now known as hyperbolic space—was dealt with by Gauss, Lobachevsky and Bolyai, but some time after the appearance of Riemann's lecture it was shown that there were also 2 kinds of Riemannian space to which the names elliptical and spherical were given. Einstein's fundamental assumption, which can be expressed in the form that Euclidean G. ceases to be valid in a space where masses exerting gravitational forces are present, is dealt with elsewhere. (See EINSTEIN; RELATIVITY.)

Analytical Geometry differs from pure G. in that problems are solved by algebraical methods. It necessarily enables solutions to be found in certain cases where the methods of pure G. are much

less convenient. This branch of the subject is also known under the heading *co-ordinate geometry*, since the position of a point is determined by its co-ordinates or distances from certain fixed axes. In its most elementary form it is familiar to most under the name *graphs*. The student first learns to plot the position of a point with reference to 2 fixed perpendicular axes (in plane G.). By measuring a distance 4 units along Ox and then 3 units parallel to Oy , the point A is obtained (Fig. 3). It is said to be the point (4, 3) or the point $x = 4, y = 3$. The first of the 2 co-ordinates is known as the *abscissa*, and the second is the *ordinate*. If the first number is negative it is measured in direction Ox . If the y co-ordinate is negative, it is measured along Oy . Hence B, C , and D are respectively the points $(-4, 3)$ $(-4, -3)$ $(4, -3)$. Now consider the equation $3x + 4y = 12$. It is possible to find any number of sets of value for x and y to satisfy the equation. Take each pair of values in turn and plot out the corresponding point on the graph, and it will be found that all these points lie on a straight line. $3x + 4y = 12$ is then said to be the *equation of the straight line*. In a similar way it is found that every equation of the first degree in x and y represents a straight line. It obviously follows that a set of values for x and y which satisfies 2 such equations at once must represent the point of intersection of the 2 lines. Hence the algebraical solution of 2 equations gives the co-ordinates of the point of intersection of the lines they represent. By similar methods the loci corresponding to equations of the second degree in x and y may be traced, and the algebraical solution of any pair of equations gives sets of values for $x + y$ which represent the points of intersection of the loci. Such is the practical beginning of co-ordinate G. It may easily be estab. that a straight line must be represented by some equation of the first degree, that the straight line $Ax + By + C = 0$ cuts the axes in points

$(-\frac{C}{A}, 0)$ and $(0, -\frac{C}{B})$, that it makes an

angle $\tan^{-1}(-\frac{A}{B})$ with the axis of x , and

so on. Various formulae are developed for the distance between 2 points, the distance from a point to a line, the angle between 2 straight lines, and so on. A corresponding list of formulae may also be found for *oblique* axes, that is, where the original axes are taken inclined at an angle ω instead of a right angle, and the co-ordinates are measured parallel to the axes.

The method of representing a point by its distance measured parallel to axes is known as the *Cartesian* method. Any point may also be represented by the distance OP and the angle POM , better known as the *polar* co-ordinates. The connection between the 2 systems may easily be seen from Fig. 4 to be $x = r \cos \theta$

and $y = r \sin \theta$, and hence the polar equation of any locus may be deduced from the Cartesian equation, and vice-versa.

In Cartesian a circle of centre (h, k) and radius a has an equation $(x-h)^2 + (y-k)^2 = a^2$, and where the point O (the origin) is the centre, this becomes $x^2 + y^2 = a^2$. From the locus definition of a circle its general equation is found to be of the form $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ (where $a = b$ and $h = 0$; a, b, c , etc., are constants), i.e. of the second degree; when the axes are suitably chosen, an ellipse, parabola, and hyperbola (q.v.) may respectively be represented by

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \quad y^2 = 4ax, \quad \text{and}$$

$$y^2 = 1. \quad \text{From these equations series}$$

of formulae may be formed for tangents and normals at any point, the polar of a given point, and so on, and thus the G. of conics may be treated from an algebraical

FIG. 4. POLAR CO-ORDINATES

point of view. Equations of the third and fourth degree in x and y , which result in more complicated curves, may be treated in a similar way.

Solid Geometry is in many respects analogous with plane G. A third axis Oz is taken perpendicular to the plane containing Ox and Oy , and a point thus has 3 Cartesian co-ordinates x, y , and z . The equation $Ax + By + Cz + D = 0$ of the first degree now represents a plane. A straight line is the intersection of 2 planes, and hence is represented by 2 equations of the first degree. There are other ways of representing the equations of a straight line: thus if it passes through 2 given points (α, β, γ) and $(\alpha', \beta', \gamma')$ the

$$\text{equations are } \frac{x-\alpha}{\alpha'-\alpha} = \frac{y-\beta}{\beta'-\beta} = \frac{z-\gamma}{\gamma'-\gamma}, \text{ or}$$

$$\text{if } l, m, n \text{ are the direction cosines of the line, } \frac{x-\alpha}{l} = \frac{y-\beta}{m} = \frac{z-\gamma}{n} = r, \text{ where } r \text{ is the distance}$$

between the points (x, y, z) and (α, β, γ) . The 3 polar co-ordinates (r, θ, ϕ) are connected with x, y , and z by the equations $x = r \cos \phi \cos \theta, y = r \cos \phi \sin \theta$, and $z = r \sin \phi$ (Fig. 5). In Cartesian, the equation of a sphere of centre (h, k, l) and radius a is $(x-h)^2 + (y-k)^2 + (z-l)^2 = a^2$, and when O is the centre the equation is

$x^2 + y^2 + z^2 = a^2$. The general equation of the second degree is a solid of which all plane sections are conics and is called a *conicoid*. A particular case is the

ellipsoid, whose equation is $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$.

From these equations formulae for tangent planes, normals, etc., are developed very much as in plane G. Many solid G. methods are, in fact, analogous with those of plane G., and many of the simpler surfaces may be derived from conics. Thus surfaces of revolution are obtained by revolving some plane curve about an axis in the same plane. The *hyperboloid of two sheets* and an *elliptic paraboloid*, for example, may be generated by the motion of a variable ellipse and a parabola respectively, and finally the

FIG. 5. SOLID GEOMETRY

hyperboloid of one sheet, the *hyperbolic paraboloid*, the cone and the cylinder, and others known as *ruled surfaces* may be generated by the motion of a straight curve. A curve in space may be represented by 2 equations, and hence the properties of such a curve are obtained by expressing the 3 co-ordinates as functions of a single variable. Such a curve is treated as a polygon, whose sides are indefinitely small. The place of any 2 consecutive sides does not in general contain the next consecutive side. These are called *tortuous curves*. By supposing x, y, z, w to be the 4 co-ordinates of a point in 4 dimensions, a similar series of results may be obtained. See articles under individual subjects and names, and DIMENSION. See E. H. Askwith, *Course of Pure Geometry*, 1921; E. E. Tweedy, *Junior Geometry*, 1928; and I. Todhunter (ed.), *The Elements of Euclid*, 1862 (Everyman's Library, 1933). For plane analytical G. the student may be referred to H. J. Smith, *Co-ordinate Geometry* (for elementary work), and A. Clement-Jones, *Introduction to Algebraical Geometry*; for solid G. to P. Frost, *Solid Geometry*, 1875; G. Salmon, *Analytic Geometry of Three Dimensions*, 1862; A. R. Forsyth, *Geometry of Four Dimensions*, 1930;

Geonim, see GAON.

Geophysical Year, International, July 1957 to Dec. 1958, during which period observations of the action of natural physical forces on the earth were made by scientists from some 40 countries at many places throughout the world. At the time chosen for the observations, solar activity would be at or near its maximum. Temporary observation stations were set up to study geophysical phenomena in the fields of astronomy, scientific radio, geodesy and geophysics, pure and applied physics, and meteorology. Specific subjects for study included Antarctica, long, and lat. determinations, the aurora, etc. Brit. contributions included the setting up of many stations in the U.K. and the Commonwealth, observations from weather ships, and an Antarctic expedition (see FUCHS). Rockets were used to obtain information about the upper atmosphere at heights up to or beyond 120 m.: by Mar. 1958 both the U.S.S.R. and U.S.A. had launched earth satellites equipped with instruments to radio information back to observation stations on the ground. See ROCKETS and SPACE TRAVEL; SATELLITE.

Geophysics, see GEOGRAPHY; PHYSICAL CONSTANTS.

Geopolitics, modern version of political geography, or anthropogeography. As such, though not novel, it has accumulated a respectable amount of scientific material. In its political aspect it served as a weapon of modern National Socialism, a rationalising ideology of imperialist expansion. It is this aspect of G. which has naturally aroused wide interest and no little misunderstanding. Regarded as a world outlook, G. is a comprehensive *Weltanschauung*, which has fired the imagination and gained the loyalty of a small yet significant group of enthusiastic adherents. This latter is the least discussed side of G., but is probably the most crucial, for it explains the appeal of this pseudo-science to immature and susceptible minds and also indicates clearly its power and danger. The difficulty of analysing G. arises from the fact that the scientific and political aspects are inextricably intermingled in the minds of its advocates and enemies alike. Used by the Ger. publicists to justify the moral basis of *Lebensraum* (q.v.), *Geopolitik*, in the hands of Prof.-Gen. K. Haushofer, became a new fashion, which soon raised its chief exponent to the role of 'the man behind Hitler.' But Haushofer's definition of G. as 'a study of the dependence of political events on the character of the earth' was not his invention, though it seems to imply some novelty; and little that was added to it by his Institut für Geopolitik will survive criticism. The significance of political geography was recognised as long ago as the time of Herodotus and Thucydides. Rodin and Montesquieu, Ranke, and Ritter all showed conclusively the importance of climate and environment

In the hist. of mankind. Dietrich von Bülow's *Spirit of the New System of War*, 1799, is a study in geopolitical vein. That the geographical approach to hist. and politics was well estab. long before the emergence of *Geopolitik* may be seen from the pages of H. T. Buckle, Taine, and particularly Treitschke, the historian of the Bismarckian age, and Otto Hintze, master of Prussian hist., whose discussion of the antithesis between the political destiny of the democratic is., Britain, and that of Prussia, the militant continental state encircled by competing land powers, has long been an accepted textbook on the Continent. The later development of the study of G. came with Friedrich Ratzel, who expounded the first great scientific theory of the environmental basis of society, and Rudolf Kjellén, who popularised Ratzel's writings. All this material provided a working basis for the wider investigation of G. in the period following the First World War; and while no doubt the Haushofer school was greatly indebted to this pre-existing material, even on an elementary plane, it contributed to the revitalisation of the collated factual data, and, of course, in Germany it awakened a wider interest in climate, natural resources, configuration, and topography considered primarily in terms of strategy. After the days of Ratzel's *Seven Laws of Expansionism* G. built up an imposing catalogue of rules and concepts. Many of them are but platitudes or half truths, though obscured in a flashy journalistic terminology, which makes works on G. difficult reading for the uninitiated; but in these voluminous utterances are sometimes implied genuine realities, which should not be lightly dismissed merely because they have been applied unscrupulously for political ends. Exponents of *Geopolitik* seized, after Versailles, on the idea of 'space-conquering forces' (borrowed from Ratzel), and claimed that *Geopolitik* was the liberator from prov. nationalism and the expression of a still inarticulate longing for a new world order. It may be noted here that the Ger. geopolitical school was officially launched in 1924, the year in which Germany overcame inflation, and its inauguration heralded the dawn of a new imperialism, accompanied by the resuscitation of such aspirations as the *Drang nach Osten*. From Kjellén's *Realpolitik*, too, Haushofer's school learned that if G. was to become a lodestar of a synthetic science the idea of a state must be widened far beyond the merely legal concept. Sir Halford Mackinder's doctrine of land power—a corrective of Mahan's thesis as expounded in his *Geographical Pivot of History*, 1904—conceived world politics as essentially a conflict between oceanic and continental powers. His *Democratic Ideals*, 1919, was an unheeded yet salutary warning against the emergence of a land bloc that would prove invulnerable to sea power. It was reiterated at the time of the Versailles peace conference, but the system as dictated by the great powers in the Versailles Treaty neg-

lected the potentialities of such great compact land masses. Haushofer's doctrine has been well described as 'Mackinder in a strait jacket.' It was on its use as a political weapon that the *Geopolitik* of Haushofer's school of fanatic disciples won historical significance. See S. Neumann, 'Fashions in Space,' in *Foreign Affairs*, vol. xxi, No. 2; R. Hennig, *Geopolitik, die Lehre vom Staat als Lebewesen*, 1928; O. Maull, *Das Wesen der Geopolitik*, 1936; S. von Valkenburg, *Elements of Political Geography*, 1939; J. H. G. Lebon, *Introduction to Human Geography*, 1952; and bibliography of GEOGRAPHY.

Geoponiæi, name given to various (Gk and Rom. writers on agriculture, also known as *Scriptores rei rusticae*. The Alexandrian writers were great compilers of treatises on agriculture, *Geoponika*, which were used by later writers, such as Cassianus Bassus, who wrote at the end of the 6th cent. AD. A main source from which such compilations were made was that of Mago of Carthage, frequently condensed and trans. Cato the Elder wrote a practical treatise, *De Agricultura*, of which parts survive; but the chief authorities, still full of useful advice and of inestimable value for knowledge of past systems of farming, are the *Libri Tres Rerum Rusticarum* of M. Terentius Varro, and the *De Re Rustica* of Columella, from which Palladius compiled his work in the 4th cent. AD.

George, St., patron of England, a martyr who suffered at Lydda in Palestine, probably under Diocletian. Though venerated from very early times in the E., his W. cult received powerful influence from the crusaders. The legends connected with his name are fictitious. His figure as the model of knighthood and avenger of women may be due to the fact that near Lydda was the mythical site of Andromeda's rescue by Perseus (q.v.). His feast is on 23 April.

George I (George Louis) (1660-1727), king of Great Britain and Ireland, son of Ernest Augustus, afterwards elector of Hanover. He married his cousin, Sophia Dorothea of Zell (or Celle), who in 1694 was divorced by him because of her alleged misconduct with Count Königsmark. The latter was assassinated and Sophia remained imprisoned until her death in 1726. The mother of G. was Sophia, the granddaughter of James I, and although the possibility of succession to the Eng. throne seemed remote, the stipulation of Protestant succession gave the succession to the Hanoverian line by the Act of Settlement, 1701. During the war of the Sp. Succession G. sent forces to the allies at Blenheim and made a strong alliance with Marlborough. In 1714 the death of his mother (Sophia) and of Queen Anne laid the way open for his succession to the Eng. Crown. The intrigues of Bolingbroke were unsuccessful, owing to the sudden death of the queen. G. was proclaimed king and came immediately to England. His succession may be regarded as the final

step in the Protestant revolution, and the stability of his crown may be gauged from the utter failure of the Jacobite rebellion of 1715. G. understood no English while his ministers did not understand German, hence his presence at cabinet meetings was futile, and the effective gov. was carried out by a prime minister (Walpole). G. apparently regarded England merely as a great country of which he was the nominal ruler, and which was to raise the prestige of Hanover and fill his pockets and the pockets of his Ger. followers with Eng. gold. G. d. at Osnabrück and was buried at Hanover. See J. McCarthy, *A History of the Four Georges*, 1905; L. Melville, *The First George in Hanover and England*, 1908; J. F. Chance, *George I and the Northern War: a Study of British-Hanoverian Policy, 1709-21*, 1909; and Sir H. M. I. Terry, *A Constitutional King—George the First*, 1927.

George II (George Augustus) (1683-1760), king of Great Britain and Ireland, only son of George I, succeeded to the throne in 1727. In 1705 he married Caroline Wilhelmina of Anspach. In 1707 he was created earl of Cambridge, and in 1708 he was present at Oudenarde. During his father's reign he was on bad terms with the king the greater part of the time. Bad feeling between father and son seems to have been one of the Hanoverian hereditary qualities. During the greater part of the reign of George I he was regarded as the official centre of the opposition, and Walpole (q.v.) expected dismissal when George I d. But through the influence of Queen Caroline he was soon reinstated, and received the loyal support of the king until his resignation. G. was a man with the coarse character and meticulous habits of a drill sergeant of his age. He was a man of method, very economical and with a prodigious memory. The politics of the greater part of his reign were quiet. Walpole gave the country a much-needed peace, but in 1737 (Caroline d. and, with her influence removed, matters became much more difficult for Walpole. He resigned in 1742. G., like his father, recognised Hanover as the dearest of his 2 possessions. That G. did not lack military skill or courage is obvious from his presence and victory at Dettingen (1745). The importance of the reign lies to a great extent in the fact that G. in practice, if not in theory, played the part of a constitutional monarch. The rebellion of 1745 proved that personal loyalty to the Hanoverian succession was not yet a factor in practical politics, and that the Protestant Ger. succession was to a very great extent regarded as a business transaction. The traditional bad feeling between the king and the heir apparent was maintained by the conduct of G. and Frederick, prince of Wales (d. 1751). G. himself d. in the middle of the Seven Years War. See R. Walpole, *Memoirs of the Reign of King George II* (ed. Lord Holland), 1846; Lord Hervey, *Memoirs of the Reign of George II, from his accession to the death of Queen Caroline*, 3 vols., 1884; R. J. Lucas, *George*

II and his Ministers, 1910; and L. B. Namier, *The Structure of English Politics at the Accession of George III*, 1929.

George III (George Frederick William) (1738-1820), king of Great Britain and Ireland, son of Frederick, prince of Wales, and grandson of George II, whom he succeeded in 1760. After the death of his father he was educ. chiefly under the care of the dowager princess of Wales (his mother) and the earl of Bute (q.v.). The lines of his education decided his policy as a king, and he was educ. chiefly, at least in policy, on the lines of the *Patriot King*, a book written by Bolingbroke (q.v.). G. became imbued with the idea that the great work of his life must be the re-establishment of the power of the Crown in practice, as well as in theory, to the position it had held under the Stuarts. G.'s mind had, as prince of Wales, been set against the system by which the king had come to choose his ministers from that party which was most powerful in Parliament, although, as recent historical research has shown, this practice had been modified by a good deal of manipulation from behind the scenes by court interests even during his predecessors' reigns. G.'s greatest innovation was, probably, his open declarations of his intention to choose his ministers as he pleased. He endeavoured to regulate affairs by means of the party known as the King's Friends.

His first choice as prime minister, the earl of Bute, was particularly unfortunate, but Bute retired early in 1763, and did not again return to office. On the Amer. question which led to the War of Independence G. was almost certainly honest in his inability to see anything unconstitutional in the attitude which he adopted towards the Amer. colonists. In this he was very largely at one with the nation; the nation as a whole was just as stubborn as G. Why the Americans should not contribute to the cost of a war which had been fought in their defence, and why it was unconstitutional for Parliament to levy taxes on the Amer. colonies, were 2 points which the king and the nation could not understand. The king chose his own minister (Lord North) and plunged into the war, believing that it was a justifiable one, and certainly never entertaining any doubt but that the result would be victory. The disasters of the war found him unmoved; the coalition of France, Spain, and America failed to open his eyes to the danger. He later declared that he had fought the Amer. colonies because he believed that the Amer. colonies were in the wrong, and he fought right to the end: he was the last to give in to the opening of the negotiations for peace.

The peace of Versailles (1783) gave America her independence, but gave England better terms than had at one time seemed possible, since the victories of Rodney and the Fr. and Sp. failures had strengthened her hand. The whole struggle, however, is illustrative of the fact that England was plunged into a world war, in which she lost a great deal

of her prestige, largely because of G.'s obstinacy. Rockingham, whom events had forced G. to accept as prime minister, although he was a Whig, *d.* in 1783, and was succeeded by Lord Shelburne, whose short-lived ministry was overthrown by a coalition of Fox and North. The coalition ministry took office only in turn to be dismissed when their India Bill was rejected by the Lords. The king then sent for Wm Pitt. On the surface, at any rate, the king had triumphed; he had overthrown the coalition, and he had appointed his own minister: the influence of the Crown was apparently restored. Pitt, without a majority of the House of Commons to support him, had been appointed minister, and was supported by the influence of the Crown until finally, 2 months later, a dissolution and general election returned a majority in favour of the king and his minister. The dissolution was the work of the Crown entirely, but the country supported the king and Pitt, and from the moment that a majority of the House of Commons gave their adherence to Pitt it may be said that his period of office became constitutional.

In 1788 G.'s mental instability, which had been increasing for some time, became acute. During this period of insanity the regency question was debated in the House of Commons, and Pitt was probably only saved from dismissal by the recovery of the king. The thanksgiving service which the king attended in 1789 was one great ovation for the king himself, and the outbreak of the revolution in France did much to increase his popularity. He was regarded as the centre of all opposition to the Fr. and to the ideals which the revolutionaries put forward. Probably his quiet home life and the purity of his family life had much to do with his popularity, and it should be remembered that in most of his policies which have subsequently been most criticised G. had the bulk of the nation behind him. The next great political question which arose was the question of Catholic emancipation. The Act of Union (1801) had been accompanied by a promise of relief to the Catholics. Pitt's proposals were brought to the ears of the king, and he rejected them entirely, declaring that his honour and his coronation oath were at stake. Pitt resigned, but the attitude of the king was approved and supported by the vast majority of the nation. Addington succeeded Pitt, and retained office until the outbreak of war, when Pitt again came into office. The king's attacks of insanity were now becoming much more frequent. G.'s personal reign really closed in 1811, when his reason finally failed him. He lived on for 9 years, blind and insane. To his people G. was a generally popular king, especially in his

and had 9 sons and 6 daughters. The death of his youngest daughter, the Princess Amelia, in 1810 brought on the final attack of insanity, from which he never recovered. His eldest son, George, was appointed regent until his father's death in 1820. See W. Donne (ed.), *Correspondence of George III with Lord North*, 1867; L. Melville, *Farmer George*, 1907; B. Wilson, *George III, as Man, Monarch, and Statesman*, 1907; Sir G. O. Trevelyan, *George III and Charles Fox*, 1912; L. B. Namier, *The Structure of English Politics at the Accession of George III*, 1929, and *England in the Age of the American Revolution*, 1930; lives by J. D. G. Davies, 1936, and C. E. Vulliamy, 1937; H. Butterfield, *George III, Lord North, and the People, 1779-80*, 1948, and *George III and the Historians*, 1957.

George IV (George Augustus Frederick) (1762-1830), king of Great Britain and Ireland, eldest son of George III, *b.* St James's Palace. He grew up to be exceedingly well gifted and exceptionally handsome. The strictness and seclusion of his home life helped to drive him to a life of extravagance and profligacy, and he plunged heavily into the gay life of London society and had a succession of mistresses. Gradually he became more and more estranged from the king, the profligacy of his life and his early political associates, Fox and Sheridan, both Whigs, helping to widen the breach. In 1783, having come of age, he was given a separate estab. at Carlton House, his debts were paid, and he was granted £50,000 per annum from the Civil List. Shortly after his coming of age he fell in love with a beautiful Catholic widow, Maria Fitzherbert (q.v.), who had been married twice before she met the prince. Marriage with her was impossible under the Act of Settlement of 1689, and further, the Royal Marriage Act of 1772 forbade any marriage without the knowledge of the king. She refused to contemplate becoming the mistress of G., and finally, in 1785, they were married by a clergyman of the Eng. Church. This marriage was acknowledged secretly by his friends and denied openly for political reasons. Their relations were broken off for a time in 1795, but soon renewed, and seem to have ended finally about 1803, though G. acknowledged her as his wife in name until 1811. In 1795 the prince married a Ger. Protestant princess, Caroline of Brunswick. After the birth of the Princess Charlotte, their only child, the couple separated. The position of the prince soon became very important in view of his father's increasing mental instability (1788). He and his friends claimed that he had the right of becoming regent without the consent of Parliament, but the Regency Bill only provided for his appointment with certain restrictions. G.'s first regency was short, but from 1811 until his father's death he was regent continuously, becoming known as the 'Prince Regent.' His treatment of his wife, his extravagance, and his loose living, especially at a time of almost

depression, and his own marked rivalry of the prejudices and virtues of the Eng. nation of the 18th cent. He married in 1761 Charlotte Sophia of Mecklenburg-Strelitz,

universal distress, made him exceedingly unpopular in the country. His appearance in the streets of London was a sign for outburst of hissings, and in 1817 he was stoned on his way to open Parliament. In 1820 he succeeded his father, and immediately plunged into a public quarrel with his discarded wife. Her name left out of the Prayer Book, her title withheld, and her honour doubted, she came to England to enforce her claims. Already the king had tried to divorce her; now she was accused of adultery. But

1817. She had married Leopold of Saxe-Coburg in the previous year. See R. Huish, *Memoirs of George the Fourth*, 1830; R. Grenville, duke of Buckingham, *Memoirs of the Court of England during the Regency, 1811-20*, 1856, and *Memoirs of the Court of George IV*, 2 vols., 1859; D. Creston, *The Regent and his Daughter*, 1932; and a life by R. Fulford, 1935, enlarged edition, 1949.

George V (George Frederick Ernest Albert) (1865-1936), king of Great Britain, Ireland, and the Brit. dominions

Harris's Picture Agency

KING GEORGE V MAKING A CHRISTMAS BROADCAST FROM SANDRINGHAM

the Bill to deprive her of her royal position failed; and throughout the proceedings public sympathy for Caroline was obvious. The disowned queen tried to force her way into the abbey during the coronation proceedings, failed, and retired to die in the Aug. of 1821. The king visited Ireland and Scotland during the early days of his reign, and his popularity there was greater than in England. Though he reigned for 10 years, he exercised no great influence on public affairs, although as he grew older his personal views on politics became increasingly reactionary, and as a ruler he was most unpopular. He was, however, an extravagantly generous patron of the arts and is famous as the creator of Brighton as a fashionable resort. His only child, the Princess Charlotte, d. in

beyond the seas, emperor of India, second son of King Edward VII, was b. at Marlborough House, London. In 1877 he and his brother, the duke of Clarence, became naval cadets. Two years later they cruised to the West Indies in H.M.S. *Bacchante*, and in the following year they made a more prolonged cruise in the same ship. Prince G. was intended to remain in the naval service; for that reason he was appointed to H.M.S. *Canada* in the North Amer. and West Indian station, and became a sub-lieutenant. In 1885, after a course at the Royal Naval College at Greenwich, he became a lieutenant; and in 1889 he commanded a torpedo boat in the naval manoeuvres. In 1890 he commanded the gunboat H.M.S. *Thrush*; but in 1892 he relinquished his commission in the navy on becoming heir apparent

George V

61

George VI

through the death of the duke of Clarence. In the same year he was created duke of York; on 6 July 1893 he married the Princess Victoria Mary of Teck. The duke and duchess visited Australia in 1901 to open the first Federal Parliament. They visited during the return journey South Africa and Canada. In Nov. 1901 the duke was created Prince of Wales. He succeeded his father 6 May 1910 as George V. He was crowned 22 June 1911; and at the end of that year he visited India, being the first Brit. emperor to do so. At his coronation Durbar at Delhi, the transference of the Indian cap. to that place was announced. In July 1914 he called a conference at Buckingham Palace of all Brit. and Irish parties to attempt a settlement of the Ulster difficulty, but no solution was found. During the First World War he frequently visited the W. Front, and at home he and his wife gave up much of their time to visiting factories, hospitals, etc. On 17 July 1917 he proclaimed an alteration in the style of the royal house: in future to be known as 'of Windsor'—all Ger. titles having been renounced. On 22 June 1921, at Belfast, he inaugurated the Parliament of Northern Ireland. He visited Belgium again in May 1922; in May 1923 he visited Rome, and was received by the pope. In April 1924 he opened the Brit. Empire Exhibition at Wembley; on 19 July of the same year he was present at the consecration of Liverpool Cathedral. In the spring of 1925 he was absent from the kingdom sev. weeks, on a health-cruise in the Mediterranean. At the end of Nov. 1928 he fell seriously ill with pleurisy, underwent an operation, and was in so grave a condition that councillors of state were nominated, and all members of the royal family summoned to Buckingham Palace; but he made a good recovery, and in Feb. 1929 was able to go to Bognor to recuperate. He did not resume opening Parliament in person until 28 Oct. 1930. In the period of social and economic turmoil which followed the First World War the popularity of the throne and personal affection for the king and queen steadily increased, as was shown by the public anxiety displayed during the king's illness in 1928, the unprecedented enthusiasm which marked his silver jubilee in May 1935, and the universal grief which followed his death on 20 Jan. 1936 at Sandringham. His quiet dignity, happy family life, and obviously sincere interest in his subjects gave him a unique position among his people. In 1932 he first broadcast a Christmas message to the nation, a practice continued by his son and granddaughter, and characteristic of G.'s desire to be in close touch with the people. Some of the most important events of his reign, apart from the First World War, were the extension of the franchise to women, the estab. of the Irish Free State (1922), the formation of the first Labour Gov. (1924), the General Strike (1926), the economic crisis (1931), and the introduction of the new Indian

constitution. George VI on 22 Oct. 1947 unveiled the statue of his father which is part of the national memorial. The statue stands in the grounds of Westminster Abbey, exactly opposite the entrance to the House of Lords, and is the work of Sir Wm Reid Dick. *See also* KING GEORGE'S FIELDS FOUNDATION. He had 5 sons—Edward (b. 1894), who succeeded him as Edward VIII; Albert (1895–1952), who became George VI; Henry (b. 1900), duke of Gloucester; George (1902–42), duke of Kent; and John (1905–19). There was 1 daughter, Mary (b. 1897), the Princess Royal, later Countess of Harewood. *See* J. Buchan, *The King's Grace*, 1935; life by A. Bryant, 1936; and J. Gore, *King George V: a Personal Memoir*, 1941.

George VI (Albert Frederick Arthur George) (1895–1952), king of Great Britain, Ireland, and the Brit. dominions beyond the seas (the title 'Emperor of India' was dropped from the royal style in 1947 on the passing of the Indian Independence Act of that year); b. 15 Dec. 1895 at York Cottage, Sandringham; second son of George V. He was educ. at the Royal Naval College, Osborne, and Trinity College, Cambridge, and was present at the battle of Jutland, 1916. G. was created Baron Killarney, earl of Inverness, and duke of York, 3 June 1920. He married Elizabeth Angela Marguerite (q.v.), daughter of the earl of Strathmore, on 26 April 1923 at Westminster Abbey, and in the next few years the duke and duchess of York made sev. official visits abroad, including visits to East Africa, the West Indies, Australia, and New Zealand. On the abdication of his brother, Edward VIII (q.v.), he succeeded to the throne on 10 Dec. 1936. His coronation took place at Westminster Abbey on 12 May 1937. Through their strongly democratic appeal the king and queen soon won great popularity, besides restoring the prestige of the Crown. G. himself was distinguished by a kind and unceremonial manner, and a high sense of duty. With the queen he made a 7-week tour of Canada, the U.S.A., and Newfoundland in May and June 1939, meeting with a memorable popular reception. He was the first reigning Brit. sovereign to visit America. For the first time in hist. he performed royal functions in a dominion, appearing in the Canadian Parliament, giving the royal assent to Bills, receiving the U.S.A. minister to Canada for the delivery of his credentials, and signing the Canadian-Amer. treaty of commerce.

Early in the Second World War G. visited the Brit. Army in France (4–10 Dec. 1939). Throughout the war he shared the common suffering of his people; always interested in industry, he paid numerous visits to factories, shipyards, and docks. The king and queen remained in London even though Buckingham Palace itself was damaged by air-raids. They made many visits to severely bombed areas in London, and to all the great prov. cities which had been

attacked. G. visited Malta (20 June 1943) to convey his appreciation of the fortitude of the Maltese during their long ordeal, including this in his fortnight's visit to the Brit. armies in North Africa. He visited Eisenhower's H.Q. in Normandy, 1944, only 10 days after D-Day, and later visited the It. front and the newly-liberated Channel Is. He took the salute of the Victory Parade in the Mall (5 June 1946). With the queen and the 2 princesses he sailed in H.M.S. *Vanguard* on the first visit of a reigning monarch to South Africa, arriving in

daughters: (1) Princess Elizabeth Alexandra Mary, duchess of Edinburgh (b. 21 April 1926), who succeeded him as sovereign, and (2) Princess Margaret Rose (b. 21 Aug. 1930).

George I (1845-1913), king of the Hellenes, b. Copenhagen, the 2nd son of King Christian IX of Denmark. On the Gk throne falling vacant at the expulsion of King Otto in 1862 he was recognised by the powers and elected king of the Hellenes in 1863, resigning his right of succession to the throne of Denmark. In 1867 he married Olga, grand duchess of Russia. He was one of the prin. engineers of the Balkan League formed in 1912, and directed against Turkey. He was assassinated in Salonica, and succeeded by his son, Constantine (q.v.).

George II (1890-1947), king of the Hellenes, b. Tatol near Athens; eldest son of King Constantine, on whose first deposition he was excluded from succession on account of his pro-Ger. sympathies, his younger brother Alexander succeeding. Alexander dying in 1920, and the restored Constantine being again deposed, G. succeeded Sept. 1922. His first gov. was Republican in sympathy, its leading figures being Venizelist (see VENIZELLOS) generals. A group of Royalist generals tried unsuccessfully to overthrow the gov. by force, and G., being implicated, was deposed and banished, while Greece was proclaimed a rep. (Mar. 1924). In 1935 a plebiscite produced an overwhelming majority in favour of G.'s return, and he returned to Athens for the second time as king. Soon afterwards Metaxas (q.v.), a leader of the Royalist party, became, in effect, dictator, abolished the constitution, dissolved Parliament, and claimed royal authority for his new regime. When Mussolini attacked Greece (April 1941) G. and Metaxas declared war on the Allies' side, but when the Germans invaded Greece the Greeks were defeated, and G. left the country for honourable exile as the head of his occupied state. When the war ended, however, the country was in a virtual state of civil war, and Archbishop Damaskinos was appointed regent. Eventually the Royalists gained power, and in 1946 a plebiscite once again resulted in a clear majority in favour of G.'s return. G., however, d. suddenly only a few months after his second return to Greece, and was succeeded by his brother, Paul (q.v.).

George V (1819-78), king of Hanover (1851-66), only son of Ernest Augustus, king of Hanover and duke of Cumberland, and grandson of George III of England, b. Berlin. He became blind in 1833. His illiberal views made him extremely unpopular, and when in 1866 Prussia annexed Hanover G. had few supporters left. The king made many unsuccessful attempts at restoration, and d. while on a visit to Paris. His remains are buried in St George's Chapel, Windsor.

George, D. Lloyd, see LLOYD-GEORGE.
George, Sir Ernest, R.A. (1839-1922), architect, b. London; started practice 1861. His work consisted mainly of

Harris's Picture Agency

KING GEORGE VI

Feb. 1947, and returning to England in May. A further tour to Australia and New Zealand was planned for the spring of 1949, but it was cancelled owing to the illness of the king, who underwent an operation in Mar. 1949 for the relief of an affection of the right leg. His recovery appeared to be complete, and in 1951 he opened the Festival of Britain. Later that year, however, he underwent another serious operation. His elder daughter and her husband increasingly attended public functions in his place, and the king's frailty was apparent.

On 6 Feb. 1952 G. d. suddenly at Sandringham, to the nation's widespread grief. He had struggled all his life against ill-health. Naturally shy and reserved, his sincerity and sympathetic interest in his people had made him loved and respected throughout the Commonwealth. He and Queen Elizabeth had 2

large country-houses, and of tn-houses in West London, e.g. Mount Street and Collingham Gardens. He favoured a picturesque Flem. style, and used terracotta largely for facing tn-houses. He also designed the Royal Academy of Music. He was a competent artist in water-colour. He was president R.I.B.A. 1908-10 and Royal Gold Medallist 1896. Among many famous architects who worked as his assistants were Sir E. Lutyens (q.v.), Sir H. Baker (q.v.), and Sir Guy Dawber.

George, Henry (1839-97), Amer. economist, b. Philadelphia. He left school at an early age in order to support himself, and first went to sea. He afterwards learned the trade of printing, and in 1858 worked his way to California, where he became a journeyman printer. He was, however, soon obliged to leave this trade, owing to its depression, and for the next few years he drifted from one employment to another. In 1865 he began to write for the press, and became a reporter on the San Francisco *Times*, where he rapidly obtained promotion. His most important work, *Progress and Poverty*, was first pub. in 1879, and in a few years obtained great popularity; and, by 1883, G. found himself regarded as the apostle of a new social creed. He wrote numerous articles for magazines, and papers on economic and political subjects, but his literary activities brought him little pecuniary return, and he remained in poor circumstances till his death. See life by his son, Henry, 1900 (also included in G.'s collected works, 1906-11); also A. N. Young, *History of the Single Tax Movement in the United States*, 1916; and J. R. Commons and others, *History of Labour in the United States*, 1918.

George, Stefan (1868-1933), Ger. poet, b. Büdesheim, near Bingen. In 1892 he founded the far-famed *Blätter für die Kunst*, aimed at reforming the Ger. language. He gathered round him an exclusive circle (*George-Kreis*), who were destined to have a profound influence on Ger. and even European intellectual life. His first poetry especially is akin to the Fr. symbolists in its aloofness and imagery: *Hymnen*, 1890, *Jahr der Seele*, 1897, *Teppich des Lebens*, 1899. In his later poems he is more aware of the cultural task of the poet in society, but he continues to stress spiritual over social values: *Der siebente Ring*, 1907, *Der Stern des Bundes*, 1914, *Das neue Reich*, 1928. He also pub. many trans. and adaptations from Mallarmé, Rimbaud, Shakespeare, and Dante. His complete works were pub. in 18 vols., 1927-34. See studies by F. Gundolf, 1921; H. Benrath, 1936; E. G. Winkler, 1937; C. David, 1952; also F. Wolters, *Stefan George und die Blätter für die Kunst*, 1930.

George, Walter Goodall (1853-1943), athlete, b. Calne, Wilts. He was the winner of the record number of 12 Amateur Athletic Association championships, and his time for the m.—4 min. 12½ sec.—stood as the world's record for 37 years.

The amateur championships he won were the m. and 4 m., each 4 times, and the ½ m. and 10 m. each twice. He turned professional in 1884, and his famous record in the m. was made against W. Cummings of Paisley at Lillie Bridge in 1886. In 1882 and 1884 he also won the national cross-country titles. In all he won more than 1000 cups and medals. Although Bannister, Ibbotson, and others have done the m. in under 4 min., G. had not the same advantages from artificial aids; he had little help from the trainer, he had no masseur, tracks were slow and badly laid, and there was no scientific dieting. See **ATHLETICS**.

George, tn in Cape Province (q.v.), South Africa, named after King George III, and described by Anthony Trollope (q.v.) as 'the prettiest village in the world; at least the prettiest I have ever seen.' G. is the seat of an Anglican bishop.

George, Lake: 1. Lake in the E. part of the state of New York, U.S.A., in the Adirondack Mts. connected with Lake Champlain by Ticonderoga Creek, and famed for beautiful scenery, which makes it a favourite summer resort. It is about 33 m. long, and from 1 to 3 m. wide, and is fed by brooks and springs.

2. Lake in New South Wales, Australia, 25 m. SW. of Goulburn. It is a salt-water lake, 25 m. long and 8 m. broad, and is 2129 ft. above the level of the sea.

3. Lake in Uganda, formerly known as Albert Edward Nyanza.

George Cross, honour instituted in 1940 to reward the performance of deeds of valour by civilians, both men and women. It ranks immediately after the Victoria Cross, and is worn before the insignia of all orders and before all other decorations. It took the place of the medal of the Order of the Brit. Empire for Gallantry (E.G.M.), holders of the E.G.M. receiving the G. C. in substitution. There is a military div. of the Cross to permit its award to members of the fighting services who perform acts of great gallantry not in face of the enemy. Among the first recipients were persons who rendered heroic service during Ger. air raids on Britain. Another notable award was to the is. of Malta in recognition of its gallant resistance in the Second World War.

George Frederick Augustus (1832-1904), king of Saxony, b. Dresden, the youngest son of John of Saxony. During the Austro-Prussian war of 1866 he distinguished himself by his military ability and courage, and was made a Prussian field-marshal in 1888. He succeeded his brother Albert on the throne of Saxony in 1902.

George Gemistus Plethon (c. 1355-1452), Byzantine philosopher, b. Constantinople. Founded a sect on the principles of Neoplatonism. His treatises on Plato and Aristotle and on Zoroaster were pub. posthumously. Works printed in J. P. Migne's *Patrologia Graeca*, clx, 1866. See W. Gass, *Gennadius und Plethon*, 1844; H. F. Tozer's article on Plethon in the *Journal of Hellenic Studies*, vii, 1886; and

A. Klekel, *Die Philosophie der Renaissance*, 1925. See NEOPLATONISTS.

George Heriot's School, Edinburgh, public school for boys, founded in 1628 as a residential school for the maintenance and education of fatherless sons of burghesses under the will of George Heriot (q.v.). It was originally called Heriot's Hospital. Its benefits were later extended, and it is now a day-school.

George of Trebizond (1395-1484), Gk philosopher and scholar, b. in the is. of Crete, but descended from a family of Trebizond. As a scholar he was famous in connection with the revival of the study of Gk in Italy. He became prof. of rhetoric and philosophy at Venice, and gained a great reputation as a teacher and translator of Aristotle, engaging in controversy with his contemporary Gemistus Plethon (q.v.).

George the Scholar, see GERNADIUS II.

Georgetown: 1. Cap. of Brit. Guiana (q.v.) and its chief port, on the Demerara R. The chief exports are sugar, coffee, and rum. There are 2 foundries, a dry dock, and factories for the manuf. of rice, cigars, chocolate, candles, aerated water, ice, etc. G.'s deep-sea fisheries are important for local consumers. A modern system of sewage disposal, and electricity, were installed in 1929. G. is connected by rail and ferry with New Amsterdam and the W. coast, and by steamer with the coastal dists. and rivs. Owing to the swampy nature of the surrounding dist. the climate is somewhat unhealthy, though it has much improved of late years. The botanical gardens are rightly famous. Artesian wells supply the city with water. The pre-1945 city was well built on low, flat land, and most of the houses were made of wood. G. was devastated by a fire on 23 Feb. 1945. There was, however, only 1 life lost. The damage was estimated at £2,000,000; but the city has made a full recovery. Pop. 94,200.

2. Municipality in Penang Is., off the W. coast of the Malay Peninsula. It is the main port of the Federation of Malaya, and was elevated to city status by royal charter on 1 Jan. 1957. Pop. 210,000.

3. City and the co. seat of G. co., South Carolina, U.S.A. It is a seaport of some importance, and has steamship communication with New York. It is served by the Seaboard Airline railway, and by steamer services. It has turpentine distilleries, and exports rice, cotton, fish, lumber, etc. G. is famous as the landing-place of Lafayette on his first visit to the U.S.A., and the tn was settled about 1700, incorporated in 1805, and chartered as a city in 1895. Pop. 6000.

4. City, now included within the limits of Washington, in the District of Columbia, U.S.A. Many famous people have lived here, amongst them being Francis Scott Key, J. H. Payne, and J. M. Mason. It was settled in the latter part of the 17th cent., chartered in 1789, and annexed to Washington in 1895.

5. Tn in Tasmania, on the E. bank of the R. Tamar. Formerly a small fishing

centre, G. has grown rapidly since aluminium production works were opened at Bell Bay in 1947. Wharves have been built to enable steamers to discharge and load. Some farming is carried on in G. Pop. 2340.

Georgia: 1. (Georgian *Sakartvelo*) ('constituent rep. of the U.S.S.R., situated in W. Transcaucasia (see TRANSCAUCASIA) adjacent to the Black Sea and the Turkish border. It is largely mountainous, with the main Caucasian range in the N., the Lesser Caucasus in the S., elevated plains in the E., and the Colchis (q.v.) lowland in the W. W. G. (see ARKHAZIA; ADZHAR AUTONOMOUS REPUBLIC; IMERETIA; MINGRELIA) has a humid, Mediterranean climate and subtropical vegetation; E. G. (see IBERIA; KAKHETIA; SOUTH OSSETIAN AUTONOMOUS OBLAST) has a dry, continental climate. The chief rivs. are the Kura and the Rioni. There are large manganese deposits, also coal, oil, peat, and mineral waters. The Georgians, a Caucasian-speaking people, are subdivided into sev. tribal and local groups with different dialects, traditions, and customs. They are mostly Orthodox Christians (since AD 318), with Muslim and Rom. Catholic minorities. Maize, wheat, tobacco, tea, and citrus fruits are cultivated; viticulture and sericulture are practised, and sheep, hogs, and poultry raised. There are varied food and light industries, engineering, metallurgy, coal- and manganese-mining, and oil extraction and refining. The chief tns are Tbilisi (cap.), Kutaisi, Batumi, Sukhumi, Rustavi, Chiatura, Poti, Mtskheta, Telavi. G. was well known in antiquity, and the existence of a Georgian kingdom in Iberia can be traced back to the 3rd cent. BC. Sometimes united, sometimes split into 2 or 3 kingdoms and sev. principalities, G. withstood conquest and domination by Romans, Persians, Byzantium, Arabs, Seljuk Turks, Mongols, the Ottoman Empire, and again Persia. The most outstanding Georgian rulers were King David IV the Builder (1089-1125) and Queen Tamara (1184-1213), both of the house of Bagratidae (q.v.). Under Tamara G. and its vassal tns. comprised the whole of Transcaucasia and neighbouring areas. The celebrated Georgian poet Rustaveli was her contemporary and dedicated to her his famous poem *The Knight in Panther's Skin*. Before 1774 W. G. was under Turkish suzerainty, E. G. under Persian. In 1783 the king of E. G. obtained Russian protection. The last E. Georgian king, threatened by Persia, ceded his country to Russia in 1800. Most princes of W. G. followed in 1803-4, though the mountainous Svanetia was not annexed until 1858. The 19th-early 20th cent. was a period of rapid growth of Georgian pop. and economic and cultural progress. Politically most influential in G. were the Social Democrats—Mensheviks (see MENSHEVIK); RUSSIAN SOCIAL DEMOCRATIC LABOUR PARTY) and Georgian Socialist-Federalists, a Populist (see POPULISM) party which advocated a Transcaucasian Fe-

deration (q.v.) within a Federal Russia. The Transcaucasian Federation was in fact formed under Menshevik leadership after the Oct. Revolution (q.v.), but soon broke up, and in 1918-21 G. was a separate democratic rep. with a Menshevik gov., first independent, then under Brit. occupation, and mostly at war with Armenia and Azerbaijan. In 1921 G. was easily conquered by the Red Army with the help of local Communists and transformed into a Soviet rep. From 1922 to 1936 G. belonged to the Transcaucasian Soviet Federal Rep. A large-scale anti-Communist uprising in 1924 was suppressed, as were riots in Tbilisi in 1956. Area 27,000 sq. m.; pop. (1956) 4,000,000, mostly Georgians (60 per cent), Armenians (12 per cent), and Russians (9 per cent). See W. E. D. Allen, *A History of the Georgian People*, 1932.

2. One of the original 13 states of the U.S.A. It is a S. Atlantic state, bounded on the N. by Tennessee and North Carolina, on the E. by South Carolina and the Atlantic Ocean, on the S. by Florida, and on the W. by Alabama. It is the largest state E. of the Mississippi. The total area is 58,876 sq. m., of which 300 sq. m. are water. The surface of the state is divided between highlands and lowlands, the Blue Ridge Mts (average elevation 3000 ft) terminating in the N. part of the state. Its drainage system is extensive, the prin. rivs. being the Savannah, the Altamaha, the Chattahoochee, and the Flint. The climate of G. shows a wide range of temp., and differs considerably in the various localities. In S. G. the climate is similar to that of N. Florida. The winters and summers are, however, free from extremes, and on the whole the climate is temperate. The greatest rainfall occurs in the extreme N., and the smallest in the E. G. is also notable for its variety of soils. In the N. part sands and clay predominate, but in the extreme NW. the soil possesses great fertility, being of a loamy character. By far the greatest variety is found in the coastal plain region; here abound red clay, grey sandy soils, and a subsoil of yellow loam. The flora and fauna of G. have no distinctive features, but in mineral resources it shows as great a variety as in its climate and soils. The most important of these is stone. The marble industry, too, has steadily grown in importance during the past years, and the G. marble has gained a reputation throughout the U.S.A. Other mineral products are silver, copper, asbestos, talc, mica, slate, limestone, cement, etc. Coal is not extensively found. Gold was found in White Co. in 1829, and even diamonds have been discovered, though not exploited. The fisheries of G. are important, oysters and shad constituting the bulk of the catch. Farming and manufacturing are the primary bases of the state's economy. The products are extremely diversified, and with the exception of the tropical fruits of California and Florida G. can cultivate almost everything produced by the U.S.A. The prin. cereals

grown are corn, wheat, oats, and rice. G. ranks second among the cotton-growing commonwealths, and has an enormous cotton-growing area. Cotton, peanuts, and tobacco are the chief cash crops. G. leads the U.S.A. in peanut and pecan production, and ranks high in peaches, and some truck crops. Livestock raising is extensive. The growth of sugar-cane is increasing. The chief industry is the manuf. of cotton-goods; others are the production of lumber, fertiliser, and food products, metal fabricating, brick and tile manufacturing, mining, printing, and publishing. Manufacturing has now passed agriculture in importance owing to the vast development of waterpower. Forests, chiefly pine, cover two-thirds of the state. G. produces 75 per cent of U.S.A. naval stores (about 50 per cent of world production) and tyre cord. Since 1916 education has been compulsory. Institutions of higher learning include the univ. of G. (at Athens), G. Institute of Technology, Emory Univ. (at Atlanta), and Mercer Univ. (at Macon). The cap. is Atlanta and the chief port Savannah. G. was the last of the Eng. colonies to be estab. in America, and is called after George II of Great Britain. It was founded by Oglethorpe as a refuge for poor debtors. It took an important part in the revolutionary war. In 1861 it passed the ordinance of secession and in 1870 was re-admitted into the Union. Pop. 3,444,580. The prin. cities are Atlanta, 331,314; Savannah, 119,638; Columbus, 79,611; Augusta, 71,508; Macon, 70,252. See C. Howell, *History of Georgia*, 1926; E. M. Coulter, *A Short History of Georgia*, 1933; and A. B. Saye, *New Viewpoints in Georgian History*, 1943.

Georgia, Gulf of. This strait separates Vancouver Is. from Brit. Columbia; it is 30 m. broad and about 250 m. long. It meets the Pacific Ocean at Queen Charlotte Sound on the N. and Juan de Fuca Strait on the S.

Georgian Architecture, see ENGLISH ARCHITECTURE.

Georgian Bay constitutes the N.E. section of Lake Huron in North America, and is divided from the lake by Manitoulin Is. and the peninsula containing the 2 cos. Grey and Bruce. The bay is nearly 100 m. long and 50 m. broad. It is fed by many rivs., chief among which are the R.s. French, Maganatawan, and Muskoka. The S. portion of the bay is watered by the R. Nottawasaga. The Trent Valley Canal connects the bay with the bay of Quinte and Lake Ontario.

Geosyncline, geological term applied to a part of the surface of the earth which is subsiding on a regional scale and upon which marine sediments are accumulating. An essential feature of a G. is its size. Virtually the greater part of Wales was occupied by part of a small G. in early Palaeozoic times, while another G. lay where W. and N. Norway are now. The sediments within a G. may reach tens of thousands of ft in thickness as they accumulate on a gradually subsiding sea

floor, a process which may continue for 100 million years or more. Many G.s become mt chains subsequently as these thick successions of sediments are uplifted in a later orogeny (q.v.). Thus the geosynclinal sediments which accumulated during the Mesozoic in the Tethys Sea, a sea which extended from the present-day Mediterranean and S. Europe to Indonesia, were subsequently uplifted during the Tertiary Alpine orogeny to form the Alps and the Himalaya.

Geotropism, see TROPISM.

Gephyrea, name given to a large class of marine worms, which includes the 4 orders Sipunculoides, Priapuloides, Echiuroides, and Epithetosomatoides. The Sipunculoides are elongated and vermiform in shape, and live in the ooze and sand at the bottom of the sea; occasionally they bore into coral rock: *Phymosoma* and *Sipunculus* are the most important genera. The Priapuloides contain the 2 genera *Priapulus* and *Halirypus*, cylindrical animals with the mouth at one end and the anus at the other. The Echiuroides are distinguished by the presence of a long contractile dorsal outgrowth, forming the proboscis. The Epithetosomatoides contain a single family which are remarkable for their long, tubular proboscis, and for a series of pores which lie on each side of the body.

Gera: 1. Dist. (*Besirk*) of the Ger. Democratic Rep. (E. Germany), bounded on the N. by Leipzig, on the E. by Karl-Marx-Stadt, on the S. by Bavaria, and on the W. by Suhl and Erfurt (q.v.). It was formerly part of Thuringia (q.v.). Area 1478 sq. m.; pop. 751,000.

2. Ger. city, cap. of the dist. of G., on the White Elster, 128 m. SSW. of Berlin. It was formerly the cap. of a Reuss (q.v.) principality. There is a palace and a 16th-cent. tn hall. Textiles, chemicals, and machinery are manuf. Pop. 85,000.

Gerald of Wales, see GIRALDUS CAMBRENSIS.

Geraldton, tn 312 m. from Perth in Western Australia, situated on Camption Bay. It is noted as being the port for the Murchison goldfield. It has a good harbour; the chief exports are gold, copper, sandalwood, and wool. Pop. 8308.

Geranium, genus of plants of family Geraniaceae. Chiefly ann. or perennial herbaceous plants with palmately lobed leaves and regular 5-petaled flowers. A characteristic elongated beak-like process attached to the ovary gives the genus the popular name of 'Crane's-bill'. Native species are *G. robertianum*, Herb Robert; *G. columbinum*, long-stalked Crane's-bill, *G. dissectum*, Cut-leaved Crane's-bill, *G. molle*, Dove-foot Crane's-bill, *G. lucidum*, Shining Crane's-bill, *G. rotundifolium*, Round-leaved Crane's-bill, all ann. *G. argenteum*, *G. cinereum*, *G. endressii*, *G. ibericum*, and *G. pratense* are good garden plants. The garden 'Geranium' belongs to the Pelargonium genus (q.v.).

Gérard, Etienne Maurice, Comte (1773-1852), Fr. gen. and marshal of France under Louis-Philippe. He served as a

volunteer under Dumouriez and Jourdan, became captain in 1794, and accompanied Bernadotte to Vienna as aide-de-camp in 1798. He was present at Jena (1806), Erfurt (1806), and commanded the Saxon cavalry at Wagram (1809). G. first won fame by his splendid charge at Austerlitz in 1805. He went to Portugal from 1810 to 1811, and then did great service to France during Napoleon's Russian campaign, helping to save the rearguard of the Grande Armée during the retreat, 1812. He distinguished himself at Bautzen in 1813, was wounded at Leipzig, but fought at La Rothière and Montereau. Joining Napoleon after his escape from Elba, G. fought at Ligny in 1815 with Grouchy. Louis XVIII named him Grand Cross of the Légion d'Honneur. G. was a member of the Chamber of Deputies in 1822 and 1827, took part in the revolution of 1830, besieged and took Antwerp, 1832, and succeeded Mortier as grand chancellor of the Légion d'Honneur, 1835. Napoleon III made him senator in 1852.

Gérard, François Pascal, Baron (1770-1837), Fr. painter, b. Rome. He entered the Pension du Roi at Paris at the age of 12, and from there went to the studios of Pajou, the sculptor, and Brenet, the painter, whom he left shortly to study under David. He competed for the Prix de Rome in 1789, but was unsuccessful. Two years later he again presented himself, but his father's death prevented the completion of his work. He then went to Rome for a year, but returned to Paris in 1791, and obtained employment under his former master, David, q.v. In 1796 he painted his famous 'Bélisaire,' and the following year 'Psyché et l'Amour.' From 1808 to 1810 he exhibited quite a number of pictures at the Fr. Salon. He is best remembered for his portraits, notably of Napoleon, Talleyrand, Mme de Staël, and Mme Récamier. See memoir by Charles Lenormant, 1846.

Gerard, James Watson (1867-1951), Amer. lawyer and ambas., b. Geneseo, New York. G. graduated from Columbia Univ. in 1890. In 1892 he was admitted to the Bar, and began practice in New York city. He was chairman of the Democratic campaign committee of New York co. for 4 years. He was elected associate justice of supreme court of New York for term 1908-21, but resigned 9 Sept. 1913, in order to become U.S.A. ambas. to Germany. Before the entry of America into the First World War G. was most energetic in seeing to the interests of Brit. prisoners in Germany. He gives a detailed account of his experiences in *My Four Years in Germany*, 1917, written when he had resumed practice in New York.

Gérard, Jean Ignace, see under GRAND-VILLE.

Gerard of Cremona (1114-87), medieval translator of Ptolemy's astronomy. He studied ancient wisdom in the Sp. and Muslim schools of Toledo, and having acquired a knowledge of Arabic, devoted the remainder of his life to the making

of Lat. trans. from its literature. His most celebrated works are the translation of Ptolemy's *Almagest* and the *Toledan Tables*. He d. at Cremona in Lombardy.

Gerarde, John (1545-1612), herbalist and writer on gardening. He lived for some time at Holborn, London, keeping a large physic garden there, and practising as a barber-surgeon. He kept Lord Burghley's gardens for over 20 years. In 1596 G. pub. his *Catalogus arborum fruticum ac plantarum... in horto Joannis Gerardi*... (1100 varieties). His *Herball*, or *Generall Historie of Plantes*, 1597, the most popular of all Eng. herbals, was based on Dodoens's *Stirptium historiac pemptades*, 1583. An enlarged ed. was issued by Thomas Johnson in 1633. G. became master of the Company of Barber-Surgeons, 1607. See M. Woodward, *Gerard's Herball*, 1636; E. Arber (editor), *A Transcript of the Registers of the Company of Stationers of London*, iii. 21, 1875; and Alice Tudor, *A Little Book of Healing Herbs, gathered from an Old Herball*, 1927.

Gérardmer, or **Géromé**, Fr. tn in the dept of Vosges. It is a tourist centre, in a most picturesque position at the E. end of lake G., which is surrounded by mountains covered by fine forests. Part of the tn was burnt in the Second World War. It manufs. textiles, household utensils, and Géromé cheese. Pop. 5800.

Gerasa (modern **Jerash**), antc city of the Decapolis, Palestine, 56 mi. from Jerusalem. It is among the mts of Gilead, about 20 m. E. of Jordan, and has been identified with Ramoth-gilead. In 83 bc it was captured by Alexander Jannaeus of the Maccabean line, and rebuilt by the Romans, 65 bc. G. was very important in the time of the Antonines (AD 138-80), and was a bishop's see in the early Christian era. The ruined forum, colonnaded streets, theatres, and temple probably date from the 2nd and 3rd cents. AD.

Gerbera, genus of perennial herbs, family Compositae, native to Africa and Asia, about 40 species. *G. jamesonii*, Barberton Daisy, is grown for its large daisy-like flowers.

Gerfalcon, see JERFALCON; FALCON.

Gerhardt, Karl Friedrich (Charles Frédéric) (1816-56), Fr. chemist, native of Strasburg. He studied under Liebig at Giessen, and with Chevreul, and trans. sev. works of Berzelius and Liebig. He went to Paris, and in collaboration with Laurent and Cahours contributed to the *Annales de chimie et de physique*. With Cahours he wrote a memoir on essential oils, embodying new theories. G. was prof. at Montpellier, 1844-8, and then returned to Paris, the greater part of his work being done in that city. In 1855 he became prof. of chem. at Strasburg. His chief works are *Précis de chimie organique*, 1844-5, *Introduction à l'étude de la chimie par le système unitaire*, 1848, *Précis d'analyse chimique*, 1855, *Traité de chimie organique*, 1853-6. See Cahours, *Notices sur Charles Gerhardt*, 1856; and

E. Grimaux, *Charles Gerhardt, sa vie, son oeuvre, sa correspondance*, 1900.

Gerhardt, Paulus (Paul) (1607-76), hymn-writer of Saxony, second only to Luther; he studied at Wittenberg, became pastor at Mittenwald, 1651, Berlin, 1657-67; moved to Lübben, 1669, and was pastor there in the Spreewald till his death. G. supported the Lutherans against the other reformed churches. His most celebrated hymns are 'Nun ruhen alle Wälder,' 'Wach auf mein Herz, und singe,' 1648, 'Warum sollt ich mich denn grämen?' 1653, 'Befehl du deine Wege,' 1656 (Wesley's 'Commit thou all thy ways'); 'O Haupt voll Blut und Wunden' (Alexander's 'O sacred head once wounded'). His *Collected Hymns* first appeared 1667. A good ed. is that of A. Ebeling, 1908. See F. Roth, *P. Gerhardt*, 1832 (ed. by Lommatsch, 1893); K. Langbecker, *P. Gerhardt's Leben und Lieder*, 1841; J. Kelly, *Gerhardt's Spiritual Songs*, 1867; and study by E. Kochs, 1926.

Geriatrics, branch of medicine that relates to diseases of old age. The term was first used by a New York physician, I. L. Nascher, in an article on G. pub. 1909. He advocated a more curative attitude of mind towards the medical problems of the aged as opposed to the traditional approach that little could be done beyond trying to solve the social problems presented by old people without kith or kin to care for them. For a long time in Great Britain the aged have been cared for in infirmaries, alms houses, and old people's homes, some of them local gov. institutions and some charitable foundations. But, in the main, until recently little active medical treatment was given in these beyond relieving certain acute emergencies and providing palliative remedies. During the second quarter of this century social changes, together with advances in medicine, have compelled a new outlook on the problems of the aged sick and G. may be said to have become estab. as a recognised branch of medicine since the end of the Second World War. It was estimated in 1956 that there were 1½ million people living alone in Great Britain and that 63 per cent of these were over 60. Of these, 34 per cent (13 per cent males and 21 per cent females) were bedridden. The number of old people in the pop. has been, and is still, steadily increasing compared with a decrease in the number of younger people, with the result that there are now fewer active members of families to care for their aged relatives in the home, and there has been an ever-growing demand on institutional beds. The financial cost and administrative difficulties imposed on the State-owned hospital service has been considerable. It has therefore become urgent in the interests of the nation as well as of common humanity actively to apply modern advances in medicine to curing the diseases of the aged where possible or, alternatively, to restoring to them the maximum of function. A hopeful, positive approach has taken the place

of the old hopeless, negative attitude, and it is proving increasingly successful. The general aim of G. policy is not to keep patients in bed if they can be got up, nor to send them into hospital if they can be kept at home, and to provide them with an occupation within the limits of their capabilities. To make senile people into active juveniles is clearly impossible, but modern medical treatment enables many of their diseases to be cured or allayed sufficiently for them to become once again useful if not overactive members of society. Many long-standing hospital cases, bedridden and regarded as hopeless, have been made fit to return home by modern treatment. Modern anaesthetics and modern surgery enable remedial operations to be performed on people whose age and infirmity would previously have made such treatment out of the question. Much is being done in the way of clubs and other community activities to restore an interest in life to old people. G. specialists have been appointed in most dists. and they are responsible for directing the treatment of patients in the wards of G. hospitals. They also visit patients who are awaiting admission to hospital, and in consultation with the patient's family doctor they advise on domiciliary treatment. Often this procedure removes altogether the need for admission to hospital. The family doctor, upon whom falls the brunt of the treatment of old people, has to assist him dist. nurses, health visitors, home helps, and such social aids as the 'meals on wheels' service. Physiotherapy (q.v.) and occupational therapy (q.v.) are most important auxiliary aids in G., but neither of these services is sufficiently developed as yet to cover much more than the requirements of hospitals. Chiropody treatment is being used increasingly in G. and has restored many immobile patients to a degree of activity again. The registration of the blind (q.v.) has brought much aid to these people in the way of visitors and services which increase their ability to keep in touch with normal life. See Lord Amulree, *Adding Life to Years*, 1951. See also LONGEVITY.

Géricault, Jean Louis André Théodore (1791-1824), Fr. painter, leader of the Romantic as opposed to the Classical school. He was a pupil of Vernet (1808) and Guérin (1810). During the Hundred Days (1814) he entered the army for a short time. He soon returned to his art, visiting Italy (1816-18) and England (1820-2), painting the Derby at Epsom. 'Le Radeau de la Méduse,' 1819, his most famous work, a great picture of a sea disaster, is now in the Louvre. The Wallace Collection, London, has his 'Equestrian Portrait of the Prince Regent.' His horses are especially fine. Other pictures are 'A Cavalry Officer on Horseback,' 1812, 'Wounded Cuirassier,' 1814, and studies for a picture of a horse-race in the Corso during Carnival. G. also produced a few bronzes and wax-sketches. See C. Clément, *Géricault*,

1867; and lives by L. Rosenthal, 1905, L. Deltell, 1924, and R. Régamey, 1926; also K. Berger *Géricault, Drawings and Water Colours*, 1946, and *Géricault und sein Werk*, 1951.

Gerizim and Ebal, in scriptural geography 2 hills of Samaria, Palestine. The former (c. 2850 ft high) stands opposite the latter (c. 3000 ft high), which is on the N. side of the fertile valley in which lies Nablûs (ancient Shechem). The curse for disobedience to the law was pronounced from Mt Ebal, the blessing for obedience from Mt Gerizim (Joshua viii. 33). After the conquest of Canaan Joshua erected an altar to Jehovah on Ebal (modern Arabic name *Jebel Eslamiyah*). The Samaritans built their temple on G.

Gerle, Hans (16th cent.), Ger. lutenist, see GERMAN (AND AUSTRIAN) MUSIC.

Germ, see BACTERIA; BIOLOGY.

German, Sir Edward (Edward German Jones) (1862-1936), composer, b. Shropshire; studied at the Royal Academy of Music, 1880-7. His operetta, *The Royal Poets*, was first produced at St George's Hall in 1886. In 1888 G. became director of music at the Globe Theatre, London, under Mansfield's management. His incidental music to *Richard III*, 1889, was the first of a series of similar compositions for Shakespearean and other plays. *Henry VIII* appeared at the Lyceum, 1892-3, dances from which became immensely popular; *Romeo and Juliet*, 1895, *As You Like It* (St James's Theatre), 1896, and *Much Ado About Nothing*, 1898. G. also wrote 2 symphonies, a *Welsh Rhapsody*, and other orchestral works; his later operettas were *Merric England*, 1902, *A Princess of Kensington*, 1903, *Tom Jones*, 1907, and *Fallen Fairies* (with Gilbert), 1909; and he completed Sullivan's *The Emerald Isle*, 1901. G.'s music is of the school of Sullivan, but has far less character, and the O.E. flavour of his dances and *Merric England* is artificial. See life by W. H. Scott, 1932.

German Architecture is here assumed to include Austria and Czechoslovakia, both of which once formed part of the old Ger. empire. At its greatest extent Rom. dominion extended as far as the Danube and the Rhine, but remains of Rom. buildings are chiefly confined to a few cities of the Rhineland, especially Trèves or Trier (*Augusta Treverorum*), where there are ruins of basilicas and baths. The imposing Porta Nigra, a work of the 3rd or 4th cent., stands almost intact. Very little building took place after the Rom. evacuation in the 5th cent.; but under Charlemagne the 'Dark Ages' became less dark than elsewhere; and at Aachen he built the Dom or cathedral in 796-804, partly to serve as his mausoleum. It is a great domed polygon. (The beautiful choir, in late-Gothic style, was added in 1414.) A few minor buildings of the same period survive; then there is a gap until we reach the abbey of Gertrude in the Harz, c. 960; and then come a group of splendid Romanesque churches in the Rhineland, so that this has sometimes been called 'Rhenish architecture';

including the cathedrals of Worms (1016-1181), Mainz, Speyer, and Trier; the abbey-church of Laach; and in Cologne the churches of S. Maria im Kapitol, St. Martin, and the Holy Apostles. Outside the Rhineland the finest Romanesque churches are the cathedral at Bamberg, and St. Godehard and St. Michael at Hildesheim. Sev. of these great churches have apses at both W. end and E. end, each generally flanked by gabled towers. Arcading is freely used as external decoration, this being a feature borrowed from Italy. There is little Romanesque architecture of note in Austria or Czechoslovakia.

The transition from Romanesque to Gothic may be studied at the cathedral of Limburg and the churches of St. Gercon and St. Cunibert, both in Cologne. Ger. Gothic architecture, though distinctive in its later phases, is directly derived from France. Typical examples are St. Elizabeth at Marburg; Cologne, Freiburg, Ratisbon cathedrals, and most of Vienna cathedral; the nave of Strasburg Cathedral; the choir of Prague Cathedral; the Frauenkirche at Nuremberg; and sev. fine brick churches in N. Prussia, especially the Marienkirche at Lübeck and the Marienkirche at Danzig. Germany still contains many picturesque timbered medieval houses. Neubrandenburg in Prussia has quaint medieval gates, and the town of Rothenburg in Bavaria and Goslar in the Harz preserve a medieval aspect. The Renaissance reached Germany and Austria rather late. In Austria it followed the classical tradition more closely than in Germany, where native architects usually derived their inspiration from the same Flem. copy-books that guided our Elizabethan and Jacobean architects; so that Ger. buildings of the late 16th and early 17th cents. resemble contemporary Eng. examples. They include the town halls of Augsburg, Bremen, Leipzig, Molsheim, Paderborn, and Posen; the Marienkirche at Wolfenbüttel, additions to the Schloss at Heidelberg, the Schloss at Aschaffenburg, and those at Stuttgart and Wilhelmsburg. More Italian in appearance are the Schloss at Wolfenbüttel; St. Michael's church, Munich; the Hofkirche at Neuburg; the Belvedere and the Micoyna in the royal castle at Prague.

Both Austria and S. Germany are very rich in buildings, especially churches, of the Baroque and Rococo periods, including the huge Karlskirche (1716-36) and the Univ. Church at Vienna; 3 large churches at Salzburg; the Theatine church at Munich; St. Martin's, Bamberg; the Jesuit church, Mannheim; the Domkirche, Fulda; the Frauenkirche, Dresden; the great monasteries of Melk (1701-16), Wiblingen, Ottobrunen, St. Florian, Gottweig; the Residenz, Würzburg; the Czernin, Clam Gallas, and Wallenstein palaces in Prague; the Kinsky and Trautson palaces as well as the great group of royal buildings in Vienna; the Zwinger palace at Dresden; Schloss Nymphenburg at Munich; and

the Rococo palace of Sans Souci at Potsdam.

The 'Greek Revival' (q.v.) reached Germany early in the 19th cent. Its chief products were the Propylaea, the Pinakothek, the Glyptothek, and the Walhalla at Munich, all designed by L. von Klenze (1784-1864); and the Brandenburger Gate, Royal Theatre, Old Museum, and Königswache in Berlin, all by K. von Schinkel (q.v.). Then followed the 'Gothic Revival' (q.v.) and

THE STADTWEINHAUS OF MÜNSTER

A replica (1905) of the old Stadtwinehaus built in 1569-71

next the 'Free Classic' movement, of which typical examples are the Cathedral (1894-1905) and the Reichstag (1884-94), both in Berlin.

Just before the First World War a more distinctive style had begun to appear, fathered by P. Behrens (q.v.), and exemplified in the large departmental-store buildings of Tietz and Wertheim in the chief cities. In the 1920's, however, a sudden change took place, and 'functional' buildings of steel, reinforced concrete and glass were designed by a group of brilliant architects, including Gropius (q.v.) and Mendelsohn (q.v.). Sev. of these men were Jews, and had to

see the country as Hitler came to power. They settled in England or America. Hitler himself had always intended to become an architect: had his ambition been realised, he might have been content, and then the Second World War would never have occurred. Before it began he had managed to secure the erection of the vast Congress Hall and Stadium at Nuremberg, also the Chancellery and the Sports Centre at Berlin, all designed by his protégé Albert Speer, who later became one of the chief Nazi ministers. Hitler's aim was to reverse the tendencies of the Jewish modernist architects, and to bring about a return to a more traditional and classic style of building.

German Art. Germany has never occupied a leading position, comparable to that of Italy or France, in the hist. of visual art in W. Europe, but the works produced there have an interesting individual character, and the best of them are acknowledged to approach to the masterpieces of more famous schools.

The medieval art of Germany developed out of that of the Carolingian Empire of the 9th cent. Carolingian art itself was a W. European rather than a specifically Ger. phenomenon, but it has left some monuments on Ger. soil, of which the most important is the octagonal domed chapel, which still forms the nucleus of the cathedral at Aachen, the central seat of Charlemagne's Gov. A specifically national style first appeared in the Ottonian period during the latter part of the 10th and the first half of the 11th cent. This was a period of great activity in architecture (see GERMAN ARCHITECTURE) and MS. illumination and, to a lesser extent, in sculpture. The monastery of Reichenau was specially celebrated for the production of illuminated MSS., of which a fine example is the Gospels of Otto III, now in Munich, executed about the year 1000. The finest surviving sculptures are the bronze doors of the cathedral of Hildesheim executed in 1015. Both the painting and the sculpture of this period, though based on Rom. and Carolingian models, are distinguished by a vigour of emotional expression that is characteristically German. The 12th cent. was a period of less artistic activity, though some fine churches were built. The rock carving of the Deposition at the Externsteine, near Detmold, executed in 1215, is an extraordinarily moving composition. Towards the end of the first quarter of the 13th cent. the Gothic style of architecture began to reach Germany from France. There was also a revival of sculpture in the 13th cent., contemporary with the first introduction of the Gothic style in architecture but itself representing rather a last flowering of the Romanesque. The most important surviving monuments of this style are the series of figures decorating the cathedrals of Freiberg in Saxony, Bamberg, Naumburg, Strasburg, Paderborn, and Münster, dating from between 1230 and 1250. This grand monumental style was succeeded in the 14th cent. by the pretty but

over-elaborate 'international style' of Gothic common to the whole of Europe at that period, and an individual Ger. style in sculpture hardly reasserted itself before the second half of the 15th cent.

There are no monuments of painting surviving comparable in importance to the great sculptured decorations of the 13th cent., but in the later 14th and earlier 15th cent. the 'international style' was developed in interesting and individual ways by such artists as Bertram von Minden and Konrad von Soest in Westphalia, Stephan Lochner in Cologne, and Meister Francke in Hamburg, whose work prepared the way for the great movement of the end of the 15th and the beginning of the 16th cent. This period is justly the most famous in the hist. of G. A. The leading sculptors were Veit Stoss (1438-1533) and Peter Vischer the elder (1455-1529), both of Nuremberg, and Tilman Riemenschneider (1480-1531) of Würzburg, all of whom combine a mannered angular development of Gothic drapery with greatly increased freedom of movement and naturalism of expression. Vischer (q.v.) is especially famous for his bronze statues on the tomb of the Emperor Maximilian at Innsbruck, 1513. In painting we find a parallel development in the work of Martin Schongauer (d. 1499) (q.v.), who is well known as an engraver, and in whose work the influence of the school of the Van Eycks is evident. The works of the artists of the next generation show a greater originality of style, and it is on them that the claim of Germany to have produced a school of painting of major European importance must chiefly rest. Matthias Grünewald (1470/80-1529) (q.v.) is an expressionist painter of unsurpassed emotional force, but the greatest figure is Albrecht Dürer of Nuremberg (1471-1528) (q.v.), unrivalled in his country as painter, engraver, and draughtsman. Dürer twice visited Venice and was influenced by the developed Renaissance art which he saw there. This influence was mainly confined to his paintings and was not wholly beneficial as may be seen in his 2 panels of apostles in Munich. He is at his best as a portrait painter and as an engraver and draughtsman, where he combines clarity of design with rich and exquisite detail. His water-colour sketches are remarkable for the breadth of handling. Gifted younger contemporaries of Dürer's were Hans Baldung Grien (1475/80-1545) (q.v.) and Albrecht Altdorfer (c. 1480-1538) (q.v.), while Lucas Cranach the elder (1472-1553) (q.v.), a painter of delightful mythological pictures and excellent portraits, carries to the middle of the century something of the spirit of its opening years. The troubles of the Reformation brought about a decay of artistic activity after about 1530. In architecture a mannered style of Renaissance decoration, of Flem. inspiration, supersedes the elaborate late Gothic, but in plan and construction buildings retain their essentially Gothic character. In sculpture there are no figures of

outstanding importance. In painting there are some good local schools of portraiture, but the only really important artist is Adam Elsheimer of Frankfurt (1578-1610) (q.v.), who spent the last decade of his life in Rome. The Thirty Years War checked even this reduced activity and the art that we find in the second half of the 17th cent. is mainly a court art, based on imported Baroque models and with little connection with anything that had gone before. Recovery from the Thirty Years War was slow, and it is not until the end of the century that Germany produced an architect and sculptor of note in Andreas Schlüter (1664-1714), who built part of the Schloss at Berlin and made the equestrian statue of the Great Elector there.

During the first half of the 18th cent. a development of the Baroque style took place in S. Germany in which architecture, sculpture, and painting were combined to produce the most striking theatrical effects. Though the origins of this style are to be found in Italy it represents an important and original Ger. contribution to the Baroque movement. The 18th cent. produced no very notable native painting. The most important painter working in Germany during the first half of the century, Antoine Pesne (1683-1757), was a Frenchman, and the great Venetian, G. B. Tiepolo, worked some years at Würzburg in the middle of the century. Anton Raphael Mengs of Dresden (1728-79) (q.v.), the most prominent artist of the second half of the century, worked much in Italy and based his style on the It. painters of the High Renaissance. At the end of the century, the Neo-Classical style was enthusiastically adopted in Germany and retained its popularity until the middle of the 19th cent.

In sculpture the Neo-Classical style is found in the works of Gottfried Schadow (1764-1850) (q.v.). In the second half of the century Adolf Hildebrand (1847-1921) (q.v.) based his style on a wider traditionalism, drawing inspiration from the great masters of the Renaissance as well as from classical models. More interesting movements are found in the painting of the 19th cent. Contemporary with the Neo-Classical style in architecture and sculpture was the Romantic movement in painting which was distinguished by a clarity of form which it owed to Neo-Classical influence. At the beginning of this movement stands a group of painters active in Rome, and known as the Nazarenes, who in their aims and methods in some respects anticipated the Eng. pre-Raphaelite Brotherhood. Their leader was Friedrich Overbeck (1783-1869) (q.v.). Philip Otto Runge of Hamburg (1777-1810) (q.v.) followed a similar line, and but for his early death would probably have occupied a dominating position. More frankly Romantic was the work of the great landscape painter Caspar David Friedrich (1774-1840) (q.v.). The Romantic style was carried on in the next generation by Ludwig Richter

(1803-84), Moritz von Schwind (1805-71) (q.v.), and Alfred Rethel (1816-59) (q.v.). A more straightforward realist painter was Adolf von Menzel (1815-1905) (q.v.), while a richer and more impressionist style of painting distinguished the Romanticism of Arnold Böcklin (1827-1901) (q.v.), Anselm Feuerbach (1829-80) (q.v.), and Hans von Marées (1837-87). Franz von Lenbach (1836-1904) (q.v.) and Wilhelm Leibl (1844-1900) were figure painters of distinction. The influence of the Fr. Impressionist movement can be seen in the work of Max Lieberman (1847-1935) (q.v.), while post-Impressionism was reflected in the Expressionism of Paula Modersohn-Becker (1876-1907) and Franz Marc (1880-1916). The sculpture of Ernst Barlach (1870-1938) and Käthe Kollwitz (1867-1945) was harsh but sincerely expressive. During the period between the First World War and the advent of Hitler Ger. artists tried a bewildering variety of experiments both in sculpture and painting, ranging from revival of primitive styles to complete abstraction. The policy of Dr Goebbels favoured a negative academic traditionalism or an hysterically expressive propaganda. After dictatorship and war no certain direction appears in G. A. Some artists, such as George Grosz, Max Beckmann, Lyonel Feininger, were to find the U.S.A. congenial. Some, like Bernhard Heiliger (1915-), have been influenced by Henry Moore. Earnestness and sincerity in modern efforts (which include a struggle with the problems of abstract form), says Prof. C. G. Heise of the Hamburg Kunst halle 'are witnesses of past suffering.' See G. Dehlo, *Geschichte der deutschen Kunst*, 1919-34; W. Museler, *Deutsche Kunst im Wandel der Seilen Berlin*, 1938; H. Picton, *Early German Art and its Origins*, 1939; and *Works of Art in Germany (British Zone of Occupation: Losses and Survivals in the IVar (H.M.S.O.), 1946.*

German Art Museums. Of great importance is the Bavarian State Gallery, commonly known as the Old Pinakothek, Munich. It was built early in the 19th cent. by Ludwig I, housing the existing dual collections (that of Maximilian Emmanuel (1679-1726) being especially notable). Later the Elector Palatine, Charles Theodore, transferred to Munich the Mannheim collection formed by the Elector Charles Philip; while his successor Maximilian IV added 2000 pictures of the Zweibrücken collection. In 1795 the Fr. under Moreau entered Munich and pillaged the galleries, though some of the stolen works were returned after 1815. Previously (1805) the famous Düsseldorf academy collection, founded by Maximilian III Joseph, was transferred to Munich. Ludwig I not only built the present gallery but added a fine collection of altar-pieces. The building was severely damaged in World War II but the pictures were, happily, safeguarded (and many shown at the National Gallery, London, in 1949). The Munich gallery

is, naturally, strong in the works of the Ger. masters, such as Michael Pachter, Altdorfer, Hans Baldung Grün, Schongauer, Grünewald ('Christ Mocked'), and Dürer. Among the great Flem. artists examples of whose best work may be seen here are Rogier van der Weyden, Dirck Bouts, Memling, Gerard David, and, above all, Rubens, who is represented here by the most varied paintings—from the immense 'Last Judgment' to the 'Drunken Silenus' and 'Landscape with Rainbow,' besides portraits of himself and his first wife. Here, too, is Jordaens's 'The Satyr in the Peasant's Home' illustrating Aesop's fable, and Van Dyck's popular 'Rest on the Flight to Egypt.' Among outstanding pictures of the Dutch school are Rembrandt's 'Abraham and Isaac' and 'Descent from the Cross'; Hals's 'Fish Girl,' and a seascape by Cuyp. The Munich gallery is not very rich in examples of the It. schools, though there is a painting of the Holy Family by Raphael, Perugino's 'The Virgin appearing to St Bernard,' Botticelli's 'Pietà,' and a 'Virgin and Child' which many experts consider a Leonardo. Titian is well represented by a beautiful 'Madonna and Child' and a portrait of Charles V. Other outstanding pictures are Goya's portrait of Luisa, queen of Spain, Poussin's 'Apollo and Daphne' and 'Mourning Christ,' and the rare series of tavern pictures of Adriaen Brouwer.

The foundations of the Dresden Gallery collection were laid by Augustus I in the 16th cent. and by Francis III, duke of Modena, who purchased Raphael's 'Sistine Madonna' from the Benedictines of San Sisto. This is commonly regarded as the supreme treasure of the collection, but other and equally outstanding pictures are Titian's 'Christ and the Tribute Money,' 'Madonna and Child with Saints,' and 'The Man with a Palm'; Correggio's 'Holy Night'—remarkable for its lovely irradiating light effect; Lotto's 'Madonna with Christ and St John'; the Swiss painter Liotard's 'Chocolate Girl'; Rembrandt's 'Saskia with a Pink' (i.e. Saskia van Uylenborch (Uijlenburgh), the Frisian girl whom Rembrandt married); Holbein's portrait of the Sieur de Morette; Vermeer's 'Young Courtesan'; and Giorgione's 'Sleeping Venus'—supposed to have been left unfinished and completed by Titian. There are also many works by Lucas Cranach and a self-portrait and other works by Dürer. The Dutch collection is also famous—works by Hals, Brouwer, Adriaen van de Velde, the 2 Ruysdaels, Van Goyen, and many lesser-known masters. After being in Soviet hands, pictures from the collection, including the great Raphael were returned to E. Germany in 1955.

The Kaiser Friedrich or National Museum, in Berlin, was named after the Emperor Frederick III—the nucleus of its paintings being the Guistiniana collection bought in France in the early 19th cent. and some hundreds of works collected by Edward Solly, an Eng. trader resident in Berlin in the same period. The finest

masterpieces in the collection were the radiant 'Daniel's Vision' by Rembrandt; Van Dyck's portrait of the Marchesa Geronima Spinola; Vermeer's 'Pearl Necklace'; Holbein's portrait of George (Isze); Giovanni Bellini's 'Christ Risen'; Zurbaran's 'Group of Theologians'; Signorelli's 'Pan'; Dürer's 'Young Woman'; and Frans Hals's 'Hille Bobbe' and 'Mother and Child.' Signorelli's 'Pan' was a major loss in the last war. The gallery is naturally very strong in the Ger. school from the early masters to the mature era of Dürer and his contemporaries. Among Ger. artists represented here besides those mentioned, are Altdorfer, Breu, and Adrian Richter. Rubens is particularly well represented, notably by his 'Perseus and Andromeda,' and 'St Cecilia.' Other Low Country masters with notable works here are Ter Borch, with 'Concert'; Pieter de Hooch, and Koninck, with a 'Landscape.'

German Bulldog, *see* BOXER.

German Catholics, a religious sect in Germany which broke away from the Rom. Catholic Church in 1844, under Ronge, an ex-priest of Silesia, and Czerski, a priest of Schneidemühl, who had seceded from the Rom. Church and formed a congregation of Christian Apostolic Catholics. Their first general council was held at Leipzig in 1845. The essentials of belief were restricted to a few doctrines, and scripture was declared to be the sole rule of faith, no external authority being allowed to interfere with its interpretation. By the end of 1845 the G. C. had some 300 congregations. Internal dissension, however, set in, and strong measures were taken against them. They were expelled from Austria, and their clergy were not recognised in Prussia. Many of the congregations dissolved or returned to Rome, and in 1859 the majority joined the free-thinkers or Free Congregations. Six years later these refused to commit themselves to belief in a personal God. The G. C. have, in fact, been superseded by the Old Catholics (q.v.).

German Colonies. Under the treaty of Versailles (q.v.), 1919, Germany surrendered all her overseas colonies and protectorates. Ger. East Africa was ceded to Britain, being renamed Tanganyika Terr. Ger. South-west Africa went to the Union of South Africa; Cameroon and Togoland were jointly partitioned between France and Britain (*see* AFRICA; CAMEROONS; TOGOLAND). The Ger. lease of Kiaochow and other interests in Shantung, together with the Ger. Pacific Is. N. of the equator, were ceded to Japan; the Ger. portion of Samoa to New Zealand, and Ger. New Guinea and the remainder of the possessions in the Pacific to Australia. In addition Germany renounced all her special rights and privileges in China, Siam, Morocco, Liberia, and Egypt.

Conformably with the development of a sense of common responsibility for the welfare of mankind, these colonies were received by the victorious Allies not as absolute, sovereign possessions, but as mandated ter. In this way the administration of Ger. colonies in South Africa was entrusted to Britain, France, and South Africa; the Pacific Is. to Australia, New Zealand, and Japan. *See also under the various countries named.*

German Democratic Republic, came into existence 7 Oct. 1949, and comprised the former Soviet zone of Germany and the Soviet sector of Berlin (*see GERMANY, History*). The People's Council, elected 1948, and consisting primarily of a Communist-dominated Socialist Unity party (a fusion of Social Democrats and Communists) was converted into a provisional People's Chamber (*Volkskammer*) and Pieck (q.v.) became president of the rep., Grotewohl (q.v.) prime minister, and Ulbricht (q.v.) deputy prime minister.

Elections were held in Oct. 1950 for the *Volkskammer* on the Communist pattern of no opposition candidates. The gov. National Front list received over 12,000,000 votes; 35,500 ballot papers were invalid. In the elections of Oct. 1954 the National Front received over 11,800,000 votes, 63,900 papers being invalid. Pieck, Grotewohl, and Ulbricht (1957) retain their original posts. Ulbricht's special power, however, resides in the fact that he is first secretary of the Politburo of the S.U.P., which actually governs the country.

The administration—education, industry, etc.—is carried out on Communist lines. Religious toleration is claimed, but in practice there has been a certain amount of active religious persecution. Security is in the hands of a special ministry of state security, and of a militarised People's Police, whose exact numbers are not known but were estimated in 1954 as at least 100,000. The People's Police is Soviet-trained and is regarded by the W. powers as functioning as an E. Ger. army as well as providing an internal secret security service.

Soon after its inauguration, the G. D. R. recognised the Oder-Neisse line as its permanent boundary with Poland, and the expulsion of over 2,000,000 Germans from the Sudetenland as 'permanent and just.'

From time to time the Rep. has made proposals for talks on Ger. reunification, but its drafts have invariably included clauses designed to safeguard the forcible continuance of its existing Communist regime, and have been rejected by the W. powers and by Federal Germany.

From its inception, the economic poverty of the Rep. contrasted markedly with the prosperity of the free economy in the Federal Ger. Rep; and the curbs on personal liberties added to a discontent which found expression in the thousands of refugees who poured into W. Berlin from the E. sector. In the spring of 1953 this discontent became so marked that the rigid gov. was relaxed a little. In

spite of this severe rioting broke out in E. Berlin 16-17 June; and there were similar riots in sev. other E. Ger. tns. In Berlin only the intervention of Soviet tanks restored order. The revolt was followed by immediate repressive measures, but these were later succeeded by a certain amount of conciliation. In Mar. 1954 the Rep. was proclaimed a sovereign state, although it was announced that Soviet troops would remain there temporarily for reasons of security.

Since 1954 the G. D. R. has been a notably quiescent member of the Soviet bloc. A certain relaxation in the rigorous administration appears to have taken place; and the discontent which resulted in the return to power of Gomulka (q.v.) in Poland and in a revolution in Hungary had no marked repercussions in E. Germany. Area 41,779 sq. m. (including Soviet sector of Berlin, 156 sq. m.); pop. (1955 estimated) 17,700,000. *See J. P. Nette, The Eastern Zone and Soviet Policy in Germany, 1945-50, 1951; and S. Brant, The East German Rising, 1955.*

German Dogge, *see* GREAT DANE.

German East Africa, formerly a Ger. colony in Equatorial East Africa, and Germany's largest dependency. It became known as Tanganyika Ter. after the First World War; with the exception of the dists. of Ruanda and Urundi, which were joined to the Belgian Congo, and a small dist. in the S., which was added to Portuguese East Africa, it was mandated to Great Britain by the League of Nations. It is now a trusteeship ter.

German Federal Republic, *see* FEDERAL GERMAN REPUBLIC.

German Language and Literature. Auct Germany, like other European nations in the years of their infancy, spoke a number of dialects, all of which grew out of the Aryan family of tongues. Most of these dialects may be affiliated to one of 2 branches, High German and Low German (Hoch Deutsch and Platt Deutsch), and both of these can be traced as far back as the 7th cent. Besides these, evidence is afforded by the 4th cent. Gothic trans. of the Bible, undertaken by Bishop Ulfilas, of a dialect quite independent of either of the 2 groups mentioned above. To-day High German dialects are split up into the Swabian, commonly spoken in Württemberg; the Alemannic, spoken in S. Baden, Alsace, and Ger. Switzerland; and the Bavarian, which is the everyday language in Bavaria, Upper and Lower Austria, Styria, Tyrol, and Salzburg. The so-called Middle Ger. dialects, the Franconian, Thuringian, Silesian, and Saxon really belong to the High Ger. stock. The Low Ger. branch, on the other hand, comprises Old Saxon and Lower Franconian. In the former dialect was written *Der Heliand*, which is a Christian epic of the 9th cent., and the celebrated *Reineke Vos* (c. 1490) is in a dialect developing from Old Saxon. The latter is father to the modern Dutch and Flem. The modern dialects, known as Frisian and Platt

Deutsch, are relics of Low German. The names High and Low originally described the geographical areas where the different branches were spoken, that is, broadly speaking, S. and N. Germany. The disintegration of the empire into separate kingdoms offers an obvious explanation of the fact that rival dialects lingered so much longer in Germany than, say, in England. But from the Reformation period, when Luther trans. the Bible into a language which was a composite of various forms of High German, the doom of the other branch, at least as far as literature was concerned, may be said to have been sealed.

The primitive Ger. peoples fed their natural love of literature on old legends, heroic sagas, and 'beast epics' (*Tierepos*), the atmosphere of which was invariably pagan and bloodthirsty. The virile and splendid animal satire of *Reineke Fuchs*, which fastened itself so firmly on the popular fancy, and which was retranslated into German from the Fr., was probably compiled originally out of one of these 'beast epics.' As in England during the Norman period, the native tongue was under the Saxon emperors left entirely to the people, being supplanted at court by Lat., then the language of cultured social intercourse. But the fullness of medieval life soon inspired men to write of it in their vernacular. The ideas of chivalry, the pageantry and splendour of the courts, the spirit of faith, and also of adventure, both of which were quickened by the stirring episodes and R. glamour of the crusades, all combined to instil fresh vigour into the common peoples, with the result that in Germany there sprang up the *Minnesänger* (Singers of Love), who correspond to the troubadours of France and the Welsh and Irish bards. During the 13th and 14th cents. these men roamed from castle to castle telling fragments of the great cycles of romance and singing little songs of love and passion. Many of these wandering poets were knights and men of courtly breeding such as Walther von der Vogelweide (c. 1170-c. 1230), the most famous of them all, and it was from their lips that the countryfolk learnt of the deeds of the great Alexander or Charlemagne, or of the exploits of King Arthur and his Knights, or of the Sangrael (The Holy Grail), or of the Dan. hero Beowulf. The immortal *Nibelungenlied* and *Gudrun* are a mine of national and heroic saga to which Wagner naturally turned when he dreamed of founding a national opera, and it is here that the epic and tragical grandeur of pagan folklore finds its noblest expressions. The names of a number of the Minnesingers are still remembered with honour, among them Heinrich von Veldeke, Gottfried von Strassburg, Hartmann von Aue, and Wolfram von Eschenbach, all of whom were authors of court epics (*Tristan und Isolde*, *Der arme Heinrich*, *Parzival*, by the 3 last-named authors respectively). It is important to note that in the 13th cent. laws began to be couched in the native German instead of in Lat., as is

clear from the 2 famous collections, *Sachsenspiegel*, 1230, and *Schwabenspiegel*, 1270. This displacement of Lat. is important, for the fact that the monks wrote a mass of scriptural paraphrase and religious poetry in the classical tongue seemed for the time being to stigmatise German as unworthy of literary usage.

The 15th cent. was fruitful in all kinds of truly popular literature. Thus passion plays and mysteries roused dramatic interest up and down the country and familiarised men in a most delightful manner with the leading figures of biblical story; *Volkslieder*, or national ballads, appealed to the inborn sentiments of patriotism; prose was for the first time handled with success in the romantic and wonder-telling *Volksbücher*, such as *Tyil Eulenspiegel*, *Dr Faust*, and *Die Schildbürger*, whilst the degeneracy of many ecclesiastics offered a rich field both for mocking satires and serious theological discussions. Moreover this and the following century were the age of the craftsmen-poets or *Meistersänger*, the best known of whom is Hans Sachs (1494-1578), the cobbler of Nuremberg and the author of the metrical *Schwänke* and *Fasnachtsspiele*. These men were already associated into guilds for their trade, and conceived the quaint notion of founding also guilds of poetry, which should draw up a strict code of rules for the composition of correct and model verse. The greatest benefactor to literature was, however, Martin Luther (q.v.). His Ger. Bible (1522-34) has already been referred to, but when it is remembered how, with amazing rapidity, this book found its way even to the most insignificant towns and solitary households, and further how eagerly it was read and re-read, it will be admitted that too much stress cannot be laid on its position as a milestone along the path of Ger. literary advancement.

On top of the Reformation came the Thirty Years War, which quenched the springs of literature and art.

From 1624 to 1748 has been called the Age of Imitation. Real literary talent was scarce, and men who had leanings towards letters unfortunately believed that the art of writing poetry could be taught. As in England during the years following the Restoration, the Fr. classicists, Racine, Corneille, and Molière, became the models for all youthful writers of inspiration. At the many courts the Fr. manners and language were zealously cultivated, and the people at large lost sight of their native tales and ballads. To such an extent had the Ger. dialects become adulterated with the steady infiltration of foreign words, that a number of language-reforming societies sprang up everywhere on the lines of the 'Fruit-bearing League' founded in Weimar, 1617. To this somewhat lifeless epoch belong the Silesian poets who are usually divided into 2 schools. Of the first the chief ornament was the precise and servile Martin Opitz (1597-1639), whilst Hoffmann von Hoffmannswaldau (1618-79) is typical of the second. Romances and

windy tales of fiction and adventure steadily gained ground: many were the Ger. versions of *Robinson Crusoe*, and the stormy years of the Thirty Years War (1618-48) were reflected in numerous *Tales of Ups and Downs*, by far the liveliest of which was the 'Simplicissimus' of Grimmelshausen (d. 1676). The healthy rivalry between the Leipzig and Zürich schools in the 18th cent. contributed much towards clearing away the pedantry and artifice which seemed likely to submerge any real stuff that was written. Thanks to the Swiss leaders, Bodmer and Breitinger, imagination and emotion reappeared in poetry, while Gottsched (1705-68), the foremost of the Leipzig

LESSING.) It is necessary to note the important place which the sensuous and witty romances of Wieland will always occupy in the hist. of Ger. prose, and also his celebrated fairy epic *Oberon*, 1780. (See WIELAND.) From the historical point of view the great merit of Herder was his deep love of all poetry that was truly national. Thus he gathered together the *Volkslieder* of many nations, and studied and wrote about primitive Heb. poetry. (See HERDER.) He may be regarded as the source of inspiration for all that was noble in the *Sturm und Drang* movement, which now assailed literature; but in a broader sense this movement must be regarded as part of that unrest and desire of change which in France was manifested in the great revolution.

The term *Sturm und Drang* (Storm and Stress) was taken from a play of Klinger which bore this title. The intentions of the leading exponents, Klinger (1752-1831) and Maler Müller (1749-1825), were undoubtedly good: they wished to fling away the shackles of art and to give free rein to all their enthusiasms and poetic ideals. Unfortunately, like the dramatists who followed Shakespeare, they were none of them gifted with outstanding literary talents, so that all their plays and novels are marred by extravagances of passion and hideous caricature. To realise the full force of this period of temporary madness it is only necessary to recall the fact that Goethe's *Götts von Berlichingen* and his *Die Leiden des jungen Werthers*, in which literature may have paid its highest tribute to sentimentalism, were both written under its influence.

Goethe (1749-1832), of course, stands aloof from the normal channels of literary development. His *Faust* belongs to universal literature. It is the summary of its author's mental life, and may be said to mirror the struggles which are eternally raging in every human breast. (See GOETHE.) His *Iphigenie* (prose version 1779, verse version 1787), *Emmott*, 1788, and *Torquato Tasso*, 1790, rank with *Wallenstein*, 1799, *Maria Stuart*, 1800, *Die Jungfrau von Orléans*, 1801, and *Wilhelm Tell*, 1804, four of the finest dramatic productions of Schiller (1759-1805), his friend and almost rival. (See SCHILLER.) These two stand easily at the top of Ger. dramatists. Moreover both Goethe and Schiller outgrew the fevers of the *Sturm und Drang* period, and the former especially discovered the secret of that harmony which exists between the wonderful calm and self-restraint of the Hellenic spirit on the one hand and on the other the warmth, colour, and emotional fullness of the Romantic.

Jean Paul Richter (1763-1825), too, stands quite apart from the contemporary Romantic phase. In his lifetime his novels were even more applauded than Schiller's or Goethe's works, and especially those classified as humorous, the first of which was *The Invisible Box*. All his books are remarkable for their fund of wit and wealth of exuberant fancies.

GOTTHOLD EPHRAIM LESSING

men of letters, helped by his *Critical Art of Poetry* to wean men's tastes away from the Fr. to which they had so long been blindly fettered. It remains to notice the 2 great writers of Protestant hymns after Luther, namely Gerhardt (1607-76) and Gellert (1715-69), for it was chiefly through them that literature diffused itself among the common people. Gellert's *Fables* also, with their arresting simplicity, shared in this work of popular education.

The second classical period opens in 1748, and the great movement towards literary regeneration, which may be said to culminate in Goethe and Schiller, was nobly heralded by Klopstock (1724-1803), Lessing (1729-81), Herder (1744-1802), and Wieland (1733-1813). Klopstock's epic, *Messias*, inspired as it was by *Paradise Lost*, is the fullest and finest expression of the unstinted admiration which Germans felt for the Eng. masterpiece. In his *Laocöon* and other critical works, Lessing taught men the difference between the pseudo-classicism of the Fr. and the true Hellenic spirit as it is revealed to us in Gk sculpture and drama. (See

The aims of the Romantic school were not unlike those of Wordsworth and Coleridge and their successors in England. Novalis (1772-1801) was a precursor of this school, but the 'theoretic basis of Romanticism' was estab. by the brothers Schlegel (August Wilhelm, 1767-1845, and Friedrich, 1772-1829). These men and their followers widened the prov. of poetry so as to include music and philosophy and all the other elements of intellectual life; they were opposed to the shallow utilitarianism and unlovely rationalistic theories of their age, and turned back for their inspiration into the medieval days of knights and pageants,

(1786-1837), whose philo-Fr. *Briefe aus Paris* are of vital importance in the progress of Ger. prose; and Heinrich Heine (1797-1856), the greatest of them all. In spite of his negative bias and unbeliefs his poetry will live: for to him was given with Schiller and Goethe that purely inborn gift of lyrical outpouring. (See HEINE.) From this time forward literature gradually grew more and more comprehensive, so that now it includes all branches of knowledge and every field of human interest.

From 1850 to 1870 the novel engrossed most of the best writers. This form of literature became the favourite vehicle of expression all over Europe, probably because it is so elastic that the author may freely bend it to his will and embody in it the whole sphere of his culture and experience. Thus there were many social novels on the basis of Gutzkow's *Ritter vom Geiste*; there were political and antiquarian novels, there were stories which dealt with the peasants, such as Auerbach's *Schwarzrödder Dorfgeschichten*, 1843-54, and there were tales in the form of biography, such as Keller's splendid *Der grüne Heinrich*, 1855. For some time authors devoted themselves to realistic fiction, but *Buddenbrooks*, 1902, by Thomas Mann and the work of the women writers, Clara Viebig, Helene Böhlau, and Gabriele Reuter, deal rather with problems of emotion and psychology which seem better suited to the Teutonic temperament.

In dramatic literature the two outstanding writers in the 19th cent. were F. Grillparzer (1791-1872), an Austrian, and Friedrich Hebbel (1813-63) (qq.v.).

For other writers, see individual articles.

Twentieth-century German Literature.—

Before the First World War Ger. literature experienced comparative calm. Important writers of this period were the dramatists Gerhart Hauptmann (q.v.), brother of Carl Hauptmann (q.v.), his contemporary Sudermann (1857-1928), Frank Wedekind (1864-1918), the Austrian Hugo von Hofmannsthal (1874-1929), and the poets Dehmel, Rilke, and Stefan George (qq.v.). The main influences of this period were naturalism and its opposite 'art for art's sake', Hauptmann leading the former school and Stefan George the latter. The Impressionist novel derived from the naturalists with, however, a greater emphasis on character, particularly as manifested in the artistic temperament. Outstanding among the Impressionist novelists are Emil Strauss (1866-), Hermann Hesse (1877-), who was awarded the Nobel prize for literature in 1946, Jacob Wassermann (1873-1934), and particularly the brothers Heinrich (1871-1950) and Thomas Mann (1875-1955), the latter especially a notable figure in modern world literature; he received the Nobel prize for literature in 1929. Interest was shown by the poets in machinery and the subjection of physical resources to the use of civilised

FRIEDRICH SCHILLER

of miracles and mysticism. Mentally, too, they travelled further afield into the unexplored riches of the E. and away back into the world of folklore and weird pagan superstitions. It was a time of admirable trans. such as the elder Schlegel's *Shakespeare*, 1797-1810, and it was also a time when Ger. philology and medieval literature were first seriously studied, for both the Grimms came under the influence of Romanticism.

In time the Romantic school began to lose its hold, and after the famous July Revolution of 1830 'young Germany' occupies the literary field. Writers of this period no longer form a definite school, but they all reflect in their works the period of uncertainty and transition through which Europe was then passing. Furthermore, all manner of industrial, social, and economic problems begin to permeate literature, and it is customary also to associate together young Germany and the predominance of Hegelian philosophy. The leading man of letters at this time were Laube (1806-84), the author of social works of fiction; Börne

man. Towards the end of the First World War war weariness and despair, accentuated in Germany by the revolution (1918), had its effect on the younger writers. Johannes Becher in his works violently opposed war, and the chaotic state of life was expressed generally in literature by expressionism (q.v.), a movement borrowed from painting in a spirit of almost ecstatic mysticism. Some writers, such as Armin T. Wegner, turned from the cities and roar of machines to find satisfaction and peace on the land and in the countryside. Labourer poets of the war were Karl Broger, Gert Engelke, Max Barthel, and Heinrich Lersch. War novels were written by Remarque; one of the greatest war books is *Opfergang*, written by Fritz von Unruh in the trenches in 1916. Post-war Germany was mirrored in Ernst Toller's tragedy *Hinkemann*, and Reinhard Goering in the drama *Seeschlacht* represents the attitude of the navy in the First World War. Satirists of the early 20th cent. were the novelist Heinrich Mann, the poet and essayist Karl Kraus, and the dramatist Carl Sternheim. Expressionist drama, dealing with types and making use of allegory, was written by Walter Hasenclever, Fritz von Unruh, Franz Werfel, Arnold Bronnen, Ernst Toller (*Seven Plays*, Eng. trans. 1935), Georg Kaiser, and Anton Wildgans. A significant novelist of this period was Alfred Döblin (1878-1957) (*Die drei Sprünge des Wangen; Berlin-Alexanderplatz*). The works of Franz Kafka (q.v.) only gained influence after the author's death. The Expressionist writers were as a rule Socialists, Kurt Eisner (q.v.), the poet, being assassinated, while another tendency revealed in their work was their changed attitude towards women, relationship between men and women being intellectual rather than emotional. In 1922 Expressionism subsided and painters and writers, tired of dealing with types and symbols, sought new forms. Some writers, such as von Unruh, made use of historical subjects, while others have shown a renewed interest in the Catholic religion. Another interesting tendency was the marked manifestation of Jewish temperament, owing to the great number of Jewish writers who achieved international fame—Wassermann, already mentioned, Feuchtwanger (q.v.), Stefan Zweig, Bruno Frank, and Emil Ludwig (q.v.). The Austrian novelist and playwright Robert Musil (1880-1942) became known posthumously by his great and long novel *Der Mann ohne Eigenschaften*, 1930-3 (trans. under the title of *The Man without Qualities*, 1953 ff.) dealing with life in pre-war Austria. Hans Carossa (1878-1956) wrote fine autobiographical stories. Among poets Rilke gained in stature until his death in 1926, and is now recognised as one of the major poets of the 20th cent. Even under the Nazis literature managed to survive persecution and dictation principally by devotion to historical and biographical work in which hostility to the regime could be disguised.

Alfred von Martin's *Burckhardt und Nietzsche*, 1941, and Matthias Gelzer's *Julius Caesar*, 1941, are examples. The majority of great writers, however, went into exile.

Surrealistic tendencies had their exponents in Hermann Kasack (*Stadt hinter dem Strom*) and Hermann Broch (*Der Tod des Vergil, Die Schuldlosen*), both writers dealing with man's relationship to death and his expectations after death.

Immediate post-war literature was chiefly concerned with the attempt to explain the rise and fall of Nazi Germany. The first work of moral and literary merit was Theodor Haacker's *Tag- und Nachtbücher*, 1947, justifying the catastrophic end of the Reich. Political works having little literary value continued to appear during the following years, among them Gerhard Ritter's *Europa und die deutsche Frage*, and Erich Meissner's *Zwiespalt im Abendland*, 1950. Gerhard Nebel wrote an outstanding account of the last stages of the Italian campaign in *Unter Kreuzfahrern und Partisanen*. A further feature in W. Germany was the great number and popularity of translations, especially of Brit. and Amer. fiction, whilst literature in E. Germany began to reflect the political situation on Marxist lines, represented by Anna Seghers and Bertold Brecht (q.v.).

Among contemporary essayists and novelists who have established themselves are Ernst Jünger (q.v.) and his brother Friedrich Georg Jünger, Gerhard Nebel, Walter Jens, Heinrich Böll, and Hans Werner Richter. Lyrical poetry is represented by the works of Hermann Hesse (q.v.), Gottfried Benn (q.v.), Günther Eich, Rudolf Hagelstange, Hans Egon Holthausen, and Manfred Hausmann. Erich Kästner (q.v.) is a writer of topical satire, and also a well-known author of children's novels. In the field of drama the names of Bertold Brecht (q.v.), Carl Zuckmayer (q.v.), and the Swiss playwrights Max Frisch and Friedrich Dürrenmatt have become known, mainly for a tendency to disregard tradition and to create new provocative plays.

Recent Christian literature has been represented by the Protestant poets Rudolf Alexander Schröder and Otto von Taube, who has also trans. numerous poems from sev. languages, including those of Wm. Blake. Catholic writers include Gertrud von Le Fort, Hans von Savigny, Stefan Andres, Werner Bergengruen, and Reinhold Schneider; Edvard Schaper's novels reflect a deep and convinced Christian mentality. See also SWITZERLAND, Literature.

German Measles, or Rubella, see under MEASLES.

German (and Austrian) Music. If Germany and Austria are usually thought of as having excelled every other country in their cultivation of music, this is not so much a matter of historical fact as of chronology. So far as composition is concerned, at any rate, their hegemony is

of recent date, and therefore easily remembered; but it lasted scarcely longer than a century and a half, roughly and perhaps debatably from 1750 to 1900. A great tradition has remained, and has certainly maintained itself in performance, especially of opera, and it is a tradition dating sev. centuries back; a number of considerable composers are found in the 16th cent. and a few in the 15th, though none to compare with the greatest Flem., Fr., It., and Eng. figures until we come to Hans Leo Hassler (b. 1564) and the first universal Ger. master, Schütz (b. 1585). Schütz cultivated Passion music, not for the first time, but in such a superior way as to give Germany a claim to it as the earliest indigenous form of musical art. Other specifically Ger. types arose later, as we shall see presently; but there had been nothing before the Passion comparable in exclusiveness to the polyphonic church music of the Netherlands, the Fr. *chanson* for sev. voices, the It. madrigal and its forerunners, or the Eng. string fantasy.

There had however been, as in other countries, music produced anonymously in the shape of songs and dances. Songs in parts and some dances were written down and gathered in 15th-cent. collections such as the song-book of Lochheim and Glogau. Meanwhile solo song had thrived from Walter von der Vogelweide in the 13th cent. to the last of the *Minnesinger*, Oswald von Wolkenstein, who d. in 1445. But the *Minnesang* was not a new contribution to music exclusive to Germany, for it was largely modelled on the troubadour and trouvère songs of France. And the songs of the 15th-cent. *Meistersinger*, which were transferred from the aristocracy to middle-class craftsmen, of whom Hans Sachs of Nuremberg is the most famous, were too cramped by old rules to represent a truly new art. A distinctly Ger. type was the chorale, the hymn set in 4 parts, which came in with the Lutheran Reformation for congregational use; but precisely because it aimed at encouraging the people to take part in the singing, its tunes were as a rule those of secular songs already familiar. Of course, hymns existed elsewhere, in the Genevan psalter, for instance. But an exclusively Ger. form of instrumental composition was later to arise out of the chorale. On the instrumental side the 15th and 16th cents. advanced particularly the playing of the organ and the lute, the blind organist Conrad Paumann and the lutenist Hans Gerle, both of Nuremberg, being outstanding representatives. Heinrich Finck, Paul Hofhaimer, and the Austrian Leonhard Puminger were composers of some eminence in the 15th cent.

The 16th cent. gave birth to a greater number of creative musicians, none quite reaching the distinction of Hassler, much less the greatness of Schütz. Schütz excelled in music of many kinds, sacred and secular, vocal and instrumental, and wrote the first Ger. opera, *Dafne*, the music of which is lost and the libretto of

which was a trans. by Martin Opitz of that by Rinuccini, first set by Peri and afterwards by Gagliano. Schütz's work was produced at Torgau in 1627 and thus takes us into the next century, which made no further advance in Ger. opera till Theile's *Adam und Eva* appeared at Hamburg in 1678. For the rest, the courts either had It. operas performed, or Ger. composers like Kerll set It. librettos. Two important 16th-cent. composers who remain to be mentioned, mainly for their church music and songs, are Schütz's close contemporaries, Schein and Scheldt, *b.* respectively in 1586 and 1587.

Sev. composers *b.* in the 17th cent. began to build up the important Ger. school of organ music. The earliest were Tunder and Froberger, both pupils of Frescobaldi in Rome, and then came Reinken and the Dane Buxtehude. Buxtehude belongs to Ger. music as organist at Lübeck for many years and was one of the first to introduce the hymns of the day with organ improvisations on them and thus to build up that exclusive Ger. form already referred to, the chorale prelude, which in Tunder's hands had still been variations on the tune rather than fantasies and fugues based on it. Pachelbel and Böhm continued on the same lines before Bach made the chorale prelude his own as one of his most glorious achievements. During the interval between the lives of Schütz and Bach, Passion music was written by Sebastiani. Hammerschmidt, Rosenmüller, and the two Kriegers wrote concerted instrumental music, Biber made a beginning with the violin, and Georg Muffat, Kuhnau and Johann Caspar Fischer wrote for the harpsichord, Kuhnau's 'Biblical' sonatas being striking early examples of descriptive music. The first great Austrian master, Fux, wrote a vast amount of church music, 10 oratorios and 18 operas, which, however, were still Italian. Ger. opera, mixed with It. airs at first, now began to occupy Hamburg in the early years of the 18th cent. Its important composer was Keiser, who managed an opera-house as he wished, Hamburg being a free Hanse city without a court. Matheson was there also, and Handel joined him there for a short time as a young man and wrote his first operas in that mixture of Italian and German. Telemann was a very prolific composer in all kinds of music, *b.* 4 years before Bach.

For incomparably the greatest Ger. composer of the first half of the 18th cent., and one of the supreme masters of all time, see BACH, JOHANN SEBASTIAN. It is true that Handel is in his way as great, but except for his Ger. birth he does not properly come under this survey, for he is not a Ger. composer at all. Like Gluck later, Handel set very few Ger. words to music all his life and, if another comparison may be made, he is no more a Ger. composer than the It.-born Lully is an It. one: both were naturalised in their adopted countries, both altered the spelling of their names, and, what is much

more, neither showed a trace of his native musical style or influence. Handel's music is based on It. influence and much coloured by his Eng. environment. A great Ger. opera composer, Hasse, also remained musically an Italian.

The 18th cent. as a whole shows a crowd of Ger. composers, most of them small figures in themselves, but making a varied picture. Two, both *b.* in 1714, stand out: Bach's second son, Carl Philipp Emanuel, who advanced both keyboard technique and the sonata form with music in the new 'courtly' style, quite different from his father's and often rather vapid; and the Austro-Bohemian Gluck, who hardly belongs to the Ger. school any more than Handel, not because he is now sometimes claimed as a Czech, but because he wrote many operas in the pure It. manner of the time, introduced reforms into that manner, and afterwards into Fr. opera in Paris. But if no individual composer *b.* before Haydn (1732) or between him and Mozart (1756) cut much ice, groups of them started 2 new musical species, one of the utmost importance and predominantly German—the symphony—and another less significant but more purely German—the *Singspiel*. The symphony was all but originated by the 'Mannheim School,' a group of musicians working at the court of Mannheim, where there was a superior orchestra with which they could experiment. It is not completely a Ger. phenomenon, because it grew out of the It. opera overture and because its best representative, Stamitz (actually Starnic), was a Bohemian; another, Beck, went to live at Bordeaux, and a third was the It. Toeschi. The others were F. X. Richter, Holzbauer, Filtz, and Cannabich. The Mannheim symphonies are full of the novel device of strong dynamic contrasts, their thematic material is rather empty, and their form as yet rudimentary; but if the school had had a great composer, the symphony would have reached maturity on the spot, as it did reach it afterwards in the hands of Haydn. The *Singspiel*, a very light type of opera or operetta, in fact hardly more than a play with songs, owed its beginnings to Ger. translations of Eng. ballad operas by Charles Coffey, but its subjects and language at once made it a thoroughly Ger. form of entertainment. Though it contributed little to the Ger. art of music, the *Singspiel* did at least draw many pleasant songs from its best composers, of whom Johann Adam Hiller was the first, followed by Dittersdorf, Umlauf, Neefe, Schenk, Schack, and others, mainly working in Vienna as it happened, though the form began at Leipzig. Mozart's *Entführung* is still in the nature of a *Singspiel*, but transformed into opera by genius.

For the 3 supreme masters who dominate the 18th cent. see HAYDN, MOZART, and BEETHOVEN. Towards the end of the century arose another Ger. species almost as important as the symphony, the *Lied*. The word simply

means 'song,' and it is true that in a sense a *Lied* is merely a song with Ger. words. Nevertheless the species is so characteristic as to constitute a typically Ger. kind of music, recognisable as such even if the words were trans. or not heard at all. Like the symphony, it began with small composers, Reichardt, Zelter, and Zumsteeg, and sometimes in the form—if anything so haphazard can be called that—of long, rambling ballads, which were imitated by Schubert in his adolescence. But Schubert soon saw that merely to string a number of contrasting sections together to illustrate a narrative poem was not to compose a piece of music, and he completely mastered the art of song-writing long before he had come of age. By then he was a major composer and made equally important contributions to the symphony, to chamber music, and to the piano sonata, and enriched almost every other category of music. Weber, b. a decade before Schubert, also wrote songs, but they have not survived. He lives, in fact, by extremely little of his large output, and only one of his operas, *Der Freischütz*, represents his world characteristically as a kind of mixture of *Singspiel* and Fr. grand opera, but with an utterly Ger. and highly romantic character of its own. Other romantic operas came later, such as those by Spohr, Reissiger, and especially Marschner, whose influence on Wagner's *Flying Dutchman* is evident. But all this, including Weber and Schubert, belongs to the next century, as does Meyerbeer, whose work, however, was first Italian and then Fr.

For the 3 great composers b. in the early 19th cent. see MENDELSSOHN, SCHUMANN, and WAGNER. The first was too conservative and the second too individual to have much influence; the influence of Wagner's music-drama in its full maturity was enormous, but it was also curiously unproductive of a great succession, no doubt because he had himself carried out his ideas with such overpowering mastery that nothing was left to be done with them. Kistler, Thuille, Schillings, and early Pfitzner were all handicapped by Wagnerism; Humperdinck's *Hänsel und Gretel* was successful in spite rather than because of its Wagnerian procedure and because of its quite different and freshly charming material; Richard Strauss's operas began to be successful only after the Wagnerian *Götterdämmerung*; and Schreker's marked the last stages of decadence. Meanwhile a new type of comic opera had arrived, more solid than the *Singspiel*, and, although German in language, feeling, and subject, as well as in its admitting a special type of over-simple and sentimental song, also had many of the good qualities of Fr. *opéra-comique*. The lightness and elegance of works of this kind by Lortzing, Nicolai, and Flotow was further refined, perhaps over-refined, by Cornelius and Götz. There was also grandiose opera by Goldmark, frankly bad opera by Nessler, and opera inclining towards It. *verismo*

by d'Albert. Turning back to earlier years of the century in Vienna, we find the waltz developing out of the old *Ländler* country dance in the dance-halls led by Lanner and the elder Johann Strauss, which was brought to its greatest triumphs by Johann Strauss the younger, who also cultivated the operetta, of which the waltz was an indispensable ingredient. But operetta, together with the waltz, progressively declined by way of Lehár, Fall, Oscar Strauss, and others.

Piano music of as great a refinement as Schumann's, but different according to each composer's character, was written by Henselt, Kirchner, and Jensen (the Hungarian-b. Heller is hardly admissible here). The *Lied* was kept alive by Robert Franz until it was ready to be treated with the utmost subtlety by Hugo Wolf, continued with a certain fervour by R. Strauss, and with a mixture of simplicity and sophistication by Regner. The *Lied* being romantic, modern Ger. music has turned away from it into new channels. The symphony threatened to become picturesquely programmatic in the hands of Raff, a disciple of the 'new German' school of Liszt, a cosmopolitan who is himself no more German as a composer than he is genuinely Hungarian; and it did turn later into the most egotistical means of self-expression with Mahler, who even in his symphonies reveals himself as essentially a songwriter. The 2 notable symphonists of the later 19th cent., though almost comically antagonistic towards each other, are Bruckner and Brahms, the former a rather clumsy composer without the true symphonic art of transition, but a great one in spite of all his faults. For the latter, who wrote in every medium except that of opera and had an enormous influence even beyond his own country, see BRAHMS.

The 20th cent., which begins with the upheaval of Schoenberg's new system (see TWELVE-NOTE MUSIC) that has had an influence as far-reaching as Brahms's, with very different effect, is as yet difficult to sum up. Schoenberg's most distinguished Austrian disciples have been Webern and Berg, while Křenek came to embrace the Schoenbergian creed later and Wellesz resolved to drop it. Another very influential composer, with a very different outlook, is Hindemith, who has also attracted many pupils and, far from renouncing tonality, has based new ideas of key-relationship on the natural harmonic series. His own work, which includes opera and nearly every other musical form, is notably distinguished. Contemporary with Hindemith is Carl Orff, and after him a dozen or so of Ger. composers b. in the 20th cent. have attracted international attention. See H. J. Moser, *Geschichte der deutschen Musik*, 1930; H. Mersmann, *Eine deutsche Musikgeschichte*, 1934; R. Malsch, *Geschichte der deutschen Musik*, 1949; see also composers' names mentioned in this article.

German Ocean, *see* NORTH SEA.

German Silver, or **Nickel Silver**, alloy consisting approximately of 6 parts copper, 3 parts zinc, and 1 part nickel, with sometimes a trace of iron. It forms a white, tough metal, taking a good polish, and is largely used for the manuf. of spoons, forks, and other similar articles, but, as it soon tarnishes, it is usually electro-plated. G. S. has a high electrical resistance, and is largely used for making resistance coils.

German South-West Africa, *see* AFRICA, SOUTH-WEST.

German Volga Republic, *see* VOLGA GERMANS.

Germander, name given to the Brit. species of *Teucrium*, a genus of labiate plants. The wood G. is *T. scorodonia*; the wall G., *T. chamaedrys*, the water G., *T. scorodum*.

Germander Speedwell, *see* HIND'S EYE.

Germanic Laws, The, designation of the systems of law evolved and codified by the prin. Teutonic tribes on the estab. of native kingdoms at the retirement of the Romans from Germania. The codes date back to the 5th and 6th cents., and show in general a blend of native tribal law and of Rom. law. The following tribes possessed coded laws: Alemans, Bavarians, Burgundians, Frisians, Saxons, Thuringians, and Visigoths. The codes were framed in the Lat. language with scraps of barbaric legal terminology.

Germanicus Caesar (**Tiberius Drusus Nero**) (15 BC-AD 19), Rom. gen., son of Nero Claudius Drusus by Antonia (Mark Antony's daughter). He was adopted by Tiberius in the lifetime of Augustus, and fought against the Pannonians, Dalmatians, and Germans (AD 7-12). On the death of Augustus (14) G. had command of the legions in Germany when a serious mutiny broke out. After restoring order he devoted himself to the subjugation of Germany with such energy that within the space of a year he had reduced the whole country between the Rhine and the Elbe. Tiberius, jealous of his achievement, recalled him in AD 17, and gave him a general command throughout the E. provs. At the same time, however, he appointed Gn. Piso governor of Syria with secret instructions to thwart G.'s efforts. G. d. at Antioch, poisoned, as was commonly believed, by Piso, whom Tiberius was obliged to sacrifice to the indignation of his subjects. G. was one of the most popular figures of his age. By his wife Agrippina (q.v.) he had 9 children, including the emperor Gaius (Caligula) and Agrippina, the mother of Nero. *See* Tacitus, *Annales*, ii., iii.

Germanium, chemical element discovered in 1886 by Winkler in argyrodite (GeS₄Ag₂S), a mineral found at Freiberg. It also occurs to a minute extent in the mineral euxenite. In almost all its compounds it is quadrivalent, and it has marked affinities with silicon and other elements of that group. In properties it agrees very closely with Mendeléef's hypothetical eka-silicon. Atomic weight 72.5; melting-point 900° C.

Germantown, NW. residential section of Philadelphia, Pennsylvania, U.S.A. It contains many historic houses, e.g. the Chew House, built by Benjamin Chew, who was imprisoned as a loyalist in 1777, and the Morris House, the H.Q. of Gen. Howe, and the residence of President Washington when Philadelphia was the cap. of the U.S.A. In this vicinity, too, the first paper mill in America was erected in 1690, and the first Bible printed in America was pub. here in 1743. G. was founded in 1683 by 13 families from Germany, incorporated in 1689, and annexed to Philadelphia in 1854. A famous battle in the War of Independence took place here 4 Oct. 1777.

Germanus of Auxerre, St. (c. 378-448), b. there of noble family. He became an advocate at Rome, and after his marriage was made one of the 6 dukes of Gaul. Elected bishop of Auxerre in 418, he at once changed his way of life and became an ascetic. G. visited Britain in 430 and again in 447 to campaign against Pelagianism (q.v.). On the first of these occasions he was responsible for the Alleluia Victory over the Picts and Scots. He d. at Ravenna.

Germanus of Constantinople, St. (c. 650-740), patriarch, transferred from Cyzicus in 715. He defended the practice of the Church against the Emperor Leo and the Iconoclasts with the encouragement of Pope Gregory II. In 730 he was deposed. *See* Heuschoen, *Patrologia Graeca*, vol. 98; W. Smith, *Dictionary of Christian Biography*, 1880.

Germany (Ger. *Deutschland*; Fr. *Allemagne*), county of N. central Europe, the boundaries of which have varied at different periods of hist. For the modern hist. of G., *see* FEDERAL GERMAN REPUBLIC; GERMAN DEMOCRATIC REPUBLIC. When the Ger. Empire was estab. in 1871 (*see* History, below) G. had a total area of some 208,800 sq. m., and comprised 26 states: the kingdoms of Prussia, Bavaria, Württemberg, and Saxony; the Grand Duchies of Baden, Hessen, Oldenburg, Saxe-Weimar, Mecklenburg-Schwerin, and Mecklenburg-Strelitz; the Duchies of Brunswick, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxe-Altenburg, and Anhalt; the Principalities of Lippe, Schaumburg-Lippe, Schwarzburg-Sondershausen, Schwarzburg-Rudolstadt, Reuss-Greiz, Reuss-Schleiz, and Waldeck; the Imperial Ter. of Elsass-Lothringen (Alsace-Lorraine); and the Free Hanse Tns. (*see* HANSEATIC LEAGUE) of Hamburg, Bremen, and Lübeck (qq.v.). After the First World War, the treaty of Versailles (q.v.) reduced the ter. of G. by some 27,250 sq. m. by the following transfers: Alsace-Lorraine to France; parts of W. Prussia and Upper Silesia to Poland; Eupen, Malmédy, and Moresnet to Belgium; and N. Schleswig to Denmark. Danzig (Gdańsk) and Memel (qq.v.) also were lost to G., and the Saarland (q.v.) was placed under the control of the League of Nations, France being given certain rights there for 15 years. As a result of the creation of the 'Polish

Corridor* (q.v.) E. Prussia (q.v.) was separated from the rest of the Ger. ter. The new Ger. federal rep., the 'Weimar Republic,' comprised 17 states: the free states of Prussia (including Waldeck), Bavaria, Saxony, Mecklenburg-Schwerin, Mecklenburg-Strelitz, Oldenburg, Brunswick, Anhalt, Lippe, and Schaumburg-Lippe; the people's states of Württemberg and Hessen; the federated state of Thuringia (q.v.), formed by the amalgamation of Saxe-Weimar, Saxe-Coburg, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Sondershausen, Schwarzburg-Rudolstadt, Reuss-Greiz, and Reuss-Schleiz; the rep. of Baden; and the Hanse states of Hamburg, Bremen, and Lübeck. After Hitler came into power, the federal states became administrative provs. of the Third Reich, with minor alterations to the boundaries, particularly of Prussia, Oldenburg, and Hamburg. Lübeck became part of Prussia, and Mecklenburg-Strelitz and Mecklenburg-Schwerin were united to form the prov. of Mecklenburg. As a result of the aggressive foreign policy of the National Socialist régime the ter. of the Third Reich was gradually increased, and before the outbreak of the Second World War G. had absorbed Austria, the Sudetenland (q.v.), and Memel, and had created protectorates in Bohemia and Moravia (q.v.). After the defeat of G. in 1945, the Potsdam Agreement (q.v.) provided that the part of E. Prussia lying N. of a line drawn between Braunsberg (Braniewo) and Goldap should be transferred to the U.S.S.R. (the E. Prussian cap., Königsberg, becoming Kaliningrad). It was also decided that, subject to the provisions of the final peace settlement, Poland should administer all the remaining parts of G. lying E. of a line drawn from the Baltic coast, just W. of Swinemünde (Swinoujście), along the Oder and the Lusatian Neisse (q.v.) to the Czechoslovak frontier.

By the Berlin Declaration of 5 June 1945 the govs. of the U.K., the U.S.A., France, and the U.S.S.R. assumed supreme authority in G., and designated separate military zones of occupation. The ter. of Greater Berlin (q.v.), divided into 4 sectors, was to be under joint gov.

During 1946 and 1947 the state of Prussia was dissolved (on 25 Feb. 1947) and G. was divided into *Länder* as follows: in the Brit. zone, Schleswig-Holstein, Lower Saxony, North Rhine-Westphalia, and Hamburg; in the Amer. zone, Bavaria, Hessen, and Württemberg-Baden; in the Fr. zone, Rhineland-Palatinate, Baden, Württemberg-Hohenzollern, and Saar; and in the Russian zone, Saxony, Saxony-Anhalt, Brandenburg, Thuringia, and Mecklenburg.

In June 1948 the U.K., the U.S.A., and France agreed on a central gov. for their zones, and on 23 May 1949 a Federal Rep. of G. (*Bundesrepublik Deutschland*) came into being, its ter. being that of the Brit., Amer., and Fr. zones. On 5 May 1955 the military occupation of the ter. of the Federal Rep. ceased, and on the same day the Paris and London treaties of

Oct. 1954 came into force, and estab. the Federal Rep.'s sovereignty.

In the Russian zone of occupation a Ger. Democratic Rep. (*Deutsche Demokratische Republik*) was formed on 7 Oct. 1949.

In 1949, and subsequently, some minor frontier adjustments were effected, by which small dists. of G. were ceded to the Netherlands, Belgium, Luxembourg, and France.

On 6 July 1950 an agreement between the Ger. Democratic Rep. and Poland declared the Oder-Neisse line to be the permanent frontier between G. and Poland. This agreement, and a further one extending the Polish ter. in Mecklenburg and on the is. of Uedom, are not recognised by the Federal Rep. or by the W. Allies.

The ter. of G. as it exists to-day (i.e. the ter. of the Federal Rep. of G. and the ter. of the Ger. Democratic Rep.) has an extent of 136,450 sq. m. (of which 94,650 sq. m. are in the Federal Rep.). It is bordered on the N. by the North Sea, Denmark, and the Baltic Sea; on the E. by Poland and Czechoslovakia; on the SE. by Austria; on the S. by Austria and Switzerland; and on the W. by France, Luxembourg, Belgium and the Netherlands. The Ger. Democratic Rep., situated in the NE. part of the Ger. ter., is divided into 14 *Besirke*, which were formed in 1952 (with deliberate non-observance of historic boundaries) to replace the 5 *Länder* of the Russian zone of occupation; they are: Rostock, Schwerin, Neubrandenburg, Potsdam, Frankfurt-an-der-Oder, Kottbus, Magdeburg, Halle, Erfurt, Gera, Suhl, Karl-Marx-Stadt (Chemnitz), Dresden, and Leipzig (q.v.). The Federal Rep. is divided into the following 10 *Länder*: Schleswig-Holstein, Hamburg, Lower Saxony, Bremen, North Rhine-Westphalia, Hessen, Rhineland-Palatinate, Baden-Württemberg (formed in 1952 from the former *Länder* of Württemberg-Baden, Baden, and Württemberg-Hohenzollern), Bavaria, and Saar (q.v.). According to the constitution of the Federal Rep., Berlin (which is partitioned between the Federal Rep. and the Ger. Democratic Rep., the section belonging to the Federal Rep. forming an enclave in the ter. of the Ger. Democratic Rep.) is both a city and a *Land*, but it has not been formally incorporated as such. The present cap. of the Federal Rep. is Bonn (q.v.).

Geography.—In its physical structure G. may be said to fall naturally into 3 divs.: the lowlands of the N., the tableland of the S., and the basin of the middle Rhine. The lowlands are part of the great European plain and stretch from the Netherlands frontier to the Polish frontier. They are largely occupied with sandy tracts, but here and there have peaty heathland (see LÜNEBURG). They are well watered, and in certain dists. are fertile. The S. tableland is interspersed with sev. mt groups, of which the Fichtelgebirge (q.v.) forms the pivot.

To the NW. of the Fichtelgebirge rise the Thuringian Forest and the Harz Mts; to the NE. is the Erzgebirge; and to the SW. lies the Black Forest (q.v.). In the Bavarian Alps, at the extreme S. of Bavaria, is the Zugspitze (9633 ft), the highest mt in G. The fertile and beautiful Rhine (q.v.) valley is sheltered, between Basel and Mannheim, by the Vosges to the W. and the Black Forest to the E. The three great drainage basins of the country are those of the Danube (q.v.) to the S. and E., the Rhine and Elbe (q.v.)

dykes which serve, as in Holland, to keep out the sea where the sand-dunes are not strong enough.

Climate.—Broadly speaking, the physical characteristics of the country do not permit of a good climate; for the level, exposed flats, N. and NE., offer no resistance to the passage in winter of the dry, piercing winds from Siberia and the Arctic, whilst to the S. and W. the mountainous tracts form effectual barriers against the moist anti-trades. As regards temp., the extremes increase

BERNKASTEL AND THE MOSEL (MOSELLE)

to the N. and W., and the Oder (q.v.) to the E. The watersheds are both far from the sea (sev. of the rvs. thus being of considerable length) and comparatively low, so that there are no great falls in the main streams. The chief rvs. are therefore navigable for the greater part of their courses, and their utility has been very much increased by intricate systems of canals. Of the larger rvs. only the Weser (q.v.) is a purely Ger. stream. G. has a coastline (in the N.) on the North Sea and on the Baltic Sea, but it has very few good harbours. The reasons for this are: (1) that on the Baltic Sea shallow lagoons, called Haffs, prevent good anchorage; (2) that the shore waters are not deep enough to take vessels of any size; and (3) that, owing to the lack of protection N. and E., the Baltic ports are constantly choked with ice. Along the North Sea shores there are numerous

eastward in proportion to the distance from the Atlantic. In the warmer lat. of the S., the elevation of the plateaus counteracts the natural tendency to grow hotter, so that Regensburg, in the S., lies on the same isotherm as Hamburg, in the N. In the Upper Harz the rainfall reaches 66 in., as the Harz Mts are far enough N. to catch the rains borne by the winds sweeping across Holland, but the mean ann. precipitation is only about 20 in. On the whole the climate may briefly be described as continental. It should be noted that the general slope of the country is from the SE. to NW., that is, away from the sun, and also that the Rhine valley is so sheltered that it reaps the full benefit of its warm lat., and thus enjoys excellent weather conditions.

Flora and Fauna.—The flora and fauna are numerous in type, including over 2000 varieties of vascular plants and

as many as 16,000 species of insects. All plants peculiar to the temperate zone are cultivated with success, and in general the flora may be said to be such as would be expected from the union, which occurs here, of the Alpine and Baltic elements. As regards the fauna, there are hardly any types which are exclusive to G. The wild boar, stag, and roe continue to occupy the remoter and more hilly dists. Larger game have become extinct. The rivers and seas teem with fish, the former abounding in members of the carp and salmon tribes.

Agriculture, etc.—Agriculture is of great importance in G.; scientific methods of farming are encouraged by the govts. and extensive use is made of locally produced fertilisers. In 1937 over 71,000,000 ac. were under cultivation, and G. was about 80 per cent self-sufficient in agric. produce. In 1955 there were in the Federal Rep. some 20,400,000 ac. of arable land, 13,900,000 ac. of pasture land, and 1,310,000 ac. of vineyards, orchards, and market gardens. In the ter. of the Ger. Democratic Rep. (where many of the greatest pre-war demesnes were situated) large estates, representing some 40 per cent of agric. land, have been divided up without compensation and distributed among landless peasants, farm workers, and refugees from the dists. now under Polish administration. In 1953 there were 12,550,000 ac. of arable land in the Democratic Rep. Rye and oats grow in the N., despite the drawbacks of poor climate and soil. Flax, hemp, and beet are grown in the central and Baltic areas. The vine covers the dry, sunny slopes of the Mosel, and is also grown along the Rhine. The rich alluvial soils of the sheltered valleys in the SW. are also favourable to the production of tobacco and hops. In 1956 the area under cultivation (in ac.) and the yield (in metric tons) for the chief crops in the Federal Rep. were: wheat, 2,882,000; 3,487,000; rye, 3,864,000; 3,898,000; barley, 2,127,000; 2,310,000; oats, 3,282,000; 3,419,000; potatoes, 2,837,000; 26,756,000; beet, 672,000; 8,346,000. The yield (in metric tons) of the chief crops in the Democratic Rep. in 1955 was: wheat, 1,273,000; rye, 2,464,000; barley, 983,000; oats, 16,603,000; linseed, 15,400; beet, 6,145,000; potatoes, 12,106,000. Livestock in the Federal Rep. at the end of 1955 numbered: pigs, 14,593,000; cattle, 11,553,000; sheep, 1,188,000; horses, 1,099,000; goats, 766,000; poultry, 52,302,000. The figures for the Democratic Rep. in 1956 were: pigs, 8,325,000; cattle, 3,718,500; sheep, 1,892,800; horses, 641,400; poultry, 23,090,000.

Forestry is state controlled. As would be expected, the boisterous winds from the sea dwarf the scanty trees in the NW., the land being covered for the most part with moors and heaths. Trees are still plentiful in the Black Forest and the Thuringian Forest. Chief among the deciduous trees are the beech and the oak. The Scots pine is ubiquitous, and the white birch is important. In 1955 the

forest area in the Federal Rep. was 17,500,000 ac., and in the Democratic Rep. 7,250,000 ac. The yield of sea and coastal fisheries in the Federal Rep. in 1955 was 751,300 metric tons. In the same year the fishing fleet of the Federal Rep. consisted of 217 steamers, 100 luggers, and 1500 cutters.

Resources and Industry.—G. is rich in minerals, especially in coal. The industrial prosperity of the country was built on the fact that the deposits of coal and the, smaller, deposits of iron were found together, and, moreover, in proximity to navigable water-courses. The chief coal mines are in North Rhine-Westphalia, where they were the reason for the development of the great steel-producing area of the Ruhr (q.v.) basin. Coal is found also in the Saarland, in Lower Saxony, and around Zwickau and Dresden (q.v.). Lignite is mined in North Rhine-Westphalia, in the Alpine foothills, and in the neighbourhood of Halle and Leipzig (q.v.). Iron comes chiefly from the Westervald, from Lower Saxony (SW. of Brunswick), and from the Harz Mts (q.v.). In the Harz Mts, also, copper, silver, and molybdenum are found. There are extensive salt deposits (Berchtesgaden, Bad Reichenhall, q.v.), and there are many well-known mineral springs (Baden-Baden, Wiesbaden, Ems, Bad Nauheim, etc.). The prin. oilfields are in the Emsland and in Lower Saxony.

The production figures for mineral in the Federal Rep. in 1955 were (in metric tons): coal, 130,728,000 (134,378,000 in 1956); lignite, 90,337,000; iron ore, 15,684,000 (16,928,000 in 1956); potash, 16,107,000; crude oil, 3,147,000; barite, 407,000.

The textile industry is the oldest estab. Important centres of it to-day are Krefeld, München-Gladbach, Wuppertal, Karl-Marx-Stadt (Chemnitz), Plauen, Zwickau, and Zittau (q.v.). The iron and steel industry is concentrated principally in the Ruhr dist., centres being Dortmund, Essen, and Duisburg-Hamborn (q.v.). The restrictions imposed by the Allies at the end of the Second World War on Ger. steel production were removed with the entry into force on 25 July 1952 of the agreement setting up the European Coal and Steel Community. Figures for the production of iron and steel in the Federal Rep. in given years were (in metric tons): pig-iron (1956), 17,576,000 (1938, 15,176,000); steel ingots and castings (1956), 23,187,000 (1938, 17,902,000); rolled products (1955), 14,207,000 (1938, 11,730,000).

In the Democratic Rep. the second 5-year plan, sanctioned on 30 Mar. 1956, set as targets for 1960 (in metric tons): iron-ore, 2,200,000; pig-iron, 2,250,000; steel ingots, 3,500,000; rolled steel, 2,600,000.

The chemical industry of the Middle Rhine has centres at Mannheim, Offenbach, Darmstadt, and Ludwigshafen (q.v.). Other important chemical manufacturing tns are Erfurt, Hanover, Magdeburg, and Halle (q.v.).

The optical and precision instruments of Jena, Wetzlar, and Dresden are well-known, as are the porcelain of Meissen, and the printing and publishing industries of Munich, Stuttgart, and Leipzig (qq.v.). Other industries of importance include the manuf. of motor-cars, jewellery (Pforzheim), locomotives (Kassel), sugar, beer, toys, paper, tobacco, leather, and wooden goods.

Foreign Trade.—The growth of the commercial prosperity of G. during the 19th cent. and the first part of the 20th cent. was extraordinarily rapid, but the First World War, with the subsequent treaty of Versailles, did much to check the expansion. The previous development was due in great measure to the Ger. Customs Union (*Zollverein*), which after 1879 incorporated G. among the protec-

THE MANNHEIM-HEIDELBERG AUTOBAHN

E.N.A.

Industrial production figures for the Federal Rep. in given years were as follows (in metric tons):—

	1936	1955
Gasoline .	492,000	2,977,000
Diesel oil .	120,000	2,938,000
Potassium ferti- lizers .	546,000	1,697,000
Sulphuric acid	1,058,000	1,861,000
Soda .	425,000	983,000
Cement .	8,526,000	18,769,000
Rayon .	49,200	218,000
Cotton yarn	276,000	373,000
Woollen yarn	47,000	115,000

In 1955 the Federal Rep. also produced 705,418 passenger vehicles, 146,318 commercial vehicles, 1,054,000 bicycles, and 75,779,000,000 k.w.h. of electricity.

The Democratic Rep. in 1955 produced (in metric tons): fertilisers, 377,960; sulphuric acid, 483,205; synthetic rubber, 72,226; and cement, 2,970,000. 28,695,000,000 k.w.h. of electricity, 32,300,000 sq. metres of woollen fabrics, and 200,500,000 sq. metres of cotton fabrics were also produced.

tionist countries. In the latter part of the inter-war years the Ger. economy was geared to the military programme of the National Socialist régime, and foreign trade was affected accordingly. Since the end of the Second World War Ger. overseas commerce has made a remarkable recovery. Textiles, iron and steel goods (including machinery), coal, paper, glass, leather, beer, sugar, precision instruments, and electrical goods are among the chief exports, while grain and flour, raw minerals, textile goods, chemicals, and hides are important imports. The value of the main items of foreign trade in 1955 was as follows:—

Imports:	
processed foodstuffs .	\$1,816,000,000
raw materials .	\$1,732,000,000
Exports:	
finished manufs. .	\$4,822,000,000
semi-finished manufs. .	\$780,000,000

The chief countries to which G. exports, in order of the value of trade, are: Netherlands, Sweden, Belgium, U.S.A., Switzerland, France, Austria, U.K., and Denmark. The chief countries from which G. imports, in order of the value of trade,

are: U.S.A., Netherlands, France, Belgium, Sweden, Italy, U.K., Switzerland, Denmark, Austria.

Communications.—The total length of railway track in the Federal Rep. in 1956 was 25,010 m., of which 1365 m. were electrified. In 1954 the railways carried 1,447,000,000 passengers. The roads of G. were very greatly improved under the Third Reich; the most important development was the construction of some 2000 m. of straight, fast motorways (*autobahnen*) between major cities. In 1955 there were 80,310 m. of roads in the Federal Rep., including 1350 m. of *autobahnen*, 15,140 m. of highways, and 33,180 m. of first-class country road. In 1956 there were 5,672,779 licensed motor vehicles in the Federal Rep.

In addition to these communications G. possesses an elaborate network of canals. By far the most important of these is the Kiel (Kaiser Wilhelm) Canal, which unites the North Sea and the Baltic. The Mittelland Canal, opened in 1938, runs for 273 m. and connects Berlin with the Oder, Elbe, Weser, and Rhine. Other important canals are the Dortmund-Ems and the Elbe-Trade. The total length of navigable rivs. and canals in use in the Federal Rep. in 1956 was 2870 m., and the inland waterways fleet had a tonnage of 4,014,479. Before the Second World War the Ger. mercantile marine stood third among the merchant navies of the world in respect of tonnage and fourth in respect of the number of ships. At that time it had some 2300 ships, with a registered gross tonnage of 4,492,708. At the end of 1956 the mercantile fleet of the Federal Rep. comprised 2433 ocean-going ships with a registered gross tonnage of 3,376,608. Sea-going ships in foreign trade loaded 14,448,145 metric tons in 1954 (14,492,000 in 1938) entering, and unloaded 27,003,028 metric tons (21,638,000 in 1938) clearing, in the ports of the Federal Rep. The civil air-line of the Federal Rep., *Deutsche Lufthansa A.G.* (formed on 6 Jan. 1953, and originally called *A.G. für Luftverkehrsbedarf*) is mainly state-owned, and operates on European, Transatlantic and Near East routes. Its H.Q. are at Cologne.

The *Lufthansa* of the Democratic Rep. operates services between E. Berlin and Moscow and the E. European caps.

The Federal Rep. had in 1955 some 26,700 post offices and 12,000 tele-communications offices. There were 3,686,000 telephones in the country. The number of wireless licences issued was 12,799,000 in 1954, and television licences 84,300.

Population.—In 1939 the pop. of the Ger. Reich was 69,622,483, an increase of 3,454,000 since the 1933 census. The 1939 pop. was distributed as follows: Prussia 41,762,040; Bavaria, 8,280,090; Saxony, 5,206,861; Württemberg, 2,907,166; Baden, 2,518,103; Thuringia, 1,760,595; Hamburg, 1,682,220; Hessen, 1,469,909; Mecklenburg, 910,826; Saarland, 883,736; Brunswick, 599,208; Oldenburg, 582,400; Anhalt, 436,213; Bremen,

400,086; Lippe, 188,598; Schaumburg-Lippe, 54,162. The pop. of Austria (Ostmark) in 1939 was 7,009,014 and that of the Sudetenland, 2,945,261, so that the pop. of Greater G. in that year (excluding Bohemia and Moravia) was 79,576,758.

After the Second World War the area of G. was approximately one-fifth smaller than in 1933, and the pop. (census 1946) was 65,910,999. This figure included some 3 to 4 million refugees.

The present distribution of pop. between the *Länder* and *Besirke* is as follows:—

Federal Rep.	51,595,400
(June 1956)	
Schleswig-Holstein	2,271,000
North Rhine-Westphalia	14,989,500
Rhineland-Palatinate	3,324,900
Lower Saxony	6,541,200
Baden-Württemberg	7,232,100
Bavaria	9,191,800
Hessen	4,603,100
Hamburg	1,792,900
Bremen	628,800
Saarland	988,000
Democratic Rep.	16,692,300
(Dec. 1955)	
Potsdam	1,208,900
Magdeburg	1,445,500
Neubrandenburg	686,700
Halle	2,055,300
Schwerin	651,300
Kotbus	799,000
Erfurt	1,302,900
Rostock	845,600
Dresden	1,941,300
Karl-Marx-Stadt	2,218,000
Leipzig	1,582,200
Gera	740,700
Suhl	548,600
Frankfurt-an-der-Oder	666,300
W. Berlin (June 1955)	2,195,200
E. Berlin (June 1953)	1,248,000

The pops. of the prin. tns (except for erlin) were as follows in 1956:—

Hamburg	1,792,900
Munich	968,233
Cologne	715,914
Düsseldorf	645,486
Frankfurt/Main	639,976
Essen	630,905
Dortmund	618,305
Leipzig	613,707
Stuttgart	602,928
Hanover	432,247
Bremen	499,900
Dresden	496,548
Duisburg	478,983
Nuremberg	418,950
Wuppertal	405,359
Gelsenkirchen	371,693
Bochum	342,436
Mannheim	280,670
Karl-Marx-Stadt	280,153
Halle	289,680
Magdeburg	261,392
Kiel	257,294
Wiesbaden	250,178
Brunswick	244,479
Oberhausen	239,096

Lübeck . . .	228,766

Görlitz . . .	96,147

Religion.—Before the advent of the National Socialist régime in G. it was estimated that about 64 per cent of the pop. were Protestant, the rest being mainly Catholic. Catholicism was strongest in Bavaria and the Rhineland, though there were Catholic minorities elsewhere. Of the pop. of the Federal Rep. (census 1950) 51 per cent are Protestant, and 45 per cent Catholic. It is estimated that in the Democratic Rep. about 80 per cent of the pop. are Protestant, and 12 per cent Catholic. The disestab. of the Church after the fall of the Ger. monarchy had an adverse effect on the strength of the Protestant communions. After the disestab. the Protestants banded themselves together in the 'German Evangelical Church League.' In 1934 an attempt was made to unite the Evangelical churches into a Church under the direction of a Reich bishop, 'called' by the National Synod at the nomination of the heads of the regional churches. The attempt failed, and the State authorities found themselves in conflict with the regional churches. In Sept 1935 a law was promulgated for the security of the 'German Evangelical Church,' giving absolute power in eccles. matters to the Minister for Eccles. Affairs. Throughout 1937 and 1938 the State authorities continued in conflict with both the Protestant and the Catholic Church organisations, the State striving to establish a Ger. National Church closely associated with the paganism of the doctrines of Alfred Rosenberg (q.v.). In 1939 further State control of the Ger.

Evangelical Church was effected by the Minister for Eccles. Affairs, particularly by the order that pastors might be removed from office for 'official reasons' and by the application of the Nazi conception of leadership in Church administration. (In the same year both Catholic and Protestant Churches in Austria were disestab. by the Nazis.) After the war the Nazi-influenced constitution of the Ger. Evangelical Church was abrogated, and a Council of the Evangelical Church in G. (E.K.D.: *Evangelische Kirche in Deutschland*) was created. The Evangelical Church (which is composed of 13 Lutheran churches, 13 United churches, and 2 Reformed churches) was admitted to the World Council of Churches in 1946.

There are 5 Catholic archbishoprics, and 17 bishoprics. Outside of the E.K.D. there are sev. small Protestant Churches (such as Baptists and Methodists), and there are small numbers of 'Old Catholics' (q.v.) and members of the Society of Friends.

Education.—G. has for long had a high standing in the field of state education, and is known for its systemisation and for the variety and thoroughness of its technical training. Under the Weimar Rep., by a law of April 1920, Ger. children were bound to receive a 4-years' course of instruction after the age of 6 years in the 'foundation school' (*Grundschule*). The next highest school for elementary education was the 'people's school' (*Volkschule*). Besides these, there was the 'middle school' (*Mittlere Schule*), where instruction was given, *inter alia*, in Eng. and Fr. The Republican constitution abolished all private preparatory schools, making the public elementary school common to all. To prepare students for the univs. and for admission to certain professions there were secondary schools with a course of study extending over 8 years (*Gymnasium*). Two other kinds of schools were estab. experimentally—the high school (*Deutsche Oberschule*) and the *Aufbauschule*, the former specialising in Ger. subjects and modern languages, the latter providing an intensive and curtailed high school education for the more promising pupils of the elementary schools. The univs., with their 4 faculties of theology, law, medicine, and philosophy, were the centres of intellectual life. Compulsory religious education, common to all schools during the Empire, was replaced during the Rep. by optional classes in religion at the discretion of the parents. On his accession to power Hitler promised absolute equality in education to all Germans. This promise was not kept, and secondary education steadily declined under the Third Reich. Less than 20 per cent of the Ger. people had completely free education. After the Second World War one of the first tasks of the Allied Control Council was to 'denazify' the schools. In the Third Reich the whole system of education had been geared to the Nazi doctrine, and text books and teaching had

been falsified to that end wherever necessary. Teaching staff had therefore to be renewed and proper text-books provided. By Oct. 1945 schools were open in all 4 zones of occupation.

Throughout G. all children between the ages of 6 and 14 are obliged to attend a recognised school. The Lat. script, instead of the Gothic, is used in all schools (since 1941).

In 1955 there were in the Federal Rep. 29,465 elementary schools, 806 middle schools, 1572 secondary schools, and 1001 special schools. In the *Länder* of Schleswig-Holstein, Hamburg, and Bremen there were 467 unified schools, combining elementary, middle, and secondary education. There were also some 7900 full-time and part-time vocational schools. The following univs. are situated in the Federal Rep. (date of foundation given in brackets): Berlin (1948), Bonn (1818), Erlangen (1743), Frankfurt-am-Main (1914), Freiburg (1457), Göttingen (1736), Hamburg (1919), Heidelberg (1386), Kiel (1665), Cologne (1387), Mainz (1477, 1946), Marburg (1527), Munich (1472), Münster (1780), Tübingen (1477), Würzburg (1582). In the winter semester 1955-6 the univs. were attended by 85,914 students. The Federal Rep. has also 12 Rom. Catholic theological colleges, 7 technical colleges, a mining academy (at Clausthal-Zellerfeld), a veterinary college (at Hanover), 4 Protestant training colleges, an agric. college (at Hohenheim), a college of social sciences (at Wilhelmshaven), an academy of athletics (at Cologne), 10 academies of music, 9 academies of art, and commercial colleges.

In the Democratic Rep. there were in 1955, 11,007 elementary schools, 824 secondary schools, 1354 vocational schools, 61 teachers' training colleges, and other educational institutions. The following univs. are now in the ter. of the Democratic Rep. (date of foundation given in brackets): Berlin (1809), Greifswald (1456), Halle (1694, amalgamated with univ. of Wittenberg 1817), Jena (1558), Leipzig (1409), Rostock (1419).

Finance.—The budget of the Federal Rep. for the year 1956-7, ending 31 Mar., showed (in DM 1,000,000):—

Revenue

Federal taxes and Federal share of income and corporation taxes	25,906
Postal services	255
Coinage	38
Withdrawal from occupation cost carry-over reserve	2,282
Withdrawal from budget equalisation reserves	1,738
Other (including loans)	2,427
 Budgetary revenues proper	 32,646
Transferring and appropriated items	2,376
 Total revenue	 35,022

Expenditure

Defence	11,902
Social charges (from war)	6,912
Other social charges	3,952
Financial assistance to Berlin	950
Price equalisation for imported foodstuffs	50
Housing	1,255
Debt service	1,306
Other	7,015
Less Savings under '10 per cent clause' of Budget Law	- 696
 Budgetary expenditure proper	 32,646
Transferring and appropriated items	2,376
 Total expenditure	 35,022

On 16 Sept. 1953 agreements came into force settling G.'s external debts. Claims arising from post-war economic assistance given to G. were settled as follows: the U.K. to accept £150,000,000, without interest, to be repaid in 20 equal ann. instalments; France to accept \$11,840,000, without interest, to be repaid in Fr. francs in 20 equal ann. instalments; the U.S.A. to accept about \$1,200,000,000, bearing interest at 2½ per cent per annum, to be repaid in 35 ann. instalments. The Federal Rep. is also to pay DM. 4,000,000,000 in settlement of pre-war debts, mainly to the U.S.A., U.K., France, and Switzerland; DM. 3,500,000,000 are to be paid in settlement of private debts. In pursuance of an agreement signed at Luxembourg on 10 Sept. 1952 the Federal Rep. is to pay DM. 3,000,000,000 to the State of Israel, and another DM. 450,000,000 in respect of the 'Conference on Jewish Material Claims against Germany.'

In accordance with laws issued by the governors of the Brit., Fr., and Amer. occupation zones in June 1948, the *Reichsmark* was replaced by the *Deutsche Mark*. In July 1957 a Federal Central Bank (*Deutsche Bundesbank*) came into being in the Federal Rep. to replace the Bank of the Ger. *Länder* (*Bank Deutscher Länder*), created in 1948, as well as the central banks of the *Länder*. The Federal Central Bank will regulate the circulation of notes and the supply of credit within the Ger. economy. The gov. of the Federal Rep. resumed the right of coinage in July 1950. At the end of 1956 the coinage in circulation amounted to DM. 1,068,000,000.

In the Democratic Rep. *Reichsmark* notes were exchanged for *Deutsche Mark* (East) in June 1948. A 'German Bank of Issue,' set up in Berlin, was empowered to issue the new notes. The circulation of notes and coins in mid 1955 amounted to DM. (E.) 4,871,000,000. On 13 Oct. 1957 all paper currency was suddenly withdrawn from circulation, and existing bank notes were changed at par for new notes up to the amount of DM. (E.) 300. Sums in excess of DM. (E.) 300 were credited to special bank accounts to be

released later, provided that there was no suspicion that they were 'of speculative origin.'

Since Nov. 1953 the DM. (E.) currency has been based on gold, the gold content of a DM. (E.) being fixed at 0.399902 grammes. This fixation has not been recognised by the International Monetary Fund; it would mean a relationship of DM. (E.) 1 -- DM. (W.) 1.89, whereas, in fact, in recent years the relationship has varied between DM. (E.) 4 to 5 -- DM. (W.) 1.

Justice.—Ger. civil law, a model of codification, was first assembled in 1887, and after revision became law in 1896. At the same time an entire transformation of the commercial code and the code of civil procedure was effected to bring them into harmony with the civil code, and these codes came into force in 1900. A further revision of the code of civil procedure took place in 1924. The code of criminal law was revised in 1876. The arrangement of the civil code was based on Rom. law, which, in a modernised form, was the 'common law' of G. before the introduction of the civil code. The code is divided into 5 books: the first is general; the second, third, fourth, and fifth books treat of the 'law of obligations,' the 'law of things,' 'family law,' and the 'law of inheritance.' The commercial code was compiled in 3 divs.: the first dealing with mercantile trade generally, the second with mercantile partnerships, and the third with mercantile transactions. There is no actual guide to the interpretation of Ger. law, but precedent, although theoretically not binding, carries great authority in practice.

Under the Third Reich the Supreme Court (*Reichsgericht*), which had a revisory jurisdiction over all inferior courts, and the People's Courts (*Amtsgerichte*), which were the lowest courts of first instance with petty civil and criminal jurisdiction, became organs of the central gov. A law promulgated in 1935 estab. the novel principle in criminal law that the courts could punish offences under the criminal code if they were considered deserving of punishment 'according to the underlying idea of a penal code or according to healthy public sentiment.' By a later decree (24 Aug. 1942) statutory justice was abolished, and Hitler became the supreme arbiter of law, administering justice through the Minister of Justice and the President of the Secret People's Court.

According to the Basic Law of the Federal Rep., all persons are equal before the law, and no person, whatever his race, nationality, or religion, is to be deprived of his legal rights. Freedom of the individual may be restricted only on the basis of a law, and no one may be prevented from appearing before his lawful judge. A detained person may not be subjected to mental or physical ill-treatment. The police may hold no one in custody for longer than the end of the day of arrest without a decision of a court; the person in arrest must be brought

before a judge, who shall inform him of the reasons for his detention at the latest on the day following the arrest. If detention is to be continued a person in the confidence of the detainee must be notified of the detention forthwith.

The Basic Law provides also that no person may be deprived of his property without due process of law, and in Article 102 the death penalty is abolished.

The chief courts of the Federal Rep. are: (1) the Federal Constitutional Court, which decides the interpretation of the Basic Law where there is doubt of the compatibility of a Federal or *Land* law with the Basic Law. It has also jurisdiction in disputes between the Federation and the *Länder*, or between different *Länder*; (2) the Supreme Federal Court, which has jurisdiction where its decision would be of importance in the interests of the uniformity of the administration of justice by the higher federal courts; these have ordinary, administrative, labour, financial, and social jurisdiction.

Extraordinary courts are forbidden.

Defence.—After the Ger. defeat in the First World War the law of 30 Dec. 1920 reconstituted the Ger. Army at the strength allowed by the treaty of Versailles (q.v.). The limit was 100,000 men, of which no more than 4000 were to be officers, the men serving for 12 and the officers for 25 years. Only a certain number of discharges were allowed each year to avoid the formation of a reserve force of men who had undergone military training. The former Ger. general staff was proscribed, but in spite of this Gen. von Seeckt (q.v.) was given the rank of commander-in-chief of the Reichswehr. The federal armies were abolished, but a decentralised body of police (*Schutzpolizei*) was formed, trained on military lines. By the Boulogne note of 22 June 1920 the number of police permitted to G. was fixed at 150,000, of which 85,000 were allotted to Prussia. By the same terms the police were allowed 1 rifle to every 3 men, a machine pistol to every 20 men, and 1 armoured car to every 1000 men. In addition to the police there was an armed citizen guard called the *Einwohnerwehr*. This force was disbanded owing to allied pressure after the Kapp (q.v.) *putsch* in Aug. 1920, but the Bavarian *Einwohnerwehr* remained. Conscription for the Ger. Army was abolished. Under the Nazi regime, however, the obligations of the treaty of Versailles in respect of armaments were repudiated (16 Mar. 1935), and conscription was reintroduced. The army was accordingly expanded, and by 1938 it was made known publicly that the army comprised 39 infantry divs., 4 light divs., 5 armoured divs., 3 mt. divs., and a cavalry brigade. An infantry div. was reckoned to number approximately 15,000 men, and the total armed forces were estimated at nearly 900,000 men, excluding reserves. On mobilisation on the outbreak of the Second World War a conservative estimate was double this number of men. By 1944 it was estimated that

there were over 300 divs., including 50 armoured divs., and in Oct. of that year the *Folksturm* (q.v.) was also brought into existence on the lines of the Brit. Home Guard. Following G.'s unconditional surrender on 5 June 1945 the work of demobilising and disarming the Ger. Army was put in hand by the Allied Control Commission, and was largely completed by the end of 1946.

The treaty of Versailles restricted the Ger. Navy to 6 battleships, 6 cruisers, 12 destroyers, and 12 torpedo boats, while submarines were prohibited. These restrictions were disregarded and were virtually replaced by the Anglo-Ger. Naval Agreement (1935), which allowed G. a maximum tonnage equal to 35 per cent of the Brit. tonnage for each class of vessel with the exception of submarines in which parity was permissible with, however, a corresponding reduction in other classes. G. entered the Second World War with 3 so-called 'pocket battleships,' the *Deutschland* (later renamed the *Lützow*), *Admiral Graf Spee* (q.v.), and *Admiral Scheer*, each of 10,000 tons, heavily armed and with a cruising range of 10,000 m. In addition the *Meissenau* and the *Scharnhorst*, battleships of 26,000 tons, were completed in 1938. Three battleships of 35,000 tons were also under construction. There were 6 light cruisers and 2 of 10,000 tons—the *Admiral Hipper* and the *Prinz Eugen*. Destroyers and torpedo boats numbered about 40. At least 50 submarines were in commission, built since 1935 when building was resumed. At the end of the war the surviving ships of the Ger. fleet were distributed between Great Britain, France, U.S.A., and U.S.S.R. The *Prinz Eugen* and the *Nürnberg*, which were the only 2 surviving cap. ships, were allotted to the U.S.A. and the U.S.S.R. respectively.

G. under the Nazi regime built a formidable air force in defiance of the provisions of the treaty of Versailles. Its size was not revealed, but it was estimated at the outbreak of the Second World War that there were over 3000 first-line aircraft. Later the *Luftwaffe* consisted of 420 squadrons, each with 12 aircraft, including reserves; it was disbanded at the end of the war.

The Paris treaties, which came into force in May 1955, provided for a contribution by the Federal Rep. to W. defence within the framework of the North Atlantic Treaty Organisation (q.v.) and the Western European Union. The Constitution of the Federal Rep. was amended in 1955 to make this possible. The Federal Defence Force (*Bundeswehr*) was designed to have by the beginning of 1958 a total strength of 120,000 all ranks; 3 motorised infantry divs., 2 armoured divs., and the nuclei of an airborne div. and a mt div. were to be provided. The new Federal Ger. Navy consists of patrol boats, minesweepers, escort vessels, fishery protection vessels, tugs, and surveying vessels. The revived *Luftwaffe* was planned eventually to consist of 100,000 officers and men, in 20 wings.

In the Democratic Rep., legislation of Jan. 1956 provided for the creation of a Defence Ministry and a 'People's Army.' The army is organised in 3 army groups. The navy of the Democratic Rep. consists of escort, patrol, minesweeping, torpedo, and surveying vessels. An 'Air Police' estab. in 1950, had a strength of about 8000 in 1955.

Oversea Possessions.—G. pursued a vigorous colonial policy from the time of Bismarck (q.v.), but by the treaty of Versailles (q.v.) the Ger. colonial empire was entirely destroyed. During the First World War all Ger. colonies fell into the hands of England, France, and Japan; secret treaties were in existence providing for the occupation of the colonies in the event of an allied victory. The treaty of Versailles disposed of the colonies as follows: the *Kamerun* was divided into the New Cameroons (107,000 sq. m.; native pop., 2,800,000), which was incorporated into Fr. Equatorial Africa, and the Old Cameroons, which were placed, in part, under a Fr. mandate (166,489 sq. m.; pop. 3,000,000) and in part under a Brit. mandate (31,000 sq. m.; pop. 555,000). As 'B' mandates of a similar class, 22,000 sq. m. of Togoland (pop. 747,000) went to France and the remaining 12,600 sq. m. (pop. 185,000) to Great Britain. Former Ger. East Africa was renamed Tanganyika Ter. and became a Brit. possession, Ger. SW. Africa was awarded to the Brit. Union of South Africa; New Guinea (Ger. Kaiser Wilhelm Land, Bismarck Archipelago, and Ger. Solomon Is.) to Australia; Ger. Samoa to New Zealand; Nauru Is. to Great Britain; and the Caroline, Marshall, Marianne, and Pelew Is. to Japan, which country received also Kiao-Chau.

Political Parties.—In the general elections of Sept. 1957 in the Federal Rep. only the 4 main political parties obtained seats. They are:—

The Christian Democratic Party (C.D.U.), which stands for united action between Catholics and Protestants for the rebuilding of Ger. life on a Christian basis, while guaranteeing the freedom of the individual and the possession of private property.

The Social Democratic Party (S.D.P.), a Socialist party.

The Free Democratic Party (F.D.I.), a party of the Right, which has also a radical wing.

The German Party, also a Right-wing party; a 'national party of the Right.'

The election returns were:—

Party	Seats	
	1957	1953
Christian Democratic party	270	244
Social Democratic party	169	151
Free Democratic party	41	48
Ger. Party	17	15

The 12 other parties, which secured no seats in the 1957 elections, included the *Refugee Party* (B.H.E.), which occupied 27 seats in the previous *Bundestag*. The *Communist Party* was dissolved in Aug. 1956, after it had been declared unconstitutional by the Federal Constitutional Court. The neo-Nazi *Socialist Reich Party* had previously (1952) been declared unconstitutional, and banned. The neo-Nazi *German Reich Party* polled 307,881 votes in 1957, compared with 295,615 in 1953.

Constitution and Government.—The Constituent Assembly of the ter. now known as the Federal Rep. of G. met in Bonn on 1 Sept. 1948 and produced a Basic Law, which was approved by a two-thirds majority of the assemblies of the participating *Länder* and which became effective on 23 May 1949.

The Basic Law (*Grundgesetz*) consists of a preamble and 146 articles. The opening articles guarantee the dignity of man, his right to the free development of his personality, the equality of all before the law, and the right to freedom of faith and conscience. Men and women have equal rights, no one is to be prejudiced because of sex, descent, race, language, homeland, faith, or religious and political opinions. No one can be forced against his conscience to take part in combatant duties in war. Freedom of assembly and of associations are guaranteed, as are freedom to express opinions, and freedom of the press and of reporting by radio and cinema. Marriage and the family are to be protected; parents have a right to determine the care and upbringing of their children. Schools are to be provided by the state; religious instruction in schools will be given but not against the wishes of parents. Dwelling-places are inviolable, and can be searched only by order of a court. No one may be deprived of his citizenship if this would make him stateless. Persons suffering from political persecution have a right to asylum.

G. is a federal rep. (article 20) and a democratic and social state. Each *Land* is to have its own constitution, which must conform to the principles of the republican, democratic, and social state, based on the rule of law. All dists. and pars., as well as *Länder*, must have a representative assembly resulting from universal, direct, free, equal, and secret elections. Federal law supersedes *Land* law where they conflict. Every German has the same rights and duties in each *Land* of the Rep. Political parties may be freely formed, but their internal organisation must be democratic. Parties aiming at harming or abolishing the free and democratic basic order or aiming to jeopardise the existence of the Federal Rep., are unconstitutional (article 21). Activities tending to disturb the peaceful relations between nations are unconstitutional, in particular preparations for aggressive war. The Federal Rep. may, however, join in a system of mutual collective security intended to preserve the peace.

Länder are to be organised with due regard to regional unity, territorial and cultural connections, and economic and social considerations.

Any citizen of 21 years of age may vote in elections, and any citizen over 25 years of age is eligible for election.

The organs of the Federal Rep. are:—

1. The Federal Diet (*Bundestag*), elected in universal, direct, free, equal, and secret elections for a term of 4 years.

2. The Federal Council (*Bundesrat*), which consists of members of *Länder* govs. Each *Land* has at least 3 votes; *Länder* with more than 2,000,000 inhab. have 4; and *Länder* with more than 6,000,000 inhab. have 5. The votes of a *Land* can be given only as a block vote.

3. The Federal President (*Bundespräsident*), is elected by the Federal Assembly for a term of 5 years. He is the Rep.'s representative in international affairs. He may be re-elected once.

4. The Federal Assembly (*Bundesversammlung*), consists of the members of the *Bundestag* and an equal number of members elected in proportional representation by the popular representative bodies of the *Länder*.

5. The Federal Gov. (*Bundesregierung*) consists of the Federal Chancellor, elected by the Federal Diet on the proposal of the Federal President, and the Federal Ministers who are appointed and dismissed by the Federal President on the proposal of the Federal Chancellor.

Federal laws, after being passed by the Federal Diet and adopted, are submitted to the Federal Council, which has a restricted veto. The Basic Law may be amended only upon the approval of two-thirds of the members of the Federal Diet and two-thirds of the votes of the Federal Council. The Federal Rep. has exclusive powers of legislation in the following matters: (1) foreign affairs; (2) federal citizenship; (3) freedom of movement, immigration, etc.; (4) currency, weights and measures, regulation of time and calendar; (5) customs, frontier protection, commercial and navigation agreements; (6) federal railways and airways; (7) posts and telecommunications; (8) legal status of persons in federal employment; (9) trade marks, copyright, and publishing rights; (10) co-operation of the Federal Rep. and the *Länder* in the criminal police and in matters affecting the protection of the Constitution, the estab. of a Federal Office of Criminal Police, and the combating of international crime; (11) federal statistics.

The Constitution of the Ger. Democratic Rep. (dated 7 Oct. 1949) was enacted by a provisional People's Chamber, which took the place of the People's Council of the Russian military zone of occupation.

National Flag, etc.—The flag of the Federal Rep. is black (top)-red-gold, in horizontal bands.

The metric system of weights and measures is in general use throughout G.

History.—Recorded Ger. hist. begins with the Rom. period. As far back as 113 BC there is mention of certain Germanic tribes, the Cimbri and Teutones, who had to be driven back across the Rom. border. In the course of his Gallic conquests, Caesar came up against the Ger. chieftain, Ariovistus, and banished him and his followers across the Gallic frontiers and beyond the Rhine. In 55 BC Caesar beat back the Suevi and Marcomanni from their settlements in modern Belgium. An attempt in the reign of Augustus to Romanise the Germanic peoples led to a patriotic rising under Arminius, the champion of the Cherusci. From the 3rd cent. onward the N. confines of the empire were continually threatened by the Saxons, Frisians, Thuringians, Goths, Alemanni, and Franks, tribes which every so often built up great confederacies against their common enemy, Rome, and which were obliged to infiltrate into Rom. ter. because of the hordes into their own ters. of the savage hordes of Huns and Magyars. Christianity was estab. in G. in the 7th and 8th cents. Henceforward till the treaty of Verdun (843) G. was occupied by chieftains perpetually at war with one another, except when invasions from outside forced them into transitory alliance. Charlemagne, the Frankish king, was crowned emperor of Rome by the pope in 800, and after his death his empire was partitioned. His grandson, Louis, received the lands between the Rhine and Elbe, known as the 'Teutonic Kingdom of Francia,' or as the 'Kingdom of the E. Franks.' This infant G. consisted not of a single people, but of a number of fairly homogeneous tribes, the Saxons, Swabians, Bavarians, Thuringians, and Franks.

Descendants of the Carolingian Louis ruled over G. till 911, when the line became extinct, and a mass meeting of the Diet, or National Assembly, arrogated to itself the privilege of choosing a king, so that from this time forward G. became theoretically, at least, an elective in place of an hereditary monarchy. Their first choice was Conrad of Franconia. His successor, Henry of Saxony, popularly called Henry the Fowler, founded the Saxon dynasty which lasted till 1024, and was remarkable for the energy of its rulers. In 963 his son, Otto I (q.v.), was crowned emperor of the Holy Rom. Empire at Rome by the pope. From this dates the tradition to which the Ger. rulers jealously clung, that he who had been crowned Ger. emperor at Aachen was entitled also to be crowned king of Italy at Milan and emperor at Rome. (See further under HOLY ROMAN EMPIRE.)

From 1024 to 1125 G. was governed by Franconian emperors. The most noteworthy is Henry IV (1056-1106 (q.v.)), whose humiliation before Gregory VII at Canossa (1075) remains one of the most dramatic episodes in hist. Ever since Otto I had revived the title of Rom. emperor, there had been a rivalry, which daily assumed larger proportions, be-

tween emperor and pope. It became an open quarrel when Henry refused to obey Gregory on the investiture question. The issue was eventually settled by compromise; in Ger. hist. it is primarily important because it started a long period of sporadic civil war.

The most celebrated of the Hohenstaufen emperors who ruled G. 1138-1254, was Frederic I Barbarossa, or 'Red-beard' (1152-90). He had ambitious schemes of lt. conquests, but the Lombard League defeated him at Legnano (1176). His successors continued his battles, and so the Guelph and Ghibelline factions,

THE PFALZ OR PFALZGRAFSTEIN NEAR CAUB, ON THE RHINE

A hexagonal building founded by Emperor Louis the Bavarian (1314-47)

that is, the adherents of the pope on the one hand and of the emperor on the other, spread insidiously all over the empire, so that on the fall of the Hohenstaufens (1254) even the Ger. kingdom had become like the Holy Rom. Empire, a phantom. It was now split up into over 270 virtually independent states.

There now followed an interregnum (till 1273), which is important for the formation of the Hanseatic and Rhenish Leagues. The tns were growing strong and resorted to union as the one defence against the anarchy of the times, and especially against the arbitrary oppression of the great nobles. Theoretically the kingship was still elective, although 4 secular and 3 spiritual princes now claimed exclusive rights to choose the emperor. They gave the title in 1273 to the count of Hapsburg, who accordingly reigned as Rudolf I. Hapsburg was the name of a paltry Swiss principality, yet

the house of Hapsburg was destined to furnish a long and illustrious succession of Ger. emperors. Louis the Bavarian, emperor from 1314 to 1347, was involved in struggles both with his rival Frederick of Austria and with the pope, who refused to recognise his title. Louis gained the support of the Ghibelline faction, and of the electors, who in 1338 stood out for their elective rights, and in the Frankfurt diet denied the necessity of papal approval of the Ger. king's election. For a time allied with Edward III of England against the pro-papal Philip of France, Louis aroused hostility by an acquisitive policy, and was saved only by his sudden death. In 1437 Albert II of Austria was chosen emperor by the 7 electors, and from that date till the dissolution of the empire by Napoleon the imperial crown may be said to have been hereditary in the Hapsburg line.

Maximilian I (1493-1519) was one of the last of the great medieval rulers as he was also in another sense the first representative of a new order; for not only may he be said to have assured the long succession of his own family, but also to have made an earnest effort towards unification and peace. Anxious to check the aggressions of Charles VIII of France, he summoned a Diet at Worms with the result that a perpetual national peace was declared, and an imperial court was established, to see that that peace was maintained. Further, the empire was divided into 10 circles and dists., the object of which was to enforce the execution of the imperial chamber's recommendations.

Behind the death of Maximilian (1519) lie the Dark Ages and in front loom Luther and the Reformation. After Maximilian the steady growth of the free imperial cities shows that the people were building up an active municipal life, whilst the great Gothic cathedrals, like those of Strasbourg and Cologne (begun in 1248), bear testimony to the faith and religious zeal of the masses. But although religion was thus a vital part of the lives of Ger. citizens, the great schism and the abuses produced by the sale of indulgences led to a certain amount of popular anti-papal feeling, though this was fairly limited in application. It was strongest in the univs., where the Renaissance (q.v.) had cultivated religious scepticism. The resentment was set ablaze by Luther (q.v.) in reaction against Tetzels abuse of the indulgences for the building fund of St. Peter's at Rome. In spite—or because—of the papal bull of 1520, and the great Diet of Worms of 1521, Luther obtained considerable princely support, so much so that a gathering of 7 princes and many cities issued a formal protest against the intolerance of the Second Diet of Spire (1529) and thus became known as Protestants. The emperor, Charles V (1519-56) (q.v.), exercised all his influence to reconcile the opposing religious factions; but the stubbornness on points of detail by the theologians on both sides, and the vested interest of the Protestant

princes who had acquired vast church property in the religious revolution and had no intention of returning it, helped to make a reconciliation impossible. That Luther realised that his religious movement rested primarily on the goodwill of princes and not of the people is shown by his conduct in the Peasants' War (q.v.), when he urged extreme ruthlessness in repressing a popular revolt founded on genuine grievances.

The emperor's position was weakened by his constant need to pacify the Ger. princes of whatever confession in order to gain their help in his external wars. Solyman the Magnificent, the martial Turkish sultan, had already besieged Vienna (1529), and was advancing westward with overwhelming forces to attack the emperor's dominions. Charles lost no time in making a patriotic appeal to the Germans to forget their differences in the face of the common foe, and was soon surrounded with a splendid army, more than sufficient to intimidate the Turks. To the Protestants he had granted provisional toleration by the peace of Nuremberg. The expedition against the Turks at Tunis (1535), the punishment of rebellious Ghent (1539-40), attacks on the Algerian corsairs, and 2 more ravaging wars with the Fr. king, Francis, kept him fully occupied till the treaty of Cr py (1544). But in the year of Luther's death (1546) he began his work of crushing the Protestant league. This proved an easy task, for at the eleventh hour Maurice of Saxony (q.v.), one of the pillars of the Reformation, deserted to the Imperial side for purely material reasons; the Protestant forces broke up, and the league melted away. The leaders were executed and fines exacted from Protestant cities. But once his immediate objective was achieved, Maurice went over to the Protestants again; and Francis's successor on the Fr. throne was eager to snatch at any means of humbling his father's rival, and accordingly lent substantial aid to the oppressed Lutherans. At the Diet of Augsburg (1555) Charles was obliged to make notable concessions to his triumphant foes. It was arranged that in future every Ger. prince should be allowed a free choice between the Augsburg confession—which was accepted as a summary of Lutheran orthodoxy—and Rom. Catholicism, and that once his choice was made he should be at liberty to enforce his religion upon his subjects and to drive the latter out of the kingdom should they refuse his faith. This principle of *cuius regio eius religio* was far-reaching, for it precipitated the subsequent religious wars and persecutions of the old religion in the new Protestant states. The Ger. Reformation was considerably influenced by the intervention, at frequent intervals, of Catholic France on behalf of the Protestants—an intervention based on France's fundamental distrust of Hapsburg power. This basic distrust was to affect Franco-Ger. hist. for the next 400 years in varying degrees.

The peace of Augsburg had treated the Calvinists as non-existent, yet in G., as elsewhere, many had come to prefer the confession of Geneva to that of Augsburg. The result was perpetual strife among the various Protestant sects, for the Lutherans showed small mercy to the Calvinists or to any reformers who ventured to follow a different creed from that drawn up by Melancthon (q.v.). After Charles there were 2 moderately enlightened emperors, and then followed Rudolf II (1576-1612), who was a fanatical and bigoted Catholic. Dread of oppression impelled the Protestant states towards mutual alliance, and in 1608 a confederation was duly formed, called the Evangelical Union, the moving spirit of which was the Calvinist Prince Christian of Anhalt. This was followed, in 1609, by a counter-move on the part of the Catholics, who founded the Holy League, at the head of which was Maximilian of Bavaria. It wanted small additional provocation to induce these leagues to fly at one another's throats, and that provocation was given by a band of Protestant nobles of Bohemia, who, infuriated by the vacillating policy of the emperor, marched to the royal castle at Prague, and hurled the 2 imperial representatives and their secretary out of the castle window.

The first chapter in the Thirty Years War (q.v.) (1618-48) was the subversion of the Protestant cause in Bohemia. The second chapter centres on the personality of Christian IV of Denmark, who now came forward to help his fellow religionists, the Protestants. Other notable Protestant leaders on his side were the Ger. prince, Christian of Anhalt, and Count Mansfeld, whilst ranged against them were two of the most formidable generals G. has ever produced, Tilly and Wallenstein (qq.v.). Mansfeld d. shortly after his crushing defeat by Wallenstein at Dessau on the Elbe (1626), and his death was soon followed by that of the Ger. Christian; the Dan. king was utterly vanquished by Tilly at the field of Lutter; the remnants of Lutheranism were wiped out from Austria as well as from Bohemia; Wallenstein swept with his plundering armies over the greater part of N. G., and completed his destruction by breaking the backbone of the once flourishing and influential Hanseatic League. The year 1629 is marked by the retirement from the war of Christian IV, and also by the Edict of Restitution, which restored to the Catholics all the church properties which the Protestants had appropriated since the treaty of Passau (1552). Then appears a second and greater champion in the person of the Swedish king, Gustavus Adolphus (q.v.), the Lion of the N., subsidised from France by Richelieu. This opens the third period of the war. For the time being Gustavus changed the fortunes of the day and twice defeated Tilly, first at the battle of Leipzig (1631), whilst in the course of the second engagement Tilly received a mortal wound. Then Wallenstein met Gustavus at the field of Lützen (1632). Though Gus-

tavus's army was victorious, the king himself was killed in the battle.

The final chapter opened in 1635. The war had now entirely lost its religious character, and had developed into a European contest in which the one object of the combatants was either to despoil the empire themselves, or to hinder their rivals from territorial expansion. At last the peace of Westphalia was arranged, the terms of which were fundamentally prejudicial to the interests and prestige of the empire. France received a great part of Alsace and the 3 Lotharingian bishoprics, Metz, Toul, and Verdun; Sweden received important tracts of land in N. G., to hold as fiefs of the empire, and the independence of Switzerland and of the Netherlands was finally acknowledged. Lutherans, Catholics, and Calvinists were placed on an equal footing, but princes might still impose their own creeds upon their states. A crushing blow was dealt to the empire; for its dismemberment was for the time being sealed by the recognition of the practical independence of the sev. states, which might even contract their own foreign alliances. The war had a crippling effect on Ger. economy, culture, and political development. It is said that the pop. of G. fell during the brief space of 30 years from 30,000,000 to 12,000,000; the proud Hansa cities and their union were broken up; flourishing towns were levelled to the ground, their sites being marked by charred masses and scattered hovels; agriculture was hopelessly neglected, and it was hard to find a stretch of countryside not disfigured nor wasted by the brutal devastations; industries and commercial routes were obliterated, and education, science, and the fine arts languished, and standards of political morality were lost.

The meteoric ascendancy of Prussia took place against this background. Prussia, the name of which was taken from the Borussi, a Slavonic tribe of fierce pagans, lay along the Baltic coast E. of the Vistula. These had been converted and their ter. occupied by the military religious Teutonic order. In 1529 Albert Hohenzollern the Grand Master, declaring himself a Protestant, arrogated the land to himself as a secular duchy which became formally independent of Polish suzerainty in 1660. In 1618 the duchy of Prussia was linked with the electorate of Brandenburg under one Hohenzollern ruler, and when these fell into the hands of the great elector, Frederick William (1640-88) (q.v.), the foundation of the future greatness of Prussia may be said to have been laid. Frederick was an able ruler who determined to make himself felt in European politics. For this purpose he drilled an excellent and permanent military force. It was, however, in the reign of his son, Frederick III (1688-1713), that Prussia achieved the status of a kingdom. Frederick was succeeded by Frederick William I (1713-40), who, in spite of his eccentricities, proved an energetic if brutal tyrant, and left to his son, Frederick the Great (1740-86) (q.v.), a

large, thoroughly disciplined standing army. Frederick the Great was gifted with a genius for war, and it was largely on this that he relied in lifting his little kingdom to the level almost of the great powers in Europe. When the Pragmatic Sanction of Charles VI was disregarded and the possessions of Maria Theresa (q.v.) were assailed, Frederick invaded Silesia. His claim to his conquest was finally acknowledged in the peace of Aix-la-Chapelle, which ended the war of Austrian Succession (1748). The Seven Years War (1756-63), was an unsuccessful attempt to humble Prussia. Maria Theresa had as her allies France, Russia, Saxony, Sweden, and Poland, whilst Frederick could rely only on England, but Eng. subsidies were an invaluable help to him. He defeated the Fr. at Rossbach and the Russians at Zorndorf, but was really saved by the accession to the Russian throne of Peter III, who was his enthusiastic admirer. At the peace of Paris (1763), Frederick came well out of the war; while England gained an overseas empire from it.

Napoleon's victory at Austerlitz (1805) was the death-knell of the Holy Rom. Empire, and Francis II, in 1806, took the much less pretentious title of emperor of Austria. Thus the long line of Hapsburg ascendancy over G. began to come to an end. The confederation of the Rhine (q.v.), that is, a union of 16 Ger. states under the protectorate of Napoleon, was short-lived. The year 1815 saw the federation of 39 petty kingdoms under the nominal presidency of the Austrian emperor. At the time of the revolution in France, July 1830, there was a sympathetic wave of revolt in many quarters of G., but it was not strong enough to extort any lasting concessions from the various courts. Finally the sev. states, with the exception of Austria, entered into a commercial treaty with one another by which they agreed to set up no protective barriers between themselves, but to encourage free trade everywhere within Ger. boundaries. This treaty grew into the famous Customs Union, or *Zollverein*, and was dominated by Prussia.

Once again in 1848, as in 1830, Ger. patriots were stirred to open demonstrations of their dissatisfaction with the existing state of affairs by the tidings of the summary dismissal by the Fr. of Louis Philippe, and their inauguration of another commonwealth. The govts. of the smaller states were at once intimidated into carrying into effect a series of liberal measures. In Austria Metternich (q.v.) was obliged to flee the country, and a representative Diet was summoned whose members were chosen by a popular suffrage. The same process was gone through in Prussia; a national assembly was convened and Frederick William IV swore to observe the new constitution. But the all-Ger. assembly which met at Frankfurt in 1848, with hopes of uniting a liberal G., ended in failure.

William I ascended the Prussian throne in 1861, and it was not long before he

made Bismarck (q.v.) his chief minister. Bismarck realised that G. could never be united under Prussian leadership while Austria still retained some of her old position there. Eagerly he seized on the disputes about the duchies of Schleswig-Holstein as an efficient *casus belli*. In 1863 Austria and Prussia seized Schleswig-Holstein from Denmark, and 3 years later a quarrel about the administration of the conquered provs. led to the Austro-Prussian war that Bismarck had wanted. Austria was totally crushed at the battle of Sadowa, and was debarred once and for all from future participation in Ger. affairs. In 1867 the N. Ger. Confederation (q.v.) was formed under Prussian leadership. Frankfurt, Nassau, and Hanover were now part of Prussia, and the only kingdoms of importance still outside the union were Bavaria, Baden, and Württemberg, that is, the Catholic states of the S. Three years later the S. states fell into Bismarck's hands as a result of the Franco-Prussian war (q.v.). Fear of France was the deciding factor; and in 1871 the N. Ger. Confederation was replaced by the Ger. Empire (*Reich*) with the king of Prussia as emperor. G. was united at last.

Bismarck became Imperial Chancellor (1871). Broadly speaking, his aims were to concentrate all power in the person of the emperor and to fortify his dignity and the dignity of the empire by diverting as large a portion of the national expenditure as he dared towards enlarging and increasing the efficiency of the army. His policy towards the increasingly important Socialists, who were constantly in revolt against his administration, was to disarm their criticism by remedying the evils against which they cried. Thus, those measures for compulsory insurance of workmen and for old age pensions, etc., measures which are sometimes described as state socialism, were really the outcome of the chancellor's recommendations. Bismarck's least successful struggle was with the pope. In 1872 the Jesuits were expelled, and during the next 3 years the May Laws were promulgated, their object being to undermine papal authority and to establish the legality of state interference in eccles. affairs. This struggle, known as the *Kulturkampf*, ended in compromise, and Bismarck was eventually obliged to make substantial modifications in the laws.

The contest between the Reichstag and the chancellor over whether or not the former should retain a constitutional control over the army centres on the 'Septennial' (1874), by which the army grants were fixed for periods of 7 years at a time. The second period would expire in 1888, and Bismarck was determined to make considerable additions to the peace estab. in view of the rapid increase of the Fr. military forces. Parliament stubbornly refused to countenance his plans, and accordingly was dissolved in 1887. In the election that followed Bismarck triumphed; subsequent budgets showed an enormous increase in army supplies,

and the period of conscription was extended. By now, too, G. had aspirations towards colonial expansion. In 1882 a Ger. colonisation society was started at Frankfurt, and from that time date the Ger. acquisitions in Africa and the Pacific, but the colonies did not on the whole prove a successful enterprise from the financial standpoint.

In 1879 Bismarck publicly renewed amicable relations with Austria, and when Italy agreed to join the 2 empires in 1883 there was constituted a triple alliance which lasted down to the First

not affect the basic strength of the movement. While many Ger. Socialists were not Marxists, Marxism did influence Ger. Socialism generally a good deal, and many former Ger. Socialists later formed the nucleus of the Ger. Communist party.

It remains only to note one other salient feature of modern G., and that is her naval policy prior to the First World War. The emperor and his advisers conceived the idea that G. was a world empire, and must have a great navy to defend her trade and exports, on which her whole prosperity depended. This

A painting by Anton von Werner

World War. In his choice Bismarck was guided by the consideration that with Austria at his back there would be less danger of a combined attack of France and Russia.

In 1888 the emperor, William II (q.v.), the grandson of the first Ger. emperor William I (1871-88), ascended the throne with the determination to continue his grandfather's and Bismarck's policy. But it soon became clear that 2 strong personalities such as himself and Bismarck could not work together, and Bismarck resigned in 1890. G.'s industrial expansion continued under his successors, and there was further social legislation. But this did not prevent the steady rise of a strong Socialist party in the country. In the elections of 1912 the Socialists polled more votes than any other party, and various attempts to curb trade-union activities by legislation did

desire for naval expansion was stimulated by the knowledge of the huge fleet which England possessed; for it was felt that, as things were, the supremacy of the latter at sea would confer upon her an overwhelming advantage in the event of open hostilities breaking out. The causes of Ger. antipathy towards England were not far to seek. To begin with both countries had had a similar industrial development; only, as Great Britain had almost a century's start in the field of foreign trade and of manufs., there was in G. the natural jealousy of her rival competitor. Anti-Brit. feeling in G. reached fever heat at the time of the Boer war, and largely accounts for the ease with which the Navy Bill of 1900 was passed, in spite of alarming increase in the naval estimates. Throughout the war the sympathy of the Germans was openly with the Boers; but by 1913 it seemed that the relations

between Great Britain and G. had improved, and hopes were being widely expressed that some arrangement between the govs. might be come to by which the race in naval armaments might be checked, but the Ger. Army Bill of Mar. 1913 raised the total of the forces by 145,000 and put their peace strength in 1914 at some 870,000. During the Austro-Serbian crisis after the murder of the Archduke Ferdinand at Sarajevo, G. at first refused to aid Austria against Serbia, but endeavoured to prevent Russia mobilising in aid of Serbia. There was, however, in G. a div. between the diplomats and the soldiers, and at an important council meeting at Potsdam on 29 July 1914 the latter evidently triumphed. Immediately after this meeting the Ger. chancellor made overtures to the Brit. ambas. to secure Brit. neutrality, but the 'infamous proposals' were rejected. On 31 July G. demanded complete demobilisation of Russia within 24 hrs, but did not require the same measure from Austria. Receiving no reply from Russia, G. declared war on 1 Aug. France stood by her alliance with Russia, but G.'s declaration of war against France did not arrive until 3 Aug. The neutrality of Belgium and Luxembourg was violated by the Ger. armies, and England, receiving no assurances, declared war on G., 4 Aug. (For a fuller account of the war, see WORLD WAR, FIRST.)

The Ger. people showed a remarkable unanimity over the question of war, propaganda concerning the Russian mobilisation rallying all parties, including most of the Socialists, to the support of the gov. policy. As the war progressed the conflict of opinion between 'Easterners' and 'Westerners' became more marked, and the rivalry between the E. and W. commands was a handicap to Ger. military aims. After the battle of the Marne had stalemated the Ger. offensive in Flanders, it was in the E. that Ger. arms were spectacularly successful. The Russians were defeated at Tannenberg, and Rumania in 1916 was put out of the war almost as soon as she had entered it. By the end of 1916, however, it appeared that G. no longer looked forward to a decisive military victory. Peace negotiations were tentatively proposed by the Ger. chancellor on 12 Dec., soon after the defeat of Rumania. The peace offers were rejected by the Allies, and the intervention of President Wilson as arbitrator was cut short by the decision of the Ger. militarists to pin their faith to the submarine. The 'sink at sight' U.-boat campaign which brought America into the war against G. was at first comparatively successful, and this, combined with the disaffection of Russia, made Ger. prospects brighter at the beginning of 1917. Austria however, since the death of Francis Joseph in Nov. 1916, was anxious for peace, but the Emperor Charles was unable to come to terms with Italy, and Austria was forced back into line with G. (see also AUSTRIA-HUNGARY).

Domestic affairs in G. were now

becoming increasingly disturbed. The Minority Socialist agitation towards peace and parl. reform was now joined by the Majority Socialists. At the beginning of 1918 there was a strike in the munition factories, fostered by the Spartacists (q.v.). It was suppressed, but by June it was admitted by von Kuhlmann, secretary of state for foreign affairs, that the war could not be ended by a military success. At the eleventh hr the Liberal-minded Prince Max of Baden was called upon by the Kaiser to form a Cabinet and introduce truly parl. gov. After the failure of Ludendorff's final offensive Prince Max signed the petition for an armistice. On 5 Nov. 1918 conditions were announced, and included evacuation of all occupied ter., withdrawal beyond the Rhine, together with a neutral zone on the r. b., and the surrender of all guns, aeroplanes, and ships. The naval mutiny at Kiel which had broken out on 4 Nov. marked the collapse of the will to war, and on 9 Nov. a rep. was proclaimed in Berlin. The same day the Kaiser abdicated and fled to the Netherlands. A provisional gov. under Ebert (q.v.) replaced that of Prince Max, and the terms of the armistice were accepted. The Majority and Minority Socialists united in this gov., and in Jan. 1919 crushed an attempted Spartacist revolt in Berlin, during which Rosa Luxemburg and Liebknecht, the leaders of the Spartacists, were killed.

On 19 Jan. the election was held for the National Assembly, which was summoned to meet on 6 Feb. The assembly met at Weimar, and after deliberation and amendment the provisional constitution was adopted. Ebert was elected president, while Scheidemann formed a Coalition Cabinet, containing 8 Majority Socialists, 4 Democrats, and 3 of the Centre party. The new gov. attempted some financial rehabilitation, but all measures were unstable, pending the presentation of the allied terms of peace. These were received by G. on 7 May. There was an immediate outcry against their acceptance. They involved tremendous sacrifices of ter., the payment of reparations in money and produce, and also complete disarmament. Scheidemann resigned, and Bauer formed a gov. for the purpose of accepting the terms with reservations over the question of the admission of G.'s war guilt and the surrender of the so-called 'war criminals.' The Allies rejected the reservations, and demanded unconditional acceptance. This was at length forthcoming, and G. signed the treaty of Versailles (q.v.), which came into force from Jan. 1920. The terms of the treaty were so severe that the gov. which had accepted them became unpopular in the country, and this unpopularity was fostered not by the Communists, whose hopes had been destroyed at Weimar, but by the reactionaries—disbanded soldiers and royalists. A counter-revolution, known as the Kapp *putsch*, began in Mar. The gov. fled to Stuttgart, but within a week the revolt was suppressed.

After the Kapp *putsch* chancellor Bauer lost his prestige, and was succeeded in May 1920 by Müller, with Wirth as finance minister. The Müller Gov. paved the way for the general elections of 6 June, in which the Socialists lost ground. A Coalition Gov. was formed on 20 June, with Fehrenbach as chancellor. The prin. work of this ministry was in connection with reparations. G. received the estimated allied demands at the conference at Spa in July, and for the next 10 years the question of reparation payments dominated the foreign policy of G. (see under REPARATIONS). At this time also the allied demands for disarmament to within the treaty limit of 100,000 men became pressing, and were the basis of the Paris terms of Jan. 1921. They were countered by a widespread secret traffic in armaments and the formation of societies devoted to the purposes of military training. Foreign affairs at this time centred also on the Silesian plebiscite in which G. polled some 700,000 votes to Poland's 500,000, while 664 coms. were for G. and 597 for Poland. In May the London ultimatum with respect to reparations was presented to G., and Wirth succeeded Fehrenbach as chancellor of a gov. prepared to accept the ultimatum. As a result, however, of the Silesian award and the fall of the mark consequent on the effort to meet reparation requirements, G. by July 1922 was no longer able to cover her obligations, and the following year the Ruhr dist. was occupied by Fr. and Belgian troops.

This drastic move, however, had been preceded by allied conferences, the chief of which was at Cannes at the beginning of 1922, but the effort to recognise G.'s limitations was thwarted by the recall of Briand to Paris. At the economic conference at Genoa which followed in April G. secured some definite result by concluding a treaty with Soviet Russia, renouncing mutual indemnities and conceding economic advantages, and this treaty further antagonised the Fr. The Ger. policy of passive resistance to the Fr. occupation of the Ruhr was initiated by chancellor Cuno, who succeeded Wirth in Nov. 1922. With the failure of the Ger. policy in the Ruhr to secure anything except impoverishment of the country, Cuno went out of office, and Stresemann came forward and formed a Cabinet in Aug. 1923. The problems which confronted him were to liquidate the struggle in the Ruhr, to restore internal order, and to stabilise the mark. The order for passive resistance was withdrawn on 27 Sept., and this step was only opposed by Bavaria where a separatist movement was aiming at the restoration of the Bavarian monarchy and the overthrow of the Ger. rep. It assumed serious proportions, but was divided into 2 parties, one purely monarchist under von Kahr, the other Fascist under Hitler and Ludendorff. Owing to this div. the plans of both parties miscarried. In Saxony also there was a revolt against the Rep. on the part of the Communists, and a Republican Prole-

tarian Gov. was set up. Stresemann issued an ultimatum, ordering this gov. to resign, and appointed a military commissioner with dictatorial powers. To cope with the financial problem Stresemann inaugurated a Powers Bill which would give him special powers to act on his own initiative while keeping within the bounds of parl. gov. A second Powers Bill was later passed. Economic stabilisation was further helped by the introduction of the Dawes plan (q.v.), which secured the evacuation of the Ruhr and put the question of reparation payments on an economic basis. The London Conference in 1924, at which the Dawes plan was adopted, paved the way for the Locarno treaties (q.v.) the following year, and for G.'s entry into the League of Nations in Sept. 1926.

On 20 Oct. 1924 the Reichstag was dissolved, and at the subsequent elections in Dec. the extremist Communists and Nationalists both lost a number of seats. During this period of transition towards more stable conditions, President Ebert d. Feb. 1925, and was succeeded by Hindenburg (q.v.). Luther was now chancellor, and Stresemann, who was foreign minister, concluded the Locarno treaties with France, Belgium, Great Britain, and Italy. The Locarno treaty was followed in April 1926 by a treaty with Soviet Russia much in the spirit of Locarno, but giving assurances that G.'s treaties with the W. powers were not directed against Russia. When Marx became chancellor in Jan. 1927 Stresemann was again foreign minister, and the Locarno treaty and the League of Nations continued to receive Ger. support as a means of securing equality of treatment. In Feb. the Inter-Allied Military Commission of Control was withdrawn, and the chief obstacle was thus removed from the hitherto secret reconstruction of the Ger. Army.

With the fall of the gov. in 1928 the Socialists gained in the ensuing elections, and Stresemann became foreign minister, this time in a gov. with the Socialist Müller as chancellor. In these elections the National Socialist or Nazi party won 12 seats with a total of over 800,000 votes—evidence of the success with which Hitler had built up the party since its eclipse in the Munich *putsch* of 1923. The following year the Young plan superseded the Dawes plan, and the Allies agreed to evacuate the Rhineland by June 1930. The first stage in the reconstruction of G. was thus complete, and the end of the period is marked by the death of Stresemann (3 Oct. 1929), his work largely accomplished.

Stresemann's methods had not, however, been thoroughgoing enough to please the Ger. Nationalist party, which was loud in its denunciation of the Young plan. Hugenberg, the leader of the Nationalists, became allied with Hitler in their joint opposition to the plan, and as a result the financial power of the industrialists and the propaganda machine of the Nationalists were of service in building up the

Nazi party. The Socialist influence waned, and in Dec. 1929 Müller was succeeded by Brüning, leader of the Catholic Centre party. Brüning did not have a majority in the Reichstag, and governed mainly by decree during the 2 years he remained in office. In 1930 the Reichstag was dissolved, and the elections were a triumph for the Nazi party, which gained 107 seats as against their previous 12, with a total vote of nearly 6,500,000. Hitler now sought to consolidate his victory by directing National Socialist propaganda against the Jews and Marxists, the alleged injustices of the Versailles treaty, and the Republican system of gov. The accentuation of the world economic depression of the 1930's resulted in Hitler acquiring a broader basis of support from the hard-hit lower middle classes, and in the succeeding elections Hitler's following grew even larger until, when he stood against Hindenburg in the presidential elections in 1932, he secured over 13,000,000 votes. Hindenburg was nevertheless elected by a majority of 6,000,000, and notwithstanding Hitler's success in the Reichstag elections Hindenburg refused him the chancellorship.

Subsequently, however, the reactionary group around Hindenburg persuaded him to make Hitler chancellor over a mixed Cabinet of Nazis and Nationalists. There is no doubt that they hoped Hitler would prove no more than a compliant figurehead, amenable to the wishes of the non-Nazi Nationalist party (Jan. 1933). But they had set flowing a Nazi tide which was destined very soon to sweep down all barriers. Hitler's first act was to stage the Reichstag fire, the responsibility for which he placed on the Communists. By this means he was able to restrict the activities of both Communists and Socialists at the subsequent elections, for many sincerely believed that he had saved G. from a threatened Communist uprising. He now had the substance of power, and could afford to disregard forms, though, having forcibly expelled the Communist and other opposition deputies, he went through the farce of obtaining from the Reichstag an Enabling Act, whereby he now meant to rule as a dictator, compelling submission by means of troops, concentration camps, and secret police—*Sturmabteilung* (S.A.) and *Schutzstaffel* (S.S.) and *Geheime Staatspolizei* (Gestapo) (see also S.A.; S.S.). His intensive propaganda 3 years previously had made a point of decrying the Republican polity. Now he could give the old constitution its death-blow. Their constitutional liberties gone, no resistance by any elements of the Ger. people could now avail. All opposition parties were suppressed, including the Nationalists, who had naively believed that Hitler would be their tool. As yet, however, Hitler did not show his hand in foreign affairs—apart from the fact that in its general outlines his policy could have been found in *Mein Kampf* (q.v.). For the next few years he intended to consolidate his position by giving the world the impression that he

really believed himself to be the bulwark against Bolshevism (see ANTI-COMMUNISM PACT), besides being a respecter of international obligations. He had not, however, disposed of all opposition and the Ger. dictator himself murdered or caused to be murdered those within the Nazi party who still offered resistance. This incident took place on 30 June 1934, when the Socialist or radical-wing leaders of the Nazi party were suddenly arrested and summarily executed. These included Röhm (q.v.), chief of the S.A., the man to whom Hitler was largely indebted for his triumph, and a number of non-Nazis were also executed at the same time.

In Aug. 1934 Hindenburg *d.*, and Hitler became both president and chancellor and, later, adopted the title of Führer, appointing a number of Gauleiters (dist. leaders) or nominees to act in the various provs. or former states of G.

Attention was now focused on the Saar dist., in which a plebiscite was held on 13 Jan. 1935 under the terms of the Versailles Treaty to determine whether this area should return to G. The Nazi propaganda campaign was such that the result was a foregone conclusion, and on 1 Mar. the important mining dist. of the Saar was returned to G. by a majority of over 90 per cent. Hitler's next move (16 Mar.) was to denounce the armament clauses of the treaty of Versailles, and to declare G.'s intention of re-establishing compulsory military service. An army of 550,000 men was planned in place of the 100,000 permitted by the treaty. In the same year (18 June) an Anglo-Ger. agreement on naval ratios was concluded, under which appeasement policy the Brit. Gov. allowed G. to build up to 35 per cent of Brit. naval strength (see NAVY; SEA POWER). G.'s next act was to defy the Locarno Treaty, adherence to which Hitler had himself reaffirmed. Both this treaty and the treaty of Versailles were repudiated when on 7 Mar. 1936 the demilitarised Rhineland zone was re-occupied by Ger. troops. France and Britain made no opposition, their fears in some sort allayed by Hitler's undertaking not to fortify the zone, and by his declaration that 'he had no territorial demands to make in Europe.' Relations between France and G. inevitably deteriorated, particularly as the result of the clash of interests aroused by the Sp. Civil war. The end of the Abyssinian war brought a *rapprochement* between Italy and G., and the so-called Berlin-Rome axis came into being in the autumn of 1936. This was followed on 25 Nov. by the agreement which G. signed with Japan. Announced as a defence against the interference of the Communist international in the internal affairs of the nations, this agreement was viewed as a dangerous military alliance by the rest of the world.

The following year (1937) G. continued to work towards a position of self-sufficiency, and to emancipate herself still further from the Versailles Treaty. The agitation for the return of the former

Ger. colonies was intensified. Intervention on behalf of Franco in the Sp. Civil war also helped to bring G. and Italy into line with each other in a joint policy versus the rest of Europe. The Italy of Mussolini accordingly joined the Ger.-Jap. Anti-Comintern Pact in Nov.

By the spring of 1937 the first phase of Nazi war economy was completed; the point of 'full employment' had been reached through rearmament and an unlimited spending policy. Expenditure on armaments, however, continued to increase, and the requisite resources were obtained partly by reducing the consumption of the people, partly by levying

therefore preceded by a change in the direction of the army and of the Foreign Office. Hitler became commander-in-chief of the army and Keitel was raised to be his chief of staff. On the political side von Neurath (q.v.) gave place as foreign minister to von Ribbentrop (q.v.), until then Ger. ambas. in London. The way was now ready for expansion. In Mar. 1938 Ger. troops invaded Austria, which was occupied without resistance. On 13 Mar. the union of G. and Austria was announced.

Italy's acquiescence in the annexation of Austria served outwardly to strengthen the ties with which she was bound to G.,

E.N.A.

THE GERMAN INVASION OF AUSTRIA, MARCH 1938

A Munich infantry regiment crossing the frontier at Kiefersfelden, in Bavaria

on the Jews and other minorities, and partly by enforced measures of rationalisation and extended hrs of labour (trades unions had long been suppressed). It was now that G., emboldened by previous successes and by the knowledge that she alone among the nations was rearming at top speed, began the policy of piecemeal absorption of European ter. (see further under EUROPE, History and WAR, SECOND WORLD). In each case the technique was the same—to trump up charges of ill usage of Ger. minorities or nationals, and stir up disorder with the aid of spies, coupled with the widely disseminated but hollow allegation of the hostile encirclement of G. Steps taken by other nations in self-defence were inevitably construed as proofs of encirclement.

There was, however, still some opposition in G. to Hitler's policy of Nazi domination of Europe. His plans were

and the accord between the 2 countries was affirmed at a meeting between Hitler and Mussolini in Rome during May. Thus Italian support was assured for Hitler's next move against Czechoslovakia. Propaganda was intensified on behalf of the Sudeten Germans in Czechoslovakia, while to protect G. in the W. the fortification of the Siegfried line was hastily erected. In Sept. the crisis came to a head. G. demanded the cession of the Sudetenland under threat of war. These demands were formulated by Hitler at conferences with the Brit. Prime Minister, Neville Chamberlain, at Berchtesgaden on 15 Sept. and at Godesberg on 22 Sept. Finally, on 28 Sept., a conference was held at Munich between Hitler, Mussolini, Chamberlain, and Daladier, at which Hitler gained his demands. The Sudeten Ger. dists. were accordingly occupied and the Czech fortifications taken over. An Anglo-Ger. declaration repudiating war

was signed on 30 Sept., followed in Dec. by a pact between G. and France. Neither of these agreements, however, served to prevent the deterioration of the European situation.

In order to pay for her successive ventures G. fell heavily into debt, and it was with the aim of easing their economic difficulties that the Nazi party organised one of the worst pogroms against the Jews in Nov. 1938. In Mar. 1939 a Ger. protectorate was set up over Bohemia and Moravia, incorporating over 6,000,000 Czechs in the Ger. Reich, while Slovakia was formed into a rep., nominally independent but actually subject to G. This move was accompanied by a trade drive in Rumania and the Balkans, resulting in barter agreements to give G. the foodstuffs so greatly needed in exchange for manufactured articles. Lithuania was forced to cede Memel to G.

On 28 April Hitler denounced the Non-Aggression Pact concluded with Poland in 1934 and also the Anglo-Ger. naval agreement of 1935. To offset the supposed encirclement of G. by Great Britain, France, and Poland, a military alliance was made with Italy, thus openly directing the Berlin-Rome axis towards war. The demand for Danzig became more menacing with the accompaniment of frontier clashes. Hitler was undeterred by the Brit. promise of support for Poland, which he countered by a non-aggression pact with Soviet Russia. This was concluded on 26 Aug., and for the sake of it Hitler outwardly reversed the anti-Communist policy on which hitherto the Nazi state had been largely based. Secure as he imagined from a war on 2 fronts Hitler forced the issue with Poland, which was invaded on 1 Sept. Great Britain and France then declared war on G. on 3 Sept. (For a fuller account of the war, see WORLD WAR, SECOND; and articles on separate campaigns, etc.)

The Polish campaign lasted only a month. G. was, however, forced to agree to Russian annexation of half the Polish ter., while at the same time Russia strengthened her position in the Baltic by securing bases from Latvia, Lithuania, and Estonia. With the spring of 1940 came the period of renewed military success. Norway was invaded on 8 April to protect the transport of iron ore from Sweden, which was essential to Ger. armaments. The invasion of the Netherlands, Belgium, and Luxembourg followed on 10 May. With the occupation of these countries and the surrender of France, fighting in Europe had come to an end by July. Plans were made for the invasion of Britain, but the offensive and defensive successes of the R.A.F. caused these plans to be abandoned. Politically Hitler now sought to maintain his prestige by dictating settlements for the differences which prevailed between Hungary and Rumania, Slovakia and Bulgaria. These countries were accordingly brought within the orbit of G. The New Order in Europe was launched, by

which the economy of each European country was linked to that of G. and made to subserve the aims and ambitions of the master people, the Ger. *Herrenvolk*. Meanwhile it was Hitler's hope to guard against Amer. intervention by means of a 10-year pact with Italy and Japan, concluded on 27 Sept. 1940. The mutual military and economic support which the 3 countries guaranteed to each other in the event of attack by a country not at that time at war was held to be directed towards the U.S.A. It did not, however, serve to hinder Amer. economic aid to Britain. Hitler's New Order meant the subjugation of the peoples of Europe to work for G., and the organisation of foreign labour was pushed forward in order to keep up the supply of men and materials necessitated by the Ger. campaign in Greece and the invasion of Russia, Luxembourg, Alsace-Lorraine, and part of Yugoslavia, formerly belonging to Austria, were incorporated in the Reich during 1941.

Political events which preceded the invasion of Russia on 22 June 1941 were a tightening of the bonds which reduced Bulgaria, Rumania, and Croatia to the status of vassal states of G. Rumania, Finland, Hungary, and Slovakia lent armed aid to G. against Russia. At the same time a pact of friendship was concluded with Turkey. The prolongation of the war bringing reverses to the Germans in Russia and North Africa meant in the Ger. Reich itself an intensification of propaganda to stiffen morale and a tightening of the grip of the Gestapo. The New Order in Europe gave way to Ger. domination, and the appearance of collaboration began to disappear, particularly in relation to France. The persecution of the Christian religion and of the Jews continued. By a decree in 1943 the Jews ceased to have any legal existence. The predominant position of the Gestapo was emphasised by the appointment of Himmler, leader of the S.S., to the post of minister of the interior. His position was further strengthened the following year as a result of the attempt on Hitler's life on 20 June 1944. This unsuccessful plot to destroy Hitler by a bomb explosion was organised by a number of high-ranking officers in the army. Reprisals were severe, and were conducted by Himmler, who became supreme commander of the home army. Defeatism was everywhere ruthlessly suppressed, especially in the face of the Russian advance in the E., and an example was made of high officials, notably the deputy burgomaster of Breslau and the mayor of Königsberg, who were executed in the early months of 1945. In the W. the morale of the fighting forces was rallied for the offensive in the Ardennes, launched by von Rundstedt. In Jan. 1945 the Russian advance again went forward, and the allied offensive in the W. began the following month.

On 1 May 1945 Doenitz broadcast the death of Hitler. It is now generally accepted that Hitler committed suicide

in the last hrs before Berlin fell into Russian hands. Doenitz announced himself as Hitler's successor, but his gov. did not survive the unconditional surrender which Doenitz announced by wireless on 6 May. He was arrested as a war criminal and his gov. dissolved. The official terms of surrender were signed in Berlin in the early hrs of 8 May by Keitel for the Ger. Army, von Friedeburg for the navy, and Stumpf for the air force. G. was divided into zones of occupation, roughly corresponding to the areas conquered by each of the allied armies. The normal life of the country had come to a standstill. Nearly all the large cities suffered severe damage from bombing, and the countryside lost much either as a result of the actual fighting or by the Germans themselves in their retreat. An Allied Control Commission was set up, consisting of the allied commanders-in-chief, Eisenhower representing the U.S.A., Montgomery for Great Britain, Zhukov for the U.S.S.R., and de Lattre de Tassigny for France. The commission held its first meeting on 5 June, and announced that it had taken over all powers of gov.

The policy to be followed towards defeated G. was decided by a three-power conference held at Potsdam in July and attended by Truman, Stalin, Winston Churchill, and Attlee (see POTSDAM AGREEMENT). The main decision of the conference was that the political and economic life of the country was to be decentralised. All laws of Nazi origin were to be abolished, and reorganisation of the judicial system and of education was to follow. There was to be complete disarmament and elimination of war potential. The W. frontier of Poland was fixed provisionally on the Oder-Neisse line, thus giving Prussia E. of the Oder and Silesia to Poland, also the S. part of E. Prussia, including Danzig. Königsberg and the N. part of E. Prussia was allotted to the U.S.S.R. As a result of the Potsdam Conference the zones of occupation were given a demarcation slightly different from the areas originally taken up by the occupying armies earlier in the year. The Brit. zone included the Rhur, N. Rhineland, Westphalia, Hanover, Oldenburg, Schleswig-Holstein, Hamburg, Lippe, Schaumburg-Lippe, Brunswick, Helioland, and the Frisian Is. The Amer. zone included Bavaria, part of Württemberg, Bremen, Waldeck, Hesse, and Hesse-Nassau, and Baden N. of and including Karlsruhe. The Russian zone included Mecklenburg, Brandenburg W. of the Oder, Anhalt, Thuringia, and Saxony. The Fr. zone included S. Rhineland, the Saar basin, the Rhenish Palatinate, Baden S. of Karlsruhe, and part of Württemberg. Berlin was created a fifth zone, divided into occupational areas among the 4 powers. One of the first problems facing the commission was the shortage of food. As great a task was provided by the numbers of homeless and wandering people, displaced persons as they came to be known, a category

numbering some 8,000,000. After some months the majority were settled in their former homes. There remained about 500,000 for which U.N.R.R.A. (see UNITED RELIEF AND REHABILITATION ADMINISTRATION) became responsible.

By 1946 the 4 zones of occupation had hardened almost into the semblance of 2 separate states; the Fr., Brit., and Amer. zones forming a W. bloc, the Russian an E. bloc. In the W. permission was granted for the formation of political parties with the prospect of free elections at a later date. The leading political parties were the Social Democrats led by Schumacher (q.v.), the Communists, and the Christian Democrats under Adenauer (q.v.). Parallel with the growth of political activity went the process of de-nazification. Education was re-started, and a free press set going. In the Russian zone Pieck (q.v.) and Ulbricht, former leaders of the Communist party, returned to Berlin under Russian auspices, the former to become chairman of the party's central committee. Under Russian pressure proposals were set on foot to fuse the Social Democratic party with the Communists. This fusion was formally effected in June 1946, and Pieck and Grotewohl (q.v.), the fusionist leader of the Social Democrat party, became joint chairmen of a single Socialist Unity party, in reality entirely Communist in outlook.

In the Russian zone the large estates of Mecklenburg, Brandenburg, and Saxony were broken up, and land amounting to over 4,000,000 ac. was distributed to some 300,000 families of peasants, including refugees deported from Poland and Czechoslovakia. Administration in the 3 provs. and in Thuringia and W. Pomerania was carried out by representative Ger. govts. set up by the Soviet military authorities with executive, legislative, and judicial authority, while a central administration for the whole zone was created in Berlin. Elections for the prov. assemblies were held in 1946 with the Socialist Unity party in the majority throughout the zone. Municipal elections were held in all 4 zones in various stages throughout 1946—the first free elections since 1932. In the Brit., U.S.A., and Fr. zones the Christian Democrats proved the strongest party, with the Social Democrats a strong second. In the Russian zone the Socialist Unity party had the strongest vote. In Berlin itself the Social Democrats won a victory in the face of strong Communist opposition.

In Dec. 1946 discussions were started between the U.K. and the U.S.A. towards an economic fusion of the Brit. and Amer. zones with the aim of achieving a self-sustaining economy. The project received greater impetus following the failure of the Council of Foreign Ministers at a conference in Moscow in Mar. 1947 to reach agreement on any plan whereby G. could be governed as a single economic unit. By May negotiations between the Brit. and U.S. Govts. led to an agreement which accomplished a full economic

fusion of the 2 zones while maintaining the political independence of the *Länder* govts. concerned. Developments in the Russian zone were more radical. The occupying power continued the transfer of properties to so-called *Aktion-Gesellschaften* to acquire Ger. factories, removed vast quantities of goods and equipment to Russia, and rapidly tightened the hold of the one-party regime. Living conditions in the Russian zone were bad and, according to Ger. reports from that zone, worse than in the W., but shortages were

order forbidding all traffic between their zone and the W. Thus began the 'blockade of Berlin' and soon afterwards the Allies' measures to supply their sectors with food and other goods through the 'air lift.'

The W. allies in June recommended that the Germans call together a parl. assembly for W. G. by 1 Sept. The assembly was to work out a constitution by the end of the year and elect a gov. by the spring of 1949. There was considerable doubt in the minds of Ger.

THE BUNDESTAG IN SESSION

Camera Press

aggravated by the hardest winter in living memory.

In London (Dec. 1947) four-power negotiations in the Council of Foreign Ministers broke down on the future of a politically and economically united G. The govts. of Britain, France, and the U.S.A. therefore decided to carry out, without Russia, the political and economic integration of their zones. G. had now become a pawn in the political conflict between the W. world and Russia. As a part of their plan to aid Ger. recovery the W. powers announced a drastic currency reform to apply to their zones but not to Berlin; and on 20 June the Reichsmark was withdrawn and the new Deutsche mark introduced. The Russians countered this move on the same day with an

politicians, who feared that a gov. in W. G. would deepen or perpetuate the E.-W. div. of the country. But subsequently they decided to co-operate with the policy of the W. powers, mainly because the 16 European recovery nations had accepted W. G. as a beneficiary under Marshall aid and this would give a chance of prosperity for G. and the cutting down of the allied reparations demands. The W. Allies wanted a Ger. gov. in the W. because they could not get one for the whole of G. They wanted Germans to administer their own affairs under direct allied control, because they wanted to ease the burden on the taxpayers at home; they wanted the political and economic integration of W. G. because it would be a good bargaining counter in their dealings.

with the Russians; and finally, they wanted an economically prosperous and politically stable G. to play her part in the European recovery programme (see on this *EUROPE, History*).

On 1 Sept. 1948 the Parl. Council met at Bonn to begin the work of drafting a constitution. Its task was made more difficult because the W. Allies had slightly different ideas about the form which the proposed Ger. state should take: and because the status of the W. sectors of Berlin in the new state raised difficulties of a technical nature.

By April, however, the 3 W. powers had largely resolved their difficulties among themselves through the solidarity achieved by the conclusion of the North Atlantic Treaty (see *EUROPE, History*), which was the corollary to the W. Union. The political effect of this treaty for strengthening the mutual defence of the W. nations from external aggression upon Russian opinion was soon manifested, for in the same month the gov. of the Soviet Union informed the U.S. Gov. that it was willing to raise the blockade of Berlin if a definite date were set for a council of foreign ministers to discuss Ger. questions. (The blockade was, in fact, raised in May, though some restrictions remained until Sept. 1949.) It was, however, made clear by the W. powers that the holding of a council would not deflect the 3 govts. from their plans to establish a gov. for W. G. These plans were now easier of accomplishment by reason of the fact that the parl. council at Bonn had come to an agreement over the draft constitution. By 23 May the legislatures of some 8 *Länder* had ratified the Bonn basic law by substantial majorities and the two-thirds majority required before promulgation was thus obtained.

In anticipation of the completion of the basic law, the govts. of the U.S.A., Great Britain, and France had drawn up an agreed memorandum to govern the exercise of their powers and responsibilities in G. following the estab. of a Ger. federal rep. The Allies, who retained their supreme authority, reserved the right to take direct action themselves in certain limited fields set out in the Occupation Statute when the Ger. federal rep. should have been estab. Military gov. as such would terminate and the functions of the allied authorities would be divided—control functions being exercised by a high commissioner and military functions by a commander-in-chief. The 3 high commissioners together would constitute an allied high commission—one of whose chief duties would be the unanimous approval of amendments to the federal constitution proposed by the federal gov.

The Federal Ger. Rep., comprising the former Brit., Amer., and Fr. zones, came into existence on 23 May 1949, and the subsequent hist. of W. G. is contained in the article *FEDERAL GERMAN REPUBLIC*. The Soviet Union protested formally at its creation, and on 7 Oct. 1949 the Ger.

Democratic Rep. (q.v.) was estab. in the Soviet zone, and its hist. is dealt with in the article *GERMAN DEMOCRATIC REPUBLIC*.

Various proposals made by the W. powers, the Soviet Union, and the Germans themselves for the proposed reunification of the 2 Ger. states have so far (1958) come to nothing. Federal G. is now linked to the W. powers by economic and military treaties, while the Ger. Democratic Rep. has, since its inception, been one of the most subservient of the Soviet satellites.

Germinal (month of buds), 7th month of the year in Fr. revolutionary calendar. See CALENDAR.

Germination, development of the embryo contained in the seed into a seedling, in consequence of exposure to the necessary conditions of moisture, warmth, and aeration. The radicle, or root, appears first, and grows vertically downwards; the plumule, or young shoot, then grows upwards, while the cotyledons take an approximately horizontal position.

Germiston, third largest tn in the Transvaal, South Africa, 9 m. from Johannesburg; an important air and railway junction in the heart of the Rand (q.v.) goldfields. The gold refinery is the world's largest. Many secondary industries are sited in G., which is also an educational centre. There are large railway workshops. Pop.: Whites, 50,200; Bantus, 90,395; Coloureds, 2454; Asiatics, 4157.

Gérôme, Jean Léon (1824-1904), Fr. painter, b. Vesoul. In 1841 he became a pupil of Paul Delaroche. In 1847 his 'Young Greeks Cockfighting' was the first of many popular reconstructions of life in the anc. world. In 1855 the State purchased his 'Le Siècle d'Auguste et la naissance de Jésus-Christ', and bestowed upon him the Cross of the Légion d'Honneur. The 'Duel' of 1857 increased his reputation, and the 'Gladiators', 1859, was looked upon as his masterpiece. Among his oriental studies are 'Turkish Prisoner', 'Prayer', and 'Slave Market.' He was also a celebrated academic teacher of art.

Gérôme, see GERARDMER.

Gerona: 1. Sp. prov., in Catalonia (q.v.), at the E. end of the Pyrenees, with a coastline on the Mediterranean. It is watered by the Ter and the Fluvià, and has varied physical features, including mts, ranges, the plain of El Ampurdán, and the picturesque Costa Brava (q.v.). There is a small detached dist. at Llívia (q.v.). Coal, copper, lead, and iron are found, and there are textile, paper, cork, leather, cement, and fish-curing industries. Area 2265 sq. m.; pop. 328,600.

2. (anc. **Gerunda**) Sp. tn, cap. of the prov. of G., at the confluence of the Oñar and the Ter. It was taken by Charlemagne in 785, and fell to the Fr. in 1809 after a memorable siege. The splendid Gothic cathedral, begun in 1312, is remarkable for the great width (90 ft) of its single nave. There are some Rom. remains. Pop. 38,400.

Gerry, Elbridge (1744-1814), Amer. statesman, b. Marblehead, Mass.; graduated at Harvard in 1762. From 1774 to 1775 he was a member of the Massachusetts Prov. Congress; a member of the Continental Congress, 1776-85, and was a great advocate of the Declaration of Independence. From 1810 to 1812 he was governor of Massachusetts. His administration was marked by the enactment of a law by which the state was divided into new senatorial dists., which gave an unfair advantage to the party in power. From this has arisen the term gerrymander. In 1812 he was elected vice-president of the U.S.A., and was an ardent advocate of war with Great Britain. See J. T. Austin, *Life of Elbridge Gerry*, 1828-9.

Gerrymander, see GERRY, ELBRIDGE.

Gers, dept of SW. France, formed of part of Gascony. Chains of hills (the foothills of the Pyrenees) run from N. to S., and the dept is watered by many rvs., including the G., Baise, Save, and Gimone. Vines are extensively cultivated, being mainly grown for distillation into Armagnac brandy (see BRANDY), and cereals, vegetables, fruit, and tobacco are produced. Stock raising (horses, cattle, and poultry) is important. There is little industry. The prin. tns are Auch (the cap.), Condom, and Mirande (qq.v.). Area 2430 sq. m.; pop. 185,100.

Gershwin, George (1898-1937), Amer. composer, b. Brooklyn, New York. He studied the piano under Charles Hambitzer,

harmony under Edward Kilenyi and Rubin Goldmark. He first had to earn a living as pianist in a jazz shop, but in 1919 made a success with a musical comedy, *La, La, Lucille*. Others included, with mounting success, *Our Nell*, 1923, *Lady be Good*, 1924, *Tell Me More*, 1925, and *Of Thee I Sing* (Pulitzer prize), 1932. More ambitious was the Negro opera *Porgy and Bess*, produced at Boston in 1935, and his greatest success in the concert-room was the first *Rhapsody in Blue*, 1924, for piano and jazz orchestra. (A second appeared in 1931.)

Gerson, Jean (1363-1428), chancellor of the univ. of Paris, and, with Pierre d'Ailly, originator of Gallicanism, i.e. the claim that general councils were superior to the pope. He urged this as a means of healing the Great Schism and largely through his efforts the councils of Pisa, 1409, Constance, 1414, and Basel, 1431, were held. See also KEMPIS, THOMAS A.

Gersonides, or **Levi ben Gershon** (1288-1344), Fr.-Jewish philosopher, mathematician, and physician; b. Bagnols-sur-Cèze in the co. of Orange. Sometimes called **Rabag**—that being a vocalisation of the initials of Rabenu Levi ben Gershon. He came of a family of scholars, but the identity of his father is in dispute. His prin. work is *Milhamot Adonai* (Wars of the Lord), a treatise on immorality, prophecy, omniscience, providence, the celestial spheres, and the eternity of matter. He followed Aristotle, being the first Jew that dared, in so doing, to join issue with Heb. theology. He d. at Perpignan. See I. Husik, *History of Medieval Jewish Philosophy*, 1946.

Gersoppa, Falls (also called the **Jog Falls**), lie on the Shrivati R. where it forms the boundary between Bombay and Mysore States, India. They are possibly the finest falls in India. The riv. divides in its descent into 4 cascades, and the cliff over which it falls is 830 ft high.

Gerstöcker, Friedrich (1816-72), Ger. writer and traveller, b. Hamburg. For some years he lived an errant life in America, of which he pub. an account on his return to Germany. Later he travelled extensively in both America and Africa (1850-68). His narrative descriptions of his travels, written in vivid style, have enjoyed considerable popularity. He also wrote many novels, the plots of which were founded on his experiences.

Gerstenberg, Heinrich Wilhelm von (1737-1823), Ger. poet and critic, b. Tondern, Schleswig. He entered the Dan. Army, and served in the Russian campaign of 1762, but later left the army for the civil service. In 1759 he pub. a vol. of anacreontic poems, *Fändelein*; but his best works are *Briefe über Merkwürdigkeiten der Literatur*, 1766-70, and his tragedy, *Ugolino*, 1768, which was one of the prin. forerunners of the *Sturm und Drang* period. See A. M. Wagner, *H. W. von Gerstenberg*, 1920.

Gertrude, St (c. 1256-1302), Ger. Benedictine nun and mystical writer who lived in the convent at Helfta, near

Eisleben. Her mystical writings did much to promote devotion to the Sacred Heart of Jesus. Patron of the West Indies, her feast is on 16 Nov., having been extended to the universal Church in 1877.

Gertsen, see **HERZEN**.

Gerunda, see **GERONA**.

Gervase of Canterbury (fl. c. 1160-1199), Eng. chronicler, a monk of Christ Church, Canterbury. He wrote an eyewitness account of the burning and repairing of Canterbury Cathedral, 1174. G. championed the rights of his archbishop against those claimed by the abbot of St Augustine's, and much of his writing deals with these inter-monastic disputes. But his *Mappa Mundi* and *Gesta Regum* are more general historical works, and are valuable for the picture they give of England in Richard I's reign.

Gervase of Tilbury (d. c. 1235), Eng. historical writer, said to have been a native of Tilbury. He studied law at Bologna, and was present at the meeting of the Emperor Frederick I and Pope Alexander III at Venice. He was first employed by Henry II, for whom he wrote a jest-book, and later entered the service of William of Champagne, cardinal archbishop of Rheims. In 1198 he entered the service of the Emperor Otto IV, who made him marshal of the kingdom of Arles, and married him to an heiress. It was to amuse the emperor that he wrote his best-known book, *Otia Imperialia*, which contains a historical geography of the world as well as a good deal of legendary matter.

Gervex, Henri (1852-1929), Fr. painter, b. Paris. He first devoted himself to the painting of mythological subjects and the paintings of the nude, but afterwards took up the study of modern life and of effects of bright daylight, indoor and outdoor, with great success. His most famous picture perhaps is his 'Before the Operation,' 187, a hospital scene, showing the surgeon Péan and his pupils.

Gervinus, Georg Gottfried (1805-71), Ger. historian, b. Darmstadt, and educ. at Sussen and Heidelberg. In 1835 he was appointed prof.-extraordinary at Heidelberg, and in 1836 prof. of hist. and literature at Göttingen, from which he was dismissed in 1837 for signing the protest against the unconstitutional conduct of Ernest Augustus. He went to Heidelberg, and in 1847 started the *Deutsche Zeitung*. In 1848 he was a member of the Frankfurt National Assembly. G. was a patriot of liberal ideals and a defender of constitutional liberty as is shown by his writings as well as by his conduct; his *Introduction to the History of the 19th Century* led to his imprisonment. See life by M. Rychner, 1928.

Geryon (Greek for howler, or roarer), a monster with 3 heads, son of Chrysaor and Callirrhoe, and king of the is. of Erythraia. His herds of red cattle were guarded by the giant Eurytion and the 2-headed dog Orthrus. One of the 12 labours of Hercules (q.v.) was the capture of these cattle.

Gesenius, Heinrich Friedrich Wilhelm (1786-1842), Semitist, founder of modern Heb. philology and of Phoenician epigraphy. From 1810 onwards prof. of theology at Halle. In 1810-12 he pub. *Hebräisch-deutsches Handwörterbuch des Alten Testaments*; his *Hebräische Grammatik*, 1814 (and numerous subsequent eds.), is still a standard work; in 1815 appeared *Neues hebräisch-deutsches Handwörterbuch und Geschichte der hebräischen Sprache und Schrift*; in 1817, *Ausführliches grammatisch-kritisches Lehrgebäude der hebräischen Sprache*; in 1829-58, *Thesaurus Linguae hebraeae*, etc., 3 vols.; in 1837, *Scripturae linguaeque Phoeniciae monumenta*. He also pub. other works, including those on the Maltese and Samaritan languages.

Gesner, Conrad von (1516-85), Swiss writer and naturalist, b. Zürich. Hallam described him as 'probably the most comprehensive scholar of his age.' He studied at Strasburg, Bourges, and Paris, and was appointed prof. of Greek at Lausanne in 1537. In 1541 he became prof. of natural hist. at Zürich. G.'s favourite study was botany, and he pub. in 1542 a *Catalogue of Plants in 4 languages*: Lat., Greek, German, and Fr. He founded a small botanical garden at Zürich. Another important work of his is *Bibliotheca universalis*. This is a catalogue of all the writers who had ever lived, with their works, and is written in Hebrew, Lat., and Greek. In 1551-8 appeared his great zoological work *Historia animalium*. Besides these he wrote *Mithridates de differentiis linguis*, an account of about 130 languages, and the Lord's Prayer in 22 tongues. See H. Buess, *Schweizer Ärzte als Forscher Entdecker und Erfinder*, 1945; also studies by P. A. Cap, 1864; J. Hanhart, 1924; and W. Ley, 1929.

Gesner, Johann Matthias (1691-1761), Ger. classical scholar, b. Roth near Nuremberg, and studied at Jena. In 1715 he became prof. and librarian at Weimar; in 1728 he was made headmaster of the gymnasium at Ansbach (Anspach). In 1730 he was appointed head of the Thomas Schools at Leipzig, and in 1734 became prof. and librarian at Göttingen. His works include eds. of the *Scriptores rei rusticae*, of Claudian, Horace, Quintilian, and Pliny the Younger.

Gesneria, a genus of South Amer. perennials, family Gesneriaceae, about 50 species; chiefly grown as greenhouse flowers in Britain and America.

Gessner, Salomon (1730-88), Swiss painter and poet, b. Zürich. He first became famous by his *Lied eines Schweizers* in 1751. Other writings of his are *Daphnis*, 1754, *Idyllen*, 1756, *Inkel und Der Tod Abels*, 1758, and *Evander und Alcimna*, 1768, an idyllic prose pastoral, which was trans. into many languages, including Welsh. His works are sentimental, delicate, and feeble, but they achieved universal popularity at the time of their pub., owing to the appreciation of Goethe, Lessing, and Herder. His paintings are mostly in water-colours,

but he also executed some very fine engravings. His *Letters on Landscape Painting* were pub. in 1772. He illustrated a large ed. of his poems *Idyllen*, 5 vols., 1772. See P. Leemann-van-Eick, *Salomon Gessner*, 1929.

Gesta Romanorum ('Deeds of the Romans'), name given to a collection of short, didactic Lat. stories for the use of preachers, the compilation of which was begun probably at the end of the 13th cent., or at the beginning of the 14th, by an Eng. Franciscan. Its title is only partly appropriate, for it was gradually expanded and at the present time it contains fragments of oriental and European origin as well as those from Lat. and Gk. hist. The style of the book is bad, but it is interesting from a literary point of view, for it contains the sources of the writings of Gower, Chaucer, Shakespeare, and others, e.g. Chaucer's *Man of Lawes Tale* and the main outlines of Shakespeare's *King Lear* and *Pericles*, and the incidents of the caskets and the pound of flesh in *The Merchant of Venice*, and Longfellow's *King Robert of Sicily*. The first printed ed. of the modern form of G. R. was issued at Utrecht about 1473, and an ed. in Eng. was printed by Wynkyn de Worde, 1510-15. There is a good modern trans. by C. Swan in Bohn's Library and a selection trans. into German by H. Hesse.

Gestapo, abbreviation for *Geheime Staatspolizei*, the Ger. secret police. It was deliberately organised as an integral part of the Nazi machinery of coercion soon after the rise of Hitler to power in 1933. Its ramifications extended throughout Germany into every kind of anti-Nazi organisation and by methods of terrorism it soon stamped out all resistance to Hitler. Its agents, who probably eventually numbered 150,000, supervised the conduct and even the utterances of the whole pop. and exercised the power of arbitrary arrest wherever opposition was found. The head of the G. was Heinrich Himmler (q.v.), supreme commander of the *Schutz Staffeln* (S.S.) (q.v.). The G. was pronounced at the Nuremberg trial of war criminals (1946) to be a criminal organisation.

Gestation, the retention of the young in the uterus from the time of the fertilisation of the ovum—that is, conception—to the moment of delivery. The period of G. varies with the number of the offspring and the degree of their development at birth, with the size of the mammal, and, above all, with its status in the scale of evolution. The longer duration of the condition of pregnancy is an important factor in the growth and evolution of the higher species. For women the period varies considerably above and below the average of 280 days. As regards animals which have litters the normal length of G. for a rat is 28 days, for a rabbit 35, and for a bitch 62 days. The G. of a sheep, cow, and mare usually lasts 6, 9, and 11 months respectively. For a giraffe the period may be 430 days, and for an elephant more than 600 days.

Gesualdo, Carlo, Prince of Venosa (c. 1560-1613), It. musician, b. Naples, was renowned as a brilliant amateur performer on the bass-lute. He married his first cousin Maria d'Avalos, who though only 21, had already been married twice and had children. Carlo and she had 1 son. She became paramour of Fabrizio Caraffa, 3rd duke of Andria; Carlo had them killed on the night of 16 Oct. 1590. He succeeded his father as prince (1591). In 1594 he married Elanora d'Este, at the court of whose family, at Ferrara, he afterwards resided, occupying himself with composition; but he d. at his Neapolitan estate. His madrigals, which are daringly chromatic, show him to have been a law unto himself, in composition as in life. See C. Gray and P. Heseltine, *Carlo Gesualdo*, 1926.

Getae, Thracian people, mentioned by Herodotus and Thucydides as dwelling S. of the Ister (Danube). In the time of Alexander the Great their ter. lay beyond that riv., and in the early part of the 1st cent. BC they became politically united with the Dacians (see DACIA).

Gethsemane (Aramaic, from *gath*, wine press; *shemen*, oil), a small area about 1 of a m. from Jerusalem, at the foot of the Mt of Olives, E. of the Kidron. It contained and still contains a garden, the favourite resort of Christ and His disciples, and the scene of His agony on the night before the Passion. The present garden, cared for by the Franciscans, contains olive trees of great age, some of which are descended from, if they may not actually be, those which sheltered Christ. The rock of the agony is now enclosed in a beautiful basilica of the nations, built by subscriptions from all the national churches. The rock, surrounded by a fine low bronze rail representing thorns and pelicans, lies in front of the High Altar, over which is a large picture of Christ in His agony of prayer.

Gette, riv. in Belgium, which flows through the provs. of Brabant and Limbourg. It joins the R. Demer above Diest. Its banks were the scene of a fierce battle in May 1940 to delay the Ger. advance.

Gettysburg, U.S.A., bor. and co. seat of Adams co., Pennsylvania, situated on the W. Maryland and the Philadelphia and Reading railroads, 35 m. SW. of Harrisburg. It is an agric. region, built on and surrounded by picturesque hills, and contains sev. mineral springs of medicinal value. It is the seat of a Lutheran theological seminary and of G. College, founded in 1826 and 1832 respectively. G. was founded in 1770 and incorporated as a bor. in 1806. The battle named after it, one of the most important of the Civil war, was fought here in 1863 when the S. general, Robert E. Lee, was defeated by the northerners under Meade, and a battle monument, surmounted by a statue of Liberty, now rises from the brow of the hill in G. National Military Park. G. is the site of President Dwight Eisenhower's farm. Abraham Lincoln's celebrated

dedicatory address was made here on 19 Nov. 1863. Pop. 7000.

Geulinox, or Geulingx, Arnold (1624-1669), Dutch philosopher, b. Antwerp, and one of the disciples of Descartes. Studied philosophy and medicine at Louvain and graduated as doctor. He lectured at Louvain Univ., 1646-58. In 1665 he was appointed prof. of philosophy at Leyden. G. is a leading exponent of the speculative doctrine known as 'Occasionalism,' and the salient point of his teaching is an endeavour to explain the relations existing between body and soul. In his lifetime there were pub. only the theses which he defended on graduating at Louvain: *Saturnalia, seu quaestiones . . . disputatae*, 2nd ed., 1665. His chief works in the hist. of philosophy are *Metaphysica vera*, 1691, and also *Ethica, post tristia auctoris fata*, 1696; first part 1665. Besides these he wrote *Physica vera: Logica restituta et Annotata in Principia, Philosophiae R. Cartesii*. See J. P. N. Land, *A. Geulinx und seine Philosophie*, 1895; E. Grimm, *Arnold Geulinx Erkenntnistheorie und Occasionalismus*.

Geum, genus of herbaceous perennial plants, family Rosaceae, including about 40 species, of which the water avens (*G. rivale*), with orange flowers, and the wood avens (*G. urbanum*), are found in Britain. The water avens and other species are grown in gardens as border and rockery plants.

Gex, Fr. tn, cap. of an arron., in the dept. of Ain, on the Jouran. It is a tourist resort, and the spa of Divonne-les-Bains is near by. The surrounding region, the pays de G., was part of Burgundy, and in the 16th cent. alternated between Savoy, Berne, and Geneva. It became Fr. in 1601, but in 1815 6 cantons were given to Geneva. Pop. 2000.

Geysers (Icelandic *geysa*, to burst out violently), mts. of hot water and steam of an eruptive nature met with in some volcanic regions, more especially in Iceland and New Zealand. A geyser consists of 2 parts, a basin and a tube. Deposits of silica, formed as the water evaporates, and sometimes becoming like a crater, form the basin of the geyser, whilst the tube leads beneath the surface. Water accumulating in fissures connected with the tube is heated until the pressure of steam overcomes the pressure of the water, and a column of hot water is projected into the air through the tube. The G. in Iceland are the best known in the world. They are situated within sight of Mt Hekla, and are the hottest springs in Europe. The G. of New Zealand are celebrated principally on account of the beautiful terraces associated with them. The basins connected with these G. are much used by bathers and resorted to by invalids. The Yellowstone region in North America also abounds in G. The 3 localities mentioned are where G. attain their highest development; but they also exist in many volcanic regions, such as Japan, South America, and the Malay Archipelago. (See illustration, next page.)

Gezelle, Guido Pierre Théodore Joseph (1830-99), Flem. priest and poet, b. Bruges, the son of a gardener. He was trained for the priesthood, and after ordination held teaching posts at Roulers and at Bruges, until jealousy on the part of his superiors forced him to accept a curacy at Courtrai. There he spent 25 years, and did not return to Bruges till the last year of his life. He is one of the most individual figures in the revival of Flem. poetry, and the greatest of Flem. lyric poets, his work being marked by a blend of religious and patriotic fervour and a rare sensitivity of perception. He was elected a member of the Flem. academy. Besides various translations from Eng. and Fr. he pub. *Kerkhofblommen*, 1858,

and on the N. by the Fr. Sudan. The area of G. is 91,843 sq. m., and is composed of 4 divs.: the Northern Ter., 30,486 sq. m.; Ashanti, 24,379 sq. m.; Southern G. (formerly the 'Gold Coast Colony'), 23,937 sq. m.; and Togoland (formerly a U.N. Trusteeship Ter.), 13,041 sq. m. The prin. tns are Accra (cap.), pop. 135,000; Kumasi (cap. of Ashanti), pop. 78,000; and Sekondi-Takoradi (the main port of G.), pop. 44,000. Fifty different languages are spoken.

Economy.—The economy of the country is virtually dependent on the cocoa crop, which is grown entirely by peasant farmers. G. is the world's largest single producer of cocoa and has been supplying one-third of the world's requirements.

High Commissioner for New Zealand

FRYING-PAN HOT GEYSER, ROTORUA, NORTH ISLAND, NEW ZEALAND

Dichtoefeningen, 1858, *Gedichten*, 1863, *Volledige Gedichten*, 4 vols., 1878-1880, *Liederen*, 1880, *Tijdskrans*, 1893, and *Rijmnoer om en om het jaar*, 1897. His collected works were pub. in 13 vols., 1903-5. See Caesar Gezelle, *G. Gezelle, zijn leven en werken*, 1918; B. Verhoeven, *G. Gezelle*, 1930; W. Williams, *G. Gezelle*, 1944.

Gezer, city in Palestine, referred to in the Bible as the city of Dan. It is situated in the low hills W. of the Jerusalem Mts. In auct. geography it was a Canaanite city within the ter. of Ephraim. Its site is the modern Tel Jezar. About 1500 bc it is noticed as a trib. to Egypt. In 1902 the Palestine Exploration Fund began excavations and made some interesting discoveries. See R. Macalister, *The Excavations of Gezer*, 1912.

Ghadames, see GADAMES.

Ghana, Brit. dominion in West Africa, formerly the Gold Coast colony and protectorate. G. extends for 334 m. along the Gulf of Guinea and is bounded on the E. by Fr. Togoland Trusteeship Ter., on the W. by the Fr. Ivory Coast,

Exports of cocoa represent over 90 per cent of the country's agric. exports and almost 70 per cent of the total value of domestic exports. The cocoa crop has been threatened by 'swollen shoot' disease and only drastic measures prevented it from spreading, in which case G. might well have faced financial disaster. The fluctuating world prices are often a disturbing factor. A Cocoa Marketing Board, through which the cocoa is sold, has accumulated a large sum of money by means of a compulsory levy. The fund is intended to assist growers should world prices drop below a certain level. In 1954 the value of cocoa exported was £84,598,864 (214,148 tons).

Gold is produced and 787,894 oz., valued at £10 million, was exported in 1954. Other important exports were diamonds, £4,272,684; manganese, £5,137,713; and timber, £6,680,296. Other exports are palm kernels, palm oil, copra, and kola nuts. Total exports were valued at £114 million (1954) and imports at £71 million.

An ambitious development plan was

approved by the Legislative Council in 1951 and commenced in that year. The expenditure was estimated at £82 million, of which 18 per cent is to be spent on economic and productive services; 31 per cent on communications; 32 per cent on social services; and 19 per cent on common services. In the first 4 years £47 million was spent. Grants of £4 million from the Colonial Development and Welfare Funds and from the Foreign

of G. would be very much stronger than at present. (Already a harbour is being built at Tema, 17 m. E. of Accra.) As originally envisaged, the Volta R. scheme was to be a joint venture by the G. Gov. and the Brit. Gov., associated with Canadian and Brit. aluminium companies, at an overall cost of £230 million. The International Bank is now interested, and at the G. independence celebrations both U.S. and Canadian financial interests

THE NEW BANK OF GHANA

Dr Kwame Nkrumah and others are inspecting the building during construction

Operations Administration have been received. A scheme to harness the waters of the Volta R. and use the power to exploit great bauxite reserves has reached the blue-print stage. The production of aluminium in vast quantities within the sterling area at comparatively low cost is an extremely attractive idea and technically there appear to be no serious obstacles. The feasibility of the scheme was examined on behalf of the Brit. and G. Govs. in 1949, and as a consequence a Preparatory Commission was set up in 1953 to complete the investigations and to report. If the scheme were to materialise, the economy

made it clear that they were favourably disposed in principle towards assisting with the development of G. The Prime Minister has taken every opportunity to emphasise that foreign capital will be welcomed provided there are no political strings tied to investment and that repatriation of capital and profits will be guaranteed. It may, however, take a long while for G. to create the political and economic climate necessary to instil confidence in the minds of foreign investors. That confidence does not at present exist, so that the implementation of the Volta R. project in the near future seems somewhat problematical.

Revenue and Expenditure.—The revenue of G., 1954-5, was £80,567,534, and expenditure £79,860,268, compared with £3,780,288 and £3,489,346 in 1938. The main source of revenue is from customs and excise, £62,388,361 in 1954-5.

Climate.—The climate varies considerably according to the altitude and seasons. Sea breezes make the coastal regions habitable for Europeans. Other areas are less pleasant and the humidity is usually over 90 except between Dec. and Mar. in the N., when it drops to perhaps 30. The harmattan (dry N.E. winds from the Sahara) extend through Jan. and

sion, and 10 private hospitals. The total number of beds in 1958 was 2660 and 378 cots. Besides the hospitals there are 128 dressing stations in rural areas.

Communications.—Accra has an international airport linking G. with other parts of West Africa, Europe, and America. There are airfields at Kumasi, Tamale, and Takoradi, used mainly for internal services. There are 670 m. of railway track, the main lines being from Accra to Kumasi (357 m.). The gauge is 3 ft 6 in. During the year 1954-5 4,805,051 passengers were carried, and 1,612,679 tons of freight. There are 4177 m. of road maintained by the gov. Other roads are maintained by local authorities and regional organisations. The chief port is Takoradi, and 6,537,749 tons were handled there during 1954. A modern harbour is being built at Tema in connection with the Volta R. project (q.v.).

Education.—There is an insatiable demand for education in G., where the literacy rate is extremely low. There were in 1954 3706 primary and middle schools with 459,834 pupils (324,155 boys) and 44 secondary schools with an enrolment of 8185 (6893 boys). Trade and technical institutions have an enrolment of 1256 (1120 boys). There were (1954) 2869 students in teacher-training colleges (1981 men). These figures do not include the schools in Togoland, which at the same date numbered 429 primary and middle schools with an enrolment of 47,952 (30,857 boys); there were 6 secondary schools with 417 pupils (4 girls) and 4 teacher-training colleges with 403 students (340 men). The Univ. College of G. prepares for London Univ. degrees in arts, theology, science, economics, law, and agriculture. There is a dept. of extra-mural studies. There are 349 undergraduates in residence. Achimota College, opened in 1925, was built at a cost of £500,000 by the gov.; on its site, in 1948, was founded the Univ. College of G., which remained there until the completion of the permanent site at Legon. The College of Technology, Arts, and Science at Kumasi has an enrolment of 676 students in residence. In 1954 there were in the U.K. and Ireland 854 students and trainees from G. A further 121 were in the U.S.A. In 1954-5 expenditure on education was £7,222,750 compared with £290,553 in 1937.

Religion.—The great majority of the inhab. are fetish worshippers. Superstition and the power of ju-ju show little sign of disappearance. Human sacrifice and ritual murder, though seldom brought to light, still exist. In 1945 a number of men were sentenced to death for the murder of Akyea Mensah, the Odikro of Apediva, who was sacrificed to the spirit of the late paramount chief, Nana Sir Ofori Atta. In the Northern Ter. Islam has made steady, but Christianity, on the other hand, very slow, progress, and while the official figures are (1955) Rom. Catholics 527,000, Presbyterian Church of G. 180,000, Methodists

GOLD MINERS AT WORK IN THE TARKWA GOLD MINE, GHANA

Feb. and often carry so much sand that in the N. region visibility becomes poor and air navigation difficult. Aug. is the wettest month in the N., and Oct. further S. There is a short rainy season in May and June.

Health.—Malaria is still common as well as most other tropical diseases. Medical science has done a great deal to check the effects of disease, but much has yet to be done before G. can claim to be a healthy country. In 1954-5 £4,133,392 was spent on medical and health services, which sum included £2,096,702 for development projects. The total should be compared with that spent in 1935-6, i.e. £281,395. It will then be realised that inadequate as may be the amount spent (in view of the necessity for increased research and active field work), nevertheless there is a movement in the right direction. There are 4 central (gov.) hospitals with specialist facilities, in addition to 27 gov., 10 mines, 10 mis-

149,000, it can be doubted whether fetish worship has been entirely abandoned by a high proportion of those who are nominally of the Christian faith. The Christian missions have played an important role in the development of education in G.

History.—In 1471 Portuguese navigators reached G. in search of gold, spices, and ivory, and in 1482 built their first fort at Elmina. They built sev. other forts which served as trading ports. After 160 years the Portuguese withdrew, and until 1872 the hist. of G. is largely an

Guinea. England's association with G. in those days was based entirely on the slave trade. Little was known of the hinterland except that it was a source of prisoner-of-war slaves who were brought down to the European forts along the coast by their Ashanti captors. It has been estimated that an average of 10,000 slaves a year were exported from G. After the abolition of slavery the Brit. and Ashanti had nothing in common; on the contrary they became enemies, and between 1800 and 1800 there were 7 Ashanti wars. These wars arose mainly because the Brit. endeavoured to protect the coastal people against the Ashanti. In 1874 Sir Garnet Wolseley marched on Kumasi, which was defended by 40,000 Ashantis who suffered losses estimated at 20,000. The Brit. entered Kumasi and destroyed it, and the treaty of Fomona was signed, under which the Colony of the Gold Coast was set up in July 1874 and the tribes freed from Ashanti domination. In 1886 another expedition under Sir Francis Scott marched on Kumasi to enforce terms of the treaty of Fomona, which included undertakings to cease the practice of human sacrifice and to pay indemnities. Neither of the conditions was fulfilled. In 1897 the Northern Ter. came under Brit. rule following treaties concluded with various chiefs. In 1896 Prempeh, the chief, and 7 other lesser chiefs, together with the queen mother, were exiled to the Seychelles. He was allowed to return in 1924. The Ashanti Confederacy was restored in 1935, and Prempeh's successor was proclaimed Asantehene, the Ashanti designation for the head of the nation. Following Sir F. Scott's capture of Kumasi, a fort to hold 300 was built. The symbol of the spiritual body of the Ashanti people is the Golden Stool (q.v.). It was thought that if this could be obtained the Ashanti would thereafter become more tractable. In 1900, therefore, the governor, Sir F. Hodgson, visited Kumasi and demanded the Golden Stool, whereupon the garrison was besieged in the fort and eventually had to fight its way to the coast. The chiefs were deposed but the Golden Stool was not surrendered. It was brought out from its hiding place many years later. In 1901 the protected areas were annexed as a Brit. possession, and the boundaries between these areas and Gold Coast Colony demarcated by Order in Council 5 years later. In 1922 a portion of Togoland (q.v.), formerly a Ger. possession, was placed under Brit. and Fr. mandate by the League of Nations and the Brit. portion was administered as an integral part of the Gold Coast. Togoland became a trusteeship ter. after the formation of U.N.O. There were serious disturbances in Mar. 1948, attributed to disaffection stimulated by men who had served in the army overseas and who found it difficult to readjust themselves, financially and otherwise, to prevailing economic conditions. To this must be added, as an aggravating factor, the increased cost of living. Riots followed

C.O.I.: Crown Copyright

INDUSTRIAL WORKER MAKING CLOTH ON A MODERN LOOM

extension of the struggle between the Netherlands and Britain. The expansion of the slave trade attracted Swedes, Germans, and Danes, who built sev. castles, including Christiansborg which is to become the official residence of the prime minister of G. Hitherto it has been the residence of the Governor. As early as 1618 James I granted a charter to a London company for 'adventuring in the golden trade of Africa.' The bulk of the trade, in both gold and slaves, was carried on by chartered companies. The fortunes of war between the Dutch and Brit. were evenly divided, and after the peace of Breda a new company under the patronage of Charles II built 7 more castles along the coast. In 1673 these events were celebrated by the coining of 50,000 gold pieces bearing the company's stamp—an elephant. These were called 'guineas' because they were struck in the gold brought by the company from

and the general circumstances were exploited by political parties of various hues and the trouble became widespread. So far as is known officially, 15 people were killed and 115 injured. In due course the Governor reported, and this report should be examined by students of politics if for no other reason than that there followed a chain of reaction in other parts of the African continent, especially perhaps in the Sudan. Immediate and subsequent events were regarded in some quarters outside the Sudan as indicative of weakness at Westminster. The Governor's report asserted that there was a link between organised Communism and the extremists of the 'United Gold Coast Convention' which first became known in 1947—a most opportune moment. Closer investigation showed that the convention, although it had the attainment of self-gov. as its aim, was in fact revolutionary. It is interesting and significant (if read in connection with the hist. of other parts of Africa now within the Brit. Commonwealth) to note that African lawyers trained in the U.K. seem to predominate as anti-Brit. leaders. The Governor's report, pub. on 4 Aug. 1948, attributed the disturbance to political frustration among educ. Africans who saw no prospect of attaining effective political power under existing conditions, which appeared to favour the estab. chiefs: to increasing literacy, and general stimulation of political consciousness. There were, of course, sev. other factors, but the overall attitude of the local pop. was one of attack against the suzerain power, i.e. the U.K. The Brit. Gov., at the time of the Governor's report, issued a statement and commented that 'a European system cannot be imposed arbitrarily on an African society; readiness to give must be matched by willingness to receive.' The 1948 riots had their political repercussions. The United Gold Coast Convention, led by Dr J. B. Danquah, came under particular scrutiny, as stated above. A commission was appointed, and as a consequence recommendations were made by an all-African committee under Mr Justice (Sir Henley) Coussey and a constitution drafted. In the interim, the 'Convention People's party' under Mr Kwame Nkrumah won control following a general election in 1951. Mr Nkrumah was in gaol at that time for his part in a passive resistance movement which had ended in violence. This is worthy of note because non-violence as a political weapon is not one which can easily be adapted to the African temperament. However, the Convention People's party having won the election, the governor, Sir Charles Arden-Clarke, summoned Mr Nkrumah to form a gov. and Mr Nkrumah was accordingly released from prison and became the 'Leader of Government Business.' In 1952 this title was converted to that of 'Prime Minister.' On 18 June 1954 the Gold Coast (Constitution) Order in Council, 1954, came into operation, which provided

for a 'Cabinet of ministers consisting of not less than 8 members of the Legislative Assembly appointed by the Governor acting in accordance with the constitutional convention applicable to the exercise of such functions in the United Kingdom by Her Majesty.' The Council of Ministers dropped the remaining Europeans and the Gold Coast obtained full internal self-gov. In 1954 and in 1956 there were general elections, both of which were won by the Convention People's party. Meanwhile a strong opposition had grown up, especially among the Ashanti. The National Liberation Movement, with Prof. K. S. Busia as leader, and the National People's party made strong joint representations to Mr Lennox-Boyd, Colonial Secretary, demanding 'separate independence for Ashanti and the Northern Territories, and a partition commission to divide the assets and liabilities of the Gold Coast among its four component parts' (20 Nov. 1956). On 27 Nov. the National Liberation Movement issued a 10-point plan, which was forwarded to the Colonial Secretary, calling for the estab. of Ashanti (or a Union of Ashanti and the Northern Ters.) as an independent state within the Commonwealth. The Ashantehene, Otumfuo Sir Agyeman Prempeh, supported both opposition parties; Prof. Busia visited London, and on 10 Dec. 1956, through the medium of the press, protested about the lack of checks, balances, and safeguards 'essential to the preservation of individual liberty and the rights of minorities and regions in a nascent state.' A Colonial Office statement on 10 Dec. issued in Accra said that 'H.M. Government does not consider that partition of the Gold Coast is in the interests of the Gold Coast as a whole or of any of its component parts, and cannot abandon its established policy.' Late in Jan. 1957 the Colonial Secretary spent a week in the Gold Coast and met political leaders of all parties. It seemed probable at one stage that there would be a repetition of the riots which had occurred in Kumasi during Jan. and May 1955. There was talk of revolution and general threats of resort to violence. On 18 Sept. 1956 the Colonial Secretary announced that the Gold Coast would achieve independence on 6 Mar. 1957. This date was chosen because of local historic significance since it was the anniversary of the signing in 1844 of the document by virtue of which jurisdiction over the Gold Coast accrued to Britain. On 8 Feb. 1957 a White Paper (Cmd. 71) was pub. and on the same day the G. Independence Bill was enacted. The leaders of all the political parties expressed qualified satisfaction and on 12 Feb. conciliatory statements were made in the G. Legislative Assembly.

At the eleventh hr strong armoured detachments of the G. Regiment were despatched to Togoland to maintain law and order, but only after some spilling of blood. At midnight 5-6 Mar. the state of G. became a full member of the Brit.

Commonwealth of Nations; the first National Assembly of G. took the place of the Legislative Assembly; and on 7 Mar. the Security Council unanimously approved G.'s membership of the U.N., the 81st member state. The Queen was represented at the independence ceremonies by her aunt, the Duchess of Kent.

The name G. was derived from that of an ant African kingdom which fl. in the W. Sudan from about AD 300-1240. It has been claimed that the ancestors of the Akan tribe originally came from this kingdom, but we have no definite proof. The flag of G. is a tri-colour of red, gold, and green horizontal stripes with a black star on the gold stripe. Sir Charles Arden-Clarke, the last governor of the Gold Coast, became the first governor-general of G. He retired in May 1957, and Lord Listowel was appointed in his stead. The opposition parties to the Nkrumah gov. were re-formed in Oct. 1957.

Pop. of G., 4,620,000 African and 13,000 non-African (Northern Ter., 1,000,000 plus; Ashanti, under 1,000,000; Togoland, 400,000; Southern G., 2,500,000).

Gharapuri, see ELEPHANTA ISLAND.

Gharbiya, maritime prov. of Lower Egypt. Area 2818 sq. m.; pop. 2,327,031.

Ghats (Sanskrit gates, passes, or cauc-way), 2 converging ranges of mts, known as the E. and W. G., running parallel with the E. and W. coasts of S. India. The W. range starts from the Tapti valley and forms an almost unbroken and precipitous barrier of rock, the prin. passes being the Thalghat and the Bhorghat. On the landward side there is a gradual slope to the table-land of the Deccan, and the W. G. appear as low hills, forming the W. edge of the plateau. The E. G. begin in the neighbourhood of Balasore and run through Andhra and Madras states. They are of a more broken character, with an average height of 1500 ft. The word *ghat* is also regularly used in India for a landing-stage on rvs., also for riverside cremation sites.

Ghazal, monorhythmic verse form, or ode, used by Persian, Arab, Turkish, and Urdu poets. The 2 hemistichs of the first line rhyme, the remaining rhymes being at the end of each line. The G. is usually erotic or mystical, and not more than some 12 lines. The poet's *nom de guerre* is customarily introduced in the last line.

Ghazali, Mohammad Al- (1059-1111), Muslim theologian and philosopher, known in the W. as Algazel. He was b. at Tus in Khorasan, studied there, at Nishapur, and other places, and was

appointed teacher of theology and law in the Nizamiya college in Bagdad, but stayed there only 4 years, for he lost his faith and became ill in body. He described the crisis and his recovery in *The Deliverer from Error*. He led a wandering life for 10 years in Syria and Egypt before returning to Bagdad. During this time he recovered his faith and wrote his greatest work, *The Revivification of Religious Knowledge*. He taught for a time in Bagdad and Nishapur and then retired to Tus where he lived quietly, teaching and practising religion. His work in philosophy was to show that it could not prove what it claimed to prove, and in religion he made it possible to combine the fervent piety of the mystic with the legalism of the orthodox. See Carra de Vaux, *Ghazali*, 1902; Margaret Smith, *Al-Ghazali*, 1944.

Ghazipur, tn of Uttar Pradesh State, India, on the Ganges, 45 m. E. of Benares. A mausoleum commemorates the death here of the governor-general, Lord Cornwallis, in 1805. G. was formerly the site of one of the opium agencies estab. by the gov. of India.

Ghaznevids, or **Ghaznevides**, famous Muslim dynasty of 21 rulers, founded by the freedman, Alpteghin (Alp-Tigin) of Bokhara, at Ghazni, Afghanistan, about AD 962. He withstood the Samani dynasty, and his successors Sebuktghin (Sabuk-Tigin) (977-97) and Mahmud (999-1030) (the most celebrated of the line) extended their sway over Kabul, Peshawar, and Lahore to N. and E., to Bagdad and the Caspian on W. and NW. The poet, Firdausi, and the philosopher, Avicenna, fl. at Mahmud's court. Later rulers were Maand I (1030-41), Maudud (1042-8), Farrukh-zad (1053-9), Ibrahim (1059-99), Bahram (1117-50), Khusru Malik (1160-86, last of the dynasty). The cap. was moved by the last 3 kings from Ghazni to Lahore in India. The power of the G. was shattered by the rulers of Ghur (about 1152), and finally overthrown by Shihab ud-Din Mohammad, Prince of Ghur (1186). Ghazni was destroyed by the Mongols under Genghis Khan in 1224. It was the site of Brit. struggles for possession in Afghanistan in 1839 and 1842.

Ghazni, **Ghuznee**, **Ghizni**, or **Gazna**, tn and fort of SE. Afghanistan, on R. G., 80 m. SW. of Kabul. Near by are ruins of the ant city, important in the Middle Ages and one of the finest cities in Asia under Mahmud (11th cent.). G. is surrounded by a mud wall, and is commercially important as being on the caravan route from Persia to India. It stands about 8000 ft above sea level. The Brit. stormed the tn in 1839, and recaptured it from the Afghans in 1842. There are 2 famous towers, and the site of Mahmud's tomb. The celebrated 'gates of Somnath,' kept here from about AD 1000, were removed to Agra by the Brit. in 1842. Moslem pilgrims frequently visit its numerous shrines. Trade in fruit, skins, and wool is carried on. Pop. about 10,000.

Gheel, *see* GEEL.

Ghent (Flem. *Gent*, Fr. *Gand*), cap. of the prov. of E. Flanders and one of the most important cities in Belgium. It is situated at the junction of the Rs. Lys and Scheldt, 34 m. NW. of Brussels. The city is divided by its many streams and canals into 26 is., connected by 64 bridges. The building of new roads and streets has destroyed much of the medieval character of the city, but many of the old buildings are still preserved in their original states. The city has an area of 14 sq. m. and a pop. of (1955)

hall (1518-1620), and the numerous old guild houses, one of which dates back to the 13th cent. There is still to be seen an arch of the old *Prinsenhof*, where Charles V was b. in 1500. G. has about 20 monasteries and 3 *béguinages* or convents, the oldest being of the 13th cent. The squares of G. have played a great part in hist., especially the *Marché du Vendredi*. There are also sev. museums. G. is a great industrial centre, and leads all Belgium in textile production, which employs about half the city's available man-power. The cotton mills of G.

GHEENT: THE QUAI AUX HERBES

E.N.A.

163,000. The best view of the city is to be had from the 315-ft belfry (1183-1339) in the city centre. Most famous of the many churches is the cathedral of St Bayon (12th- and 16th-cent.), one of the best examples of pure Gothic in Belgium, and with magnificent marble interior decoration. The cathedral is rich in art treasures, amongst them the famous 'Adoration of the Lamb' by the brothers van Eyck. Other famous churches are the 13th-cent. church of St Nicolas, the church of St Jacques, with 12th-cent. Romanesque façade, the 16th-cent. church of St Michael containing van Dyck's 'Crucifixion,' and a baroque church of St Peter. Nor is G. deficient in beautiful secular buildings; the castle of Gravenstein (1180) is considered the most perfect example of a medieval fortress in Belgium. Also worth seeing are the Duivelsteen (1245), the Cloth Hall (1325), the tn

house twice as many spindles as all the rest of the country. Machinery and chemicals are also manufactured in considerable quantities. In and around the city are hundreds of nursery gardens, producing large quantities of azaleas and begonias for export. A world-famous flower show, the *Floralies*, is held in G. every 5 years. G. is the second port of Belgium and has excellent harbour and port facilities to cope with its large vol. of foreign trade. A ship canal gives direct communication between the Grand Bassin and the harbour of Terneuzen in Holland and the R. Scheldt. A new lock at Terneuzen allows passage to vessels up to 26 ft draught at any tide between that port and G. G. is the seat of a bishopric—and of the Royal Flem. Academy—it has a court of appeal, a commercial court, and sev. consular representatives.

G. has played a great role in hist.; it was

first mentioned in the 7th cent. It waged violent wars against Flanders and Burgundy and Charles the Bold, rebelled against Charles V and Philip II, and was sev. times captured by the Fr. It was incorporated in the kingdom of the United Netherlands under the peace of Paris in 1814, and passed to Belgium on the estab. of that kingdom in 1830. During the First World War G. was occupied by the Germans from Oct. 1914 till the armistice. In May 1940 the retreating Allies blew up many of the bridges, and there was also some bomb damage, but fortunately no historic monuments were affected. G. was then occupied by the Germans, and was liberated by Canadian troops on 6 Sept. 1944.

Gherardesca, Ugolino della, see **UGOLINO**. **Ghetto**, name of the Jewish quarter in It. cities, and later in others. Originally Jews were strictly confined to this part and quite separated from their Gentile neighbours. The G. of Rome, instituted by Pope Paul IV, 1556, was removed in 1870.

Ghibelline, see (**GUELPHS** AND **GHIBELLINES**).

Ghiberti, Lorenzo (1378-1455). It. goldsmith, painter, and sculptor. b. Florence. He studied design under Bartoluccio, and in 1400 executed a fine fresco at Rimini in the palazzo of Pandolfo Malatesta. G. was chosen as colleague of Brunelleschi in the erection of the Santa Maria del Fiore. His design for the bronze gates to the baptistery of St John at Florence was preferred to those of his competitors, Brunelleschi being one of them. Scenes from the O.T. were represented, and later G. did another still finer gate. Michelangelo gave them the highest praise, pronouncing them worthy to be the gates of paradise. The first gate was completed in 1424, the second in 1452. Other masterpieces are statues of St Matthew, St John the Baptist, and St Stephen for the church of Orsanmichele (1414-22); bas-reliefs for the Baptistry of Siena and sarcophagus of San Zenobio in Santa Maria del Fiore; sepulchral monuments of Dadi and of the Albizzi at Florence (c. 1427). The bas-reliefs of the shrine of San Zenobio are especially fine. G. did much to restore the antique style in sculpture. In beautiful ornamentation and perfection of form and finish in all details he has never been surpassed. His earliest known work, a bronze-relief of the 'Sacrifice of Isaac,' is in the Uffizi. See L. Scott, *Ghiberti and Donatello*, 1882; G. Vasari, *Lives of the Painters and Sculptors*, 1885; Lord Balcarras, *Evolution of Italian Sculpture*, 1909; and lives by H. Gollub, 1929, and J. von Schlosser, 1941.

Ghika, Helena, Princess Koltsov Masalsky (1829-88), Rumanian writer, pen-name 'Dora d'Istria.' A daughter of Prince Michael, she married a Russian prince, 1849, but left him in 1855. After living in Belgium and Switzerland she settled in Florence in 1861. Her works include *La Vie monastique dans l'église orientale*, 1855, *La Suisse allemande*, 1856,

Les Femmes en Orient, 1859-60, *Des Femmes, par une femme*, 1864, *Gli Albanesi in Rumensia: Storia dei Principi Ghika*, 1873, *La Poésie des Ottomans*, 1873.

Ghika, Jon (1817-97), Rumanian statesman, studied at Paris, becoming prof. of mathematics and political economy at Jassy, 1843-5. A leader of the revolution of 1848 in Wallachia, he was representative of the provisional gov. at Constantinople. In 1854 the sultan made him governor of Samos, where he rid the is. of pirates, and prince, 1856. In 1859 he returned to Wallachia and served as a minister under Cuza, whom he helped to depose. G. was prime minister under Prince Charles, Cuza's successor, 1866-7 and 1870-1. He was Rumanian minister in London, 1881-8. Apart from political works he wrote *Letters to Vasile Alecsandri*, 1887, *Memories of Exile*, 1890, and trans. of sev. plays of Shakespeare.

Ghilliaiks, see **GILYAKS**.

Ghilzais, warlike clan of Pathan stock in E. Afghanistan, between Kabul and Kandahar. By language they are Aryan, and Hoidich (1899) believes them to be of Turkic origin. A race of sturdy farmers and shepherds, they were a severe menace to the Brit. troops during the retreat from Kabul, 1842. They profess Islam, but some of their customs tend to reveal the existence among them of a primitive Christianity.

Ghirlandajo, or Ghirlandaio, Domenico (c. 1449-94) (properly Domenico Bigordi, or Corradi), surnamed Il Ghirlandaio or Grillandajo (garland-maker) after his father Tommaso Bigordi, a goldsmith. He was a celebrated painter and mosaicist, the head of a very active studio, and the first Florentine to attain skill in aerial perspective. He studied under Baldovinetti, and was influenced by Castagno, Masaccio, and Verrocchio (q.v.). Among his pupils were his 2 brothers Davide and Benedetto, Michelangelo, Francesco Granacci, and Bastiano Mainardi. Domenico painted numerous scenes from the lives of the Virgin and John the Baptist. He executed frescoes in Florence in the church and refectory of Ognissanti (1480), only 'The Last Supper' and 'St Jerome' being left; in the Sassetti chapel in Santa Trinità (1485); 'Life of Saint Fina' in the Capella Fina, 1475; in the choir of Santa Maria Novella ('St Francis', 1485-90); in the chapel of the Innocenti, 1488; and in the Palazzo Vecchio, 1481. His pictures include 2 'Holy Families' (Berlin); 'Adoration of the Shepherds', 1485 (Florence Academy); 'Madonna and Child with Saints'; 'St Catherine of Siena' and 'St Lawrence' in the Pinakothek at Munich; 'Adoration of the Kings', 1487; 'The Visitation', 1491 (now in Louvre); 'The Birth of the Virgin', 1490; 'The Calling of St Peter and St Andrew', 1485 (Sistine Chapel, Rome). See R. Zürcher, *Italianische Wandmalerei*, 1944; also studies by E. Steinmann (in *Knackfuss's Künstler Monographien*), 1897; C. S. Davies, 1908; and J. Lauts, 1943.

Davide (1452-1525) and **Benedetto** (1458-97), brothers of Domenico, assisted

him in his works, but left no original ones. Davide helped Domenico in the mosaic of the 'Annunciation' over the N. portal of Florence cathedral, and executed others at Orvieto, Florence, and Siena.

Idolfo (1483-1561), son of Domenico, was a skilful painter and friend of Raphael. His works include 'Coronation of the Virgin', 1503 (in Louvre); 'Annunciation' (Uffizi, Florence); 'Goldsmith' (Pitti Palace), formerly attributed to da Vinci; 'Nativity' (Berlin Museum); 'San Zenobio raising a Dead Child' and 'Burial of San Zenobio' (Uffizi, Florence); 'Madonna della Misericordia'; 'Virgin adored by Saints.'

Ghiura, see GYAROS.

Ghizeh, see GIZA.

Ghizni, see GHAZNI.

Ghost (animal), see LEMUR.

Ghost Marriage, institution by which a man who dies without heirs has a wife 'married' to his name by his brother. She bears children (by the brother, with whom she lives) who are legally those of the dead man, who thus has heirs to inherit his wealth and sacrifice to his spirit. It is found in many primitive peoples, e.g. the Zulu.

Ghosts, see APPARITION; HALLUCINATION.

Ghūr, or **Ghore**, **Gaur**, **Gour** (Sanskrit, fort), mt region of W. Afghanistan, 120 m. SE. of Herat, stretching towards Kandahar. It is in part the site of the anct Paropamisus, and medieval Gharshistan. In all ages the country has been inaccessible, and the site of the old cap. Firoz Koh cannot be definitely fixed. The peak Chalap Dalan or Koh-i-Kaisar is 13,000 ft high. The present pop. are mostly Hazaras or nomad Aimaks. Since 1845 G. has been included in the ter. of Herāt. It was famous in the 12th and following cents. as the seat of a native dynasty, the Ghūri, founded by Ala-ed-Din Jahansoz, who burnt Ghazni, 1152, and harassed the Ghaznevids. His successors extended their empire and completely subdued Ghazni, 1186. Out of their victories grew up the Mogul kingdom of Delhi, and the preponderance of Islam in Hindustan dates from this time. Their power was broken by Mohammed Shah and Jelal Ed-Din of Khwarezm (Khiva), 1214-16. A short revival took place under the Kurt dynasty, 1245, but the final overthrow came with Timur's capture of Herāt, 1383. See also AFGHANISTAN. See J. Ferrier, *Caravan Journeys*, 1856.

Ghūrkhās, predominant race of Nepal in the Himalayan region. They are hardy mountaineers of Hindu descent, speaking a Sanskritic dialect. Driven out of Rajputana by Muslim invaders, they conquered Nepal after much fighting, 1767-8. The East India Company came into conflict with them, 1814, but peace was soon declared, the company obtaining possession of the S. slopes of the Himalaya, but recognising Nepal's independence. As soldiers the G. have won fame for extreme courage and determination. All of the 10 regiments of G. served during the First World War,

either in France, Flanders, Gallipoli, Mesopotamia, Persia, Baluchistan, Egypt, Palestine, or on NW. Frontier of India. Their roll of battle honours commences with Bhurtapore, and includes the Second and Third Afghan wars, Burma campaign, Indian mutiny, and China 1900 campaign. Also fought under Gen. Wavell against the Italians in the battle of the W. Desert, 1940, and later in the Burma campaigns and on the W. Front.

Ghuznee, see GAZNA.

Giacometti, Alberto (1901-), Swiss sculptor and draughtsman, b. Stampa, son of the painter Giovanni Giacometti. Studied sculpture at Geneva and in Paris, where he was first influenced by cubism and then by surrealism. Not concerned with the sculptural problem of mass, he is noted for attenuated figures which materialise impressions and feelings, and to that extent bring the aims of sculptor and painter into novel combination. His 'Pointing Man', 1947 (Tate Gallery), is an example.

Giambattista, see TIEPOLO, GIOVANNI BATTISTA, and CIPRIANI.

Gianibelli, or **Giambelli**, **Federigo** (c. 1530-92), It. military engineer, inventor of the 'infernal machines' that wrought so much havoc among the troops of Parma near Antwerp, 1585. By means of an explosive ship he destroyed the bridge built by the Spaniards across the Scheldt. G. then went to England and assisted in the preparations against the Armada, designing the fireships sent among the Sp. Fleet. See J. Motley, *United Netherlands*, vol. i.

Giannone, Pietro (1676-1748), It. historian. He studied law and practised as a barrister at Naples, spending many years in composing his *magnum opus*—*Storia civile del regno di Napoli*, 1723. This attack on the Rom. Catholic Church led to his banishment. He retired to Vienna, Venice, and finally Geneva, where he wrote his diatribe *Il Trivregno* against papal authority. He was enticed into Savoy, arrested by order of the king of Sardinia, and confined at Turin till his death. His *Opere Postume*, containing 'Anecdotes ecclésiastiques', 1738, appeared in 1760. Mancini issued his *Opere Inedite*, 1859.

Giannuzzi, Giulio Pippi dé, see GIULIO ROMANO.

Giants (Gk *gigas*, giant), name given to adult human beings of abnormal size and stature. The average height of the whole human species is 5 ft 5 in., the tallest giant exceeding this by about 3 ft 10 in. The Akkas of central Africa are about 4 ft 5 in. in height, the Scottish farmers of Galloway 5 ft 11 in. Among famous G. may be mentioned Og, king of Bashan (Deut. iii. 11); Magrath, Bishop Berkeley's giant; Patrick Cotter (1761-1804); Charles Byrne; Winkelmaier's Austrian (d. 1887); Topinard's Finlander (9 ft 4 in.); Chang, the Chinese giant; and the Russian Machnow (9 ft 3 in.) who appeared at the London Hippodrome, 1905. Such abnormal beings are often dull of intellect, weakly, and ungainly. As a disease 'giantism' is

closely allied to 'acromegaly,' caused by a morbid process in the sphenoid bone of the skull, an excessive development of the anterior lobe of the pituitary body. If this condition occurs in early youth the whole of the limbs are affected and gigantic proportions are the result. Giantism may be racial and not the result of disease. There would seem to have been a progressive tendency towards reduction in height since the earliest men, there being evidence of giant forms in the Middle Pleistocene, called *Gigantopithecus*. In mythology the title giant was applied to men of pre-eminent strength or prowess, not necessarily of great size. Among the various Gk conceptions were Enceladus, Typhoeus, Briareus, the Titans, and the Cyclopes. The great representation of the *Gigantomachia* (a mighty battle between the G. and the gods, later than Zeus's overthrow of the Titans, but mentioned neither by Hesiod nor Homer) is sculptured upon the altar at Pergamum. See C. Weinhold, *Die Riesen des germanischen Mythos*, 1858; M. Meyer, *Die Giganten und Titanen in der antiken Sage und Kunst*, 1887; F. Weidenreich, *Apes, Giants, and Men*, 1946.

Giant's Causeway, famous promontory of closely packed basaltic columns on the coast of Antrim, Northern Ireland, W. of Bengore Head, 8 m. from Portrush. Its origin was a great outpouring of basalt in the Tertiary period, but legend ascribed it to Finn McCoul or Fingal, who built it as a bridge between Ireland and Scotland for the giants to cross from Antrim to Staffa. The columns are mostly hexagonal or pentagonal, about 40,000 in number, perfectly articulated by means of convex and concave joints. The 3 chief portions are the Little, Middle, and Grand Causeway. The last extends 500 ft out to sea, and is 60 to 120 ft broad. Other detached groups are called Giant's Loom, Giant's Organ, Lady's Fan. E. of the Causeway is the Giant's amphitheatre, a bay with cliffs 350 ft high. Beyond is Sp. Bay, where an Armada vessel was wrecked. Chimney Point and Pleaskein Head are also near, and the ruined castles of Dunseverick and Dunlace. See also POT-HOLES.

Giaour (corruption from Arabic *kafir*, unbeliever, or Persian *gaur*, infidel), name by which the Turks designate all those who reject Mohammedanism, especially European Christians. The word is spelt in the It. fashion popularised by Byron (q.v.), and usually employed in an offensive sense.

Gib, Adam (1714-88), Scottish 'anti-burgher' leader and preacher, b. Castle-town, Perthshire. He was the only Edinburgh minister who strongly upheld the Protestant succession (1745). He led the minority in the Anti-Burgher Synod of 1747, and in later years his fame as a preacher drew enormous congregations to his church in Nicolson Street.

Gibara, well-known Cuban seaport and resort on the N. coast (G. Bay) of the prov. of Santiago de Cuba. It has a well-fortified harbour and civil and

military hospitals. Trades in fruit, corn, tobacco, coffee, sugar. Gold and silver are found near by. Pop. 8100.

Gibaros, see JIBAROS.

Gibberd, Frederick (1808-), architect and tn-planner, b. Coventry; was trained in Birmingham; started practice in London, 1830. An early work was Pullman Court (flats), 1934-5. In 1946 he designed some prefabricated houses, and steelworks at Frodingham, also the

C. W. Jones

THE GIANT'S ORGAN, GIANT'S CAUSEWAY

master-plan for Harlow New Tn. Since then, his work has included a tn-plan for Nuneaton; the new buildings of London Airport; a hospital for E. Belfast; and the Hull College of Technology.

Gibbet, species of gallows erected near the scene of a crime on which the convicted criminal was suspended in chains after his execution, by order of the courts of justice. The body thus hung, encased in an iron frame, was supposed to serve as a public warning to terrorise the evil-minded. This practice, legalised in 1752, was abolished in 1834. G. was the name of the highwayman in Farquhar's *Beaux' Stratagem* who boasted himself the

best-conducted man in his profession. See A. Hartshorne, *Hanging in Chains*, 1891.

Gibbings, Robert (1889-1958), artist and travel writer, b. Cork. During the First World War he was badly wounded at Gallipoli. Settling in London, he was proprietor for a time of the Golden Cockerel Press, and then became a lecturer in typography at Reading Univ. He wrote a number of travel books, illustrated with his own wood engravings. After *A Tahitian Journal*, 1932, *Coconut Island*, 1936, and *Blue Angels and Whales*, 1938, he scored a notable success with *Sweet Thames Run Softly*, 1940, *Coming Down the Wye*, 1942, and *Lovely is the Lee*, 1944. He went back to the South Seas for *Over the Reefs and Far Away*, 1948, and home again for *Sweet Cork of Thee*, 1951, *Coming Down the Seine*, 1953, and *Till I End My Song*, 1957.

Gibbon, Edward (1737-94), historian, b. Putney. He was a very delicate child. At 7 he received some training in arithmetic, Eng. and Lat. from a private tutor, and at 9 he went to school at Kingston-on-Thames. G. went to Westminster School in 1749. He passed many hrs in his grandfather's library at Putney, and here he developed an enthusiastic love for reading. At school poor health caused his progress to be very slow and finally the idea of education at school was given up and he was instructed henceforth intermittently by tutors. His love of reading, hitherto indiscriminating, now led him into a preference for hist., and when once interested in a subject of hist. he devoured all he could find upon it in every book to which he could gain access, not reading the book all through but pursuing his subject into every hole and corner. In his sixteenth year his health improved as if by miracle, his constitution became 'fortified and fixed,' and from that time onwards he was free from ailments. The same year (1752) he went to Oxford as a gentleman commoner of Magdalen College. Fourteen months of desultory reading and of gaiety, during which he read Bossuet and declared himself a Rom. Catholic, ended in his being expelled by an outraged univ. and sent by an angry father to Lausanne to the home of a Calvinist minister, M. Pavillard, 'there to be brought to a better way of thinking.' Under excellent guidance he here pursued a course of serious study, including the Lat. classics, Locke, Grotius, Montesquieu, and Pascal, together with logic and mathematics. Returning to England in 1758 he pub. in 1761 a little book in Fr., *Essai sur l'étude de la littérature* (an Eng. trans. appeared in 1764). After 2 years of 'military servitude' as captain in the Hants militia, he set out on the 'grand tour.' In Rome, amid the ruins of the Capitol, in 1764, he conceived the idea of writing the *Decline and Fall*. Hardly daring to attempt so vast a work, he contemplated his idea 'at an awful distance,' for some years working laboriously and honestly, studying original records, inscriptions, medals, etc.

His father's death in 1770 leaving him independent, he settled in London, became M.P. for Liskeard in 1774, and accepted a gov. sinecure, which supplemented his income by about £800 a year. Losing this on a change of gov., he retired to Lausanne and settled there with his great friend Deyverdun. In 1775 the first vol. of the *Decline and Fall* was pub. The work aroused tremendous enthusiasm, and was sold out in a few days, a second, and then a third ed. becoming necessary. The next 5 years were wholly taken up with the gigantic labour of producing the succeeding vols. Vols. ii and iii appeared in 1787, and vols. iv, v, and vi in 1788. G.'s *Decline*

EDWARD GIBBON
Engraving after a picture by Sir
Joshua Reynolds

and *Fall* has borne the critical judgment of more than a century and a half without losing its place as one of the foremost historical works of all time, although modern research has shown some of G.'s assumptions and judgments to be faulty. It is unsurpassed for its comprehensiveness and its wealth of information, together with its stately diction and charm of narration. Innumerable details have been made to yield up a 'philosophy of history' in the light of which characters, events, and conditions account for each other. Defects there are, both of style and of judgment—gallicisms creep in easily, the stateliness sometimes becomes monotonous rhythm, the remarkable clearness occasionally falls. Worst of all, the calm judgment is sometimes obscured where G.'s prejudices and preferences are involved. Religion had come to have no interest for him, and the famous 15th and 16th chapters would no doubt have been more acceptable to the intellect had he not offended the

feelings by disobeying his own 'great law of impartiality' and let his love for classical Rome lead him into sarcasm in dealing with the early Christianity which he makes responsible for her downfall. His other works include *Mémoires littéraires de la Grande Bretagne* (with Deyverdun) (2 vols.), 1767, 1768, *Critical Observations on the Sixth Book of the Aeneid*, 1770, *Vindication*, 1779, *Antiquities of the House of Brunswick*, edited by Lord Sheffield, 1814, and *Memoirs of my Life and Writings*, ed. by Lord Sheffield (2 vols.), 1827. See E. Clodd, *Gibbon and Christianity*, 1916; L. Strachey, *Portraits in Miniature*, 1931; also lives by J. M. Robertson, 1925; G. M. Young, 1932; R. B. Mowat, 1936; and D. M. Low, 1937. *Gibbon* (*Hyllobates*), the smallest of the anthropoid apes, rarely exceeding 3 ft in

height, is found principally in the Malay peninsula. The species include the hoolock (*H. hoolock*), a native of Assam, Harlan's G. (*H. concolor*) from Borneo, the white-banded G. (*H. lar*), a native of Malacca and Siam, and the Siamang (*H. syndactylus*). This last, found in Sumatra, is the largest of the group, black in colour with a large laryngeal pouch. The G.s are noted for their agility in climbing, their slim contour and length of arm contributing to this facility. Their loud voices and howling cries resound through the woods, particularly in early morning. They are gregarious, very intelligent, and easily tamed when young. See ANTHROPOID APES.

Gibbons, Edward Stanley (1840-1913), philatelist, b. Plymouth. He joined his father's chemist's business in 1855, and in 1856 started part-time stamp dealing, thus founding the firm of Stanley Gibbons. 1863 saw the purchase of the historic 'Cape Triangular' sack of stamps. In 1865 his first catalogue was pub.; c. 1870 he became a whole-time dealer and pub. his first stamp albums. He removed to Clapham in 1874, and to

8 Gower Street, London, W.C., in 1876. G. retired in 1890, selling his business to C. J. Phillips who formed the present limited company.

Gibbons, Grinling (1648-1721), celebrated wood-carver and sculptor, b. Rotterdam, his father being English. He settled in London, where his talent was first discovered by the diarist John Evelyn, who brought G. to the notice of Charles II and Sir Christopher Wren. G. became master carver in wood to the Crown until the time of George I, and was responsible for many of the carvings in the royal residences, at Windsor, Kensington, and Whitehall. His association with Sir Christopher Wren is a famous instance of collaboration between architect and master craftsman, his commissions including not only the choir stalls and other detail at St Paul's, but work in sev. of Wren's city churches, and busts, coats of arms, and ornament for the library at Trinity College, Cambridge. He was employed on the decoration of many mansions, e.g. Blenheim, Chatsworth, Petworth (where a ceiling is considered one of his masterpieces). As a sculptor he was also successful. The statues of Charles II at the Royal Exchange and at Chelsea Hospital, and the statue of James II (bronze) in front of the National Gallery, are by him. The base of Charles I's statue at Charing Cross was possibly executed to his design. In 1934 4 statues, representing St John, St Peter, St Paul, and the Church, in College Garden, Westminster, were identified as his work. His association with Ingh May, the clerk of works at Windsor, and with Lely and the It. decorative painter, Verrio (as well as with Wren), was important in result, and marks a new baroque tendency in Eng. decoration—as at Cassiobury Park (now destroyed) and at Windsor. The replacement of pilasters by pendants of fruit and flowers and the framing of a picture above the overmantel by elaborate naturalistic carving are typical.

G. was one of the most skilful craftsmen who ever worked in England, a master of still-life carving. This may sometimes claim too great an independence from interior architecture; and on the other hand, G. is less remarkable in figure sculpture (in which he employed collaborators, e.g. A. Dievot and L. Vandermeulen, who helped on the statue of James II, and Quellin of Antwerp) than still-life. His finest work, however, is a prodigy of skill and delicacy as in the choir-stalls of St Paul's and its great organ-case (made 1696-7). The decorations in limewood with trumpets, scrolls, and flowers above the stalls, and the boys supporting the bishop's mitre, and the heraldic 'pelican in her piety,' are a personal achievement. G. lived most of his life in Bow Street and was buried in St Paul's, Covent Garden. See H. A. Tipping, *Grinling Gibbons and the Woodwork of his Age*, 1914; A. E. Bullock, *Grinling Gibbons and his Contemporaries*, 1914; R. Gunnis, *Dictionary of British Sculptors*, 1953.

Gibbons, Orlando (1583-1625), composer, *b.* Oxford into a distinguished musical family. He was brought up at Cambridge, and took the degree of B.Mus. at Cambridge in 1606. The degree of D. Mus. was conferred on him by Oxford in 1622. G. was made organist of Westminster Abbey in 1623. He *d.* suddenly at Canterbury while waiting to take part in Charles I's marriage service, for which he had composed the music. Orlando G. marks the apotheosis of the anct Eng. musical art and with him the old church school of England may be said to cease. His compositions are still in frequent use in the church services to-day. The most famous are *Morning and Evening Service in F*; anthems: *Hosanna, O Clap your Hands*, and *God is gone up*; madrigals: *The Silver Swan* and *Dainty Sweet Bird*. He also composed some beautiful chamber music. His son, Christopher (1615-76), is the member of the family second to him in importance. See E. H. Fellowes, *Orlando Gibbons*, 1925.

Gibbons, Stella Dorothea (1902-), novelist, *b.* London. She studied journalism at Univ. College there, and worked for 10 years in Fleet Street. In 1933 she married Allan Bourne Webb, an actor, and in the same year her first novel, *Cold Comfort Farm*, a clever skit on the rural novel, won the Femina Vie Heureuse prize. *Christmas at Cold Comfort Farm* appeared in 1940, and *Conference at Cold Comfort Farm* in 1949. Others of her novels are *Bassett*, 1934, *Embury Heath*, 1935, *Miss Linsey and Pa*, 1936, *Nightingale Wood*, 1938, *My American*, 1939, *The Bachelor*, 1944, *The Matchmaker*, 1949, and *The Shadow of a Sorcerer*, 1955. *Beside the Pearly Water*, 1954, is a collection of short stories, and her *Collected Poems* appeared in 1950.

Gibbs, James (1682-1754), architect, *b.* near Aberdeen, was educ. in that city; then studied in Rome, returning to Britain 1709. He then enjoyed a very large practice in London. His chief buildings were: St Mary-le-Strand, 1714-23; St Martin-in-the-Fields, 1722-6; St Peter, Vere Street, 1722-4; the steeple of St Clement Danes, 1719--all in London; new wing of King's College, Cambridge, begun 1724; the 'Radcliffe Camera' at Oxford, 1737-47 (his masterpiece); and St Nicholas, Aberdeen, 1752. Most of his country-houses have been demolished. He wrote useful books on architectural drawing and design.

Gibbs, Josiah Willard (1837-1903), Amer. physicist, *b.* New Haven, Connecticut. From 1871 prof. of mathematical physics at Yale Univ. Although his scientific papers were not numerous all were important. His fame was made by a paper, pub. in the *Transactions* of the Connecticut Academy, 1875-8, and entitled 'On the Equilibrium of Heterogeneous Substances,' which led to the estab. of the 'phase rule' of chemical equilibrium and change (q.v.). Other papers: *Graphical Methods in the Thermodynamics of Fluids*, 1873, *Methods of Geometrical Representation of the Thermo-*

dynamic Properties of Substances by Means of Surfaces, 1873, and treatises on the electro-magnetic theory of light, 1882-3, and on vapour densities. In 1902 he pub. *Principles in Statistical Mechanics developed with special reference to the Rational Foundations of Thermodynamics*. In 1879 he was elected Foreign Member of the Royal Society, and was awarded the Copley Medal in 1901. See W. L. Miller, *Method of Willard Gibbs in Thermodynamics*, 1925.

Gibbs, Sir Philip Hamilton (1877-), Brit. journalist, was privately educ. He became literary editor successively of the *Daily Mail*, *Daily Chronicle*, and *Tribune*. His novel *The Street of Adventure*, 1909, tells of Fleet Street. As special correspondent he did brilliant work with the allied forces in the First World War, and was made a K.B.E. in 1920. A number of books, including *Realities of War*, 1920, were based on his war experiences. A Rom. Catholic, he performed the great journalistic feat of interviewing the Pope. He wrote many novels, of which the most noteworthy are *The Middle of the Road*, 1922, and *The Cross of Peace*, 1933. Among the best of his other books are *Ten Years After*, 1924, *The Day After Tomorrow*, 1928, *European Journey*, 1934, and *The New Elizabethans*, 1953, a study of the modern Eng. people. *The Pageant of the Years*, 1947, and *Crowded Company*, 1949, are autobiographical.

Gibeah, city occupied by the Benjamites, the modern Tell el-Ful, 3 m. N. of Jerusalem, partly excavated by Albright in 1922-3. He discovered that the original fortress was built towards the end of the 13th cent. bc and was burnt near the end of the 12th cent. bc. It was the scene of the outrage described in Judges xix, for which the Benjamites were decimated. The city was rebuilt and fortified afresh: it prospered as Saul's bp. and cap., c. 1030 bc (1 Sam. x. 26; xiv. 2; xxvi. 1).

Gibello, Monte, see ETNA.

Gibeon, anct city of Palestine, 5 m. NW. of Jerusalem. The vil. of El-Jib, remarkable for its springs, now occupies the site, which is a solitary hill overlooking a corn valley. It was the scene of the combat between the fighters of David and of Ishbosheth (2 Sam. ii. 12-32), of the murder of Amasa by Joab (*ibid.* xx. 8-10), and of the victory of Joshua over the 5 kings of the Amorites who were besieging the tn because the Gibeonites had won a truce from Joshua by deceit and trickery (Joshua ix. x).

Giblin, Lyndhurst Falkiner (1872-1951), Australian economist, *b.* Hobart, educ. Univ. College, London, and King's College, Cambridge. G. was gov. statistician in Tasmania, 1920-8, and acting Commonwealth statistician, 1931-2. In 1929 he was appointed prof. of economics at Melbourne Univ. His achievements were by no means confined to the academic world, for as director of the Commonwealth Bank, 1935-42, a member of the Commonwealth grants commission, 1933-1936, and chairman of the Commonwealth

financial committee, 1939-46, G. was able to exert considerable influence on economic developments in Australia. He pub. *The Growth of a Central Bank: the Development of the Commonwealth Bank of Australia, 1924-45*, 1951.

Gibraltar (Sp. Jibraltar; Arabic Jebel Tariq), Brit. strongly fort. tn and promontory in the extreme S. of Cádiz (q.v.), Spain, 16 m. N. of Ceuta (q.v.) across the Strait of G., and forming the E. horn of the Bay of Algeciras or G. It is an important strategic point of control for the W. Mediterranean. Known to the ancients as Calpe, it formed, with Mt Acha near Ceuta, the 'Pillars of Hercules' (q.v.). The great promontory, of brownish-grey limestone or marble, is connected with the

extended into Algeciras Bay. The fine harbour has 2 moles, 1100 and 700 yds long. There are a lighthouse and an important wireless station situated by Europa Point on the S. The tn has 2 main divs., N. tn and S. tn, while the part on which the lighthouse is situated is styled Europa. In the tn, however, are some slums, tawdry shops, and restaurants. Alameda Park is a moderate-sized garden in the central part of G., and the governor's house on the 'convent' is situated a m. away in the main street. There is an admiral's residence, an official house called The Mount on the Europa Road, half a m. S. of the gardens. The theatre is half a m. N. of the gardens. There are also the exchange building and the barracks. G.

GIBRALTAR

E.N.A.

mainland by an isthmus of sand. It is shaped like an enormous lion, 3 m. long, averaging 1 m. broad, reaching upwards over 1400 ft above sea-level, except on the W., where it slopes more gently to the sea. Though barren in appearance its vegetation includes capers, asparagus cacti, and aloes, and its fauna partridges, woodcocks, pigeons, rabbits, and small monkeys (Barbary apes), the only native monkeys of Europe. There are numerous caverns and galleries cut out in the rock, the largest being St Michael's, with a hall 230 ft long. G. is in fact a labyrinth of tunnels, an underground city divided into many self-contained parts, and still tunneling goes on, to accommodate great power plants, hospitals, laundries, bakeries, kitchens, ammunition stores, hoists, gun emplacements, and living accommodation for thousands of men. The narrow ledges bristle with wireless masts and radar equipment. The Sp. lines are near the point of junction of the rock of G. and the mainland, the space between being called neutral ground. On the flat isthmus joining the rock to Spain is the aerodrome,

is the see of an Anglican and a Rom. Catholic bishop. There are Anglican and Rom. Catholic cathedrals, and 2 other Anglican and 4 other Rom. Catholic churches. There are 16 primary schools and 4 secondary schools. A Crown colony of Great Britain, controlled by a governor, and executive council, and (since 1950) a legislative council, G. is of extreme importance as a fuelling station and for its control of the Mediterranean Sea. It has been a free port since 1704, but, for revenue purposes, there are import duties on malt liquors, wine and spirits, tobacco, motor spirit, perfumery, and coffee. Industries are of no importance, but there is a fair transit trade at the port, and G. is becoming a popular tourist centre. There is cable communication with the Continent, Tangier, the Mediterranean E. ports, and England.

History.—The fortress was taken, AD 711, by the Saracen chief, Tarik ibn Ziad. The Moors finally ceded it to Spain, 1462. After 1540 it was extensively fortified by Charles V. In 1704 it was captured by the Eng. and Dutch

under Rooke (q.v.). It was subsequently often besieged by the Spaniards, notably 1779-83, when it was gallantly defended by Heathfield (q.v.) against the united Fr. and Spanish. It was ceded to Great Britain by the treaty of Utrecht in 1713, renewed by the treaty of Versailles in 1763. Since 1897 a new mole and enclosed deep harbour has been built at the N. end. In the Second World War, as in the First World War, G. was of paramount importance as a pivotal point of Britain's sea lines; for a successful thrust either at G. or at Suez or at both together would have meant her expulsion from the Mediterranean and jeopardised her hold on the Middle E. On the other hand it may be that the Nazis in the Second World War hesitated to attack Spain for fear of dispersing their own resources over too extended an area without appreciably increasing them; besides which Spain would have been of little practical aid against G. Early in 1942, with Italy in the war, it was questioned by many in Britain whether Malta could be held and whether it should even be attempted to be held. This was the school of thought which for some years had argued that, in case of war with Italy, it would be wisest to abandon the Mediterranean and to be content with sealing it at both ends through control of G. and Suez; and the arguments for this course had been reinforced by the collapse of France. Fortunately other counsels prevailed—strengthened by the amazingly successful defence of Malta. Again, in the late autumn of 1942 the Brit. command of the straits of G. prevented any serious interference with the Anglo-Amer. expedition to North Africa, whether by Axis submarines or by air patrols, when passing through the straits. Naturally, the bottle-neck at the straits invited a U-boat concentration in the surrounding area, but the most efficient organisation for patrol and protection, which was rendered possible by the very fact of holding G., kept losses down to a low level in the first 6 months of 1943, when 11,000,000 gross tons of shipping was escorted by the R.N. into the ports of North Africa. There was always a danger that the Ger. reply to the allied invasion of North Africa would be an invasion of Spain and the occupation of bases dominating the straits without opposition from Gen. Franco. But before the end of 1942 there were signs that doubts were beginning to influence the mind of Gen. Franco, for a move towards a firmer neutrality might be seen in overtures to Portugal for the formation of an Iberian bloc. The civilian pop. is mainly of Sp. and It.

Gibraltar and the Mediterranean, 1939; Stetson Conn, *Gibraltar in British Diplomacy in the Eighteenth Century*, 1942; and R. Henry, *Journey to Gibraltar*, 1943.

Gibraltar, Strait of (anot Fretum Herculeum), entrance from the Atlantic to the Mediterranean, having a length of 50 m. and a breadth varying from 9 to 23 m. It is flanked on the N. by Spain, on the S. by Morocco in Africa. See HERCULES, PILLARS OF.

Gibson, Charles Dana (1867-1944), Amer. artist, b. Roxbury, Massachusetts, son of Charles de Wolf G. He attended for 1 year the schools of the Art Students' League in New York, and first drew for the comic weekly, *Life*. It was his portrayal of the Amer. girl, especially of an idealised type, in which health, refinement, and extreme dignity were suggested, that estab. his name and made magazines vie with one another for his drawings of what came to be known as the G. girl. After having made a fortune by contributing to *Collier's Weekly*, in which appeared the famous 'Education of Mr Pipp,' G. essayed portraiture in oils, but eventually returned to his designs in pen and ink.

Gibson, Edmund (1669-1748), Eng. divine, who in 1692 brought out an improved Eng. trans. of Camden's *Britannia*. His great work was *Codex juris ecclesiastici Anglicani*, 1713, written to plead the privileges of the Convocation. Bishop of Lincoln, 1716; bishop of London, 1720.

Gibson, Edward, see ASHBROURNE, BARON. **Gibson, John** (1790-1866), sculptor, b. Gylfin, near Conway, son of a market gardener. For some years he worked in the studio of Canova, and later became for a time the pupil of the Dane Thorwaldsen. But the old Gk sculptors were his true masters, and their influence is reflected in his works. Gk mythology supplied him with his subjects, 'Bacchante and Faun,' 'Amazon thrown from her Horse,' 'Proserpine,' 'Sappho and Psyche,' etc. It was the knowledge that Pheidias and Praxiteles had coloured their statuary that suggested to him the tinting of his 'Venus,' 1854, and other of his works, a process which was naturally regarded as a daring innovation. It was moreover in classical garb (the Rom. toga) that he insisted on representing Peel (Westminster Abbey) and Huskisson (Liverpool). But the above are merely external illustrations of his paganism in art. In his reliefs, such as 'Hours leading the Horses of the Sun,' he shows an appreciation of the true nature of the plastic art. Among his many imposing monumental works may be mentioned the group of Queen Victoria with Clemency and Justice in the Houses of Parliament. See T. Matthews, *J. Gibson*, 1911.

Gibson, Wilfrid Wilson (1878-), poet, b. Hexham, Northumberland. He was for a time a social worker in the E. end of London, and during the First World War he served in the ranks. These experiences form the background of much of his work.

Most of his poems—notably the 17 dramatic pieces which make up *Daily Bread*, 1910, and the work *Livelihood*, 1917—present the normal tolling life of man in our modern industrial world. There is nearly always a story even in his shortest pieces, and the story is generally full of interest. Though he chooses unlovely themes, the ugliness of the hand-to-mouth existence, he is certainly the 'laureate of modern industrialism' (A. C. Ward), who sings of a man-made hell of machines and creatures of the machines in verse which creates the illusion of the glare of furnaces and the grime and murk of industry. Two of the most striking of his individual pieces are 'Flannan Isle' and 'The Ice-Curt.' His poems include, besides those mentioned, *Stonefolds*, 1907, *Fires*, 1912, *Thoroughfares*, 1914, *Borderlands*, 1914, *Battle*, 1915, *Friends*, 1916, *Whin*, 1918, *Home*, 1920, *Neighbours*, 1920, *I Heard a Sailor*, 1925, *The Golden Room*, 1928, *Hazards*, 1930, *Highland Dawn*, 1932, *Fuel*, 1934, *Coming and Going*, 1938, *The Alert*, 1941, *Challenge*, 1942, *The Searchlights*, 1943, *The Outpost*, 1944, and *The Island Stag*, 1947. He also wrote a number of plays, including *Womenkind*, 1912, *Kestrel Edge*, 1924, and *Within Four Walls*, 1950.

Giddings, Joshua Reed (1795-1864), Amer. statesman, sat from 1838 to 1859 in the national House of Representatives, first as a Whig, later as a Free-soiler, and eventually as a Republican. The abolition of slavery was very materially assisted by his able and outspoken speeches. When the slaves of the *Creole* slew their captain and claimed their liberty (1841) he courageously asserted that in 'resuming their natural rights to liberty' they 'violated no law of the U.S.A.' In 1842, when Congress passed a vote of censure on him, he resigned his seat, but his immediate re-election proved that the public fully recognised the value of his disinterested and splendid work.

Gide, André Paul Guillaume (1869-1951), Fr. novelist and critic, b. Paris. He was educ. at École Alsacienne and Lycée Henri IV. At one time he conducted *La Nouvelle Revue Française*. A great Fr. writer, G. began in a vein of turgid romanticism veiled as symbolism; but *Le Voyage d'Urien*, 1893, *Les Nourritures terrestres*, 1897, and *L'Immoraliste*, 1902, would have been ignored but for the soundness of their ideas and sentiment and for the promise which was to develop much later in *Si le grain ne meurt*, 1921. *Les Caves du Vatican*, 1914, is a fantastic tale which seems to exploit the moral theory of acts without motive, a paradox exemplified also in the work *L'acte gratuit* (a tale of homicide without reason), the former of which, says Prof. Denis Saurat, would have been a masterpiece had it been possible not to take it seriously. *Les Faux-Monnayeurs*, 1925, depicts the rebellion of youth, and the struggle between the 2 generations. A remarkably different outlook seems to

pervade his 2 delightful travel books, *Voyage au Congo*, 1928, and *Retour du Tchad*, 1929, books completely antithetical to the spirit which seems to inform his 'motiveless' stories. The substance of G.'s writings is, all through, his own self, a *moi* which has not achieved any cohesion and yet up to a point seems to reflect everybody's outlook. What he seems to be driving at in his more complex works is that sincerity is the prime virtue but consists in having no fixed beliefs. But above all G. is a supreme stylist, as may be seen in his autobiographical *Si le grain ne meurt* and his *Journal*, 1939, and the 2 African travel books, and many Fr. critics hold that he is the greatest modern writer of French. His *Journal* will probably remain his most read work. Some of the numerous themes which recur most frequently in it include his home at Cuverville, travel, piano-playing, Racine, Dostoevsky, homosexuality, his wife, the Gospels, the devil, Browning, insomnia, temptation, the problem of style, animals, Pascal, health, Conrad, the Catholic Church, children, and Bossuet. Even so summary a list serves to afford some indication of G.'s main preoccupations. It also indicates the peculiar rhythm of his existence, in perpetual oscillation between discipline and anarchy, between classicism and revolt, between austerity and sensuality. What is significant in G. and emphasises his originality as a writer is that he has no wish to suppress any of these extremes, nor to decide between the alternatives suggested to him by his own nature. He is equally attracted by heaven and hell, and is disposed to think that the kingdom of God partakes of both, particularly because, as the Gospel text teaches which he quotes so often, that kingdom is within you. G. was awarded the Nobel prize for literature in 1947. His other works include *Les Cahiers d'André Walter*, 1891, *Les Poésies d'André Walter*, 1892, *La Tentative Amoureuse*, 1893, *Paludes*, 1895, *Le Prométhée mal enchaîné* and *Philoctète*, 1899, *Lettres à Angèle*, 1898-99, 1900, *Le Roi Candale* (drama), 1901, *Saül* (drama), and *Prétextes*, 1903, *Amyntas*, 1906, *Le Retour de l'enfant prodigue*, 1907, *Dostoevsky d'après sa correspondance*, 1908, *La Porte étroite*, 1909, *Oscar Wilde*, 1910, *Nouveaux Prétextes* and *Isabelle*, 1911, *Bethsabé*, 1912, *La Symphonie pastorale*, 1919, *Corydon*, 1920, *Numquid et tu . . . ?* 1922, *Incidences*, 1924, *Caractères*, 1925, *Dindiki* and *Faïls divers*, 1928.

See S. Braak, *A. Gide et l'âme moderne*, 1923; C. du Bos, *Le Dialogue avec André Gide*, 1929; R. Fernandez, *André Gide*, 1931; L. Pierre-Quint, *André Gide: sa vie, son oeuvre*, 1932, revised ed. 1952; Klaus Mann, *André Gide and the Crisis of Modern Thought*, 1948; *The Journals of André Gide* trans. by Justin O'Brien, vol. 1, 1889-1913, 1947; vol. II, 1914-1927, 1948; *Homage to André Gide* (Gallimard, 1951).

Gide, Charles (1847-1932), Fr. political economist, b. Uzès (Gard). Prof. at univ. of Paris, 1898-1920. Early became attached to Christian Socialist movement.

Works include *Principes d'économie politique*, 1884, *La Coopération*, 1900, *Histoire des doctrines économiques* (with Charles Rist), 1909, *Premières notions d'économie politique*, 1921, and *La Coopération à les colonies communistes et Coopératives*, 1930.

Gideon, warrior judge of Israel, won the name Jerubbaal ('Let Baal plead') for destroying Baal's altar at Ophrah, his bp. But his great achievement was to overwhelm the Midianites near Mt Gilboa (Judges vj.-vii.).

Gielgud, Sir Arthur John (1904-), actor, b. London. His father, Frank G., was a member of a Polish family which had settled in England some years previously. On his mother's side he is connected with the celebrated theatrical Terry family (q.v.). His mother was a daughter of Kate Terry and a niece of Ellen Terry. G. was educ. at Westminster School, and then at the Royal Academy of Dramatic Art. His first appearance on the stage was in 1921 at the Old Vic Theatre as the herald in *Henry V.* Early in 1928 he visited New York, playing at the Majestic Theatre in *The Patriot*, in which he took the part of the Grand Duke Alexander. In 1929 he was again with the Old Vic Company, playing a number of Shakespearean roles, including Hamlet and Macbeth. The following year he played Hamlet at the Queen's Theatre and also John Worthing in Wilde's *The Importance of Being Earnest*. With these 2 roles he assured his reputation as one of the leading actors in the country. He then scored a big success with his production of *Richard of Bordeaux*, in which he played the title role. In 1939 he was at the Lyceum Theatre as Hamlet, which he played with the Old Vic Company at Elsinore on the outbreak of war. During the war years he toured in plays for the army and the R.A.F. in the U.K., Malta, and Gibraltar. In 1944 he formed his own company for a season of repertory at the Haymarket Theatre, playing Hamlet, Valentine in *Love for Love*, Oberon in *Midsummer Night's Dream*, and Ferdinand in *The Duchess of Malfi*. He played Benedict in *Much Ado About Nothing* in 1952 and 1955, Lear in 1955, and Prospero in *The Tempest* in 1957/58. In 1956 he played the lead in Noel Coward's *Nude With Violin*. He has also appeared in films, notably in *The Good Companions*, 1932, as Disraeli in *The Prime Minister*, 1940, and in *Richard III*, 1956. In 1953 he was knighted.

Gien, Fr. tn in the dept of Loiret, on the Loire. It was severely damaged in the Second World War. There is a castle dating from 1494. Porcelain is manufactured. Pop. 7700.

Giesebrecht, Friedrich Wilhelm Benjamin von (1814-89), Ger. historian, b. Berlin, and studied under Ranke (q.v.). He was prof. of hist. at Königsberg, 1857, and at Munich, 1862. His most valuable and exhaustive work is his *Geschichte der deutschen Kaiserzeit*, 1855-84, dealing with events up to 1181.

Gieseler, Johann Karl Ludwig (1793-1854), Ger. writer on church hist., graduated in philosophy from Halle in 1817. In 1819 he was appointed to the chair of theology at Bonn, and in 1831 accepted a similar position at Göttingen. His prin. work is *Lehrbuch der Kirchengeschichte* (5 vols.), 1824-57.

Giesen, Ger. tn in the Land of Hessen (q.v.), on the Lahn (q.v.), 40 m. NNE. of Wiesbaden. It rose to importance after the foundation in the tn of a univ. in 1607. The univ. (with which Liebig (q.v.) was connected) no longer exists, but there is an agric. and veterinary college, and there is a medical research institute. There are tobacco, engineering, and glass industries. Pop. 47,000.

Giffard, H. S., see HALSBURY, EARL OF. **Giffard, Walter** (d. 1279), archbishop of York. He was consecrated bishop of Bath and Wells, 1265, and was made chancellor of England after the battle of Evesham. Pope Clement IV appointed him archbishop of York, 1266, and he resigned chancellorship. G. received great seal on death of Henry III, was principal of the three governing England till new king's arrival (1274), and one of the guardians of England during Edward I's absence in 1275.

Gifford, William (1757-1826), critic and poet, b. Ashburton, Devon. Early left an orphan, he was rescued from a 'state of savage melancholy' by Cooksley, a local surgeon, who sent him to school and afterwards to Oxford. His ability and sad story persuaded Lord Grosvenor to appoint him tutor to his son and to afford G. his home as an asylum (1782). From this time forth G. devoted himself to writing. His *Baviad*, 1794, and *Maeviad*, 1795, were powerful satires directed against the Della Crusceans, and the ineptitudes and corruption of modern dramas respectively. In politics he was an enthusiastic admirer of Pitt, a good hater of the Fr., and a bitter opponent of Radical principles. Among his illustrious associates were Pitt, Canning, Frere, and the marquess of Wellesley. G. was the first editor of the *Quarterly Review*, with which he was connected from 1809 to 1824, but though by his vigorous political partisanship he secured for it an ever-increasing circulation, he nevertheless blackened its pages with a cruel and prejudiced attack on Keats's *Endymion* and many similar onslaughts on the writings of Shelley, Lamb, Hazlitt, and others. See W. Hazlitt, *Letter to William Gifford*, 1819; and R. B. Clark, *W. Gifford, Tory Satirist, Critic, and Editor*, 1930.

Gift, transfer of property without valuable consideration (q.v.) to a person who accepts the property either by himself or through his trustee. To constitute a G. there must be both a complete transfer and an intention to give. As to what amounts to the former, much depends on the nature of the property. Such a movable chattel as a bicycle would require no more than delivery accompanied, as the law says, by *verba de*

præcens doni (i.e. by words indicating that a G. is made). The transfer need not, however, be to the person intended to be benefited, but may be to a trustee for the benefit of the donee. A donee is not bound to accept a G., but if the G. be made by deed it vests in the donee without acceptance until he repudiates it. A promise to make a G. in the future gives no right whatever. An infant may accept a G. and repudiate it on attaining 21. A *donatio mortis causa* is a G. made by a man in contemplation of his death from an existing illness. Following the principles of the civil law (q.v.), the law is that a 'death-bed gift' is made only on condition that the thing shall be returned if the donor recovers, and that it is revoked by the predecease of the donee. A *donatio mortis causa* is ineffectual without delivery, either to the donee or someone on his behalf. It appears to be settled law that bank shares, railway stock, consols, and building society shares cannot be the subject of a *donatio mortis causa*, and cheques given must be cashed or negotiated before the donor dies. Delivery of the key of a safe would be effectual to pass securities in the safe.

Gifu, industrial and commercial city of Gifuken, Japan, about 20 m. N. of Nagoya. The seat of the prefectural gov., it is also noted for silk and chemical fibre textiles, paper, as well as its centuries-old tradition of handicraft (paper lanterns and umbrellas). Pop. 260,000.

Giga, *Gigue*, see *Jig*.

Giggleswick, par. and vil. of Yorks (W. Riding), 16 m. NW. of Skipton. The public school was founded in 1512; near by is an ebbing and flowing well. Pop. 800.

Giggleswick School, public school for boys founded in 1512 at Giggleswick, Yorks, and granted a royal charter by Edward VI in 1553. It was reorganised under a new scheme in 1872 (amended in 1903, 1910, and 1922).

Gigli, Beniamino (1890-1957). It. operatic tenor, b. and educ. at Recanatì, his father, a shoemaker, being the sacristan of the cathedral there. At the age of 7 he joined the cathedral choir. He studied at the conservatory in Rome under Cotogni and Rosati. He made his debut on the operatic stage at Rovigo, near Venice, in 1914, as Enzo in Ponchielli's *La Gioconda*. He then toured the chief It. cities and sang in Paris, Berlin, Madrid, and elsewhere in Europe. He also sang at the Scala in Milan, where he estab. his reputation as one of the best tenors of the day. In 1920 he went to New York as a member of the Metropolitan Opera Company, and made his debut there on 17 Nov. of that year as Faust in a revival of Boito's *Mefistofele*. He remained with the Metropolitan Opera until 1932, singing in Fr. and It. opera. He also sang at Covent Garden and in opera houses of Budapest, Vienna, Hamburg, Munich, and Zürich. As a concert artist he gave recitals in most of the large cities of Europe, the U.S.A., and South America.

Gigue, see *Jig*.

GIJÓN, Sp. tn in the prov. of Oviedo, lying on a small peninsula in the bay of Biscay. It is on the site of a pre-Rom. settlement, and Rom. remains have been found. There are many fine anct. buildings, including palaces and churches, and there are museums and libraries. The tn is an important manufacturing centre, with metallurgical (copper, iron, and steel), chemical, glass, pottery, and tobacco industries. It ships large quantities of coal from the Mieres and Langreo (qq.v.) dist., and has prosperous fisheries. Its port is called E. Musel, and is used by trans-Atlantic ships. There are sev. good beaches near by. Pop. 111,000.

Gil Blas, see *LESAGE*, ALAIN RENÉ.

Gila Monster, popular name for the poisonous lizard called *Heloderma suspectum*, which frequents the sandy wastes of

GILA MONSTER

Arizona, Texas, and New Mexico. In colour it is bright orange and black, and its victims are chiefly birds and small animals.

Gilan, prov. of Persia, bounded by the Caspian Sea on the N., Mazandaran on the E., Azerbaijan on the W., and Qasvin and Khamseh on the S. It is low-lying, swampy, and unhealthy towards the Caspian, but more salubrious where the ground rises to the S. It has large forests. Rice is cultivated on the Caspian littoral; tea, olives, citrus fruits, and tobacco are also produced. The fisheries are good.

Gilbert, Sir Alfred (1854-1934), sculptor and goldsmith, studied under Cavalier at the Ecole des Beaux-Arts in Paris and also in the studio of Sir Edgar Boehm, R.A. At Rome and Florence he was an enthusiastic admirer of the masterpieces in the galleries of sculpture, and his admiration is reflected in his 'Mother and Child' and 'Perseus Arming,' which were assuredly inspired by Renaissance work. His 'Icarus' attracted much attention in the Royal Academy Exhibition of 1884, but of his work known to the general public the most highly appreciated is the Shaftesbury memorial fountain ('Eros'),

1885, in Piccadilly, London. G. also executed the statue of Queen Victoria at Winchester, 1888, the memorial to the duke of Clarence, and fine busts of G. F. Watts, Sir Henry Tate, and many others. G. received Brit. Sculptors' Society gold medal, 1926. See Sir J. Hutton, *Life and Work of Alfred Gilbert*, 1903, and Isabel McAllister, *Alfred Gilbert*, 1929.

Gilbert, Cass (1859-1934), Amer. architect, b. Zanesville, Ohio. Began practice in 1883. Was noted for his skyscrapers—especially the Woolworth Building, New York. He designed the Capitol and other buildings at St Paul; Essex Co. Court House, Newark, New Jersey; Agric. Building, Omaha Exposition, 1897; U.S. Custom House, New York; Festival Hall, St Louis Exposition; Central Public Library, St Louis; Detroit Public Library; general plans of univ. of Minnesota, univ. of Texas, and completion of Arkansas Capitol at Little Rock; U.S.A. Treasury Annex, Washington, D.C.; W. Virginia State Capitol; U.S.A. Chamber of Commerce. President Amer. Institute of Architects, 1908-9.

Gilbert, Sir Humphrey (c. 1539-83), Eng. navigator, educ. at Eton and Oxford. He

SIR HUMPHREY GILBERT

served as a soldier in Ireland and the Netherlands, was in Parliament, and pub. his famous *Discourse on a North-West Passage to India*, 1576, before he finally obtained his much-coveted patent from the queen to 'discover and possess' remote 'heathen lands not actually possessed of any Christian prince or people.' The immediate result of this charter was the fruitless expedition of 1578-9, when Raleigh sailed in his company. In 1583 he fitted out another fleet, formally occupied Newfoundland, where he landed in Elizabeth's name, and having planted the first Eng. colony was on his way home when the little frigate, the *Squirrel*, in which he insisted on sailing, captured, and the *Golden Hind* was left to carry

home the tidings of the leader's untimely death. See life by D. B. Chidsey, 1932.

Gilbert, J. H., see LAWS.

Gilbert, Sir John (1817-97), painter and illustrator, b. Blackheath, sketched and drew from his earliest childhood, and was self-taught except for some lessons from Lance, the fruit painter. He exhibited at the Royal Academy from 1838, and continued, except between 1851 and 1867, till his death to exhibit there historical and illustrative themes such as 'Don Quixote's First Interview with the Duke and Duchesse,' 1842, 'Holbein painting the Portrait of Anne Boleyn,' 1842, 'Charlemagne visiting the Schools,' 1846, 'Rembrandt,' 1867, and 'Naseby,' 1873. Two hundred and seventy of his water-colours were hung from 1852 onward in gallery of the Old Water Colour Society, of which he became president in 1871. The success of the *Illustrated London News* is said to have been due not a little to his engravings. He is more considerable as a vigorous and prolific illustrator than as a painter.

Gilbert, Sir John Thomas (1829-98), founder of the Public Record Office in Dublin, was for many years (1855-89) in charge of the library of the Royal Irish Academy, an office which he found very congenial, as it gave him every facility for satisfying his passion for hist. and antiquities. He ed. the civic records of his bp., Dublin, as far back as 1730, and was the author of *Historical Essays on Ireland*, 1851, *History of Dublin*, 1854-9, and *Contemporary History of Affairs in Ireland*, 1641-1652, 1880. See life by his wife, 1905.

Gilbert, William (c. 1544-1603), b. Colchester, father of the science of magnetism, studied in Cambridge and Italy, and about 1573 was admitted to the College of Physicians in London. Queen Elizabeth made him her physician-in-ordinary, but his fame rests on a far more substantial basis than royal favour; for in 1600 he pub. his exhaustive and original treatise on magnetism, viz. *De magnete, magneticisque corporibus, et de magno magnete tellure*, a work which earned him the admiration of Galileo and an encomium from Erasmus containing the words (he is) 'great to a degree that is enviable.' In his realisation of the affinity and essential difference of magnetism and electricity, and of the communicability of telluric magnetism, in his fine conception of the whole earth as a great magnet influencing the direction of the magnetic needle N. and S., and his invention of terms 'electric emanations' and 'electric attractions,' etc., he may be said to have estab. all the 'fundamental facts' of his science. See the Eng. trans. of *De Magnete* by S. P. Thompson, 1900.

Gilbert, Sir William Schwenck (1836-1911), humorist and playwright, b. London, the son of a novelist, and a descendant of Sir Humphrey G., the explorer. His schooling was received in Boulogne and Ealing, and in 1856 he graduated from King's College as a B.A. of the univ. of London. For 4 years (1857-61) he led

a clerk's life in the education dept of the Privy Council, but finding such an existence too slow decided to follow law, and was called to the Bar in 1864. From this year onward his time was largely occupied with all manner of literary activities, though he found time to serve as magistrate for Middlesex (1891), and to hold a captaincy in the volunteers. For many years after 1861 G. was a popular contributor of comic verse and illustrations, signed 'Bab,' to *Fun*, and his *Bab Ballads*, which appeared in 1869, were a collection of his contributions. These lyrics, together with *More Bab Ballads and Songs*

Penzance, 1880; *Patience*, 1881; *Iolanthe*, 1882; *The Mikado*, perhaps the masterpiece, 1885; *Ruddigore*, 1887; *The Gondoliers*, 1889; and *The Yeoman of the Guard*, 1888, the last-named undoubtedly containing some episodes of true poetry. These operas are one and all animated by a rich vein of humour which consists in 'a logical topsy-turvydom,' and of sly hits at the follies and foibles of the day, the satire being of such a disarming urbanity as to be free from all the odium which usually attaches itself to satirists. He was knighted in 1907. See Edith A. Browne, *H. S. Gilbert*, 1907; F. Cellier and

LAGOON ISLAND, GILBERT AND ELLICE ISLANDS

of a *Savoyard*, are full of splendid nonsense and of graceful whimsicalities. For some time G. acted as dramatic critic for the *Illustrated Times*, and it was his work on this paper which turned his attention to the stage. From 1866, the year of his success with a burlesque entitled *Dulcamara*, he continued to write original plays, among them being a clever fairy play entitled *The Palace of Truth*, 1870; *Pygmalion and Galatea*, a mythological comedy, 1871; *Sweethearts*, 1874; and *Dan'l Druce*, 1876. *Fogerty's Fairy and other Stories* is the best collection of his tales, most of which first appeared in magazine form. His famous partnership with Sir Arthur Sullivan (q.v.) dates from 1871. At the Savoy, under the management of Richard D'Oyly Carte, there appeared in rapid succession a series of delightful operas, of which G. was the librettist, the most popular of them being *H.M.S. Pinafore*, 1878; *The Pirates of*

C. Bridgeman, *Gilbert and Sullivan and their Operas*, 1914; and H. Pearson, *Gilbert and Sullivan*, 1935.

Gilbert and Elllice Islands, Brit. colony in SW. Pacific, comprising some 3 main groups of is. scattered in the form roughly of a triangle, the approximate geographical positions of whose vertices are N. (Gilbert Is.) 3° N., 173° E.; E. (Phoenix Is.) 4° S., 171° W.; S. (Elllice Is.) 11° S., 179° E. The colony comprises the Gilbert Is. proper; the Elllice Is.; Ocean Is.; the Phoenix group; and, away to the E., and immediately to the S. of Hawaii, the 3 detached is. of Washington, Fanning, and Christmas. The colony was built up gradually between 1877 and 1937; and, since 1939, 2 of the atolls of the Phoenix group (pop. 850), Canton and Enderbury, have formed an Anglo-Amer. condominium, the value of the is. being enhanced in these days of trans-Pacific air travel. With the sole exception of Ocean

Is. all the is. are coral atolls, which explains their relatively tiny land area of 400 sq. m. in relation to the vast area of sea over which the groups are scattered (2,000,000 sq. m.). Christmas Is., scene of the 1957 Brit. H-bomb tests, occupies about half the land-area. Ocean Is. or Banaba, lying about 250 m. from the Gilbert group proper (1500 ac.), is rich in phosphate worked by the Brit. Phosphate Commission. It is 280 ft high and covered with vegetation (pop. 2880). The colony H.Q. is Tarawa. In the Second World War Betio Is. in the Tarawa atoll was the site of a Jap. airfield and stronghold occupied by most of the 6000 Jap. troops in the Gilbert Is. The Amer. marines landed in Nov. 1943, with tanks and artillery, but only captured the stronghold after a fierce 3-day struggle which cost them 3800 casualties. The total pop. of the G. and E. I. is only 36,000 and consists of Micronesians and Polynesians. The pop. of the Gilbert Is. in 1947 was 29,923; that of the Ellice Is., 5066. The Gilbertese are Micronesians, the Ellice islanders Polynesians. The Gilbertese are inclined to be reserved, but the Ellice islanders are probably the most vivacious of all Polynesians. Life is very austere on these is., for, apart from the coconut and pandanus, nothing grows easily, though a coarse tuber, the 'babai' (*Xanthosoma sagittifolium*), is cultivated in garden pits. Politically the Gilbertese and Ellice islanders are remarkably advanced for primitive peoples, working for themselves a sound form of local gov., with native magistrates and headmen (*kaubure* in Gilbertese and *falupe* in Ellice). There are also in each is. a chief *kaubure*, a native scribe, and a local police force. Each council or 'native government' makes its own local regulations subject to the approval of the dist. officer (Brit.) and criticises the draft laws of the colony to be administered by the local courts before they are sent to the High Commissioner for the W. Pacific for enactment.

The main exports are Ocean Is.'s phosphate rock (285,000 tons in 1953, but a wasting asset) and copra (7000 tons in 1953). Export duty on copra and tax and royalty paid by the Brit. Phosphate Commission are the mainstay of the budget of the colony, which is not grant-aided. The only European inhab. are scattered Her Majesty's Oversea Service officers of the colony gov., some 60 employees of the Brit. Phosphate Commission, about 50 of Pan-American Airways on the Anglo-U.S.A. condominium Is. of Canton in the Phoenix group, a dozen of the cable company at its Fanning Is. station, and a few Sacred Heart and London Missionary Society missionaries. Contact with the outside world is maintained by occasional visits from copra ships bound for the U.K.; 6 Brit. Phosphate Commission phosphate ships a month plying between Melbourne and Ocean Is., which is within the ambit of small local vessels from the groups; the Brit. Phosphate Commission recruiting

ship making the ann. tour of the groups; and the London Missionary Society ship *John Williams V* from Fiji 3 times a year. Nearly every Is. has a wireless station and daily contact with Suva, Fiji, and Honiara is maintained through Tarawa. Copra marketing and trade in imported goods, mainly oil, soap, tobacco, and cloth, are almost entirely in the hands of the islanders' own co-operative societies, which are becoming of increasing social importance. The native pop. is Christian and even the smallest is. has its large church dominating the main vil. Primary education at mission schools on each is. achieves general literacy, and the gov. maintains a secondary school on Tarawa. Selected pupils are trained in Fiji as assistant medical practitioners for service in the colony. The colony gov. is under the High Commissioner for the W. Pacific whose H.Q. are at Honiara in the Brit. Solomon Is. Protectorate.

Historically, after a period of chaos and strife following the coming of Europeans to the Pacific (vividly depicted in R. L. Stevenson's *In the South Seas*), the G. and E. groups were brought in 1877 under the jurisdiction of the High Commissioner for the W. Pacific. Subsequently they became a separate entity by the proclamation of a Brit. protectorate over the Gilbert Is. at Abemama, May 1892, and over the Ellice Is. 4 months later. The protectorate was extended to Ocean Is. in 1900. So acceptable did Brit. rule prove to the natives that it was not long before the 'native governments' expressed the wish to be formally incorporated in the Brit. Empire. The G. and E. groups of is. were annexed in 1915 and with Ocean, Fanning, and Washington Is. were constituted into the G. and E. I. colony in 1916. Christmas Is. was included in 1919 and the Phoenix group in 1937. The pop. of the whole colony is steadily increasing and it was to meet a deteriorating economic situation that the Phoenix Is., previously only intermittently inhabited though claimed by Britain, were formally incorporated in the colony. On them numbers of Gilbertese have been successfully settled. Both the Gilbertese and the Ellice islanders are gifted and artistic people, who find their highest form of self-expression in dancing. See ann. *Colonial Reports, Gilbert and Ellice Islands Colony*, H.M.S.O.

Gilbey, Sir Walter, Bart. (1831-1914), wine merchant, b. Bishop's Stortford, Herts. He volunteered for civilian service in the Crimea, and after his return founded the well-known firm of wine merchants, W. and A. Gilbey. His spare time was devoted to the improvement of the breeds of Eng. horses, on which subject he wrote some standard works. He was president of the Royal Agric. Society in 1895. His writings include *History of the Great Horse or War Horse*, 1888, *Pontes Past and Present*, 1900, *Horse Breeding in England and India*, 1901, *Modern Carriages*, 1904, *Farm Stock One Hundred Years Ago*, 1910, etc., and a vol. on agriculture from

George III to George V, *The Royal Family and Farming*, 1911.

Gilboa (corruption probably of Heb. *Gib'ath habba'al*, hill of Baal), chain of hills between the plain of Esdraelon and the valley of the Jordan, now called Jebel Fukua, scene of the death of King Saul and his 3 sons after the Philistines had defeated them.

Gildas (c. 516-70), Brit. historian. His treatise, *Liber Querulus de Excidio Britanniae*, is the one contemporary source of events in Britain in the first half of the 6th cent.; it is the work of an embittered traditionalist and unreliable in much of its historical information, but it does give important facts about conditions in G.'s own region and own time.

Gilder, Richard Watson (1844-1909), Amer. poet and editor, b. Bordentown, New Jersey. He served as a private during the Civil war. Entering journalism he founded the *Newark Register* with Newton Crane, becoming subsequently assistant editor of *Scribner's Monthly* and editor-in-chief of the *Century Magazine* in 1903. He was one of the founders of the International Copyright League, and took an active interest in all public affairs. His works include *The New Day*, 1875, *Lyrics*, *The Celestial Passion*, *The Great Remembrance*, *Two Worlds* (collected in *Five Books of Songs*, 1894), *Poems and Inscriptions*, 1901, *In the Heights*, 1905, *Collected Poems*, 1908, *Lincoln the Leader*, 1909, and *Grover Cleveland*, 1909.

Gilding, art of covering surfaces with gold by mechanical or chemical means for ornamental purposes. According to Herodotus and Pliny the custom was in use among the anc. Egyptians and also the Romans after the siege of Carthage. The thickness of the gold leaf they employed accounts for the comparatively solid traces extant. The art is seen to perfection in the native processes still pursued in India. G. in modern days is widely employed. The various processes used are as follows: (1) Leaf-gilding, in which pieces of gold leaf are applied to the surfaces by hand and with adhesives. This is the method employed in church and interior decoration, and also by the shop-fitter, picture-frame maker, and the book-binder, though the latter uses heat or pressure, or both, as well. (2) The application of finely divided gold powder instead of leaf is used extensively in the decoration of glass, pottery, and porcelain. (3) Chemical or electrochemical deposition. In this process the plating is effected by depositing the gold from solution by means of low-voltage direct current supplied from a rectifier, motor-generator, or battery. The articles to be gilded are first solvent degreased, and this is followed by alkali cleaning, preferably electrolytic. A thin preliminary film of copper from a cyanide electrolyte is then applied to articles of Britannia metal, tin, zinc, lead, or pewter, prior to immersion in the gold solution. To reduce pitting, a deposit of bright nickel frequently precedes the

The gold solution is prepared by dissolving cyanides of gold and potassium in distilled water. The articles are wired on to copper wires and hung in the hot solution (140° F.), or if of small size are supported in a perforated carrier made from stoneware or other suitable insulating material, and connected to the negative pole of the electric current source at 2-3 amperes per sq. ft. Agitation of the work being gilded is frequently employed. The anode consists of an annealed fine gold plate of area at least equal to that of the work in process. See also GOLD LEAF.

Gilds, see GUILDS.

Gilead ('hard' or 'rugged'), fertile mountainous tract of country traversed by deep ravines, situated in Palestine to the E. of the Jordan. It is bounded on the N. by the R. Yarmak (Hieromax) and on the S. by the Arnon. The tribal land of Gad also seems to have formed part of it. Jephthah and Elijah belonged to G. Josephus sometimes mentions it as divided into small provs. called after the caps. estab. by Gk. colonists in the time of the Seleucidae. The chief tns of G. were Jabesh, Mizpeh, Jazer, Penuel, Succoth, Ramoth-Gilead, Mahanaim, and later Pella and Gerasa. See L. Oliphant, *The Land of Gilead*, 1880.

Giles, Ernest (1839-97), Australian explorer, b. Bristol and educ. at Christ's Hospital, London. He went to Australia at an early age, and in 1872 made an expedition into the interior, which resulted in the discovery of Lake Amadeus. He crossed from Adelaide to Perth about the parallel of 30° S. lat. (1874-6), and recrossed the country between the 24th and 26th parallels, the journey being undertaken on camels. G. proved the interior W. of 132° E. long. to be waste scrub and desert. He pub. *Geographical Travels in Central Australia* (Melbourne), 1874, *The Journal of a Forgotten Expedition* (Adelaide), 1880, and *Australia Twice Traversed*, 1889.

Giles, St (Lat. *Aegidius*) (d. c. 712), probably a Provençal by birth. He was abbot of a monastery on the site of the present city of Saint-Gilles. One of the most popular saints of the Middle Ages, he is still venerated as the patron of beggars, cripples, and blacksmiths. His feast is on 1 Sept.

Giles, or Gilles, A. de Colonne, see COLONNE.

Gillilan, George (1813-78), critic and poet, b. Comrie, Perthshire. Educ. at Glasgow Univ., he became minister of a church in Dundee. His works include *Literary Portraits*, 1850, and a collection of Brit. poets in 48 vols., with introductions and notes. He also wrote *Night*, 1867, a poem in 9 books, and sev. biographies.

Gilgal, name of sev. places mentioned in the O.T.: one at Joshua iv. 19, about 3 m. N. of Jericho; another in Mt Ephraim, N. of a third SE. of Caesarea, known as G. of the Golan; another near Shechem; and a fourth near Jericho, mentioned as a sacred place in the time of Samuel. The

name means a circle of stones (like Stonehenge).

Gilgamesh, old Babylonian epic, the fragmentary remains of which were found inscribed on 12 tablets in the library of Assur-bani-pal at Nineveh. It tells of the adventures of G., who was ruler of Erech, and Enkidu, the wild man who became his friend. It resembles the story of Nimrod. See also ASSYRIA, *Literature*.

Gilgit, or **Gilgit**, formerly a Brit. Agency (estab. 1889), now part of Pakistan. It is the name both of a tn and dist., which includes Chitral, G., and part of the Indus. The tn is situated nearly 5000 ft above sea-level NW. of Kashmir, and is in a wild mountainous region. During the winter the only communication with G. is by air.

Gill, Arthur Eric Rowton Peter Joseph (1882-1940), sculptor and typographer, b. Brighton, son of Rev. A. T. Gill, was educ. at the Preparatory School, Brighton, and, from 1897, at the Chichester Art School. He was pupil to Douglas Caröe, the architect, 1889-1903, but preferred letter-carving, which led him on the one hand to sculpture and on the other to the designing of type-faces (notably of the fount known as G. Sans-serif). He became an agnostic and later a Socialist. In 1910 he began carving the human figure in stone, and he was encouraged by the approval of Augustus John and by the patronage of Count Kessler. A belief that absolute truth must be ascertainable led him to join the Church of Rome in Feb. 1913, in which year he was commissioned to execute the Stations of the Cross in Westminster Cathedral. After the First World War he carved 'Christ Driving the Moneylenders Out of the Temple' and it was placed as a war memorial at the main entrance to Leeds Univ. Other examples of his work are to be seen at Broadcasting House, at Jesus College, Cambridge, in the Tate Gallery, and in the Victoria and Albert Museum. During the latter part of his life he was a partner in a printing business which specialised in hand-setting. He designed the George VI series of postage stamps and made many wood engravings. Though his exquisite carvings are notable for their simplicity of design and boldness of execution, they are often done in that over-conscious defiance of convention which was first made famous by Epstein. His was the idealistic revolt of the handicraftsman against mass production. G.'s pub. include *An Essay on Typography*, 1931, *Clothes*, 1931, *Work and Leisure*, 1934, *Money and Morals*, 1934, *Art in a Changing Civilization*, 1934, *Clothing Without Cloth*, 1935, *Necessity of Belief*, 1937, *Work and Property*, 1938, and *Sacred and Secular*, 1940. See ILLUSTRATION. See also W. Shewring, *Letters of Eric Gill*, 1948. Life by E. R. Gill, 1953.

Gill, Sir David (1843-1914), astronomer, b. Aberdeen. He accompanied Lord Lindsay's expedition to the Indian Ocean, and in 1879 became H.M. Astronomer, Royal Observatory, Cape of Good Hope;

and improved observational methods by the use of photography for charting the heavens.

Gilles de Rais, see RERZ.

Gillespie, Thomas (1708-74), minister, b. Clearburn, Midlothian. He was received into the Presbyterian Church and became minister at Carnock, Fiffe. He was deposed by the General Assembly in 1752 for what they called contumacy. Attempts were made to get him reinstated, but he refused to re-enter the Church unless they altered their policy. Finally he formed the Relief Church, which was to relieve worshippers from the discipline of the church courts. This body finally amalgamated with the United Presbyterian Church. G. pub. *An Essay on the Continuation of Immediate Revelation...* in the Christian Church, 1771, and *A Treatise on Temptation*, 1774.

Gillflower (from Fr. *Giroflée*), name first given to the Pink, *Dianthus caryophyllus*, and Carnations; later to Stocks (*Matthiola*) and Wallflower (*Cheiranthus*). Chaucer's and Shakespeare's G.s were carnations.

Gillingham: 1. Municipal bor. of Kent, England, situated on the R. Medway. G. has been a settlement since the earliest recorded times; the tn is closely associated with the Royal Navy and H.M. Dockyard, and with the Corps of Royal Engineers, whose H.Q. are within the bor. Pop. 75,450.

2. Tn of Dorset, England, a few m. NW. of Shaftesbury. Pop. 3500.

Gillman, Frederick John (1866-1949), hymn-writer, b. Devizes, Wills. He was a member of the Adult School movement and the Society of Friends, and was a leading member of the committee which compiled, in association with Sir Walford Davies, the *Fellowship Hymnbook*, pub. in 1909.

Gillray, James (1757-1815), caricaturist, b. Chelsea, the son of an ex-soldier and out-pensioner at Chelsea Hospital. Successively a letter-engraver and an actor, he became a caricaturist after studying the works of Hogarth. Before 1790 he had estab. himself as one of the most successful of Eng. caricaturists. His caricatures were fiercely satirical and topical. Before the Fr. Revolution his main butts were George III, the prince of Wales, and various political celebrities in England. Later his ferocity was patriotically aimed against the Fr. and Napoleon, though he spared no one, and one of his most brutal caricatures 'Dido in Despair' was directed against Lady Hamilton. Gross in content, the prints he showed in the shop of his friend, Miss Humphrey, were highly attractive in colour and design. G. became insane in later life. See also under CARICATURE. See life by J. Wright, 1851; also F. D. Klingender, *Hogarth and English Caricature*, 1944.

Gills, or **Branchiae**, respiratory organs of aquatic animals, consist of delicate expansions of skin through which the oxygen is taken into the blood and carbonic acid emitted. Invertebrates generally respire through the skin, and their G. are merely

slight expansions of the body wall; many Echinodermata have their respiratory organs attached to their feet or tentacles, or connected with the thin filaments which float from the head; some of the lower crustaceans, e.g. Phyllopora and Branchiopoda, also breathe through their feet or through respiratory filaments, as in the case of the lobster, *Limulus*, the king-crab, is characterised by a series of broad, flat sacs called 'gill books,' which are borne on the abdominal appendages. The lamellibranchiate molluscs usually carry their G. in the form of ciliated plates on each side of the body. In fishes the G. are generally composed of triangular, membranous folds of skin which are supported by the branchial arch, and lie on each side of the gullet. G. are not found in any order higher than the amphibians and in certain cases, e.g. the frog, they are replaced by lungs in later life.

Gilly, industrial tn in the prov. of Hainaut, Belgium, N.E. of the city of Charleroi. There are important coal-mines here. Chief industries are iron and copper foundries, glass, chain, bolt, and cable works, boiler construction, brewing, and distilling. Pop. 24,800.

Gilman, Daniel Colt (1831-1908), Amer. educationist, b. Norwich, Connecticut. At the Sheffield Scientific School of Yale Univ. he was prof. of political and physical geography. He had an almost revolutionary influence on Amer. educational methods. In 1872 he became president of the univ. of California, and in 1875 he became the first president of the Johns Hopkins Univ. He became the president of the Carnegie Institution of Washington in 1901. Amongst his pubs. were *University Problems in the U.S.*, *James Monroe*, and *The Launching of a University*. See life by F. Franklin, 1910.

Gilman, Harold (1876-1919), painter. Early education, Oxford and Slade School. In Spain he studied Velazquez, and worked out a technique of delicate colour modulations. He became associated with Sickert and his Saturday afternoon receptions at 19 Fitzroy Street, London, of which Frank Rutter has said: 'Sickert was *chef d'école*.' Round him gathered gifted equals and juniors—Augustus John, Wyndham Lewis, and Henry Lamb were frequenters. 'Spencer Gore was his chief of staff, with Harold Gilman as an exceedingly able but sometimes difficult-to-manage aide-de-camp.' One of those influenced by post-impressionist

technique, G. became first president of the London group, and later a chief spirit in the Camden Town group (1911). A fellow member of the Camden Town group, W. Ratcliffe, tells that it was due to the influence of Spencer Gore that G. abandoned thin pigments and worked without a diluting medium. Like Gauguin and other post-impressionists he freely substituted pure colour for degrees of shadow. He painted portraits, domestic interior scenes, and a few landscapes, among his pictures being 'Washing Day,' 'The Yellow Hat,' 'Hampstead Road,' 1914. His last picture, 'Halifax Harbour, Canada' (6 ft by 4 ft), 1918, is at Ottawa. He is important as a Brit. interpreter of modern theory in art. G. lived his art. See F. Rutter, *Art in My Time*, 1923, and C. Ginner, 'The Camden Town Group' in *The Studio*, Nov. 1945.

Gilpin, Bernard (1517-83), clergyman, known usually as the 'Apostle of the North,' b. Kentmere Hall, Westmorland. He was educ. at Queen's College, Oxford. After accepting a vicarage for a short time, he travelled in France, and studied at Louvain and Paris. On his return he was made archdeacon of Durham in 1556. The Marian persecution inclined him to reforming views. His fearlessness and outspokenness gained for him many enemies, but he was ultimately appointed rector of the par. of Houghton-le-Spring. He was offered the bishopric of Carlisle, but preferred to remain in his own par. Here his influence for good was enormous. He did much for education, and built and endowed a grammar school. G. spent much of his time in the wilds of Cumberland and Northumberland, on what were called missionary journeys.

Gilroy, Norman Thomas (1896-). cardinal, archbishop of Sydney, b. Glebe, New South Wales. He studied at St Columba's College, Springwood, New South Wales, and the Urban College of Propaganda, Rome. G. was ordained priest in 1923, appointed archbishop of Sydney, 1940, and created a cardinal, 1946, becoming the first Australian-born cardinal.

Gilyaks (now officially called by their own name Nivkhi), Paleo-Asiatic speaking people living near the mouth of the Amur and on Sakhalin Is.; they numbered 4000 in 1926. They are mostly fishermen, now collectivized. G. retained until the 20th cent. a form of group marriage.
